Mr. J. Gibson, gardener to the Duke of Portland, Welbeck, Worksop, won first in the class for ten dishes of vegetables; his dish of Sutton's Centenary was of marvellous quality, and the Canadian Wonder beans, White Leviathan onions, Early Gem carrots, Magnum Bonum cauliflower, and, in fact, all the dishes were of highest quality. The second prize in this class fell to Mr. A. R. Searle, gardener to the Marquis of Northampton, who also had a grand lot of produce. Mr. J. Gibson was successful in Messrs. Sutton's special class for six dishes of vegetables, showing for first place their New Red Intermediate carrot, Magnum Bonum cauliflower, Perfection tomato, Centenary pea, White Leviathan onion, and Superlative potato. He was followed by Mr. A. R. Searle, Mr. T. Whysall, Mr. H. S. Foster, and Mr. H. Davis in the order indicated. In Messrs. E. Webb and Sons' class for six dishes, Mr. H. Davis was first, and Mr. H. Taylor was second. In the same firm's class for eight dishes, Mr. A. R. Searle led with a splendid collection; Mr. H. S. Foster was second, and Mr. H. Davis third. Messrs. Dickson and Robinson, Manchester, offered prizes for two bunches of their tomato Moneymaker, and Mr. T. Parry won with bunches carrying nine good fruits each; Mr. H. S. Foster was second with larger bunches, but the fruit was not ripe.

NON-COMPETITIVE EXHIBITS.

The very least that can be said of the many and varied exhibits by the trade, and a few private growers who were satisfied to exhibit outside the competitive classes, is that they constituted a really grand show in themselves. One of the most important features of the show was a very elaborate water, bog, and rock garden arranged by Messrs. Bakers, who, as local nurserymen, successfully held the field against all comers. Occupying a superficial area of 1,500 square feet, the design was at once bold and realistic. In pools were planted irises, rushes, nymphæas, etc., with gunneras, sarracenias, and ferns at the water's edge. On the moist boggy slopes, and in cool recesses, were spiræas, gillenias, eulalias, and a variety of suitable subjects, and these were backed up by bamboos and small coniferæ. This was altogether an exhibit of more than ordinary merit, and was awarded the special prize of £50 for the best exhibit in the show. Despite this great effort, Messrs. Bakers occupied another thousand feet with cut roses, sweet peas, and hardy flowers. We would much like to have given a detailed description of the many good things staged in each of these sections, but space will not permit.

A splendid model rock and water garden was arranged by Messrs. J. Backhouse and Sons, Lim., York. The general plan followed was that of an irregular bank of rock with water at base, one or two irregular mounds in the foreground serving admirably to dispel any sense of hard formality. Alpines were cleverly used among the boulders, nymphæas floated on the water, and the background of the whole was made up with ornamental foliage plants, rambler roses, etc. Messrs. Webb and Sons, Wordsley, Stourbridge, arranged on a huge but elegant brass framework, in the design of a Temple of Flora, a most tasteful display of sweet peas. Excellent blooms of the best varieties were artistically arranged, and the result was truly good. The base of the stand was occupied by vegetables, gloxinias, and ferns. Messrs. W. Cutbush and Son, Highgate Nurseries, London, N., arranged an effective group of flowering and foliage plants with tall stands of cut carnations distributed at intervals. The dwarf polyantha rose Mrs. W. H. Cutbush, and a batch of Spiræa Peach Blossom were features of the exhibit. Hardy flowers were staged by Messrs. T. S. Ware, Lim., Feltham; Delphinium Yvette Guilbert was particularly good, and the white phlox Lady Napier proved an excellent associate with the brighter colours. Zonal pelargoniums and roses were staged by Messrs. Jarman and Co., Chard, who also showed early-flowering gladioli and sweet sultans. A few good sweet peas occupied one end of the stand. A fine group of caladiums was arranged by Messrs. J. Peed and Son, West Norwood.

Mr. C. H. Herbert, Acocks Green, Birmingham, exhibited his new perpetual-flowering pink Progress. The blooms, of capital form and quality, were of that vigour and substance which bespeaks natural, open-air culture. Messrs. Gunn and Sons, Olton, Warwickshire, had a big bank of their ever popular phloxes. The best and newest varieties were shown in grand form. A bed of alpines and some good violas occupied the front of the stand. From Messrs. B. Ladhams, Lim., Shirley, Southampton, came good gaillardias, pinks, and other hardy flowers. Mr. C. F. Waters, Balcombe, Sussex, had a grand display of perpetual-flowering and border carnations. The quality of the flowers was supplemented by capital taste in arrangement. Miss S. S. Thompson, Alfred Road, Handsworth, staged a nice collection of cacti and other succulents. Mr. E. H. Suckling, Lichfield Street, Wolverhampton, staged some fine Canterbury bells, sweet peas, and hydrangeas, and in the centre of the stand was a harp, 'cello, and cushion, cleverly devised in flowers.

Hardy border flowers were staged in great variety by Messrs. Dicksons, Lim., Chester. Among the many beautiful things shown, the delphiniums stood out bold and conspicuous. Violas, pansies, sweet peas, and zonals were well shown by Messrs. Dobbie and Co., Rothesay. All were of the high order of merit customary to these experienced growers and exhibitors. Messrs. Hewitt and Co., Solihull, made a very attractive display of hardy flowers; liliums, delphiniums, and carnations were particularly good. A nice group of violas were staged by Mr. W. L. Pattison, Cherry Orchard, Shrewsbury. His blooms of the popular and newer varieties were of good form and colour.

Ferns were effectively shown by Mr. H. N. Ellison, West Bromwich. A massive piece of Platycerium alcicorne occupied the foremost position in the centre, and was surrounded by adiantums, gymnogrammas, nephrolepis, and a host of other good and useful ferns. A group of Dimorphanthus mandschuricus variegatus was shown by Messrs. Clibrans, Altrincham. From Guernsey Messrs. Lilley brought a fine array of Gladiolus Colvillei, G. cardinalis elegans, and a new variety named King Edward.

An extensive and really first-class collection of vegetables were staged by Mr. E. Beckett, gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree. There were some eighty dishes, every one of which was a model of perfection. From Mr. Charles Barnett, Albrighton, near Wolverhampton, came capital fruiting plants of an excellent tomato and also a quantity of cut bunches of the same variety. Mr. Joseph Lambert, 46, Dantzic Street, Manchester, showed rustic and other devices for the arrangement of cut flowers. Another exhibit of the same order came from Mr. A. Edwards, Arnold, Notts. A bright and pleasing arrangement of zonal pelargoniums in bunches came from Mr. Vincent Slade, Taunton. A display of sweet peas was made by Mr. T. W. Darlington, Warton, Carnforth.

The Wolverhampton Corporation Parks and Baths Committee staged foliage plants and some good plants of Pelargonium Paul Crampell. Another group from the same source furnished the end of one of the tents. Messrs. Robert Sydenham, Lim., Birmingham, staged sweet peas in elegant and tasteful manner, the value of the Sydenham table decoration devices being well exemplified.

The Gardeners' Magazine occupied its own tent near the secretary's pavilion, and in it displayed illustrations of flowers, plants, etc., and a large assortment of horticultural works for both professional and amateur gardeners.

Outside the tents Mr. J. E. Knight, Wolverhampton, made an elaborate display of rambler roses on rustic arches, pillars, etc., with beds of zonals, begonias, etc., and at the background was an arrangement of rockwork, suitably planted with alpine and kindred plants. A summer-house and rustic seats and flower stands made up a very attractive and creditable exhibit.

Messrs. Tom B. Dobbs and Co., Wolverhampton, had a rustic pergola, with a large temple-like centrepiece. Rockwork occupied the base, and shrubs, flowering plants, etc., were lavishly used.

SPECIAL AWARDS.

Silver vase, of the value of £50, or £50 in cash, for the most meritorious and effective display in the show, Messrs. Bakers, of Lichfield Street, Wolverhampton, for their water, bog, and alpine garden.

Large Gold Medals.—Messrs. Webb and Sons, Wordsley; Messrs. J. Backhouse and Son, York; Messrs. Bakers, Wolverhampton (two); Mr. E. Beckett, V.M.H., gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree.

Gold Medals.—Messrs. Dobbie and Co., Marks Tey; Messrs. W. Cutbush and Son, London; Messrs. J. Peed and Son, London.

Silver-gilt Medals.—Mr. C. F. Waters, Balcombe; Messrs. Gunn and Sons, Olton; Mr. John E. Knight, Wolverhampton; Messrs. Hewitt and Co., Birmingham; Messrs. Dicksons, Chester; Messrs. T. S. Ware, Lim., Feltham; Messrs. T. Rivers and Son, Sawbridgeworth; Mr. F. Lilley, Guernsey; the Wolverhampton Corporation.

Silver Medals.—Messrs. E. and H. Suckling, Wolverhampton; Messrs. B. Ladhams, Lim., Southampton; Messrs. Jarman and Co., Chard; Messrs. Clibrans, Altrincham; Mr. R. Sydenham, Birmingham; Mr. B. Slade, Taunton; Mr. T. Darlington, Carnforth; Mr. H. N. Ellison, West Bromwich; Messrs. Tom B. Dobbs and Co., Wolverhampton.

Bronze Medals.—Miss Thompson, Handsworth; Mr. C. Barnett, Albrighton (two).

BRUSSELS EXHIBITION, 1910.

During the Holland Park Show an informal meeting of horticulturists was held in the Lecture-room of the Royal Horticultural Society, Vincent Square, at which representatives of the Council of the Society, of the National Chrysanthemum Society, and other horticultural organisations were present. The principal object of the gathering was to receive the chairman of the Executive Committee of the British Section of the Exhibition, the Right Hon. the Earl of Lytton, to hear from him particulars of the work and operations of the Royal Commission, and to afford to horticulturists the opportunity of obtaining detailed information with a view to their sending exhibits to the exhibition.

The chair was taken by Sir Albert Rollit, who told the meeting what had already been done in relation to the exhibition. Lord Lytton stated the principal reasons for exhibitors coming forward to represent the British horticultural industry. There will be space for the maintenance of a permanent garden in the grounds, similar to the gardens of Belgium, France, etc., and there will be periodical flower shows.

The Rev. Mr. Wilks, secretary of the Royal Horticultural Society, with several members of the Council, Mr. Harman Payne (foreign corresponding secretary of the National Chrysanthemum Society), and others requested information, and the proceedings closed with a cordial vote of thanks to Lord Lytton for his attendance and speech.

Sir Albert Rollit communicated to those present the fact that Mr. Bunyard, of Maidstone, had promised to send a fruit [illegible]. The new department of the Board of Trade which deals with foreign exhibitions [illegible] simplified the business of exhibiting.

APPLE BLOSSOM WEEVIL.

A mischievous pest which is doing tremendous damage in orchards, unobserved by many people, is the Apple Blossom Weevil (Anthonomus pomorum). This pest is responsible for the curious brown-capped, unexpanded blooms to be found on the trees just now. The ravages of this insect have been especially severe this year, owing to the very cold weather at the time the apple bloom was opening, checking and retarding it, thereby affording considerable advantage to the weevil.

LÆLIO-CATTLEYA MARTINETI THE PRINCE.

A handsome hybrid exhibited at the Holland Park Show, July 6 and 7, when it received a First-class Certificate. The flowers are large, and richly coloured; the sepals and petals deep orange, and the lip rich purple.

In the spring, just when the blooms are ready to open, and the petals are showing above the calyx, the weevil ascends to the branches of the tree, laying her eggs inside the unopened blooms. This is an operation taking about three-quarters of an hour for each egg, the female first puncturing the bloom, then laying the egg, afterwards pushing it inside and closing the aperture with some sticky substance. Inasmuch as the weevil leaves off egg-laying when the blooms expand, it is obvious that with good growing weather we shall have a fewer number of affected blooms than if the cold weather retards the opening and prolongs the egg-laying period. In a few days the egg hatches and a maggot of whitish colour is produced, this eating the reproductive organs of the flower, sometimes even commencing on the rudimentary apple, as could be frequently observed this year, probably owing to unfavourable weather retarding its physical changes. The maggot moults into a yellowish pupa, which is probably its most generally observed state, and the latter again into the perfect weevil, which soon eats its way out of the brown unopened petals, and escapes amongst the leaves of the tree. At the time of writing many have made their way out, but a good many still remain in the capped blossoms on the trees.

If the latter be examined, the point at which the egg was inserted can be clearly seen by the difference in the colouring on the petal. It is quite clear that spraying can be of very little, if any value, considerable doubt seeming to exist as to whether the mature weevil feeds at all on the leaves, so that poisoning with arsenates does not seem very hopeful, and the chance with any of the contact washes even less so; and, further, it is obvious that, while in the blossom, the weevil is amply protected by the closed petals.

Hand-picking seems at present to be the only practical remedy, and of course this can only be carried out to a limited extent and only upon the smaller trees. If a careful watch is kept, the affected buds can be picked just before the weevils leave, when they are somewhat more easily removed than earlier in the season. I have frequently noticed that they seem fixed on very tightly, and one is in danger of breaking off a fruit or perhaps the whole spur in picking off those we wish to destroy.

A method of combating this pest, which promises some hope of success, is the jarring of the trees after the weevil has emerged from the blossom. It has been noticed that when the tree is jarred suddenly and vigorously the beetle falls to the ground. If, therefore, we have something in the nature of a cloth or large board covered with a sticky substance underneath the tree, we shall catch the beetles which fall off when a sudden blow is given to it.

Something of the nature of a light wood frame, made of batten, with a handle in the middle of one end and covered with canvas or American cloth should answer very well for the purpose. In large orchards, where it is possible to run poultry underneath the trees, this method might be tried, jarring the beetles off for the fowls to pick up. I have no personal knowledge as to whether they would eat them, but I should consider it very probable indeed.

The beetle hibernates in rough bark, moss, and lichen on the trees, as well as under stones and rubbish on the ground, so that thorough winter washing should be a considerable aid to combating its attacks. In this connection it seems that lime-wash of some sort must be of great service, as, if the tree is thoroughly coated, some quantity at least of the beetles must be prevented from escaping from their winter quarters. Like the other pests to which I have referred, this one seems enormously on the increase. Fifteen years ago we had to search for examples on our plantations, now we can find all too many on the first tree we look at, and no doubt it is the same all over the country, both in private gardens as well as in the market plantations of commercial men, so that it behoves us to do all that lies in our power to lessen the numbers of the foe, at least in our particular corner.

Fred. W. Hammond.

Brentwood.

LATE CELERY.

Late celery is a most important vegetable, and for autumn, winter, and spring use it is indispensable in the majority of gardens. It is valuable eaten in a raw state, or cooked as a vegetable. There is certainly no crop that I am acquainted with which does so much to improve the ground as this. Even the most stubborn and retentive soil, after it has been utilised for the culture of celery, is brought to a condition of fertility owing to the depth it is worked, and its exposure to the weather.

Late sowings may be planted at any time during the present month, but the earlier the better. It is a capital plan, where sufficient ground is not available, to take out the trenches between the rows of midseason peas, as these afford the celery a slight shelter, and immediately the plants become established, and the pea crop is over, the latter should be removed, and the ground between the trenches be forked and the space planted with lettuce, endive, radishes, spinach, or other crops which will be over before it is necessary to finally earth up the celery.

The trenches should be of good depth, and three parts filled with good half-decayed farmyard manure, made very firm; three inches of the finest of the soil taken from the trench should be placed on the top of the manure for planting. Single rows are to be preferred, as these are much more easily managed, but where space is limited two or three may be grown, providing sufficient room is allowed between the plants. From ten to fifteen inches is a reasonable distance to allow for celery. The plants should be carefully lifted, with as good a ball of soil and roots as possible, and if the growth has become drawn the outside leaves may be shortened back with good results. Plant very firmly, and give a thorough soaking. Look out for and remove every evidence of celery maggot that can be seen.

As is generally known, celery is a moisture-loving plant, and it is almost impossible to give too much water at the roots, or, during hot weather, overhead in the evenings. Liquid manure should be given in abundance at every other watering, and soot should be applied freely about once a week, or at least every ten days, both over the foliage and at the roots. Not only has the celery fly a great dislike to soot when applied in a fresh state, but soot acts as a splendid stimulant to this, as to many other vegetables. Side growths and split leaves should be removed at intervals, and the surface soil about the plants slightly stirred with the Dutch hoe frequently.

For late supplies earthing up should be deferred as long as possible, for the reason that immediately celery is bleached it becomes tender, and in very many cases it is owing to early earthing that celery does not keep well during severe weather. It is necessary also to carry this important work out piecemeal, i.e., only a small quantity of the finest soil should be added at one time, and this should be placed carefully, but firmly, round the base and between each plant. To accomplish this work properly it requires three pairs of hands, one on either side of the trench to add the soil, and the other to place it round with the hands. This work should be completed before we are likely to receive any very severe weather, and it will be necessary, when a continuous frost is imminent, to place a light covering, such as bracken, straw, or long litter, over the top of the plants.

Perhaps the most important point to observe in relation to the culture of late celery is the selection of varieties. There are many valuable varieties which can be grown for early use, but these are not sufficiently hardy to withstand severe winter. Pink and red varieties are generally to be preferred to white ones, and among these varieties, after many years' experience, I have found none to surpass Standard Bearer and Major Clark's as reds, while Aldenham Pink we have proved to be excellent for this purpose.

E. Beckett, V.M.H.

Aldenham House Gardens.

THE INFLUENCE OF FLOWERS.

The smell of Violets hidden in the green
Poured back into my empty soul and frame
The times when I remember to have been
Joyful, and free from blame.
—Tennyson.

The love of flowers is not necessarily accompanied by the love of gardening, nor the latter by the love of flowers, and most of us know people who take delight in one and not the other. Neither is the effect the same upon the individual, for, while nothing but good can come of the love of flowers, devotion to gardening may easily become such an obsession that a man's business or profession may suffer in consequence, to say nothing of family life. Gibbon, in his "Decline and Fall of the Roman Empire" states that "when Diocletian was solicited to reassume the reins of government and the imperial purple, he rejected the temptation with a smile of pity, calmly observing that if he could show Maximian the cabbages which he had planted with his own hands at Salona he should no longer be urged to relinquish the enjoyment of happiness for the pursuit of power." To come to modern times, the authoress of "A Summer Garden of Pleasure" says in the preface, that if a man desires to be a free man, "gardening he should shun like gambling and take refuge in cities and hotels from this pernicious enchantment." Against the love of flowers no such warning is necessary.

The appreciation of natural beauty, even of that of flowers, is largely a matter of cultivation. Though children like picking primroses and violets, it is rather the act of picking than the contemplation of the beauty of the flowers which gives them pleasure, as is often shown by the way the flowers are cast aside after being gathered. And yet the capacity to obtain pleasure from looking at flowers is one that, unlike the enjoyment of art, poetry, or music, can probably be acquired by the majority of people, educated or the reverse, if only the opportunity is given them; and it is one of the sad things about our great cities that there are so many who seldom or never know what it is to see a flower away from a public garden or shop window, for flowers must be held in the hand if we are to have that intimate acquaintance with them which is necessary to a full enjoyment of their beauty. An eastern philosopher of long ago advised anyone who had two loaves to go and sell one and buy a narcissus with the proceeds, and there is a deal of wisdom in the spirit of the advice, the author of it realising the importance of food for the soul as well as for the body. One who has acquired a real love for flowers has added to his mental wealth, and he who in any way implants the beginning of a similar love in other people is thereby adding to their wealth by increasing their capacity for pure enjoyment—enjoyment which, so far from cloying, grows by what it feeds upon, and can be often ministered to without expense, and never necessarily at any great cost. The following simple lines give beautiful expression to the effect produced by prolonged contemplation of even the humblest flower:

A pitcher of mignonette
In a tenement's highest casement;
Queer sort of a flower-pot—yet
That pitcher of mignonette
Is a garden in heaven set
To the little sick child in the basement.
The pitcher of mignonette
In the tenement's highest casement.

But there is another way in which flowers have an influence over us apart from the spell which their beauty casts upon us, and that is in the power of association. Happy is he whose childhood was passed amongst flowers, for he has a wealth of innocent memories which can be recalled to-day, after the lapse of half a century, in all their freshness, by the sight of some of the commonest flowers either in wild nature or in the garden; and no one is any the worse but probable the better, for having his thoughts occasionally directed to the time when he was at least more innocent of evil than now, if not better.

Then, again, flowers suggest to us or serve as illustrations for very helpful lessons. Men were once told to think upon the lilies (? anemones) of Palestine and learn a lesson of trust for the future. Wordsworth found a sermon in the daisy whenever he saw it, for he says:

Man is soon depressed;
A thoughtless thing! who, once unblest,
Does little on his memory rest,
Or on his reason;
But thou wouldst teach him how to find
A shelter under every mind,
A hope for times that are unkind,
And every season.

And again:

If stately passions in me burn,
And one chance look to thee should turn,
I drink out of an humbler urn
A lowlier pleasure.

And lastly, there is the indescribable influence of flowers, not felt by those whose minds are not attuned to it, but felt very powerfully by some. We might call it the mystic influence, and Wordsworth is the principal exponent of it. The effect produced upon him by the sudden sight of "a host of golden daffodils" is known to everyone, and, to quote from one of his poems to the daisy again, he says:

And all day long I number yet,
All seasons through, another debt,
Which I, wherever thou art met,
To thee am owing;
An instinct call it, a blind sense;
A happy, genial influence,
Coming one knows not how, nor whence,
Nor whither going.

And again:

One impulse from a vernal wood
May teach you more of man,
Of moral evil and of good,
Than all the sages can.

Nor must we forget the last two lines of the "Intimations":

To me the meanest flower that blows can give
Thoughts that do often lie too deep for tears.

Kingsley, too, tells us that we should—

See in every hedgerow
Marks of angels' feet.

Though few of us can ever expect to see in a daisy or a lesser celandine what Wordsworth saw, times do come, more or less rarely, to most of us when, owing, perhaps, to a peculiar receptivity of our normal state, flowers speak to us in a most unexpected way; and when we think of these and the various ways in which they influence different natures, the encouragement of the love of flowers becomes full of possibilities in its effects, even to the extent of sending people back to the land.

Alger Pe

ROSES AND ROSE BUDDING.

July and August being the best months for this most important operation in increasing the stock of roses, a few practical hints may be welcome. One cannot set a precise time for budding; the stocks are not always equally ready, nor can we procure buds of the desired variety at any given time. We should endeavour to have the bud in as nearly the same condition as the stock in which it is to be inserted. Of course, it frequently occurs that the stock is much older (often a couple of years or so) than the shoot the bud is to be taken from, but the main point is to have the bud fairly ripe, with sap still well on the move, and to secure similar conditions with the stock. A much better union is obtained, and the whole matures together.

Another point not sufficiently attended to is the selection of buds. Do not propagate from weaklings if it can possibly be avoided. A great deal depends upon a good commencement, with thoroughly healthy stock, and much more care might well be taken in this matter, and the constitution of the stock be improved. Shoots that have flowered will usually produce a more floriferous plant than those buds from shoots that did not flower. I feel there is more in this than many amateur growers would believe. It is different when dealing with the extra strong growers, such as Ulrich Brunner, Madame Gabrielle Luizet, Margaret Dickson, and those of the climbers often classed as Dijon teas. These more frequently flower upon the first growth when starting from the bud, especially if the buds were selected from long and rampant growths. This is natural when we bear in mind that such growths have generally the embryo buds stored up for next season's flowering. You will sometimes find a run of a dozen or more maiden plants that will be flowering upon short growths, while a following sequence of plants may be six to eight feet high and flowerless. Observation has proved this to be from buds taken off shoots that were flowerless or otherwise the previous season. There is not so much in this when dealing with climbers, because all of these will soon come into stronger growth, but I contend it is well to select carefully when we find what an effect it evidently has upon future growth.

Then, again, we find some few roses that produce far superior blooms upon one plant than upon another, and many of our best teas and hybrid teas do this. For instance, I have had two plants of Maman Cochet side by side, and of these one produced a continuance of perfect blossoms, while the other was constantly throwing a large proportion of split and badly-coloured flowers. Souvenir d'un Ami, Comtesse de Nadaillac, and a few more are very peculiar in this direction, and so I would endeavour to work from the most reliable plants.

Too strong growing a stock does not find favour with me. We often find the bark has grown so coarse as to completely bury the rose bud, the attached bark of which scarcely increases in size. This is why we do not feed our stocks, except it be to water them when too dry to allow of the bark being readily raised. The easier the bud comes away from the rose shoot, and the easier and cleaner it can be inserted in the stock, the greater are the chances of success. I would warn against too close tying.

As to stocks; these are many. You can have dwarf briars in three forms, viz., seedling, cutting, and the short eighteen-inch briar stem from the hedgerow. Briars are undoubtedly the best all round. The manetti may be used for a few of the hybrid perpetuals, and is very useful when one wants exhibition flowers from maiden growths. Monsieur Noman, Horace Vernet, A. K. Williams, Louis Van Houtte, and a few more generally produce a better flower from a maiden than an established plant, and the manetti is stronger than the briar. When the bud is inserted well upon the crown of the dwarf stock one is not much troubled with suckers. The short standards are grand for our choicest teas and hybrid teas that have a tendency to droop, and is just what is needed to keep the flowers off the ground.

One can also bud upon any other rose that is not of the desired quality or colour. Provided the plant is doing well, I would bud upon it where it stands, and cut back to this point the following season, thus obtaining the desired variety upon the same position, and saving a season or so. So long as the rose is doing well there is no reason whatever why it should not answer as a foster stock to a more desirable variety.

A. Piper.

STRAWBERRIES—PAST AND PRESENT.

Notwithstanding the fact that raisers have been successful in evolving many stocks more or less distinct, one finds when visiting gardens, whether private or devoted to market crops, that the old favourite strawberries of past years are still largely grown. In a vicarage garden recently, we found Princess Alice in bearing, a strawberry that carries one's mind back quite 30 years. Then it was a great favourite, but how few still cultivate it? In those days it was regarded as free-bearing, and I believe as early also.

At Eastwood Park, Gloucestershire, the seat of Sir G. Jenkinson, Bart., we found recently, thriving and much esteemed beds of Dr. Hogg, Vicomtesse H. de Thury, and British Queen in the company of Royal Sovereign, Scarlet Queen, and the more recently-introduced Laxton's Reward. Comparisons in flavour were made, and the merits in this respect of the old and new were discussed. In the result it was unanimously conceded that the old stock occupied an unchallenged position. Mr. Lippiatt, who has been gardener at Eastwood for the past 22 years, has tried newer varieties, but he says some of them serve only for the servants' hall, they are not permitted in the dining-room, nor will they pass the censorship of the critical owner of Eastwood Park. In going to this extent of criticism in regard to some of the newer varieties, it does not follow that their merits are decried because of the adverse opinion of one or two persons. Palates are not all alike, a fact borne out by the popularity of Royal Sovereign, a by no means highly flavoured strawberry compared to British Queen.

Even the most ordinary palate will concede the flavour point when given a ripe berry plucked from the plant, first from Reward, then from Vicomtesse H. de Thury, and when one's tastes are educated in flavour matters, it is comparatively easy to understand preferences. We can well remember some fifteen or more years since how one market grower claimed, and easily obtained, advanced prices for his British Queens; his difficulty was to get sufficient for his customers' needs. The case is different now, for in the present market distribution strawberries are strawberries, and regarded as such without critical distinction, save for size and colour. Dr. Hogg we can remember as a great favourite from 20 to 25 years since, for its firm flesh and sweet and rich flavour made lasting impressions on the memory. The plants of that period grew and thrived in heavy working soil, having an underbed of stiff clay; the same conditions, we believe, obtain at Eastwood, for the plants there were possessed of remarkable vigour, both in leaf and crop, as were also all other varieties. Royal Sovereign, which shared space in company with these others already notified, required a full yard space between the rows, so spreading were the leaves and fruit trusses. A seedling raised at Eastwood from a cross effected between the last-named and Vicomtesse H. de Thury, supplied a large fruit and sweeter flavour in its berries than the latter, but in leaf it was scarcely distinguished from Royal Sovereign.

We find in the market gardens of some districts that the once general favourite Sir J. Paxton, not only remains, but is really gaining an extension of space and popularity. It has a darker crimson colour than many of its compeers, and under suitable culture gives berries as large as Royal Sovereign, and when flavour comparisons are made, the old and respected knight offers a dignified challenge. Royal Sovereign, although cultivated by hundreds of acres, has a very prominent failing, namely, the length both of its leaf stalk and fruit trusses. In the spring months, when the flower buds advance, they are exposed to the damaging influence of prevailing frosts. In very many early plantations this year all the most forward buds were found to have blackened centres, and many growers had proof of the delusion of safety based on the faith of unopened buds. Noble, one of the pioneers of the modern strawberry, is now seldom heard of, though there is evidence of its service in later introductions. Nor do we hear of James Veitch and Cockscomb, the giants of the seventies. Auguste Nicaise, perhaps the largest and most enviable of forcing stocks, seems to have been lost in the maze of names found in the gardens of to-day. Berries of the most handsome outline and colour often turning the scales at 2½oz., were obtained, and these induced the more ambitious and successful to aim at the full 3oz. berry. The effort thus made has now been transferred to the favourite Sovereign.

Leader is still a useful first early, but is valued only in a yearling state. On young beds large berries of a deep colour come early and plentifully, and what is important, its leaves protect the rising flower trusses from frost. Givon's Prolific is one of the most fertile strawberries we know. With us this year a two-year-old bed presented one of the finest floral pictures we have seen in a strawberry plantation, the neat leaves being almost concealed beneath the profusion of flower and bud. Its season often extends into August, and most acceptable supplies are obtained through the latter part of July. Latest of All must not be confused with Laxton's Latest, the latter being a comparatively new variety not yet fully proved, but is well reported of by some who have grown it. The older stock in heavy soil proves still a dependable strawberry, giving heavy crops and fine berries when Royal Sovereign supplies are over.

Dumbarton Castle, a bright fruited Scotch variety, is retained for its useful successive service. It produces solid fruits, and has a neat habit of growth. Bedford Champion and The Bedford are maincrop varieties which provide large berries of sweet flavour and fine colour, but are of soft texture. Of the newer Reliance and Progress we have not had sufficient experience to enable us to express an opinion.

MECONOPSIS IN THE OPEN GARDEN.

The discovery of Meconopsis integrifolia was due to the Russian Przewalski, from whose herbarium specimens Maximowicz, erroneously named it Cathcartia villosa, and this was subsequently corrected by Franchet. Along with seeds of several other plants, and described as from Yunnan, seed of M. integrifolia came into the possession of M. Maurice de Vilmorin, from these plants were raised, the first of which flowered in April, 1896, and the remainder the following year. Unfortunately the plants failed to produce seed, so that the final honours associated with Meconopsis integrifolia must undoubtedly be credited to the enterprising firm of Messrs. J. Veitch and Sons, of Chelsea, to them we are indebted for its rediscovery, and also for its distribution. They say, with reference to it, "In the neighbourhood of Tatieu-lu the magnificent yellow poppy was discovered by Wilson, who secured seed from which plants were raised that flowered at Langley in September, 1904, and was distributed the following year." Not only have they given to gardens a plant of great beauty, but they have placed it within easy reach of all, and it is matter of history that Meconopsis integrifolia appears triumphantly in this firm's exhibit every year, at the Temple Show. At the one recently held they contributed a group that testified alike to the vigour of the species and to the skill displayed in its cultivation.

Since its introduction M. integrifolia has been the ambition of hardy plant specialists. In every respect it is typical of that inordinate beauty characteristic of the entire genera; sharing features common to other species, it has also characters peculiar to itself which render it most distinct. The foliage is grey-green, densely clothed by innumerable fine needle-like hairs of a golden-amber colour, the leaves are variable, at times long and narrow, they occasionally measure three inches across, and are always arranged in the form of a rosette. The golden ball-like flowers are carried upon slender stalks which spring at close intervals from the upper part of a simple stem, these do not partake of the ephemeral nature of the poppy race, as I have noticed flowers remain effective for a fortnight. The plant is a hardy biennial, and attains a height of two feet under favourable conditions; it is deciduous, though not to the same extent as with M. aculeata and M. racemosa.

The crucial stages in growing M. integrifolia are those of seed raising, and in providing suitable flowering quarters; practice will readily overcome the first, but intuition is necessary in interpreting their wants when planting permanently in the open.

Seed is short-lived, and must be sown as soon as ripe, or at latest early in spring; pots or pans may be employed for sowing, but the drainage must be ample. Use a potting compost of sandy loam and peat—that which is used for hard wooded greenhouse plants is suitable—with this fill the pots with soil and water it, and as soon as the excessive moisture has drained off, sow the seeds upon the surface and lightly cover with sifted soil. Place the seed pots in a cool frame and exclude light. When germination becomes evident admit light, but shade from direct sunlight. Water must be carefully supplied as the seedlings easily damp off at this stage, and air must be given on favourable occasions. As the seedlings become large enough to handle, put them singly in small pots, employing a compost similar to that used for seed sowing. Maintain a light shade during periods of bright sunshine, and spray the plants overhead morning and evening. Towards the end of July they will be ready for planting out, those intended for flowering in pots are grown on under the above conditions, repotting as becomes necessary; nine and ten inch pots are suitable for flowering specimens.

The best position for permanent planting, not only for this species, but for all the meconopsis is, I rather fear, a laboured point. Travellers emphasise what their leaves proclaim, that they are plants adapted to an atmosphere always more or less charged with moisture—veritable children of the mist—and it is here that numbers of English growers have failed in a too generous interpretation of this weakness, thereby subjecting the roots to a surfeit of moisture. From what I have seen of meconopsis in other gardens, compared with my own experience, I am led to avoid those contracted pit-like depressions, so frequently found as accessories to the rose garden, and generally recommended as inviting success, choosing in preference some sheltered bay among choice shrubs, and if the ground is comparatively flat so much the better for our purpose. The soil must not contain lime, and should consist of the best sample of loam, peat, and oak leaves procurable. Plant the foreground thinly with pernettyas, introducing Kalmia latifolia or similar shrubs behind, and subordinate their increase in width to the primary object of supplying shelter; group among these the various species of meconopsis, those dwarf in stature to the front, paniculata and Wallichi behind, the result will be a winter effect satisfying to the most exacting, as these two species have foliage that is marvellously beautiful and evergreen, the rain drops rest among the hairy leaves, reflecting the sunlight so that they almost vie in brilliancy with that produced by the gaily coloured fruits of the pernettyas. From May onwards till autumn the floral feast will be one of ever-varying beauty, the garment of the meconopsis is in essence that which the poppy always wears, the former supplying those colours which the latter singularly lack, the texture of their petals is as silk compared with a common fabric, their nobility in comparison to a plebeian race.

One of those idiosyncrasies which often force themselves upon the practical cultivator is that species so dissimilar in nature and habit and widely separated geographically should find congenial quarters in the same garden plot, such is my experience with M. heterophylla, the only American species, and M. Wallichi from the Sikkim Himalayas, and my contention for a drier rooting medium is amply justified by the behaviour of these species; so far Wallichi has topped the measuring rod at seven feet six inches, perfect pyramids of the most exquisite silky blue, while heterophylla makes thick little bushes two feet high of deep grey green leafage, clothed with fairy stems, supporting the deep orange and maroon blotched flowers.

Thomas Smith,

Walmsgate Gardens, Louth.

ROSE ARIEL.

An elegant variety of climbing habit, raised by Messrs. Paul and Son, and bearing large single rose-coloured flowers. Card of Commendation, National Rose Society, July 2; A.M., R.H.S., Holland Park, July 6.

CROTONS FOR TABLE DECORATIONS.

The present season, so far, has been exceptionally cool and overcast. The fitful sunshine has made the work of shading plant houses a difficult one; but, with regard to crotons, I do not trouble about any shading. The plants in small pots intended for table decoration during the autumn and winter months, are left fully exposed to the sunshine throughout the summer months. It is a very important point in connection with the cultivation of these lovely foliage plants, that all basal leaves be sound, of normal length, not seared and stumpy, and of rich colour. All experienced cultivators of crotons know well the value of such examples. In order to obtain these good features they are arranged on empty inverted flower pots on the front, or central stage, or on shelves. Each one must be clear of its neighbour, so that light and the sun rays can reach all the leaves. I do not hesitate to syringe the plants early in the afternoon when the sun is shining on them if it be necessary to do so. A high temperature is maintained, and a very moist atmosphere. Careful watering is essential to success. In lean-to structures the plants must be turned half-way round once every week. So treated very nice specimens will be available for table use later on.

Geo. Garn

EARLY PEAS IN 1909.

The late spring was a very trying one for gardeners, especially in districts where winter vegetables suffered so much from frost. The cold weather in March retarded growth considerably, and made this one of the latest seasons I can remember, and had it not been for the fine weather we experienced during the early part of April and the few warm days in May we should have been faring badly at the present time. The weather during June was all that one could desire for the production of weeds, as there was ample moisture to keep them growing, and very few opportunities to clear them off the ground. Peas, too, during the showery weather, made good progress, and though they are not so early as they have been some seasons, the crops are good, pods being abundant, and well filled.

The varieties of good early peas are now so numerous that there is no necessity to grow any of the hard, round-seeded sorts, and as each year there are a number of new kinds put on the market, some being still an improvement on their predecessors, there are sufficient to choose from to suit any soil or situation. Seasons, soils, and cultivation have much to do with the earliness, growth, and productiveness of this vegetable, for while, under ordinary treatment, varieties like Chelsea Gem, English Wonder, and others of their type only grow to a height of eighteen inches, under liberal cultivation their haulm will attain a length of five feet, or even more. This season I have seen Chelsea Gem grow fully five feet high, and clothed with pods the greater part of its length. There is no real difference in the time of gathering, as these tall plants flowered quite as early as the dwarf ones, and the peas were ready to gather about the same date. If these so-called dwarf kinds can be induced to grow more than double their reputed height, and produce heavy crops, what advantage is there in growing the taller ones? Here, I may remark that it is only by intensive cultivation that these dwarf varieties can be induced to grow so tall, for, as a rule, dwarf ones are more difficult to grow than the taller varieties, hence the reason for their preference.

Although Sutton's Pioneer, like several others of recent introduction, are considered to be dwarf, with me they have attained a height of from four to five feet, and we always put sticks to them to support growth of that height. This was sown on February 2, and though the season has been so backward, it was ready to gather on June 18. The haulm and foliage are dark green, and pods and seeds of the same colour. The flowers are small, and only produced singly, but as the joints on the growths are so close together, the crop is ample. When growers are better acquainted with such first-class kinds they will doubtless discard the older ones. World's Record is another pea of about the same height, but the foliage and pods are of a much lighter green hue. When well grown this is a first-class variety, but it needs liberal treatment. Reading Wonder has dark foliage and pods, and grows to about the same height as the two preceeding, and, like them, is of first-class quality. Advancement gives fine well-filled pods of the Daisy type, from which it is said to be a seedling.

To give a detailed account of all these

H.T. ROSE DUCHESS OF WELLINGTON.

A beautiful variety exhibited by the raisers, Messrs. Alex. Dickson and Sons, at the Holland Park Show, July 6 and 7, when it received an Award of Merit. The colour, apricot-yellow, with coppery-red centre.

early dwarf kinds would take up too much space, but, I may add, of all the dwarf ones grown here Edward VII. is by far the most productive. The foliage is broad, of a deep green colour, heavily marbled; the haulm growing to the height of between four and five feet, and is very robust. The pods are large, produced in pairs, and of a very dark green hue. The seeds are large, and of excellent flavour. It is one of the most prolific peas I have ever grown.

There are many new taller varieties, but these, on good ground and under liberal treatment, take up too much room, especially is this so in exposed places, and where good pea boughs are difficult to procure, for unless peas are well staked the wind is apt to blow them about and damage the growth, thus reducing the chance of the plants bearing a full crop of pods; but, as before remarked, these tall varieties are far less difficult to grow than the dwarf ones, especially on light, dry soils. Amongst these International, which is much after the style of Duke of Albany, but earlier; Harvestman, Edwin Beckett, and some others are good. I grew Gradus the year in which it was sent out, and considered it a very fine pea, but since that date it has deteriorated, showing how necessary it is to re-select the stock frequently.

"STREAK" IN SWEET PEAS.

A few days ago I had a conversation with several of our most successful sweet pea growers, and all assured me that their plants were affected with "streak." Further, one grower said that everyone to whom he had spoken on the subject complained of "streak." My own plants are badly affected; in some instances there are isolated plants quite free from it, growing nearly five feet high, and bearing flowers, while others near them are stunted, and the flowers they are striving to bear are also stunted, and fall off before they are fully developed.

The young plants seem to be perfectly free from "streak," and to grow well until they attain to a height of about eighteen inches or two feet, and then the points of the shoots begin to show unquestionable signs of distress.

Two years ago, and even last year, one only heard of isolated cases of "streak"; but this year, so far, the disease seems to be very prevalent indeed, and, judging from my own experience, and that of other growers, I firmly believe that it will very soon work as much havoc among sweet pea plants in the country as the hollyhock disease did many years ago. One cultivator told me he had, he thought, discovered a remedy, if so, I hope he will make good use of it. So far, I feel sceptical in the matter, and would like to enlist the help of the National Sweet Pea Society, and I would suggest that a conference of expert growers be held at the forthcoming exhibition at Vincent Square to discuss the subjust of "streak" especially. The time seems opportune, and, in view of the rapid progress made by the disease in the past, no delay must occur in attacking the disease itself, else, I am afraid, it will soon dishearten all growers. I believe the disease is caused by a fungus growth, but I have not heard that anyone really knows what "streak" is, but many are painfully conscious of its dire effects on the plants.

G. Garner.

NEW PLANTS, ETC.

◆

LÆLIO-CATTLEYA MARTINETI THE PRINCE.

This is a fine and very handsome variety of the popular hybrid derived from Lælia tenebrosa and Cattleya Mossiæ. In this case the aurantiaca variety of C. Mossiæ was used as a parent. The sepals and petals are orange, with a bronzy suffusion, and the rich purple lip has veins of deeper purple. F.C.C., R.H.S., July 6. Messrs. Sander and Sons, St. Albans.

PRIMULA LITTONIANA.

A new and very distinct primula, found in China by Mr. G. Forrest. Its inflorescence is spicate, and reference to our illustration on p. 528 will show its distinct character. The flowers are rosy-lilac, with purplish base, and a prominent feature of the spike are the deep blood-red calyces. The showy calyces are very attractive at the top of the spike, where the flowers are not expanded, and contrast with the lighter hue of the flowers below. The leaves are greyish-green, and the spikes may be from 1ft. to 2ft. high. F.C.C., R.H.S., July 6. Messrs. Bees, Lim., Liverpool.

MILTONIODA HARWOODI.

A wonderful little orchid, obtained by crossing Miltonia vexillaria with Cochlioda Noetzliana. Only one flower was borne by the seedling plant, and it was about two inches long, flattish, and showing strong evidence of the miltonia parentage. The sepals and petals are rosy-scarlet, and a little recurved, the flat lip being rosy-salmon, with creamy-white shading. Certificate of Appreciation, July 6. Messrs. Charlesworth and Co., Haywards Heath.

CATTLEYA MOSSIÆ WAGNERI VAR. SANDERÆ.

This is a very fine form of the white C. M. Wagneri, and is remarkable for the breadth and fringing of the petals and lip, and for the purity of the whiteness. A.M., R.H.S., July 7. Messrs. Sander and Sons, St. Albans.

ROSES.

Ariel.—A beautiful single rose of fine habit for furnishing pillars. It has dark shining foliage and a profusion of large flowers, deep rose shaded with dark crimson. Each bloom is three or four inches across. Commendation, N.R.S., July 2; A.M., R.H.S., July 6. Messrs. Paul and Son, Cheshunt.

Duchess of Wellington.—A beautiful H.T. rose of fine growth, and with good foliage. The flowers are rich apricot-yellow, and the long buds are especially attractive. A.M., R.H.S., June 6. Messrs. Alex. Dickson and Sons, Newtownards.

Grace Molyneux.—A large and beautiful H.T. rose, producing broad-petalled full blooms, that have a salmon-pink centre surrounded by soft white. A.M., R.H.S., July 6. Messrs. Alex. Dickson and Sons, Newtownards.

Walter Speed.—Another good H.T. rose, with full centred blooms that are white, shaded with pale yellow, and with salmon-tinted centre. A.M., R.H.S., July 6. Messrs. Alex. Dickson and Sons, Newtownards.

Countess of Shaftesbury.—A large and bold H.T. rose of deep rose-pink hue, and with broad petals of fine form. Gold Medal, N.R.S., July 2. Mr. Hugh Dickson, Belfast.

Lady Pirrie.—A charming H.T. rose of medium size; colour, rich golden-apricot shaded with orange-salmon. Gold Medal, N.R.S., July 2. Mr. Hugh Dickson, Belfast.

Theresa.—A very pretty H.T. variety, with small, shapely blooms that are yellow, shaded with apricot and rose. Commendation, N.R.S., July 2. Messrs. Alex. Dickson and Sons, Newtownards.

Muriel Jamieson.—A bright apricot-yellow single rose, very distinct and attractive. Commendation, N.R.S., July 2. Mr. Hugh Dickson, Belfast.

Sheila Wilson.—A brilliant red single rose. Commendation, N.R.S., July 2. Dr. J. Campbell Hall.

Mrs. Herbert Stevens.—A pretty, creamy-white hybrid tea rose. Commendation, N.R.S., July 2. Messrs. S. McGredy and Son, Portadown.

Climbing Lady Ashtown.—A climbing form of the beautiful H.T. variety. Commendation, N.R.S., July 2. Mr. F. M. Brad Peterborough.

SWEET PEAS.

Mrs. Townsend.—A waved variety with white ground, shaded and flaked with heliotrope-blue. A.M., R.H.S., July 6. Messrs. Jarman and Co., Chard.

Doris Usher.—A strong-growing variety, with bold broad standard. B pink. A.M., R.H.S. Mr. A. E. Usher, gardener to Sir Randolf Baker, Bart., Ranston, Blandford, Dorset.

Colleen.—A waved variety, with bright rose standard and whitish wings. After the character of Apple Blossom Spencer as shown. A.M., R.H.S., July 6. Mr. William Deal, Brooklands, Kelvedon.

Masterpiece.—A very fine sweet pea bright lavender-blue self. A.M., R.H. July 6. Messrs. Dobbie and Co., Rothe

Mrs. Henry Bell Improved.—A delig sweet pea, and distinctly finer than charming type of which it is an imp and more vigorous stock. The colour is pink over a cream ground. A.M., R.H. July 6. Messrs. Dobbie and Co., Rothe

NEPHROLEPIS MAGNIFICA.

Yet another of the plumose nephrolep This one has a general resemblance to N. amerpohli, but the fronds more finely divided than in the case of N. lycopodioides. A.M., R.H.S., July 6. Messrs. Stuart Low and Co., Bush Hill Park, Enfield.

CARNATION LIEUT. SHACKLETON.

A useful border carnation; yellow, with salmon. A.M., R.H.S., July 6. Mr. Charles Blick, Warren Nurseries, Hayes.

MESSRS. R. WALLACE & CO.'S DISPLAY AT HOLLAND PARK.

The great exhibition held by the Royal Horticultural Society at Holland Park on the 6th and 7th inst. contained many features that strongly appealed to visitors by reason of their distinctive character and attractive appearance; and prom among these was the magnificent d arranged by Messrs. R. Wallace and C Colchester. As stated in our rep this great gathering which appea our last issue, this formed one of the distinct and striking displays in the and was of much interest as evide the great value of hardy flowers, wh in the production of bold and rich The basis of the arrangement was a terrace of considerable length, and the front was a stone pathway, wh on one side a broad border, in which delphiniums, campanulas, irises, kni liliums, Ostrowskia magnifica, and choice subjects were tastefully arrang bold groups. Against the tent was a of cupressus, which formed an admira background to the flowers. On the other side of the walk the retaining wall was filled with small-growing plants suitable for walls and rockeries. In front of the wall was a narrow border, in which the fine forms of the species of ferns indig this country were arranged in ass with small groups of primulas. rangement was a veritable trium arrangement of hardy plants and flowers, and brought Messrs. R. Wall and Co. the praise they so well deserved.

"CHRYSANTHEMUMS AND HOW TO THEM FOR EXHIBITION," by J. B. Wroe. Edition, revised to January, 1909, and including the new varieties.—Full details on timing and stopping for Northern, Southern, and M tions of the best varieties, illustrated taking the buds, cuttings, staging, et net, by post 1s. 2d.; cloth, 1s. 6d., by from W. H. and L. Collingridge, 148 and gate Street, London.

PERENNIAL CORNFLOWERS.

Centaureas, or cornflowers, of perennial habit are very useful in the garden, not only being ornamental in the borders, but frequently proving excellent for the supply of cut flowers. They are not, it is true, so light in formation as the annual cornflowers, so well known, but they give blooms of much value, while their perennial habit and their hardiness make them most valuable to many.

The cultivation of the greater number is of the simplest kind, and all those here mentioned will thrive in any good loam, and will annually afford a bright display and a valuable succession of cut flowers. They can be raised from seeds or increased by division at almost any time after flowering, preferably in autumn or early spring.

MESSRS. R. WALLACE AND CO.'S FINE GOLD MEDAL DISPLAY AT THE HOLLAND PARK SHOW.

A tall and handsome centaurea for the back of the border is C. babylonica, about five feet high, and having pretty silvery foliage and large golden yellow flowers. It is a most effective plant indeed.

Then in C. dealbata we have a dwarfer but very charming species, this having flowers of a pretty rose-pink and silvery leaves. It is only about a foot and a-half high, so that it is excellent for near the front of the border. C. glastifolia, about three feet high, has branching stems, with bright yellow flowers, and is also a good border plant. The silvery-leaved C. gymnocarpa, with flower heads of a rosy purple, and about two and a-half feet high, is good; and in the handsome, if a little coarse, C. macrocephala, we have a striking thing, with heads like those of a golden yellow thistle. It grows at times more than four feet high.

In the varieties of Centaurea montana we have a most valuable set of forms, which will give plenty of cut flowers, and will yield them in succession if not allowed to seed. C. montana is an old-fashioned plant with blue and purple flowers; alba has pretty white blossoms; major is very much finer than the type, both in colour and size; rubra, one of the prettiest and most useful, has rosy blooms; and one we do not often meet with, which is called sulphurea, has pale yellow flowers. All these are very useful indeed. In the two-feet C. orientalis we have another yellow cornflower with pretty, finely-cut leaves and the blooms of a sulphur yellow. C. pulchra is thistle-like in its flowers, and in their colour, which is pink.

There is yet another yellow cornflower which calls for notice, and this is ruthenica, a charming species indeed, having pretty leaves, a good habit, and flowers of a pleasing straw-yellow hue. Orientalis and pulchra are about two, and ruthenica about three feet and a-half high. All these cornflowers bloom in summer, the whole affording a possibility of securing flowers from one or more from May until October.

S. ARNOTT.

Primula malacoides.—Many and interesting as the primulas are that are already in commerce, this new species from China will form a valuable acquisition to them. It is of graceful appearance, attaining a height ranging from 18 to 27 inches, and is immensely floriferous, well-grown plants producing from forty to fifty flower-spikes, each spike again bearing from sixty to eighty flowers, deliciously scented. The colour is a rosy-lilac, with orange-yellow centre. Unfortunately, P. malacoides is not sufficiently hardy to stand the variations of our winter outside, but it is an ideal plant for the cool greenhouse or conservatory. It is of easy culture, and produces seed abundantly. Plants raised from seed sown in spring will come into bloom the following autumn and continue in flower over a period ranging from four to six months.—P. H.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

SEEDLING ODONTOGLOSSUMS. — It will be found on examination of the plants that many of the seedlings with one year's growth and upwards are producing new roots, and any that require more pot room or fresh material about their roots should have attention without delay. It is not usual to advocate disturbing the cool house orchids for repotting purposes at the commencement of the hottest and most trying season of the year, but I find that with proper attention the young seedlings may be repotted practically at all seasons of the year. The root action must, however, be active when repotting is done. The idea of procuring flowering plants from seed as rapidly as possible is perhaps more desirable in the case of odontoglossums than with any other class of orchids. With this end in view every encouragement must be given in the early stages of growth. The first pseudo-bulb is produced in about two years from sowing seed. On the strength or weakness of this first completed pseudo-bulb will depend to a considerable extent future development. It is thus essential that from the time the seedlings are placed in a separate pot and are thus afforded a separate existence, that no check of any kind should be permitted.

REPOTTING SEEDLINGS.—It is a good plan in the early stages of growth to repot when the roots have reached the sides of the pots, and thus the seedlings are treated much in the same manner as the methods in practice with other classes of plants. In the early stages, the compost should be fine so that there may be no obstruction to the young roots. When they become more advanced the compost should be coarser and rendered porous by a liberal addition of sand and finely broken crocks. The compost we find the most suitable is one consisting of about equal portions of finely chopped peat or osmunda fibre and sphagnum moss. Where leaves have been used in the potting compost for other orchids they may be included in the compost for seedlings, but unless some previous experience has been gained with a portion of leaves in the compost, I would not advise their being included.

SEEDLINGS that are reaching their mature stage and anticipated to be sufficiently strong to produce flowers with the developing growth, should be given liberal root room at the final potting, and the compost should also be made moderately firm. I find that better flowers are produced both in substance and colour where the potting has been firm immediately previous.

SMALL SEEDLINGS.—The seedlings that were raised in the early months of the year will in many cases have reached the stage at which the first leaves are being formed and the roots are making their appearance. When in this state no hesitation need be felt in giving them separate pots at once, and they may be potted singly. It is often a case of not being able to provide space for the accommodation of the seedlings when potted singly, and there is then no alternative but to place them several together in a pot, but it is a considerable advantage to have them singly as the individual requirements of each one is then more readily attended to.—H. J. CHAPMAN, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

CONSERVATORY.—As we have reached what may possible be the warmest part of the year, there may be some occupants of the warmer houses that have somewhat outgrown their positions. With a slight degree of hardening off they may serve a very useful purpose in the embellishment of the conservatory, and nothing provides a nicer change from the wealth of bloom that we have been having than finely coloured plants of crotons, dracænas, dieffenbachias, etc. Providing they are kept fairly moist at the roots, and not placed where they are subjected to direct draughts, many of them will keep in good condition till the autumn.

CLIMBERS.—Look to the climbers, and keep them nicely tied in; and where bougainvilleas are grown they must be kept well away from where people are likely to walk or sit, as a scratch or two from them oft gives rise to pain that continues for a considerable time.

CHRYSANTHEMUMS.—These are now needing constant attention in respect to tying, and as the season, so far, has been fairly moist, they will be growing quite as freely as we wish, so do not use the syringe too freely, and keep them as dry as possible at the roots without letting the leaves flag. This will tend to harden the somewhat sappy growth. If the plants were potted early some of the stronger-growing varieties may need a little stimulant, cow manure and soot at this stage being quite enough for them, although towards the end of the month a little artificial fertiliser may be used, or a light top-dressing of soil with a little manure added.

POINSETTIAS AND EUPHORBIAS.—The later batches of these should now be rooted nicely, and be shifted into 48's. Use nice fibrous loam, and, after potting, shading must be given them for a time, a moderately warm pit being very suitable quarters. After they are nicely rooted the euphorbias would do well trained up the trellis of a melon or cucumber house, it being quite essential they should make good short-jointed growth, to ensure them flowering freely.

PELARGONIUMS, REGAL AND FANCY.—These, having gone out of bloom, should be gradually hardened off by withholding water, and, after a while, may be turned on their side and placed in full sun to finish ripening. If an increase of stock is necessary cuttings should be inserted at once, and these will root freely if placed on a shelf in an intermediate house, and given an occasional syringing.

HUMEA ELEGANS.—Young plants should now be potted off into 60's, and be kept steadily growing, and as hardy as possible, coddling in the early stages generally resulting in a loss of foliage early in the spring. I prefer to keep them in a quite cold frame, removing the lights entirely when they are nicely rooted.

CYCLAMEN.—The young plants will now be sufficiently advanced for shifting into 48's, in which they should bloom. A light rich compost should be used, for example, one prepared with loam, leaf-soil, and good coarse sand, with a little bonemeal, charcoal, and finely broken crocks. In such a compost they may be potted firmly, keeping the corm well up out of the soil, this obviating the tendency of the flowers to damp off at the base during the winter. After potting place in a quite cold frame, and water very carefully. Keep it fairly close till the roots are running freely, when all the air possible may be given, but a little shade during the hottest part of the day is very beneficial to the plants.

BEGONIAS.—These will require a good liberal treatment, and if large blooms are required all female blooms must be removed as they appear, and great care must also be taken to remove all decayed leaves and flowers; particularly is this necessary in damp weather, the stems being very susceptible to damping off.—THOMAS STEVENSON, Woburn Place Gardens.

THE FLOWER GARDEN.

INSECT PESTS.—Notwithstanding the heavy rains which we have experienced at varying intervals, insects have been extremely prevalent this season on all classes of plants (our nymphæas when closely examined being smothered), and in order to repel the attacks syringing has had to be resorted to largely. This should be performed as late in the evening as possible, and in the morning the plants should receive a thorough syringing with clear water. There are many good insecticides on the market, which, if used according to the respective directions, will be found effectual. An excellent wash can be made by dissolving a small quantity of soft soap in water. Where possible, rain water should be used, and a syringe with a spray nozzle fitted for producing a fine spray, which is both economical and effective.

EARWIGS.—Where these abound in large numbers they are a source of continual worry, and will soon do an irreparable amount of mischief. Therefore means must be taken to catch them. By far the best method is to cut up the stalks of broad beans, after drying them, into lengths of about eight inches. Place these in the plants of dahlias, chrysanthemums, etc., and remove them each morning and blow the contents into a bottle of water.

THE ENGLISH IRIS.—This, one of the most attractive of the iris family, is now flowering profusely, and lends a brilliant tone of colour to the borders and open spots in the shrubberies. For this purpose the mixed varieties can be had fairly cheap, and deserve to be planted largely. These are excellent for the supply of flowers for filling vases, and last for a considerable time.

SWEET PEAS.—These are making a brilliant display, and seem to be unusually fine throughout the country. Apply a good mulch, as this will be found of inestimable value should there be a period of dry weather. If the flowers are not required in a cut state, the rows or clumps should be examined periodically, and all forming seed pods removed. This will greatly add to the season of flowering, and pay for the little extra labour involved.

SHRUBS AND TREES.—Many of these will now require to be judiciously pruned, shortening back many of the summer growths, both for the sake of keeping the plants shapely and from occupying more than their allotted space. Thousands of fast-growing trees and shrubs are annually ruined by having their leading growths cut in two by ties, or seriously injured thereby. These should at this season be carefully examined and refastened where necessary. Since I invented and adopted the system of securing our trees with straps we have had very little difficulty in this respect, and these are easily loosened when required, and if by chance they are overlooked there is little chance, owing to their width, of their doing any serious damage. All stakes should be examined, and where at all uncertain, fresh ones should be used, as during the next three months west and south-westerly winds are generally very prevalent. Make secure also any strong growing perennials in the shrubberies or other parts of the garden, such as hollyhocks, delphiniums, lupins, campanulas, etc. — E. BECKETT, Aldenham House Gardens.

HARDY FRUITS.

MORELLO CHERRIES.—Thoroughly examine the trees for signs of black fly, and if any are found, give the foliage a couple of sprayings with an approved insecticide, but if the points of the young shoots are found badly infested with this [illegible] fill a hand bowl about three parts full with the insecticide, and dip the ends into it. This is, perhaps, a little more trouble than spraying, but is much more effective. After the trees are proved to be free from insect pests commence to train in as many of the young growths as there is room for. Lay them in perfectly straight, and not too thickly, four inches apart will be found a suitable distance. All remaining shoots may be shortened back to five or six leaves, and when pruning the trees in the winter these should be cut back to within an inch or an inch and a-half of their base for the purpose of forming useful fruiting spurs.

DESSERT CHERRIES.—As the trees are cleared of their fruit, remove the netting and cleanse the foliage from all insect pests. Train in the young growths that have been reserved for extension, or for filling up vacant portions of the trees. When tying use fairly broad strands of raffia, and allow plenty of room for the natural swelling up of the young wood. The slightest damage done to these at this season will invariably result in the loss of the branch sooner or later by gumming. All sublaterals should be kept pinched back to one leaf.

OUTDOOR VINES.—Continue to train in the young canes required for extension, and stop all laterals at the second leaf beyond the fruit, reduce the number of bunches to about one bunch to each foot and a-half super of wall space. Outdoor vines are often planted in odd corners, and the roots are in consequence very much restricted. Where this is so, a little attention is necessary in keeping the borders well supplied with moisture, and where the vines appear weakly, or are carrying a full crop of fruit, two or three dressings of a reliable fruit manure dusted on the border and well watered in will prove very beneficial.

THE FIG.—Attend to the tying in of the new wood, selecting the short-jointed shoots in preference to the more sappy ones. Avoid crowding the branches, but allow plenty of room for the proper development of the leaves. These like grape vines will require considerable attention at this season in the matter of keeping the border well supplied with moisture, and the foliage kept free from the attacks of red spider by frequent syringing with rain water.—GEO. WOODGATE, Rolleston Hall Gardens.

Nymphæa Wm. Doogue is typical of the latest development in hardy water lilies, the leaves are large and green, resting prostrate upon the surface of the water; the flowers are large, full, and globular; the petals numerous and tapering to a point, the colour delicate flesh-pink, and with the accompanying pale golden centre like the finest filigree, it forms in the aggregate one of the most beautiful and refined of all water lilies. This nymphæa is of American origin, and it succeeds in shallower water than [illegible] the Marliac hybrids.—THOMAS SMITH.

CARDIFF AND COUNTY HORTICULTURAL SOCIETY COMING OF AGE SHOW.
SOPHIA GARDENS, CARDIFF,
WEDNESDAY and THURSDAY, July 21st and 22nd, 1909.
Most liberal prizes for this show.
MONEY, PLATE, etc., Amounting to about £400.
Many special features this year.
Schedules free to any address.
Mr. A. MAURICE BAILEY, Secretary.
24, Duke Street, Cardiff.

LEICESTER. — ABBEY PARK FLOWER SHOW will be held on the 3rd and 4th August next. Open Class, Group of Plants, £20, £15, £10, £6. Liberal prizes for Collections of Fruit; Displays of Roses, etc. Schedules and full particulars from JOSEPH BURTON, Superintendent.

NORTHAMPTON MUNICIPAL HORTICULTURAL SOCIETY.

GRAND EXHIBITION OF
FLOWERS, FRUITS, and VEGETABLES,
August 4th and 5th, 1909.
At
ABINGTON PARK, NORTHAMPTON.
Upwards of £300 in Prizes.

ENTRIES CLOSE JULY 28th, 1909.

Schedules on application to
JAS. B. PALMER.
36, Cyril Street, Northampton.

SHREWSBURY GREAT FLORAL FETE.
AUGUST 18 and 19, 1909.

OVER £1,100 IN CASH PRIZES.

Schedules for this year are now ready, and may be had post free from—
Messrs. ADNITT and NAUNTON, Hon. Secs.,
Shrewsbury.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Saltaire Rose and Sweet Pea Show.

In the beautiful valley of the Aire—the famous Aire Dale—and in one of the most interesting places in Yorkshire, i.e., Saltaire, the National Sweet Pea Society held its third provincial show on Tuesday July 13, in Saltaire Park. The show was held in conjunction with the Saltaire, Shipley and District Rose Society, a society that in the seven years of its existence has progressed wonderfully, and made its annual exhibition a fashionable function in the Bradford district. There is an enthusiastic committee, under the chairmanship of Mr. F. Jowett, and with Mr. E. Wright as hon. secretary. P. H. Illingworth, Esq., M.P., is president, and Mr. G. C. Waud and Mr. J. Roberts, the past presidents, take a keen and personal interest in the proceedings, and each Lord Mayor of Bradford makes it a pleasurable duty to be present at the exhibition.

The show was not up to expectations, or, rather not up to the hopes entertained, and only the clerk of the weather was to blame. The competition was not really keen in any of the classes, either of roses or sweet peas, but there was some very fine flowers in both sections, the colouring being unusually good. There were a number of rose experts present, and a still larger number of sweet pea notabilities, and Messrs. H. J. Wright and C. H. Curtis officially represented the National Sweet Pea Society. All the show arrangements were good, and two huge marquees amply sufficed to hold the fragrant exhibits.

MR. T. BOLTON'S GOLD MEDAL NON-COMPETITIVE DISPLAY OF SWEET PEAS

At the National Sweet Pea Society's Provincial Show at Saltaire, July 13.

SWEET PEAS.

In the Yorkshire class, for the James Hill cup (one dozen bunches), the first prize fell to Mr. S. F. Brotherston, gardener to F. Samuelson, Esq., Breckenbrough Hall, Thirsk, who had good bunches of Evelyn Hemus, J. Ingman, J. Grieve, King Edward, Etta Dyke, Helen Lewis, The Marquis, Audrey Crier, Prince of Asturias, Aurora, Mrs. C. Mander, and Countess Spencer; a beautifully clean set. Mr. W. Heslington, Vore Garth, Littlethorpe, Ripon, second.

The Edwards Challenge Trophy, or Provincial Cup, for the best twelve bunches, was won by Mr. Thos. Stevenson, gardener to A. E. Mocatta, Esq., Woburn Place, Addlestone, Surrey, with grand bunches of Mrs. H. Bell, J. Ingman, Nora Unwin, Prince of Asturias, Evelyn Hemus, Clara Curtis, Mrs. H. Sykes, Marquis, Helen Lewis, Audrey Crier, and Elsie Herbert. Mr. Stevenson also won this cup at Dublin last year. Mr. W. Hopkins, gardener to Francis Wellesley, Esq., Westfield, Woking, second with a set that could have been only two or three points behind. He had lovely bunches of Mrs. Routzahn, J. Ingham, and Evelyn Hemus.

The Breadmore Challenge Trophy, a handsome silver salver, was won by Mr. Fred. J. Harrison, Rosedene, Ulverston, with a dozen good bunches of blooms that were a trifle small, but very fresh and clean; he had Helen Lewis, King Edward Spencer, and Marjorie Willis, which were very good; Mr. D. M. Pike, Railway Hotel, Newark, second.

Premier award for twelve bunches of sweet peas, trade excluded, fell to Mr. W. Hopkins for refined blooms of Helen Pierce, St. George, The King, Evelyn Hemus, Clara Curtis, Constance Oliver, John Ingman, Kitty Clive, Mrs. C. W. Breadmore, etc.; Mr. D. M. Pike was again second with a good set. Mr. A. A. Elliott, Kirkgate, Ripon, led in Mr. Sydenham's class for six bunches of sweet peas. In the class provided by Messrs. Dobbie and Co., for a dozen bunches, Mr. Thomas Stevenson again scored, and had Mid Blue, Mrs. A. Ireland, and Jessie Cuthbertson in fine condition. In Mr. Mackereth's class for six varieties, Mr. F. J. Harrison scored with a beautiful set, and in a class for six waved varieties, provided by Mr. H. J. Wright, he was again to the fore, showing well.

In the Classification class Messrs. Jones and Son, Shrewsbury, led, followed by Mr. C. W. Breadmore; the former had excellent blooms of Queen Alexandra, Jeannie Gordon, and Mrs. Collier. For a dozen bunches of waved sweet peas, distinct, Messrs. Jones and Son, Shrewsbury, led, and in their set they had splendid bunches of St. George, Apple Blossom Spencer, Elsie Herbert, George Herbert, Helen Lewis, and Mrs. Hardcastle Sykes; Messrs. Bolton Brothers, Carnforth, second, and Mr. C. W. Breadmore, Winchester, third.

Messrs. Bolton Brothers, Carnforth, led in both classes for American varieties of sweet peas, one dozen, and six bunches, distinct, and their best bunches were of White Spencer, Mrs. Routzahn, Asta Ohn, Ramona Spencer, Tennant Spencer, and Apple Blossom Spencer. Mr. A. A. Elliott led for one bunch of The Queen.

In the local classes for nurserymen, Mr. W. Heslington, Vore Garth, Littlethorpe, Ripon, led for twelve bunches, distinct, and Mr. R. Eichel, Elphick, led for six bunches, distinct.

Mr. Heslington scored in another class for six bunches, distinct. Mr. T. Shackleton, Crosshills, led for a dozen bunches, distinct, in the ten-mile-radius class, and Mr. Taylor, gardener to G. C. Waud, Esq., Ferniehurst, Baildon, came a good second. Mr. Shackleton, and Mr. T. Atkinson, Saltaire, were also successful in other local classes.

In the single bunch classes the premier awards were secured as follows: Red-flaked, Mr. Stevenson, with Jessie Cuthbertson; blue-flaked, Mr. Stevenson, with Prince Olaf; bicolor, Mr. Stevenson, with Mrs.

SWEET PEA PROVINCIAL CUP COMPETITION, TWENTY-FOUR BUNCHES,

At the National Sweet Pea Society's Provincial Show at Saltaire, July 13. Front set, Mr. T. Stevenson's first prize collection; furthest set, Mr. Hopkins' second prize collection.

Andrew Ireland; cerise, Mr. Stevenson, with Chrissie Unwin; rose and carmine, Mr. Stevenson, with Marjorie Willis; pink, Mr. Stevenson, with Countess Spencer; cream pink, Mr. Stevenson, with Constance Oliver; orange, Mr. Stevenson, with Helen Lewis; yellow shades, Mr. C. W. Breadmore, with Primrose Spencer; lavender, Mr. Stevenson, with Frank Dolby; blue, Mr. Stevenson, with Lord Nelson; mauve, Mr. Stevenson, with A. J. Cook; violet and purple, Mr. Stevenson, with Rosie Adams; maroon, Mr. Stevenson, with Prince of Asturias; magenta, Messrs. Jones and Sons, with Menie Christie; picotee-edged, Mr. Stevenson, with Elsie Herbert; blush, Mr. Samuelson, with Mrs. Hardcastle Sykes; crimson, Mr. J. Samuelson, with The King; and white, Mr. T. Stevenson, with Nora Unwin.

FLORAL DECORATIONS.

This section was a fairly good one, and the prizes were well contested. The silver medal, epergne, and first prize for a table decoration of sweet peas were won by Messrs. Jones and Son, Shrewsbury, for a charming arrangement of pink and cream flowers; Mr. T. Stevenson and Mr. F. J. Harrison second and third with pink flowers; and Mr. A. A. Elliott, fourth. Mr. T. Stevenson was first and Mr. J. D. Barratt, Yeadon, second, for an epergne of sweet peas, and each showed well. The vase class brought out a good lot of competitors, and here the awards were made in favour of Mr. Thos. Stevenson, and Mr. C. W. Breadmore, Winchester, in the order named, for charming arrangements. Mr. Stevenson, Messrs. Jones and Sons, Shrewsbury, and Mr. C. W. Breadmore, were placed in the order of mention for three buttonhole bouquets and one lady's spray.

ROSES.

In the open class for 72 blooms, distinct, the very beautiful silver rose bowl, presented by Mr. G. C. Waud, was again won by Messrs. Alex. Dickson and Sons, Newtownards, Co. Down, with a pretty set of blooms, their best being Fisher Holmes, C. J. Grahame, Frau Karl Druschki, Nita Weldon, Mrs. T. Roosevelt, Marie Van Houtte, Mrs. E. Mawley, and Mildred Grant; The King's Acre Nursery Company, Hereford, second. The Irish firm also came first for sixteen trebles, and they set up Mildred Grant, Frau Karl Druschki, Caroline Testout, Mdme. Jules Gravereaux, and G. C. Waud, in fine style; The King's Acre Nursery Compand second. Messrs. A. Dickson and Sons had also the best thirty-six blooms, and were followed in order by the King's Acre Nursery Company, and Messrs. G. and W. Burch, of Peterborough. The class for twenty-four flowers, distinct, again found the Newtownards roses to the front, with Messrs. G. and W. Burch a good second, but the latter firm led for two dozen H.T.'s, followed by the King's Acre Nursery Company. For a dozen tea roses Messrs. A. Dickson and Sons were an easy first; the King's Acre Nursery Company second.

For twelve blooms of Bessie Brown, the Messrs. Dickson held premier place, and they were also to the front for a dozen specimens of William Shean, but they had to take second place to the King's Acre Nursery Company for a dozen examples of A. K. Williams.

In the open amateur section, Mr. Tom Park was first in nearly all the classes.

There were a few classes for hardy flowers, etc., and here the leading awards were secured by Messrs. W. Artindale and Son, Sheffield; the King's Acre Nursery Company, Hereford; and Mr. M. Brook, Bradford.

NON-COMPETITIVE.

There were several excellent non-competitive displays, and the best of these was a grand exhibit of well-grown stove and greenhouse plants, tastefully arranged, by Mr. Taylor, gardener to G. C. Waud, Esq., Ferniehurst, Baildon, one of the staunchest supporters of the society (gold medal). Mr. Thomas Bolton, Warton, Carnforth, had a splendid exhibit of sweet peas, his St. George, Clara Curtis, W. H. Beaver, Tom Bolton, Evelyn Hemus, and Helen Lewis being very fine unblemished flowers (gold medal, N.S.P.S.).

Silver gilt medals were awarded as follows: To Messrs. Artindale and Son, Sheffield, for a particularly handsome and extensive collection of pansies and violas, admirably staged; Messrs. E. J. Batchelor and Sons, Harrogate, for a splendidly grown lot of Nephrolepis Whitmanni, N. todeaoides, N. Amerpohli, N. elegantissima, etc.; and Miss Hemus (N.S.P.S. Award), Holdfast Hall, Upton-on-Severn, for a goodly collection of sweet peas.

Silver medals fell to Messrs. E. W. King and Sons, Coggeshall, Essex, for excellent sweet peas (N.S.P.S. Award); Messrs. Mawson Brothers, Windermere, for hardy flowers; Messrs. Jas. Backhouse and Son, Lim., York, for hardy flowers and carnations; and Messrs. Bolton Brothers, Carnforth, for sweet peas (N.S.P.S. Award).

Other non-competitive exhibits were set up by Messrs. Dicksons, Chester (hardy flowers); Mr. F. J. Bell, Whitley Bay (violas and sweet peas); Messrs. W. Conway and Sons, Halifax (hardy flowers); and Mr. Wm. Deal, Kelvedon, Essex, new sweet peas, Colleen, Queenie, etc.

Edgware Horticultural Society.

JULY 10.

The village of Edgware retains so much of its old-time character, that it is perhaps one of the most rural of the villages within the same distance of the centre of the metropolis. It is therefore of much interest to find that, while the village possesses much to remind us of the past, the horticultural society that has its headquarters therein belongs wholly to the present, and is one of the most up-to-date of the many associations engaged in the beneficent work of encouraging the development of gardening among all classes. The advanced character of the society is chiefly due to the fact that large numbers of professional and business men have built for themselves houses, and laid out gardens, and have banded themselves together for the purpose of promoting a healthy rivalry among those who take an active interest in gardens, and of giving substantial encouragement to cottage gardeners and allotment holders belonging to the village. The schedule is arranged on quite distinct lines, and might, with advantage, serve as a model for many other societies. Instead of preparing a schedule of so comprehensive a character as to render it difficult to give substantial encouragement to any one class or section, the committee provides classes for a few subjects only, with prizes sufficiently liberal to ensure a good competition. The subjects that are specially encouraged are roses, sweet peas, vegetables, and table decorations, with the result that the display is at once distinct and attractive, and possesses considerable educational value.

Fifteen or sixteen classes were provided for roses, and in two of them valuable challenge cups were offered, in addition to the cash prizes. The most important of those open to nurserymen was that for thirty-six blooms, in which a challenge cup of the value of £10 10s., presented by Mr. C. H. Wainright, the president, and Mr. A. C. Turner formed part of the premier award. There was a very strong competition, and in the result Messrs. B. R. Cant and Sons, Colchester, were adjudged the winners. Their blooms were exceptionally high in quality, and particularly noteworthy among them were the superb examples of Gustave Piganeau, Marie Baumann, Souv. de Pierre Notting, Comte de Raimbaud (silver medal for the best bloom in the trade collections), W. Shean, J. B. Clarke, Lyon Rose, and Hugh Dickson; Messrs. D. Prior and Son, Colchester, who were the winners of the cup last year, were a good second; and Messrs. Frank Cant and Co., Colchester, were a close third. Highly meritorious also were the twenty-four blooms exhibited by Messrs. H. Lane and Son, Great Berkhamstead. In competition for the prizes for twelve teas or noisettes, Messrs. F. Cant and Co. were first with splendidly developed blooms of Muriel Grahame, Madame Jules Gravereaux, Cleopatra, Maman Cochet, and other of the finest varieties; Mr. George Prince, Longworth, Berks, and Messrs. B. R. Cant and Sons, were second and third with blooms of high quality. In the class for twelve bunches of garden roses, Messrs. Frank Cant and Co. occupied the premier place with blooms remarkable for their high quality and effectiveness; conspicuous among the varieties were Lady Wenlock, Mdme. Jules Grolez, Lady Battersea, Auguste Barbier, Mrs. F. W. Flight, and Wedding Bells; Messrs. W. and J. Brown, Peterborough, staged an excellent collection for the second award; and Mr. G. Prince was third.

Very spirited was the contest for the prizes in the class, open to all amateurs, for twenty-four blooms. In this the Edgware Challenge Cup was offered in conjunction with the first prize in cash. Mr. E. B. Lindsell, Bearton, Hitchin, was in splendid form, and obtained premier honours. As this was the third year in which he has been successful in winning the cup, it now became his property. The blooms staged were of good size, fresh and well coloured, and included a superb example of Ulster, which was selected as the finest bloom in the classes open to amateurs and was accordingly awarded the silver medal. Other blooms of exceptional merit were those of Queen of Spain, Mildred Grant, Horace Vernet, W. Shean, Ulrich Brunner, White Maman Cochet, Mdme. Jules Gravereaux, Charles Lefebvre, Mrs. E. Mawley and Oberhofgartner Terks; Miss B. Langton, Raymead, Hendon, was an excellent second and Mr. Waterton, gardener to R. W. Comyns, Esq., Heath Farm House, Watford, was third, but his blooms suffered from being staged too low down on the board. Mr. E. B. Lindsell was successful also in taking premier honours in the class for twelve teas and noisettes with finely developed blooms of well-known varieties. The Rev. F. Burnside, Great Stambridge, Essex, followed closely for second place. In competition for the prizes for twelve blooms, Mr. A. C. Turner occupied the premier position with blooms large in size and of superb quality; Miss B. Langton and Mr. J. Martin, Alexandra Grove, were second and third with excellent boxes.

The class for twelve blooms, in which the competition was limited to amateurs residing within ten miles of Edgware Church, was a good one. The prizes included a handsome challenge bowl, and this, in a close contest, was won by Mr. J. Hart, Potters Bar, who had blooms that represented cultural skill of a high order; Mr. Courtenay Page was second with a fine box; and Miss B. Langton third. In one of the amateur classes for six tea roses, Miss B. Langton was first; and in another Mr. H. K. Judd, Glenberrie, Stanmore, occupied the premier position, his blooms being staged in a high state of development. Other successful exhibitors in these classes were Mr. H. R. Darlington, Park House, Potters Bar; and Mr. A. Merck.

The more important of the classes for sweet peas was that for twenty-four varieties to be shown in vases, and the competition open to trade growers only. There was a very strong competition, more especially between Mr. W. C. Breadmore, Winchester, and Mr. Unwin, Histon, Cambridge, for the first place. In the result Mr. Breadmore was successful in winning the ten guinea cup presented by Mr. A. Merck, and its accompanying cash prize. The flowers were of large size, fresh in colour, and tastefully staged, and the varieties included Apple Blossom Spencer, Dazzler, rich orange scarlet, Paradise Red Flake, Princess Juliana, Snowflake, Audrey Crier, Mrs. Andrew Ireland, Nancy Perkins, Elsie Herbert, George Herbert, Dora Breadmore, and other of the finer varieties; Mr. W. T. Unwin was a very good second with superb flowers of Edna Unwin, Mrs. W. J. Unwin, The Queen, King Edward Spencer, and other of the newer forms; Messrs. E. W. King and Co., Coggeshall, were third with a collection of much merit.

Very spirited also was the competition in the amateurs' class for twelve varieties, in which the Blair Challenge Cup formed an important part of the premier award. The entries were numerous, and the collections closely matched in point of merit, and in the result Mr. C. H. Wainwright, Hill House, Edgware, was successful in obtaining premier honours; Mr. R. Blair followed for second place, and Mr. H. K. Judd was a close third. For four vases of sweet peas, Mrs. A. Tigwell, Harrow View, was first, with flowers of exceptionally high quality; Mrs. Tigwell was first also in the amateurs' open class for twelve vases, with a fine set; and Master P. Du Croz, Canons Park, Edgware, followed for second place, and Mr. H. Percy, King's Langley, was third.

Table decorations were of exceptional merit, and formed an immensely attractive feature. There were eleven or twelve tables, and with one or two exceptions were more or less tasteful. Mrs. Douglas was the first with a table decorated with yellow roses, and Mrs. B. Langton second with a table on which Irish Elegance was used with good effect.

Plants were not numerous, there being comparatively few classes for them. The groups were tasteful and effective, and the awards were made to Mr. Blair, Mr. Samaranga, and Mrs. Du Croz, in the order of their names. Mr. Blair was first also for six miscellaneous plants; Mr. H. K. Judd obtained premier honours for six begonias with finely-grown plants; and Mr. A. Merck, Stanmore, was first for six gloxinias with magnificent specimens, and was also awarded the Royal Horticultural Society's silver Banksian medal.

There was an exceptionally strong competition in the two classes for collections of vegetables, and in the principal one the prizes were awarded to Mrs. Boileau, Sidbury Lodge, Edgware; Mrs. A. Du Croz, and Mr. C. H. Wainwright.

Non-competitive trade contributions were numerous, and of much merit. Messrs. Dobbie and Co., Rothesay, staged a remarkably fine collection of sweet peas, and were awarded a special gold medal; and Messrs. H. and J. Brown, Peterborough, and Messrs. W. Cutbush and Son, Highgate, exhibited large and attractive collections of roses.

MR. J. MATTOCK'S FIRST PRIZE COLLECTION OF GARDEN ROSES
At the National Rose Society's Provincial Show at Luton, July 14.

National Rose Society,

The National Rose Society's Provincial Show, held this year in connection with the Luton Sweet Pea and Rose Society, at Wardown Park, Luton, on July 14, was a most successful affair. The competition was keen in nearly all the classes, and was specially good in the larger trade, open, and amateur classes. There were some splendid blooms, and also a lot of poor ones.

NURSERYMEN.

In the leading class, for thirty-six blooms, distinct, Mr. Hugh Dickson, Belfast, Ireland, led, winning the Jubilee Trophy and Gold Medal with a lovely lot of blooms of Mildred Grant, J. B. Clark, J. Bell, Lady Alice Hamilton, Harry Kirk, Mrs. W. Cooper, Lady Helen Vincent, Mrs. T. Roosevelt, Lyon Rose, Mrs. David McKee, Mrs. J. Laing, Captain Hayward, and J. B. Clark. There were nine entries, and second prize fell to Messrs. A. Dickson and Sons, Newtownards, and third to Messrs. D. Prior and Son, Colchester, with an extra prize for Messrs. B. R. Cant and Sons, Colchester.

Messrs. A. Dickson and Sons, Newtownards, led for seventy-two blooms, distinct, winning the Crawley Cup with a fresh, even lot, in which Mrs. E. Mawley, Medea, Lady H. Vincent, Mildred Grant, and Bessie Brown were excellent. Messrs. B. R. Cant and Sons, second, and Messrs. Frank Cant and Co., Colchester, third. Six entries.

There were five entries in the class for two dozen trebles, and here Messrs. A. Dickson and Sons led, showing Frau Karl Druschki, Mrs. J. Laing, Hugh Dickson, Mildred Grant, K. A. Victoria, Bessie Brown, and Killarney; Messrs. B. R. Cant and Sons, second, and Messrs. F. Cant and Co., third.

The best three dozen blooms, distinct, came from Messrs. G. and W. H. Burch, Peterborough, who were followed in order of mention by Mr. W. Leggett, Colchester, and Messrs. J. Burrell and Co., Cambridge; six entries. Mr. George Prince, Longworth, Berks, scored for sixteen trebles, and he had lovely blooms of Florence Pemberton, White Maman Cochet, and Mrs. E. Mawley; five entries; Messrs. G. and W. Burch second, and Messrs. J. Burrell and Co., third.

Mr. G. Prince led for eighteen varieties, distinct, teas or noisettes, and his best flowers were Mrs. E. Mawley (medal bloom), Mdme. Jules Gravereaux, Cleopatra, and La Boule d'Or; Mr. Henry Drew, Longworth, second, and Messrs. B. R. Cant and Sons, third; four entries. Messrs. Burrell and Co. led for a dozen teas, staging a pretty box of Mrs. E. Mawley, White Maman Cochet, Madame Constance Soupert, Madame Jules Gravereaux., Madame Cusin, The Bride, Souv. de Pierre Notting, Niphetos, Souv. d'Elise Vardon, Molly Sharman Crawford, Bridesmaid, and Jean Ducher; Mr. J. Mattock, New Headington, second, and Mr. W. Leggett, third.

Messrs. A. Dickson and Sons led for a dozen new roses with Nita Welldon, Walter Speed, Molly Sharman Crawford, George Hammond, Lady H. Vincent, Mabel Drew, etc.; Messrs. B. R. Cant and Co. second, and Mr. Hugh Dickson third; eight entries. There were fourteen entries of twelve flowers of a white or yellow rose, and here Messrs. Prior and Son, Colchester, led with Frau Karl Druschki; King's Acre Nursery Company, Hereford, second, with K. A. Victoria; and Mr. F. M. Bradley, Peterborough, third, with Frau Karl Druschki. In the "any other colour" class, twelve blooms, the King's Acre Nursery Company scored with Mrs. E. Mawley; Messrs. D. Prior and Son, second, with Lady Ashtown; Messrs. Bide and Son, Farnham, third, with Queen of Spain.

The best dozen flowers of a light rose were of Frau Karl Druschki, from Messrs. B. R. Cant and Sons; Mr. F. M. Bradley, Peterborough, coming second with J. B. Clark; and Mr. G. Prince third with Hugh Dickson. Messrs. F. Cant and Co., Colchester, had the best set of nine blooms of the new Harry Kirk.

AMATEURS.

Mr. E. B. Lindsell, Bearton, Hitchin, won the Jubilee Trophy and first prize in the amateurs' section for two dozen blooms, leading from eleven competitors with lovely flowers of Mildred Grant, Mrs. J. Laing, Bridesmaid, Duchess of Bedford, Bessie Brown, Yvonne Vacherot, Lady Moyra Beauclerck, Mrs. T. Roosevelt, Mdme. C. Soupert, and Mdme. J. Gravereaux; Mr. Alfred Tate, Downside, Leatherhead, second; Mr. Franklin Dennison, Leamington, third. Rev. T. G. Henslow, Chippenham, led for thirty-six flowers with a fair set, and was followed in order by Mr. E. B. Lindsell and Mr. A. Tate; eight entries. Mr. Alfred Tate scored for eight trebles, and his Mrs. T. Roosevelt was fine; Mr. G. H. Hammond, Burgess Hill, Sussex, second; and Mr. Conway Jones, Hucclecote, Gloucester, third.

MR. E. WIGHTMAN'S FIRST PRIZE COLLECTION OF TWELVE VASES OF GARDEN ROSES

At the National Rose Society's Provincial Show at Luton, June 14.

Mr. Conway Jones scored for nine flowers of one variety with Dean Hole; Mr. R. Foley Hobbs second with Her Majesty (including the medal H.P. bloom); Mr. E. B. Lindsell third with Frau Karl Druschki.

In the section for growers of fewer than 2,000 plants, Mr. W. Times, Hitchin, was first, and he had a medal tea rose in his Mrs. Myles Kennedy; Mr. G. H. Hammond second; and Mr. C. Speight, Market Harborough, third. For six trebles, Mr. Speight beat the Rev. F. Page Roberts, of Stratfieldsaye, while in the class for six blooms of one variety the order of merit was Mr. Hammond, with Lady Ashtown; Rev. F. Page Roberts, with Mrs. Cocker; and Mr. Speight, with Mrs. J. Laing.

Mr. C. B. Lehmann, Crawley, led for twelve blooms in the section for growers of fewer than 1,000 plants, and he was followed in order by Mr. C. F. Leslie, Hertingfordbury, and Mr. Mahlon Whittle, Belgrave Avenue, Leicester. Mr. Courtenay Page, Earldon, Enfield, led for nine distinct varieties, Miss B. H. Langton, Hendon, coming second, and Mr. Herbert Whitman, The Briars, Finchley, third.

In the section for smaller growers, Mr. W. Upton, Claremont Street, Leicester, led for nine blooms; Mr. H. C. Baker, Bayfordbury, Herts, for six blooms; Mr. C. F. Leslie for four trebles; Mr. C. B. Lehmann for six new roses; and Rev. F. R. Burnside, Stambridge Rectory, Essex, for six flowers of one variety—Frau Karl Druschki.

In the tea rose section, Mr. Conway Jones scored well, leading for a dozen distinct varieties, and for nine blooms of one variety —Mdme. Jules Gravereaux. The Rev. J. Fellowes, Attleborough, was second in the larger class.

In the extra classes, Mr. Conway Jones and Rev. J. Fellowes were first and second respectively for six trebles, the former showing Mrs. Myles Kennedy, Maman Cochet, Frau Karl Druschki, Berenice, and Mrs. E. Mawley. For six blooms Mr. Whittle and Mr. Bostock secured awards.

DECORATIVE ROSES.

These were very well shown, and in the class for eighteen varieties Mr. J. Mattock, New Headington, led with splendid bunches of Rosa Mundi, Irish Elegance, Mrs. O. G. Orpen, Edu Meyer, Rubens, and Lady Waterlow; Messrs. F. Cant and Co., second, and Messrs. Paul and Son, Cheshunt, third. Mr. Mattock was also successful in the class for a dozen varieties, and here he showed Bardou Job, Gustave Regis, and Hebes Lip finely; Mr. George Prince, second, and Messrs. F. Cant and Co., third.

In the amateurs' section, Mr. E. Wightman Bengeo, Herts, scored for a dozen bunches of decorative roses, and he put up Maharajah, Madame Leon Pain, Wm. Allan Richard René Andre, Celine Forestier, and Mr Flight in excellent style; Mrs. Dimsdal Coton Court, Cambridge, second.

Mr. E. Mawley, Rosebank, Berkhamst led for six bunches, followed by Mr. F. George, Red Hill, Worcester.

DECORATIVE CLASSES.

Miss J. B. Langton, Raymead, Hendon, was first for a vase of roses with Killarney and Mrs. G. W. Cook, Whetstone, second with Mrs. W. J. Grant. Equal first prizes were awarded in the class for a bowl of roses to Miss J. B. Langton, for Una, and Mrs Jennings, Hemel Hempstead, for Mad Abel Chatenay. Miss J. B. Langton s for a table decoration of roses with a p arrangement of Rosa macrantha Mrs. A. Staddon, Luton, second with I Elegance and Jersey Beauty; and Mrs. nings, third. In another class for a de tion of roses Mrs. G. W. Cook was suc

MEDAL ROSES.

Gold Medals for new roses were awarded to Messrs. S. McGredy and Son, Portadown Ireland, for H.T. rose Mrs. Maynard Sinton white; and H.T. rose Ethel Welch, crea to Messrs. A. Dickson and Sons, N townards, for H.T. rose Mrs. Herbert Ta blush; and to Mr. Hugh Dickson, Belfast for the crimson-scarlet Leslie Holland.

The Silver Medal flowers were:—Nur men: H.T., Mrs. T. Roosevelt, from Mr. H Dickson; H.P., Ben Cant, from Messrs. B Cant and Sons; T., Mrs. E. Mawley, Mr. George Prince. Amateurs: H Madame Melanie Soupert, from Mr. H. vert, Helen's Bay, co. Down; H.P., H Majesty, from Mr. R. Foley Hobbs; T., Mrs Myles Kennedy, from Mr. W. Times.

Bath Rose Show.

JULY 7 and 8.

The annual feast of roses, etc., pro by the Bath Floral and Band Comm was held on the above dates in the Sy Gardens. Favoured by two or three sunshine, a fairly large attendance res but it was evident the number of vis from outside the city was small, owing the fact that within a few days a His Pageant would be the centre of attra Entries were almost a record, but the of the two days preceding caused ma withdrawals, notably those of Mr. A. Gray, Beaulieu, Newbridge Hill.

NURSERYMEN'S DIVISION.

In the nurserymen's division the class 72 varieties produced four competitors, "silver cup or £6" going to Messrs Dickson and Sons, Co. Down, Ireland, fairly even lot of blooms that in Comte Raimbaud (silver medal H.P.), K. Druschki, Her Majesty, Duche Morny, Mrs. Theodore Roosevelt, B Keller, A. K. Williams, Ulster, B Brown, Madame Jules Gravereaux, F Pemberton, George Dickson, Ma Melanie Soupert, George Hammond. Mr. J. Mattock, New Headington, and Messrs. G. Cooling and Sons, Bath. For three dozen trebles there were thre lections, the awards falling in the order to the winners in the preceding Messrs. Dickson's best triplets wer Horace Vernet, C. Testout, Mrs. J. L Marie Van Houtte, Madame M. S Colonel R. S. Williamson, Dean Hole, T. Roosevelt, Robert Scott, Lady A A. Lindsell, and Mildred Grant.

Eighteen varieties, three blooms a good class, Mr. George Prince, Long Berks, leading, his premiers being Mr Mawley, Captain Hayward, J. B. C Duchess of Portland, Mrs. David and F. K. Druschki; Mr. Henry Dr worth, second; and Messrs. Jarman Chard, third. For thirty-six single Drew headed the list, having perfect of Marchioness of Downshire, Grant, Gladys Harkness, C. Testout, Brown; Mr. G. Prince, second Rowland Adams, Charlcombe, third. Eighteen teas is always a g and here Mr. Prince led, securing the N.R.S. silver medal for a grand bloom of Golden Gate, and showing fine blooms of Mrs. E. Mawley, Innocente Pirola, The Bride, Souv. d'un Ami, Jean Ducher, Madame J. Gravereaux, and the two Cochets; Mr. H. Drew, second; and Mr. Mattock, third.

For a dozen roses, five flowers each, in vases, there were four collections, but they were not very attractive, from the fact that the vases, or tubes, were of varied heights and materials. Messrs. A. Dickson and Sons were first, Mr. J. Mattock second, and Mr. G. Prince third. A dozen roses of any one variety, not teas or noisettes, proved a fair class, Mr. Drew heading the list with Mildred Grant; Messrs. A. Dickson and Sons, second, for the same variety; and Messrs. Jarman and Co., third, with Bessie Brown. For a dozen blooms of a tea or noisette rose Messrs. Jarman and Co. and Mr. G. Prince set up Mrs. E. Mawley; Mr. Mattock, third, for a charming set of Marie Van Houtte. Messrs. A. Dickson and Sons scored for half-a-dozen blooms of any new rose, staging Lady H. Vincent; Messrs. Cooling and Sons second with Batheaston Belle, a pleasing shade of carmine-red, and said to be excellent for bedding.

For an arrangement of garden roses, on 40 square feet, the honours were shared by Messrs. A. A. Walters and Son, G. Cooling and Sons, and Rowe and Adams, Charlcombe, Bath; Mr. Mattock led for eighteen bunches, and Messrs. Cooling and Walters took the lower awards.

AMATEURS' DIVISION.

In the amateurs' division Mr. Conway Jones, Hucclecote, presented a splendid box of two dozen varieties, very fine being Mildred Grant, J. B. Clark, Mrs. G. W. Kershaw, Hugh Dickson, John Ruskin, Mrs. T. Roosevelt, Dean Hole, Ulrich Brunner, Captain Hayward, Her Majesty, Mrs. Stewart Clark, Mrs. J. Laing, Madame M. Soupert, W. Shean, Lady Ashtown, Marchioness of Londonderry, and Madame W. Comtesse de Terene. The second award fell to Rev. T. G. W. Henslow, Chippenham; and Mrs. Rosa Rust, Bath (gardener, Mr. R. Merrett), was third. For a dozen trebles Mr. Conway Jones led, having well-balanced blooms of Ulrich Brunner, Madame J. Gravereaux, Dean Hole, John Ruskin, Mrs. J. Laing, and W. Shean, Rev. T. G. Henslow second. Mrs. R. Rust led for eighteen singles, her best being F. K. Druschki, M. Grant, Mrs. J. Laing, Hugh Watson, and B. Brown; the second prize falling to Rev. R. Powley, Warminster, for medium-sized blooms; but in the class for eight trebles he scored for a nice box, in which Bessie Brown, C. Testout, Dupuy Jamain, and Mrs. J. Laing were good. Mr. Conway Jones was once again first for a dozen (H.P.'s and teas, six of each); Rev. R. Powley, second; and Mr. Alan Searle, Southampton (gardener, Mr. O. Micklem), third. The last-named exhibitor scored a first for a dozen varieties; Mr. R. C. W. Dixon, Southampton, second, his F. K. Druschki being selected as the N.R.S. silver medal H.P.

For six blooms Miss Fisher, Devizes (gardener, Mr. F. Burbidge), led, showing M. Grant, F. K. Druschki, and Antoine Rivoire in good condition. Mr. Alan Searle led for four trebles, Dean Hole and F. K. Druschki being excellently well matched; while for a dozen singles Mr. W. Smith, Box, took the award.

The tea classes were excellent, but none too full, Mr. Conway Jones being placed first for eighteen teas, nine triplets, and six trebles (teas); in this latter class a bloom of Medea was awarded the N.R.S. silver medal, the box being largely of yellow roses; Rev. T. G. W. Henslow was second for eighteen.

PLANTS.

Groups of plants at the far end of the big tent were a feature, Mr. Sims, gardener to Major Doherty, being clearly first by virtue of his plenitude of orchids, but Mr. Pearce, gardener to W. Wailes, Esq., Weston Park, secured second place without orchids, his arrangement being bright with Clerodendron fallax, Miss Willmott verbena, and Francoa ramosa; Mr. Hallett, of Larkhill, third. Carnations, in collections, staged in bamboo stands, were exceedingly good, the awards going to Mr. C. Wall and Messrs. Blackmore and Langdon. A fine mass of colour was produced by the begonias arranged for effect, Messrs. Blackmore and Langdon (who had blooms of perfect circular outline, and double, fully six inches in diameter), and Mr. John Walter, sharing the honours. Double and single begonias in pots were well presented, the last-named exhibitor securing premier awards for double and single forms, in sixes, and the firsts for one plant, single and double; Mr. E. L. Sidney came second.

Specimen stove plants were limited, both prizes going to well-grown examples of Bougainvillea Cypheri and glabra. Tables of ornamental foliage and flowering plants secured awards for Major Doherty, Mr. W. Wailes, and Mr. George Hallett; Captain Gilling-Gilling, and Mr. F. Marchant were strong with gloxinias.

MISCELLANEOUS CUT FLOWERS.

In the cut flower classes Messrs. A. A. Walters and Rich and Co. made some grand exhibits with perennials; the most effectively arranged tables of sweet peas coming from Sir Howell Davies, M.P. (gardener, Mr. J. T. Curtis), Mr. E. Viner, and Mr. F. J. Cole; while for a dozen bunches the prizes went to Mr. G. Humphries, Chippenham; Earl of Devon, Exeter; and Mr. A. F. Francis.

Table decorations numbered fifteen: For sweet peas Sir H. Davies, Stoke Bishop, and Mrs. E. Vines were successful; for orchids, Miss E. Vines, Sir H. Davies, and Mrs. Colstone Hale, Warminster, shared the awards; a highly commended card going to Mrs. M. J. Woodland, Frome. In the corresponding class, limited to Bath, Mrs. Fisher led with a light design of rosebuds, yellow violas, and barley; Miss E. M. Sheppard, second, with Iceland poppies, yellow aquilegia, purple violas, and grasses; Miss L. G. Rivington, third. Classes were provided for bouquets, epergnes, sprays, and buttonholes. The collections of wild flowers were most interesting, each collection being named in Latin and English.

STRAWBERRIES AND VEGETABLES.

The strawberry competition was about an average, and exhibits were chiefly from the Batheaston gardens, Royal Sovereign predominating. The awards fell, for six dishes, to Mr. John Ricketts, who put up Royal Sovereign, Sir Joseph Paxton, The Laxton, and Princess Alice; Mr. W. D. Porter second, who had Late Prolific and Progress, in addition to Royal Sovereign and Sir J. Paxton; and Mr. E. J. Ricketts, third, who added Eleanor. The last-named exhibitor was first for three dishes; Mr. Strugnell, gardener to Right Hon. W. H. Long, M.P., Rood Ashton, second, showing Dumbarton Castle and Laxton's Reward; Mr. John Ricketts, third. Royal Sovereign was winner in the single dish prizes, Messrs. E. J. Ricketts, W. J. Downing, and Thomas Evry taking the awards; the last-named had the heaviest dozen berries (16 ounces), Mr. A. G. Andrews (14 ounces) with Royal Sovereign, and Mr. E. J. Ricketts (12 ounces) with Leader.

Some good exhibits of vegetables were staged, Mr. Strugnell securing the champion awards for Messrs. Sutton and Sons' prizes.

MISCELLANEOUS EXHIBITS.

Miscellaneous contributions included a large display of flowers, fruit, and vegetables from Messrs. Sutton and Sons, filling over 100 square feet superficial, in which were twenty varieties of melons, numerous tomatoes, cauliflowers, carrots, cucumbers, and asparagus. Messrs. Milburn, of the Victoria Nurseries, Weston, arranged an extensive rock garden; Messrs. Blackmore and Langdon put up a large collection of begonias; Messrs. Jarman and Co., Chard, sent cut flowers in variety; and Messrs. A. A. Walters contributed about thirty delphiniums, one of which the Rev. E. Lascelles, a variety of exceptional merit recently introduced by the firm, was greatly admired.

Norfolk and Norwich Horticultural Society.

This society held its annual summer show of flowers, fruits, and vegetables on Thursday, July 8, in the grounds of Mr. E. Gurney-Buxton, High House, Thorpe. Unfortunately, the day opened out wet, and continued so till mid-day, which caused a great falling off in the attendance. The exhibits fell off in roses and fruits, but increased in miscellaneous flowers (which included sweet peas) and vegetables.

ROSES AND SWEET PEAS.

In the principal class of the rose section there were three entries, all from growers outside the county. Messrs. B. R. Cant and Son and Messrs. F. Cant and Co. ran each other close for premier position, the awards eventually going in the order named; Messrs. J. Burrell and Co. were third. The two exhibitors in the class for eighteen varieties, three blooms of each, made an effective display, and the blending of whites, pinks, and reds was very pretty. Messrs. Burrell and Co., Cambridge, easily secured first place for eighteen blooms, teas or noisettes, their blooms of Souvenir de Pierre Notting, Mrs. Edward Mawley, and Cleopatra being very fine; Messrs. F. Cant and Co. second. In the class which must contain eight new roses, Messrs. Burrell came first; they had very superb blooms of the Lyon Rose, John Cuff, and Mrs. Aaron Ward. The Rev. J. A. L. Fellowes, of Bunwell, took premier position among the local amateur exhibitors, winning the silver cup presented by Mr. H. Morse, Eaton, with thirty-six splendid blooms. In the collection was the best bloom in the show, a very fine specimen of Mrs. Edward Mawley. Miss Penrice, Witton, had much better blooms than she has sent for some time past, and was thus able to beat Mr. R. Steward, Saxlingham, a keen exhibitor, in this class for thirty-six. In the class for twenty-four blooms, eight varieties, Miss Penrice again scored well, beating the Rev. J. Fellowes. Mr. Cecil Wilson, Thorpe, had a fine dozen blooms. The other classes were rather poorly filled, except that for 12 blooms of one variety. In this, four stands were set up, and again La France, from Miss Penrice, Witton, excelled. Mrs. W. J. Grant, Frau Karl Druschki, and Dean Hole were the varieties staged by the other exhibitors. The Rev. J. A. Fellowes secured another silver cup, presented by Mr. and Mrs. W. Harker, in the extra amateur class for twenty-four blooms. His flowers were far ahead of those of the other two exhibitors.

Experts and visitors proclaimed the sweet pea section as being by far the best feature of the show. The class for twenty-four bunches, distinct varieties, for which a silver challenge cup was presented by Messrs. Daniels Bros., Lim., brought out eight competitors, who filled the whole of one side of the long tent. The chief position was secured by Mr. E. G. Buxton. The blooms were bold yet dainty, and the arrangement of colours reflected great credit upon the gardener. In the collection was a bunch of Audrey Crier, which was awarded the National Sweet Pea Society's medal as the best bunch in the show. Mr. R. Fellowes, Shotesham Park, who came second in this class, had a most beautiful collection. In the class for twelve bunches, Mr. A. J. Stannard, Thorpe, and Mr. Edmund Reeve, Catton, staged the choicest varieties with telling effect, and they took the awards in the order named. Major Cubitt, Thorpe; Mrs. Mills, Brooke; Colonel Rous, Worstead; Mr. E. G. White, Eaton; Mr. F. Dow, Lowood; and Mr. Garrett Taylor, Trowse, were all winners in other classes. Mr. E. G. Buxton's first prize vase was a dainty combination of peas, grasses, and Asparagus plumosus.

CUT FLOWERS.

In this section we extend our congratulations to Colonel Petre, who has returned to the fray after resting for a few seasons. And he returns to take up the position that he was ever wont to occupy—first. Those who have visited Westwick know that only the best kinds are cultivated, and Mr. Davison, the gardener, had brought the best of these. They formed quite an educational exhibit for herbaceous flower growers. Mr. Robert Fellowes, Shotesham Park, occupied the second place, but that does not mean that his flowers were inferior, but from Westwick came bolder bunches, and greater effect. In the class for thirty-six bunches two exhibitors again had a keen fight. This time it was Colonel Rous, Worstead, and Mr. Edmund Reeve, Catton. It was a narrow margin evidently which gave the Worstead flowers the lead, and there were some who even queried the judges' award. Mr. O. Corder, Brundall, was the only exhibitor for twenty-four bunches.

Mr. H. Skelton, St. Helen's House, Norwich, was able to prove, by winning the first prize for a dozen bunches in a strong class, that the best flowers in the best of condition can be grown in the heart of the City of Gardens. His bunch of English Iris Purple Beauty was extra good. Mr. T. Chaplin, Thorpe, had a fine stand of six bunches, and was closely followed by Mr. F. A. Bainbridge, Hethersett, who had coreopsis and shasta daisies in fine form. Hardy annuals were well represented, and the flowering shrubs were extra choice, especially those from Colonel Petre, his bunches of kalmias and hydrangeas grown in the open being very fine. For choice flowers Mr. Fellowes led with orchids, cannas, carnations, and Gloriosa superba, doing him great credit. Colonel Rous, in his stand, had a very nice bunch of the ever-popular tuberose, and quite a big bunch of oncidiums. Captain Meade, first for six bunches, had some grand crinum blooms, and a bunch of very large flowers of streptocarpus. Carnations have never been seen in such profusion as at this show. With very fine blooms of Malmaisons and tree varieties, Colonel Petre, Westwick, had arranged his first prize stand in quite an artistic style. Colonel the Hon. C. Harbord was second with a very bold lot. His blooms of the yellow Cecilia beat everything of the same colour in any stand.

FRUIT AND VEGETABLES.

The fruit and vegetables had a tent to themselves, and made altogether rather a poor display. For thirty-six cherries, Colonel Harbord took premier honours with Rivers' Early Black, while Colonel Petre came second, and Colonel Rous was third. There were some tempting collections of fruit. Mr. I. B. Coaks was first with a very choice display of nectarines, grapes, melons, and strawberries. Colonel Rous ran him hard with a similar selection; and Mrs. E. Kerrison, of Burgh Hall, was a rather poor third.

The four classes for grapes brought out a most tempting display of luscious fruit. Bishop Fisher, Mr. I. B. Coaks, and Colonel Rous secured the prizes in the different classes. There were two classes for melons, Mr. Coaks, Colonel Petre, Bishop Fisher, Colonel Rous, and the Hon. C. Harbord being the prize-takers. Mr. W. J. Birkbeck, Stratton Strawless Hall, appeared to be the only exhibitor in the class for six nectarines, and he was awarded first prize. In the class for six peaches there were three exhibits, and the awards were made in this order: Mr. W. J. Birkbeck, the Hon. Colonel Harbord, and Colonel Rous. There was a good display of strawberries in the three classes, and Mrs. Edmund Kerrison took first place for a plate of 24 berries of one sort (Leader), and Mr. Robert Fellowes, of Shotesham Park, was second with Bedford Champion. Mr. R. Fellowes' collection of four varieties, with which he obtained first prize, was composed of Bedford Champion, Laxton's Trafalgar, Royal Sovereign, and Laxton's Leader. Mr. E. G. Buxton was second, and Mr. W. H. Mills, of Brooke House, third.

TRADE EXHIBITS.

The trade was not largely represented. Messrs. Daniels Bros., Lim., Norwich, had a bold display of sweet peas, which included all the newest varieties; and also displayed groups of new bedding begonias, new heliotropes, and foliage plants. Messrs. Stark and Son, Ryburgh, had the best of the newer sweet peas, most prettily grouped.

Weybridge.

JUNE 30.

The annual exhibition was held in the grounds at Oakfield, the residence of Clutton Brock, Esq., and was a great success. The schedule was a comprehensive one, and the entries were numerous.

A silver challenge cup was offered for the most meritorious exhibit in the show, whether in competition or not. This coveted award went to Mr. T. Stevenson, gardener to E. Mocatta, Esq., Woburn Place, Addlestone, for a magnificent collection of sweet peas, consisting of sixty bunches of well-grown flowers, all lightly arranged with foliage plants. Considering the lateness of the season it was a remarkable exhibit. In competition for this cup, Messrs. J. Veitch and Son, Chelsea, had an unusually fine display of pæonies and other flowers; Messrs. Spooner and Son, Woking, roses; Messrs. Fletcher Bros., Ottershaw, roses and hardy flowers.

Roses were a feature of the show, and for thirty-six, distinct, Messrs. B. R. Cant and Son, Colchester, were an easy first with medium-sized, well-coloured blooms; Mr. F. R. Cant, Colchester, second; Messrs. W. Spooner and Son, Woking, third. For twelve roses, Mr. G. Curnock Sawday, Weybridge, won with desirable blooms in keen competition; Mr. E. Watford second.

Hardy flowers were numerous and good, although many exhibits were made up with inferior kinds. For twelve bunches, Mr. F. Norris, Newhaw, was the most successful in a spirited competition. Sweet peas were very good considering the recent unfavourable weather; Mr. F. Norris won with popular varieties nicely staged.

Plants were numerous and good. For the prizes for a group of miscellaneous subjects arranged for effect in a space of 15 feet by 10 feet, there were four competitors. Mr. C. Guy, gardener to — Howard, Esq., Shepperton, was first with a brilliant collection of flowering subjects, among which clarkias were conspicuous, and palms, crotons, etc., were lightly interspersed; Mr. A. J. Rhodes, gardener to W. J. Monk, Esq., was a good second; the bridge of cork built across the centre was rendered a weak feature owing to it being sparsely clothed with plants. Specimen plants were well shown. For one specimen in bloom, Mr. J. Whitebread had a freely-flowered Stephanotis floribunda, and secured the leading award in stiff competition. Mr. J. Perryman, gardener to Mrs. Harrison, had the premier award for specimen foliage plant with Kentia Belmoreana in perfect condition. Mr. C. Morgan had the best four stove or greenhouse specimens, these being freely flowered. Gloxinias were well displayed, Mr. J. Curtis winning for six plants with large blooms and excellent foliage. Begonias were indeed a feature, not that the plants were exceptionally large, but the flowers were of exceptionally high quality. For six singles, Mr. J. Whitebread won; while in the double-flowered class Mr. W. Stedman secured the leading award.

Prizes were offered for any meritorious exhibit not provided in the schedule. Mr. J. Curtis, gardener to Mrs. Marshall, staged six specimen verbenas, plants fully a yard high, nearly as much across, and beautifully flowered, grown as seedlings from Messrs. Sutton and Sons' strain. They were very fine examples of culture.

Vegetables were plentiful and good. Mr. T. Stevenson, gardener to E. Mocatta, Esq., Woburn Place, Addlestone, won both Messrs. Sutton's and Messrs. Carter's premier prizes for six distinct varieties, with high-class produce arranged in quite the best manner.

Table decorations for ladies formed a pleasing feature, the centre of one large tent being filled with the entries in one class. Mrs. Gally, Walton, secured the coveted award with a happy blending of colour of mauve sweet peas and violas, with suitable greenery; Mrs. Carnock Sawday, with roses, was second; Mrs. W. Mitchell Crawley, Oatlands, third.

Mr. S. Bide, Farnham Nurseries, had an imposing exhibit of wreaths, baskets of roses, etc.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

PALE PLUM LEAVES.—L. M. S., Reigate: The plum, or, at least, that part of it that has the pale silvery leaves, is suffering from the silver leaf disease. This disease has so far baffled all curative efforts, though the action of sulphate of iron, in solution, has, in some cases, appeared to be beneficial. Your best plan will be to cut back all branches carrying silvery leaves to a point where the wood is sound and the foliage healthy, taking care to burn all the leaves and branches removed.

RED SPIDER ON CUCUMBERS.—F. H. T., Canterbury: The leaves sent were infested with red spider. You say they are the lower leaves. It is probable that as the pest only attacks the lower leaves these latter are near the hot-water pipes, and in such a position as to be not easily reached by means of the syringe. Sponge the infested leaves with a solution of soft soap, warm water, and flowers of sulphur, and place an evaporating trough on the pipes and keep it filled with liquid manure. When syringing take every possible care to moisten the lower leaves on both sides.

RAISERS OF NEW ROSES.—E. R., Gloucester: The Lyon rose (H.T.) was raised by M. Pernet-Ducher, Venissieux, Lyons; Rhea Reid (H.T.), by Mr. E. G. Hill, Richmond, Indiana, U.S.A.; Dorothy Page Roberts (H.T.), by Messrs. Alex. Dickson and Sons, Newtownards, Ireland; Grosherzog Friederich (H.T.), by Mr. P. Lambert, Trier, Germany; Mrs. Dudley Cross (T.), by Messrs. William Paul and Son, Waltham Cross; and Madame Segond Weber, by M. Soupert, Luxembourg, France.

DRESSING ROSES.—E. C. F., Chester: One of the regulations of the National Rose Society applies very directly to the subject of your note. It is as follows: All roses must be exhibited as cut from the plant. Artificial aid of any and every kind is strictly prohibited, with the exception of wire or other supports, which are only to be used to keep the blooms erect. A bloom so tied shall not receive any point from the judges. The dressing of rose blooms so as to alter their character is prohibited. A bloom so dressed will be counted as a bad bloom. The insertion of any additional foliage will disqualify the stand. All roses should be correctly named.

STREAKY SWEET PEAS.—Solanum, Sussex: The disease, if such it can be called, is very common this season, and has been brought about largely by the prevailing climatic conditions. Mr. Massee, the mycologist, considers the disease a purely physiological one, a sort of derangement caused by high cultivation following on close in-breeding. There is no cure, though sometimes the affected plants grow out of the streaky condition, if cut back and bright weather follows. Lime should be freely used in soil where sweet peas are liable to show the streaky character and collapse.

COLLAPSED MELONS.—N. H. P., Harrogate: A severe attack of eelworm is the cause of the collapse of the melons. You can do nothing to save the plants now. Remembering that eelworms are liable to attack many crops, you should clean the house as effectively as possible, glass, woodwork, brickwork, staging, and every other part being carefully treated. The soil should be removed and burned, and, after the house is cleared, other crops, preferably pot plants, should be grown in it for at least six months before melons are planted again. The vitality of eelworms is wonderful; they can retain life and recover when kept quite dry for several months.

*Address*____________________

ROSES TO NAME.—F. S. C., Taunton: We very much regret you should have gone to the trouble and expense of sending us two boxes of rose blooms to name, though the fragrance and beauty of the flowers gave us a great deal of pleasure. It is a practical impossibility to name forty roses without an opportunity of making comparisons in a large collection, and it is quite out of the question for us to grow collections of all kinds of florists' flowers. We have an Editorial notice that generally appears at the head of this section of the paper, drawing attention to the fact that we cannot undertake to name florists' varieties of flowers, but during the past few weeks, when every line of space has been needed for articles, illustrations, and reports, this notice, as well as some others, have been omitted. Your best plan will be to send a set of flowers, duly labelled, to a rose specialist, who will, no doubt, name the varieties for a nominal fee.

SCALDED GRAPES.—O. W. N., Norwood: It is quite evident that the berries have been badly scalded, and this has been brought about by the super-heating of moisture condensed on the berries. During such a season as the present, the bright sunshine very quickly does harm in the case of a vinery not skilfully ventilated, whereas in a season that is bright and sunny one ventilates regularly in accordance with the prevailing weather. Ventilation should begin early in the morning, and be increased according to the weather. Judging from the footstalks of the berries, we believe you have rather overcropped the vines, and this, together with an outside border and a rainy season, may produce a bad case of shanking.

WYCH ELMS.—T. E. M.: The elms are suffering from weakness, and from an attack of fly. The latter can only be removed by a careful system of spraying, and this would be a costly business. The character of the leaves suggests that the trees are in need of assistance at the roots, and we therefore suggest that in autumn and early winter all the trees receive a good dressing of rotten manure, or the mud cleared from ponds, lakes, or river beds, spreading this over the area occupied by the roots. If the trees are not too tall to be sprayed we suggest that during the winter they be sprayed with a caustic solution of potash and soda, such as is used for winter dressing fruit trees. The feeding and cleaning thus given would give the trees a good chance of recovery.

ENGLISH IRISES.—L. C., Bangor: The bulbous iris, of which the English and Spanish sections are the most important from a decorative point of view, are extremely beautiful and very cheap. They should be planted early in the autumn, and produce the best effect when arranged in small groups in the mixed border. They attain to a height of about eighteen inches, and the predominating colours are purple, blue, lavender, lilac, and white; and the Spanish varieties include yellow. The Spanish varieties bloom in June, and are closely followed by the English, which have much larger flowers. English varieties of special excellence comprise: Agrippina, Blue Morant, Columbus, Dr. Hooker, Diana, Empress of India, General Vetter, King of the Blues, Mont Blanc, Mrs. Barkley, Rosinante, Triumph, and The Sultan. The following comprise some of the best Spanish varieties: Alexander von Humboldt, Athalie, Belle Chinoise, Blue Emperor, Caroline Mamisse, Fénélon, Golden King, Hercules, King of the Blues, King of the Whites, La Dame Blanche, La Bien Aimée, L'Unique, Marble King, Royal Blue, Snowball, Sunset, Surprise, The Moor, and Wonderful.

NAMES OF PLANTS.

H. R., Chester.—1, Lupinus arborea; 2, Vitis Henryi; 3, Deutzia crenata.

R. C., Derby.—1, Catananche cærulea; 2, Campanula rapunculus; 3, Primula rosea.

E. F. J., Wantage.—1, Viburnum lantana; 2, Pteris palmata; 3, Platycerium alcicorne.

D. T. S., Epsom.—1, Achillea alpina; 2, Viola cornuta; 3, Veronica spicata; 4, Leycesteria formosa; 5, Pernettya mucronata.

TRADE NOTE.

Messrs. Sutton and Sons, Reading, inform us that the wonderful exhibit of vegetables staged at the R.H.S. show at Holland Park by Mr. Edwin Beckett, V.M.H., who was awarded a gold medal, was exclusively the produce of their seeds. The much admired collection of sweet peas exhibited by Sir Randolf Baker, Bart. (gardener, Mr. A. E. Usher), and awarded a silver cup, was also entirely grown from Messrs. Sutton's seeds.

TO-DAY! AND FOR YEARS AND YEARS PAST the XL ALL Specialities are and have been the best on the market. Where is the Gardener who does not pin his faith to one or the other of these celebrated Insecticides or Fertilisers? XL ALL FERTILISER has pleased all who have used it this season. The Sales of XL ALL FUMIGATOR prove that it is more popular than ever. XL ALL LIQUID NICOTINE INSECTICIDE is always spoken of by gardeners and growers as the most deadly to Mealy Bug, Thrip, etc. XL ALL WEED KILLER used once a year "No weeds can live." RICHARDS' ARSENATE OF LEAD for all leaf-eating insects. CUCASA (fungicide), the finest preparation of copper ever offered to gardeners. Please ask your Nurseryman, Seedsman, or Florist for a copy of my small pink list, giving particulars of these and many other XL ALL Preparations, which can be obtained from the Horticultural Trade throughout the World. G. H. RICHARDS, Manufacturer and Patentee, 234, Borough High Street, London, S.E.

AWARD OF MERIT.

By Special Appointment to His Majesty the King.

VEITCH'S

NEW STRAWBERRY

"GEORGE MONRO."

Award of Merit, Royal Horticultural Society, May 18th, 1909.

This splendid Strawberry, raised by Mr. H. Staples, Swanley, and now offered for the first time is a cross between the two well-known varieties, *Royal Sovereign* and *Sir Charles Napier*.

It is a **prolific bearer**, each plant having 50 or more fruits on long stout stems rising well above the foliage.

The fruit is large, resembling *Royal Sovereign* in shape, bright red in colour, with very firm flesh and **exquisite flavour.** It **ripens a week earlier than Royal Sovereign.**

A splendid early forcing variety, sets freely, and is **not subject to mildew.**

Its bright colour, solid flesh, rich flavour, earliness, and most prolific cropping qualities, make it **a most valuable acquisition for market purposes, as well as for the private garden.**

Plants in small pots, **6s.** per dozen; **40s.** per 100. Runners from the open ground, **3s.** per dozen; **20s.** per 100.

PRICES TO THE TRADE ON APPLICATION.

NOTES OF THE WEEK.

Sweet Peas.

Ten years have run their course since practical expression was given to the decision of the small body of enthusiasts assembled at Edinburgh in the previous autumn that the bicentenary of the introduction of the sweet pea should be celebrated in London in a fitting manner. The great display of sweet peas at the Crystal Palace in the summer of 1900 was the first public exhibition wholly devoted to these exquisitely beautiful and delightfully fragrant flowers, and therefore, apart from the spectacular point of view, was an event of considerable historic importance. Ten years is not perhaps a long period in the history of a flower or class of flowers, but in this case it is long enough to admit of a fairly correct estimate of the influence the competitive gatherings have had, both in stimulating the activity of raisers and extending the cultural area. The evidence on which to base an estimate upon these two points is so abundant and conclusive that there is no occasion to call upon the expert who has been busily engaged in the cultivation of sweet peas, and has closely watched every step that has been taken during the past decade, for his testimony. It is well known to the man in the street that there has been a remarkable development in the colour, form, and size of the flowers, and an enormous extension of their cultivation in the gardens of all classes. This is all the more interesting from the fact that when it became known that an exhibition of sweet peas was to form part of the bicentenary celebration, the promoters were supposed to have allowed their love for the flower to overcome their better judgment, and the proposal was condemned in no half-hearted manner by some, who, while occupying a prominent position in the world of horticulture, had not devoted sufficient attention to the sweet pea to be able to fully appreciate its position and possibilities. It was declared that the flower had reached its highest state of development, and it was therefore futile to look for further improvement, except, it may be, in some little variation in colour. The truism that it is "not wise to prophesy until you know," has been amply justified in this case, and we have further seen that it is not wise to place any limit upon the possibilities of improvement in any class of plants. It was certainly remarkable that an attempt should have been made ten years ago to set a limit to the possibilities of the sweet pea, for during the previous twenty years or so, the late Mr. Henry Eckford had effected such remarkable improvements as to surprise those who had devoted any considerable share of their attention to the flower, and was introducing year by year varieties that were in some way superior to those that had preceded them. The sweet pea had certainly not reached the limit of its possibilities, as proved to demonstration by the magnificent varieties that have been introduced since the bicentenary celebration. We have not as yet obtained a variety bearing flowers that equal in intensity the blue of Salvia patens, or in brilliancy the scarlet of the flowers of the once popular Tom Thumb pelargonium, or in richness the yellow of, say, Golden Glory calceolaria. Yet the development in colour, as evidenced by The King, St. George, and others, is such as to fill one with admiration of the accomplishments of the raisers. Then we have in Countess Spencer and others with flowers of similar form, a quite new type, of immense value both for garden and house decoration. Ten years ago it was declared by more than one of those who objected to the movement then being made that sweet peas were utterly unfitted for exhibition, but it is doubtful whether anyone would venture to give expression to such an opinion at the present time. So far from their being unfitted for exhibition, they produce the most delightful displays, as proved by the exhibitions held annually by the National Sweet Pea Society and other associations that hold exhibitions during July and August. There is hardly an exhibition held during these two months to which they do not contribute liberally of their charms, and to many societies they have proved of immense value by creating renewed interest in their annual gatherings. Several rose societies have altered their titles to enable them to include sweet peas in their schedules, and in all cases the change has proved highly beneficial. We need not speak of the extension of cultivation that has followed the encouragement given by the various societies, for it is now a matter of common knowledge that there is hardly a garden in this country in which sweet peas are not grown. It may, however, be mentioned that their cultivation under glass for supplying cut flowers early in the year has become an important part of the activities of some of the leading growers for market, and that the production of seed has of late years assumed enormous proportions. In taking a retrospective glance over the past ten years, one derives much gratification from what has been accomplished in improving sweet peas and extending their cultivation, and there is justification for being somewhat optimistic with regard to the future. There are, however, matters which give rise to some uneasiness, and we trust that both raisers and cultivators will give such attention to them as will have the effect of preventing any check being given to the cultivation or the popularity of the flowers. It is especially necessary that the evils arising from in-breeding and excessive manuring should

MR. M. E. MILLS.

be more fully recognised than has yet been the case in relation to these flowers. From all sides we hear of plants being affected by what is commonly known as "streak," and in some cases the losses have been considerable. This unhealthy condition is not a disease, but appears to be due to a weakened constitution that may have been brought about by one or both of the causes mentioned. The naming of sweet peas is becoming unsatisfactory, owing to the use of prefixes and suffixes that have but little meaning, and are cumbrous. The practice has arisen of adding Spencer to the more recently introduced varieties having flowers of the Countess Spencer type, with the result that we have now such absurdities as King Edward VII. Spencer, when short distinctive names would have served every purpose, and been more fitting for such dainty flowers.

Mr. M. E. Mills has for so considerable a period taken a leading part in the horticultural activities of Croydon, and occupied a high position in the estimation of those with whom he has been associated, that his many friends in and around this important town will share with us the pleasure we have in presenting our readers with his portrait. There is much that is of interest in Mr. Mills' career, and it appears to us especially interesting that he should have been resident during the greater part of his gardening career at Croydon. This suggests that he made for himself a reputation quite early in life, and that his abilities have been fully recognised by gardeners and by owners of gardens in the district. Especially interesting also is the fact that the first start made by Mr. Mills was as a garden boy in the gardens of Coombe House, Croydon, of which he has had charge during the past twenty-six years. From Coombe House Gardens he went to Pitt Place, Croydon, and after being there some time he passed on to the Forest Hill Nurseries, and became a member of the regular staff. At that time the late Mr. John Laing was busily engaged in the development of the tuberous begonia, and it may be assumed that Mr. Mills was greatly influenced by what was then being done, for he has been highly successful in evolving new forms, some that are adapted for suspended baskets being especially noteworthy. While at Forest Hill, Mr. Mills accepted a position in the gardens of Waddon House, then the residence of the late Mr. Phillip Crowley. While there he accepted the offer of the position of foreman at Coombe House, and on the then gardener leaving to take up a position elsewhere, the late Baroness Heath promoted Mr. Mills to the position of head gardener. On the death of the Baroness, Mr. Frank Lloyd, whose interest in gardening is well known, purchased the manor of Coombe, and retained Mr. Mills' services. Encouraged by a generous employer imbued by a strong love for horticulture, Mr. Mills has proved to demonstration his remarkable cultural and administrative abilities. While devoting such close attention to the management of the Coombe House Gardens as to place them in a prominent position among the horticultural establishments of the district, Mr. Mills has not been unmindful of his responsibilities in other directions. He has in consequence thereof taken a leading part in the management of the several associations in Croydon that have for their object the advancement of gardening.

Botany at Winnipeg. — The Botanical Section of the British Association, which meets at Winnipeg in the last week of August, will have for its President Lieut.-Colonel Prain, F.R.S., Director of the Royal Gardens, Kew. The papers that will be submitted to the section include the production, liberation and dispersion, of the spores of Hymenocetes by Professor Buller; the nucleus phenomena of Ascomycetes in relation to heredity, by Miss H. C. I. Fraser; the nucleus of the yeast plant, by Mr. H. Wager, F.R.S., and Miss Peniston; some problems connected with the life history of Trichodiscus elegans; anatomy of Osmundaceæ; the evolution of the inflorescens by Mr. J. Parkin; and some observations on Spiræa Ulmaria, by Professor Yapp.

The Gardeners' Royal Benevolent Institution.—The secretary, Mr. George J. Ingram, writes: At a meeting of the committee of management, held on Friday, July 9, the following resolution was unanimously adopted: "That this committee desires to record their deep appreciation of the invaluable services rendered to the institution by the horticultural Press at all times, but especially in connection with the recent successful festival dinner, and tenders to them their grateful thanks."

Red Spider is so troublesome a pest in gardens that there are but few gardeners who are not more or less interested in the various methods adopted for its destruction. In the drier atmosphere of the United States red spider does considerable damage during the summer months to runner and dwarf kidney beans, and last year some experiments were conducted in Florida with a view to control the pest. The experiments were conducted in a small field of wax beans which were badly infested. On May 22 a row was sprayed with lime-sulphur at the rate of 1lb. lime and 1lb. sulphur to 25 gallons of water, the lime and sulphur being boiled together in a portion of the water. A comparison with unsprayed plants on May 28 showed that 76 per cent. of the red spiders had been killed by the one spraying. On the same day a row of the beans was sprayed with lye-sulphur (1lb. sulphur and ½lb. lye in 40 gallons of water), and two days later comparison with unsprayed plants showed that no less than 98.4 per cent. of the red spiders had been killed. In another case a row was sprayed with sulphur in water (1oz. to 1 gallon of water), and it was found that 91.7 per cent. of the red spiders had been destroyed. Kerosene-soap emulsion was also tried, and an examination the following day showed that 95 per cent. of the red spiders were killed. The plants sprayed with the kerosene-emulsion showed a few leaves with burned edges, but this was not serious. In all other cases the plants were in no way injured.

Mr. Robert Bolton's Gold Medal Sweet Peas.—We regret that, as a consequence of a clerical error, we credited the award of a gold medal at the National Sweet Pea Society's Provincial Show, Saltaire, to Mr. T. Bolton, instead of to Mr. Robert Bolton, of Warton, Carnforth. The error occurs on pp. 561 and 562 of our issue of July 17. Mr. Robert Bolton, who thoroughly deserved this gold medal award, has introduced many beautiful sweet peas, notably Bolton's Pink, Mrs. Hardcastle Sykes, Clara Curtis, etc.

British Gardeners' Association.—On Wednesday next, July 28, a meeting of gardeners will be held in connection with the great summer show of the Horticultural Society of Northumberland, Durham, Newcastle-on-Tyne, by kind permission of the chairman and council. The first meeting will be held at 2.30 p.m. in the Recreation Ground, North Road, Newcastle-on-Tyne, in a special tent provided by the Executive Council of the British Gardeners' Association, and will be addressed by Mr. J. Weathers, general secretary of the association. Another meeting will be held in the same place at 7.30 p.m. Members of the association have the privilege of entering the flower show on the first day at half price, 1s., up to 5 p.m., on showing cards of membership at the gate.

Northampton Flower Show.—Northampton was long remarkable for its magnificent flower shows, but from some cause they were discontinued. With a lively recollection of the magnitude and interest of the annual competitive gatherings at Northampton, we are pleased to learn that strenuous endeavour is being made to revive the annual flower show on a scale worthy of the traditions of the town. This endeavour has the promise of proving highly successful, for much interest is being taken in the exhibition that will be held at Abingdon Park, Northampton, on August 4 and 5 by the Northampton Municipal Horticultural Society. Intending exhibitors should make note of the fact that entries close July 28. The secretary is Mr. J. B. Palmer, 36, Cyril Street, Northampton.

Boating in London Parks.—During the year ended March 31 the total income received in connection with the letting of boats on hire at five of the London County Council's parks was £4,424, of which amount £1,693 was received from Battersea Park, £385 from Dulwich Park, £786 from Finsbury Park, £194 from Southwark Park, and £1,364 from Victoria Park. The total working expenses were £2,614, leaving a surplus of £1,809 as compared with £1,887 in the previous year. After deducting the debt charges and income-tax the year's working shows a net surplus of £1,175.

National Sweet Pea Society's Exhibition.—In our next issue we shall give an illustrated report of the Metropolitan exhibition of the National Sweet Pea Society, held at the Horticultural Hall, Vincent Square, Westminster, on the 23rd inst.

Infestation of the Evergreen Oak.—In May a correspondent of the Board of Agriculture, resident near Guildford, forwarded a bough of evergreen oak the leaves of which were infested by the larvæ of the moth known as Lithocolletis messaniella. It was stated that apparently every evergreen oak in the immediate neighbourhood was affected, and that some of the younger trees had injuries on every leaf. At the time when the leaves were examined, the insect was in many cases still present in its pupal form, but some of the moths had already issued, and were, no doubt, preparing to lay their eggs for a new brood. These small Tineid moths, which are liable to be mistaken for tiny flies, lay their eggs on the underside of the leaves, into which the newly-hatched larvæ bore. The inside of the leaf is mined until, sufficient food having been taken, the caterpillar pupates. There is usually a brood in May, and another in late autumn. Preventive measures are not easy, as the larvæ cannot be reached inside the leaf. The best course is to collect and burn all infested leaves, and to spray the uninfested trees with paraffin emulsion, or a solution of arsenate of lead, the value of which is known in connection with allied moths. The abnormal weather prevalent during May and June appears to have had great influence on this infestation, for so long as the bright, sunny weather of May prevailed, the moths were to be seen in swarms, but the heavy rains and dull weather that succeeded cleared most of them away.

CARDIFF COMING-OF-AGE SHOW.

On July 21 and 22, in good weather, the Cardiff Horticultural Society held its coming of age show in the Sophia Gardens, and the whole affair was a great success. Seven tents were provided, and these were well filled. Cut flowers were particularly good, and one of the largest of the big tents was almost entirely given up to sweet peas and sweet pea decorations, and this was ever the most crowded section of the show. In the group classes there were some good exhibits, but in the plant classes the standard attained was not high. Neither was fruit an especially good section, though vegetables were excellent for the season.

The Cardiff Society gives considerable encouragement to children's efforts, and one tent was filled with pot plants and garden and wild flowers grown or arranged by the youngsters. The cottagers of the district also had a tent to themselves, and displayed some first-rate vegetables and some very fine pot plants, one specimen of Plumbago capensis standing out as a remarkably fine example of cultural skill.

On this auspicious occasion a deputation from the Royal Horticultural Society visited the show, and made awards; this consisted of Sir Trevor Lawrence, Bart. (president), Rev. W. Wilks, M.A. (secretary), Mr. Harry J. Veitch, V.M.H., Mr. Jas. Hudson, V.M.H., and Mr. H. B. May. The awards made by the deputation were greatly appreciated.

After judging was finished, the president of the Cardiff Society, the Marquis of Bute, accompanied by his brother, Lord Ninian Stuart, entertained the R.H.S. deputation, committee, judges, etc., to luncheon, and this function, with its short and effective speeches by leading horticulturists and local celebrities, was a very pleasant one.

GROUPS AND PLANTS.

Although only three groups were arranged in the great group class, each was a good one, and the competition was keen. Messrs. Jas. Cypher and Sons, Cheltenham, secured the leading award of £15, and on their space of 150 square feet they set up a very bold and effective exhibit, in which Lilium longiflorum and L. speciosum album were most effectively used with cattleyas, odontoglossums, and Begonia Gloire de Lorraine. The bold central mound was brightened by crotons and contrasting alocasias. Small crotons, Rex begonias, and Caladium argyrites made up the edging, and lantanas, ixoras, and ferns filled up the valleys between the central and corner mounds. Mr. Macintyre, gardener to Lady Hill, Rookwood, second; and Mr. W. E. Pearce, gardener to Henry Oakley, Esq., Caldicot, Newport, third, both these latter using Humea elegans freely.

In a smaller group glass, Mr. G. Wall, gardener to J. Llewellyn Morgan, Esq., Llandaff, was first prize winner, and in yet another class, for amateurs, Mr. G. Wall was a good first, with Mr. W. Thurston, gardener to Dr. H. Rees, Holmsdale, Penarth, second.

Mr. Macintyre scored for six table plants in the open class, but was second to Mr. W. J. Garner, Hale, Cheshire, in the amateurs' class for six plants.

ROSES AND HARDY FLOWERS.

Mr. H. Drew, Longworth, Berks, led in the class for eighteen tea and noisette roses, with some good flowers of Mrs. Stephen Treseder, Medea, Mrs. E. Mawley, etc.; King's Acre Nursery Co., second; and Mr. J. Mattock, Headington, Oxford, third. The King's Acre Nursery Co. scored for a dozen H.P. roses, one variety, with Fisher Holmes in good form; and they also led for a dozen flowers of a tea rose with Mrs. E. Mawley in very fine condition. Messrs. S. Treseder and Son, Pwlloch Nurseries, Cardiff, led for two dozen roses, distinct, and they had fine specimens of Horace Vernet, Dupuy Jamain, John S. Mill, Mrs. J. Laing, Caroline Testout, and Marchioness of Londonderry; Mr. J. Mattock second, and Mr. H. Drew third.

The president of the Cardiff Chamber of Commerce gave a piece of plate as first prize in a class for a collection of roses, arranged artistically on a space 9ft. by 4ft. 6in., and this was won by Mr. J. Mattock, Headington, Oxford, with a bold and beautiful display of rambling, H.T., and T. roses set up in stands and vases; he used sprays of foliage to great advantage, and made up a delightful and fragrant exhibit; six entries. Second prize fell to Mr. J. Crossling, Penarth; and third to Messrs. S. Treseder and Son, both of whom showed very well; Messrs. Hobbies, Lim., Dereham, fourth.

The King's Acre Nursery Company, Hereford, scored for a dozen trebles, tea roses, their Golden Gate and Mrs. E. Mawley being well shown; Mr. H. Drew was a close second; and Messrs. James Townsend and Sons, Worcester, third. Messrs. S. Treseder and Son led for twelve trebles, and had Frau Karl Druschki, Horace Vernet, and Her Majesty in fine form; King's Acre Nursery Company second, and Mr. H. Drew third.

MESSRS. JAS. CYPHER AND SONS' FIRST PRIZE GROUP AT CARDIFF COMING-OF-AGE SHOW.

Mr. Fred Treseder, chairman of the committee, gave a valuable piece of plate, which was added to the sum of £5 given by the society, to make a first prize in the open class for a collection of hardy flowers, distinct varieties, arranged on a space 15ft. by 4ft. There were four fine displays, and the chief position was secured by Messrs. G. Gibson and Co., Leeming Bar, Bedale, with a very fine exhibit, wherein the delphiniums, poppies, spiræas, Gaillardia Meteor, Lilium elegans, Potentilla Victor Lemoine, Linaria aurea, and some pæonies were the leading features; Messrs. Artindale and Son, Nether Green Nurseries, Sheffield, a good second, with great sheaves of delphiniums, gladioli, liliums, irises, and kniphofias; Messrs. H. and W. Evans, Llanishen, third.

Mr. C. F. Waters, Balcombe, Sussex, was a capital first for a collection of perpetual and Malmaison carnations, and he was followed by Messrs. Bell and Sheldon, Guernsey, and Mr. Wall, Melrose Nursery, Bath. Mr. Waters was first also for border carnations.

Mr. Robert Went, Llandaff, had a grand set of twelve bunches of hardy flowers, and won the silver cup offered by Mr. Reginald Cory with splendid bunches of Lilium speciosum, spiræas, delphiniums, etc.; Mr. A. R. Searle, Castle Ashby, second; and Mr. Febrey, gardener to J. M. Courtis, Esq., Cardiff, third.

SWEET PEAS.

The National Sweet Pea Society's silver medal and piece of plate, offered for the best six vases of sweet peas, amateurs, were won by Mr. Thomas Jones, Bryn Penylan, Ruabon, with six wonderful bunches of Helen Lewis, Etta Dyke, Menie Christie, Mrs. Henry Bell, Othello Spencer, and Elsie Herbert; Mr. J. Taylor, gardener to J. E. Alan Gibbs, Esq., St. Andrews, was placed second; and Mr. Wheeler, gardener to Mrs. Jenner, Wenvoe Castle, Cardiff, third; thirteen entries.

In the open class for nineteen bunches of sweet peas, distinct, the premier place was filled by Mr. Thomas Jones, Ruabon, who had a grand lot of flowers of Olive Bolton, Etta Dyke, Constance Oliver, Helen Lewis, The King, Clara Curtis, Nancy Perkins, Mrs. A. Ireland, and Mrs. H. Bell, etc.; there were seven competitors. Mr. H. Townsend, gardener to H. Pitt, Esq., Abergavenny, came second; and Mr. W. J. Godfrey, Exmouth, was third. Mr. Thomas Jones was also successful in Mr. Sydenham's class for a dozen varieties of sweet peas, and here again he had wonderfully clean and bright flowers, his Helen Lewis being especially fine; Mr. H. Wheeler, second; and Mr. W. T. Shackson, gardener to Mrs. Rees Jones, Porthkerry House, third.

In the Eckford class for twelve bunches of sweet peas, Mr. J. F. Jones, gardener to Lady Horell, Penarth, secured the premier award, and in Messrs. Webb's class for eight varieties Mr. Thomas Jones was once more an outstanding first, with Mr. J. Taylor a good second. In a class for six bunches, open to Glamorgan and Monmouth, Mr. E. Harvey, The Cleaves, Dinas Powis, won the piece of plate offered by Mr. W. Treseder, and he was followed in order by Mr. H. Wheeler and Mr. A. H. Cossom, gardener to R. T. England, Esq., Rumney Court.

FLORAL DESIGNS.

The best table decoration of sweet peas was adjudged to be the one arranged by Mrs. Percy Phillips, Newport, who used cream-pink flowers in elegant fashion; Mr. J. T. Curtis, gardener to Sir Howell Davies, M.P., Down House, Stoke Bishop, Bristol, second with cream and lavender; and Mr. J. Nixon, gardener to Donald Robinson, Esq., Alderley Edge, third.

Mr. Garner led in the open class for a bouquet of roses with a charming design of Abel Chatenay. The same competitor led for a basket of flowers with a gorgeous and elegant arrangement of orchids, and was followed by Mrs. J. Nixon and Mr. P. Thomas.

FRUIT AND VEGETABLES.

There were four competitors in the class for a dinner table laid for dessert for eight persons. Premier award fell to Mr. W. J. Garner, Hale, Cheshire, for a fair display; Mr. W. Hodge, Albany Road, Cardiff, second, with a pretty exhibit in which cattleyas and odontoglossums were used for decorating the fruit; Mrs. J. Nixon, Alderley Edge, third, with a charming decoration of Mrs. Burnett carnations.

Mr. N. German, gardener to E. H. Edwards, Esq., Llandough Castle, was first for white grapes with Muscat of Alexandria, with Mr. J. T. Curtis second. Mr. T. Wilkinson, gardener to G. A. Gibbs, Esq., M.P., Tyntesfield, Flax Bourton, led for six bunches of black and white grapes.

Mr. W. Barnes, gardener to A. F. Walter, Esq., Bearwood, Wokingham, had the best dish of strawberries, showing Givon's Late Prolific. Mr. A. H. Cossom had the best dish of loganberries, and he led for green gooseberries, Dr. Lynn Thomas, Penylan, scoring for red gooseberries. Gooseberries were grandly shown.

The chief vegetable class was for nine distinct kinds, and Mr. E. Beckett, gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree, won the plate, medal, and cash award offered as first prize, with a beautiful set of Leviathan onions, New Red Intermediate Carrots, Snowdrop potatoes, Canadian Wonder beans, Centenary peas, Everyday cucumbers, and Early Giant cauliflowers; Mr. A. R. Searle, gardener to the Marquis of Northampton, Castle Ashby, Northampton, a good second; and Mr. W. T. Shackson, Porthkerry, third.

Messrs. Sutton and Sons, Reading, provided a class for vegetables, and here the awards were made, in order of merit, to Mr. E. Beckett, Mr. Shackson, and Mr. Searle. Messrs. Webb and Sons' prizes fell to Mr. Searle and Mr. Shackson, who were first and second respectively.

NON-COMPETITIVE.

The very fine group of stove and greenhouse plants, and orchids that practically filled one side of a tent was reminiscent of the Temple Show. This was a splendid display of choice material, well grown, and particular well arranged by Messrs James Veitch and Sons, Chelsea. Choice palms, dracænas, bright crotons, and bold alocasias occupied the major portion of the group, with anthuriums, Gerbera Jamesoni, and Kalanchoe flammea lending further colour effect. Overhead were very fine specimens of nepenthes Dr. J. Macfarlane and N. Hookeriana. Cyanophyllum magnificum, Anthurium crystallinum, and Eugenia myriophyllum were other notable plants in this notable display. The other half of this tent was filled by Mr. Wm. Treseder, Cardiff, with an extensive display, that comprised a group of stove and greenhouse plants, a display of roses, a collection of sweet peas, a rock and water garden, a selection of hardy herbaceous flowers, and a big central grouping of floral designs, in which a lighthouse and a yacht were wonderful compositions, but which also contained beautiful baskets of roses, harps, chaplets, wreaths, anchors, etc.

Mr. H. Farmer, gardener to the Marquis of Bute, Cardiff Castle, arranged a large group of plants, and also set up a large display of strawberries, peaches, nectarines, currants, cherries, gooseberries, etc., with a large arch of finely-fruited pot vines of Black Hamburgh and Foster's Seedling, carrying excellent bunches. Messrs. Cross Brothers, Cardiff, brought a useful set of seats, summer-houses, tents, etc., suitable for garden use. Mr. L. R. Russell, Richmond, contributed variegated ivies, and a collection of flowering shrubs, etc., arranged out of doors.

PART OF MR. WM. TRESEDER'S GOLD MEDAL EXHIBIT AT CARDIFF COMING-OF-AGE SHOW.

The King's Acre Nursery Company, Hereford, showed a very fine lot of fruit trees in pots, and their plums, vines, peaches, nectarines, apples, cherries, and gooseberries attracted a great deal of attention. Messrs. James Carter and Co., erected an elegant temple of sweet peas, and under this, around the vases of flowers, they placed a goodly collection of culinary peas. Messrs. Sutton and Sons, Reading, were large exhibitors, and put up a very pleasing display of sweet peas, sweet williams, and stocks, associating with these charming flowers a selection of their culinary peas, tomatoes, carrots, cauliflowers, tomatoes, and a fine lot of melons. Messrs. E. Webb and Sons, Stourbridge, made up a most effective display of their excellent gloxinias, arranged with sweet peas, and trophies of melons and tomatoes, with selections of their choice vegetables beneath.

Messrs. Stark and Son, Great Ryburgh, displayed a bright lot of sweet peas that included excellent bunches of St. George, The Premier, George Stark, Elsie Herbert, and the bright Kitty Clive. Mr. C. W. Breadmore, Winchester, had a large table of sweet peas in excellent condition, and the flowers were well set up, the stands of Mrs. A. Ireland, Clara Curtis, Audrey Crier, George Herbert, Helen Lewis, and Lavender George Herbert standing out finely.

Mr. J. J. Neale, Penarth, put up a very interesting group of droseras, sarracenias, pinguiculas, nepenthes, and other insectivorous plants, and flanked these with banks of odontoglossums, Phalænopsis Rimestadiana, cypripediums, etc. Messrs. J. C. Wheeler and Son, Gloucester, put up a very large and imposing exhibit of sweet peas and perpetual carnations. Mr. Henry Eckford, Wem, Shropshire, was represented by a lot of beautiful sweet peas that included such good things as King Edward VII., Paradise Ivory, Queen Alexandra, Opal, Zarina, Dodwell F. Browne, Evelyn Hemus, Henry Eckford, and John Ingman. Messrs. Blackmore and Langdon, Twerton Hill, Bath, put up a superb display of double tuberous begonias, their plants and flowers of M. Gwillim, H. M. Arderne, Mrs. W. L. Ainslie, Mrs. C. F. Langdon, and Mrs. G. F. Fry being wonderful examples of fine culture. Mr. F. Lilley, Guernsey, displayed a collection of early gladioli. Mr. W. J. Godfrey, Exmouth, brought some good hardy flowers, including some splendid pentstemons. Messrs. Jarman and Co., Chard, showed their delightful sweet sultans and a collection of roses and sweet peas. Mr. Vincent Slade, Taunton, submitted a brilliant set of cut pelargoniums.

Hardy flowers, well-grown, were well set up by Mr. F. Eames, Frome, and Messrs. B. R. Davis and Sons, Yeovil, exhibited cut flowers of excellent tuberous begonias. Messrs. Barr and Sons' pigmy trees attracted a good deal of attention, and they had a grand lot of hardy flowers. Messrs. Young and Co., Hatherley, Cheltenham, set up a bold group of carnations that contained a number of good new seedlings, and a grand vase of Britannia. Mr. H. N. Ellison, West Bromwich, had a good display of elegant ferns, and Mr. N. Lowis, Bridgwater, showed a selection of hardy flowers. Messrs. Dobbie and Co., Rothesay, exhibited a large group of sweet peas, and staged their flowers effectively.

Messrs. Case Brothers, Cardiff, put up a large display of floral designs, that contained a floral piano composed of dyed laurel leaves and white stocks; this, and a floral clock, attracted a good deal of attention, though not much of admiration. Messrs. Wood and Son, Wood Green, London, N., contributed a display of horticultural sundries; and the Newport Pottery Company, Newport, sent useful designs in garden pottery. Mr. P. Thomas, Cardiff, displayed hardy flowers and water lilies well. Messrs. Bakers, Wolverhampton, brought a very large collection of hardy flowers; and Mr. Amos Perry, Enfield, set up fine spikes of delphiniums. Messrs. Garraway and Sons, Bristol, exhibited cut roses. Messrs. J. Peed and Sons, West Norwood, had a bold group of caladiums.

R.H.S. MEDAL AWARDS.

Gold.—To Mr. H. Farmer, gardener to the Marquis of Bute, Cardiff Castle, for a collection of fruit; to Mr. W. Treseder, Cardiff, for a group of plants; to Messrs. James Veitch and Sons, for a group of plants.

Silver Cup.—To Mr. H. Farmer, gardener to the Marquis of Bute, for a group of plants.

Silver-gilt Flora.—To Messrs. Blackmore and Langdon, Bath, for begonias; to Lady Hill, Rookwood, for a group of plants; to Messrs. J. Cypher and Sons, for a group of plants; to Messrs. R. Wallace and Co., Colchester, for hardy flowers.

Silver-gilt Banksian.—To Mr. Thomas Jones, Ruabon, for sweet peas; to Messrs. Gibson and Co., Leeming Bar, Bedale, for hardy flowers; to Mr. F. Eames, for hardy flowers.

Silver Knightian.—To the King's Acre Nursery Company, Hereford, for fruit trees in pots.

Silver Flora.—To Mr. C. W. Breadmore, Winchester, for sweet peas; to J. J. Neale, Esq., Penarth, for orchids and insectivorous plants; to Mr. Henry Eckford, Wem, for sweet peas; to Mr. L. R. Russell, Richmond, for hardy shrubs; to Mr. J. Mattock, Headington, for roses; to Messrs. Dicksons, Chester, for hardy flowers; to Messrs. Dobbie and Co., Rothesay, for sweet peas; and Mr. C. F. Waters, Balcombe, Sussex, for carnations.

Silver Banksian.—To Mr. H. N. Ellison, West Bromwich, for ferns; to Mr. E. E. Hole (cottager), Barry, for vegetables, etc.; to Messrs. H. and W. Evans, Llanishen, for hardy flowers; to Mr. J. Crossby, for roses; to Messrs. Bell and Sheldon, Guernsey, for carnations; to Mr. R. Went, Cardiff, for hardy flowers and ferns.

Bronze Banksian.—These awards went to cottagers and children; to Messrs. W. Mellings, C. Mellings, B. Webbe, and Duffield.

NATIONAL SWEET PEA SOCIETY.

The special award of a gold medal given by this society for the best exhibit of sweet peas in the show was made in favour of Mr. Thomas Jones, Bryn Penylan, Ruabon, for his first-prize nineteen bunches in the open class.

CARDIFF SOCIETY'S AWARDS.

Gold Medal.—To Mr. William Treseder, Cardiff, for group of plants; to Messrs. James Veitch and Sons, Chelsea, for group of plants; to Messrs. R. Wallace and Co., for display of hardy flowers; to Messrs. E. Webb and Sons, for fruit, flowers, and vegetables; to Mr. H. Farmer, gardener to the Marquis of Bute, Cardiff Castle, for plants and fruits; to J. J. Neale, Esq., Penarth, for orchids and insectivorous plants; to King's Acre Nursery Company, Hereford, for pot fruit trees and hardy flowers.

Silver-gilt Medal.—To Messrs. Blackmore and Langdon, Bath, for begonias; to Messrs. Case Brothers, for floral designs; to Messrs. J. Peed and Sons, West Norwood, for caladiums; to Messrs. Dobbie and Co., Rothesay, for sweet peas; to Messrs. H. and E. Evans, Llanishen, for hardy flowers; and to Mr. L. R. Russell, Richmond, for shrubs.

Silver Medal.—To Mr. Henry Eckford, Wem, for sweet peas; to Messrs. Stark and Son, Great Ryburgh, for sweet peas; to Mr. P. Thomas, Albany Road, Cardiff, for hardy flowers; to Messrs. Sutton and Sons, Reading, for flowers, fruits, and vegetables; to Messrs. Artindale and Son, Sheffield, for violas; and to Messrs. Bakers, Wolverhampton, for hardy flowers.

SYRINGA JAPONICA.

This species of syringa is sometimes referred to as the "Tree Lilac," for under favourable conditions it assumes tree-like proportions. It is a native of Japan, and differs considerably from any other syringa, the inflorescence and flowers reminding one more of those of a privet than a lilac. On free-growing examples the leaves are large, six inches or so long, and wide in proportion, and more or less oval in shape. The inflorescences are in the form of large panicles, four to six inches long and as much through, the individual flowers being small and cream coloured. Flowers are borne with remarkable freedom, and as the flowering time is the end of June and early July, it is a period when they are welcome on account of good flowering shrubs and trees being scarce. As is the case with other lilacs, this one grows most satisfactorily in good loamy soil. To assist it to assume a tree-like habit it is necessary to tie up the leading shoots occasionally when young, and remove, or cut in the side branches. If this is not done there is a tendency to develop a bushy head instead of trunk. As is the case with the other lilacs, it is a good plan to remove the old flower heads as soon as the flowers fade.

D.

AMONG THE ALPINE FLOWERS.

Amid the glories of the summer garden, when roses are not yet past the zenith of their beauty, and border flowers, from the lily to the old border plant which has been handed down to us for generations, the alpine flowers seem modest and quiet indeed. They do not possess the size or the exquisite form of the rose as we know it now, and their modest stature seems mean when compared with the stateliness of many of the border flowers. Yet they have their beauties, and we cannot well overlook these flowers even amid the thousand and one distractions caused by their sisters owning more opulent charms. Let us then glance at these alpine flowers of high summertide, and see if there is aught which can be told regarding them.

Onosma taurica.

The golden drop, Onosma taurica, is not surpassed by any of its congeners in beauty or in serviceableness, although we have a lingering liking for the exquisite O. albo-rosea, which, however, is not so long lived as the older favourite, of which we desire to speak. Given certain conditions, not difficult to secure, O. taurica will give plenty of its drooping, almond-scented yellow flowers, hanging in clusters in the most elegant way. They remind one of some massive golden ear-drop of olden times, and are the admired of all observers who see a good plant full of flower. The foliage is somewhat of a contrast to the smooth and pretty flowers, so rough is it, but yet the two go well together, and a fine plant in a conspicuous position is exquisite and bright in its formation and its coloration. Some find it difficult to keep, especially in wet districts where the winter rainfall is unusually heavy, but the slight precaution of placing a sheet of glass some five or six inches above the plant, to throw off the winter rains, is all that is required to save it from injury. Then, to show it well, it ought to be planted on a little flat on the rockery, and so set that it can trail over the front to show its golden flowers. Poor soil is helpful to it; and also full exposure to the sun should be afforded this onosma. It is easily propagated by taking off cuttings with a heel and inserting them round the sides of a flower pot surfaced with sand well watered in, and placed under glass.

Sedum Aizoon.

It is a mistake to have all the flowers in the rock garden of the same character, and, in addition to the dwarfer sedums or stonecrops, we ought always to keep in remembrance the value of some of the erect-growing species, few of which require any extraneous support in the way of staking. Looking over the rock garden to-day I am reminded of the fact that the old Sedum Aizoon is hardly ever referred to by writers of the present day, although it is a flower which is worth possessing either in the rock garden or in the flower border. It is of erect habit, as already indicated, and is about a foot or a little more in height, sending up from one crown several smooth stems of pretty succulent leaves, each stalk bearing a head of yellow flowers, with every bloom half an inch or less in diameter, and, as a whole, looking well, the harmony between the leaves and the flowers being complete. It takes nothing from the value of Sedum Aizoon to say that it gives no trouble, as it is not a rampant plant in any way. It was introduced from Siberia as far back as 1757, and has all these years retained a position in gardens of a certain class. Although not much seen now under name, it is worth remembering by those who like flowers of its class.

Veronica Lindsayi.

Shrubby veronicas have indeed been a boon to the rock gardens of our land, and there is no limit to the possibilities of this race of flowers in the future. They hybridise so freely, and also vary to some extent from seeds, so that every now and again we have some new form being brought before the flower-loving public. There are very many good evergreen shrubs among them which we can associate with our alpine flowers, and help to clothe our rockeries, and aid in making them free from barrenness of interest at any season of the year. Many of them bloom freely, and among these I do not know any which is more pleasing with me than Veronica Lindsayi, which owes its origin to the love of these shrubs held by Mr. Robert Lindsay, Edinburgh. This hybrid is worthily named after its raiser, and I find it one of the most satisfactory, and one of the hardiest I have here. On the rock garden it is very fine as this is written. One example, fully exposed to the sun and wind, is about a foot and a-half high, and about three feet across. It is practically covered at present with heads of small, pleasing pink flowers, and is admired by all who look upon it in its present condition. It is absolutely hardy here, and gives me no trouble whatever.

Other Flowers of the Time.

The pretty calceolarias called polyrhiza and plantaginea are yet in bloom, and close by a few of the golden blooms of Lithospermum canescens, which contrast well with the deep purple blue of L. prostratum and L. purpureo-caeruleum, both good growers here. Nestling under the Yellow-barked Dogwood is Viola elatior, with soft flowers of delicate blue. Elsewhere Viola Rydbergi and V. cucullata striata, with others of the race, are yet in flower. Erodiums and geraniums, helianthemums and cistuses, in much variety, are bright indeed; while pinks in several species, and a number of varieties, are yet in bloom, some of the single forms of Dianthus plumarius being magnificent with their sheets of colour. Ericas are lovely on the rockwork in white and pink, and crimson and purple. Then there are yet a few saxifrages, and it is the time for the reign of the stonecrops, which brighten many a place on the rockeries with their blossoms of various colour. Many other alpines there are yet in flower to show that they may have their innings even among the glowing and gorgeous show of the summer border flowers.

S. Arnott.

TWO GOOD ROSES.

Although there are new roses of exquisite form and colour introduced every year by various firms, some of the old favourites well maintain their position. I have rarely seen the variety Mrs. John Laing in better form than it was at the Finchley show held there on July 8. A bowl of roses was a conspicuous feature, the variety being Mrs. John Laing. There were about four dozen blooms, on long stems; the flowers were large, and not a petal was damaged. In the districts of Finchley and Barnet some grand roses are grown, the heavy soil suiting them well. At Holland Park Show and other exhibitions, both Mrs John Laing and Ulrich Brunner were well staged, but the latter variety was to be seen in greatest perfection at the Hanley Park Show held on July 7 and 8. Magnificent specimens were staged, of great size, grand form, and exquisite colour. Both varieties are among the best for growing as garden roses, as well as for exhibition.

G. B.

SOLANUM ETUBEROSUM.

Last year, it will be remembered that reports were given on certain results obtained by Messrs. Sutton, of Reading, from seed of this species of tuber-bearing solanum, or potato, which tended to encourage the hope that at last a really disease-proof, or, at any rate, disease-resisting, potato had been discovered. This year we have pleasure in announcing that subsequent experiments so far confirm this expectation, inasmuch as they establish the existence of a practically new strain, which is entirely independent of that susceptibility to the disease which would probably be inherited by a cross with the potato of commerce. The origin of S. etuberosum is, unfortunately, unknown, since no record of such can be found at the Edinburgh Botanic Gardens, whence the tubers were sent to Messrs. Sutton some twenty odd years ago. Since their receipt they have been continuously grown at Reading, with the result that the tubers, originally very small, increased in size to moderate commercial dimensions, and resembled the ordinary potato in all respects save that they were somewhat waxy when cooked.

For nineteen years no berries appear to have been formed, and seminal cultivation could not, therefore, be effected; in 1906, however, a single berry was noticed, and when the seeds from this were sown, some twenty plants being obtained, the remarkable result was precisely such a varied brood as the commercial potato produces from its seed, no two being alike, either in foliage or tuber, while in some of the plants the tubers fully equalled good commercial potatoes in size and quality. Naturally, this led to the idea that the said berry was the result of a cross with some of the common potatoes in the vicinity, in which case, of course, the susceptibility to disease would probably be inherited, and thus discount the fact that S. etuberosum itself had not shown a trace of infection for all the time it had been grown, though associated every season with varieties of the ordinary potato, which had frequently suffered.

To test this material point, therefore, Mr. Arthur Sutton obtained more berries, some self-fertilised by himself, and others self-fertilised by the Rev. A. Paton, quite independently, cross-fertilisation being carefully guarded against by both operators, and other berries were obtained from flowers that were cross-fertilised with the common potato for comparison. The result has fully confirmed Mr. Sutton's belief that the original berry was pure-bred, since the demonstrably pure-bred seeds have produced precisely similar broods of variable plants as constituted the original batch, and the cross-bred seeds have yielded identical results, the net outcome being that pure-bred offspring of S. etuberosum, which has resisted disease for over twenty years, have furnished a strain as variable, and therefore as amenable to selection and improvement, as the common potato.

The assumption that, after all, S. etuberosum might have been a form of the cultivated potato accidentally introduced as a pure and unsophisticated species, appears a reasonable one on the surface, in view of its seminal results, but as against this it is necessary to state that S. etuberosum, named, botanically, as a non-tuberous solanum, has much hairier foliage of a different make to any known cultivated potato, it had very small tubers when first grown, and, quite possibly, as a wild plant, these would be so small as to mislead the botanist who named it; furthermore, its berries are distinctly spotted with white, while those of the cultivated potato show no signs of this; its pollen grains, too, are purely elliptical, a peculiarity of wild species, those of the ordinary potato being very irregular in shape. Finally, we have its persistent resistance to disease as a further differentiating character. Despite therefore its production of such variable offspring, and their resemblance to those of the commercial potato, it is difficult to accept it as really the original progenitor of that tuber which botanists and specialists have sought for so long. That question still remains in abeyance, but hardly that of obtaining a potato which shall really be immune from the disease.

Chas. T. Druery, V.M.H., F.L.S.

SUMMER QUARTERS FOR GREENHOUSE AND STOVE PLANTS.

A number of kinds, known respectively as greenhouse and stove plants, are much benefited by passing a couple of months in the open air during the summer. This treatment naturally hardens their constitution, while the growth made is hard and firm, and well calculated to withstand the unfavourable conditions and comparative absence of light which prevails during the dull season. A matter of much importance is to select a suitable site, which, in addition to being partially shaded, should be well protected from the wind; exposure to south-westerly gales would ruin many subjects, including palms and tree ferns, and in consequence we must seek the friendly shelter of garden walls or shrubberies. Strict attention must be paid to watering, and this work will be reduced to a minimum if the pots are plunged to the rim in coal ashes or cocoanut fibre.

The middle of July is a good time to place the plants in the open for our purpose, and they may be housed any time during September. Amongst palms which may be treated in this manner are Seaforthia elegans, Phœnix reclinata, P. spinosa, and P. dactylifera, Livistona chinensis, Erythræa armata, Chamærops humilis, and Trachycarpus excelsus. Crinums luxuriate in the open, and seem to escape the raids of insect pests when thus placed. C. capense, C. giganteum, C. Moorei, and C. scabrum all benefit considerably by a summer holiday, preferably under the shade of a large tree.

The same applies to many of the more robust ferns, which will stand room treatment with impunity after exposure for a few weeks. Pteris tremula and a number of other kinds, Asplenium bulbiferum, and the gleichenias may be cited as examples. The tecomas are very erratic in their behaviour, from a flowering point of view, when grown entirely under glass, but if grown much in the same way as chrysanthemums, with single stems, and placed outside for two or three months in summer, they may be relied upon, or, at any rate, a large percentage, to bloom when housed in autumn. Succulents enjoy a roasting, and may well be employed in sunny positions as bedders, being arranged upon mounds, the ground being carpeted with Mesembryanthemum cordifolium variegatum, Alternanthera magnifica, and aurea, Mentha Requieni, golden creeping jenny, etc.

Himalayan rhododendrons should be placed outside in a partially shaded and sheltered position early in June, and the middle of October is quite soon enough to house them. It has been found that many orchids receive direct benefit when suspended from trees in the open for a few weeks, and, with respect to tree ferns, there will be no difficulty in finding sheltered nooks for them. It is superfluous to say that they add beauty and grace to the garden, and, further, it may be explained that growth comes to an end late in summer in the open, while, on the other hand, young fronds are produced under glass (when the plants are not summered in the open) quite late in the autumn, which have no chance to mature.

Everyone knows who boasts a garden that Indian azaleas, camellias, heaths, and ericas, eugenias, pimeleas, and quite a number of Cape bulbous plants, are stood outside upon coal ashes from June onwards. This is rational treatment, and nothing but good can accrue from it, provided due attention is paid to watering and cleanliness.

Walter H. Aggett.

TRACKING AND DESTROYING WASPS.

Grapes, peaches, nectarines, apples, pears, and plums are destroyed wholesale by wasps during some seasons, where ample protection is not given them after the ripening process has commenced. There were many queen wasps about last spring, but whether there will be hosts of nests I cannot as yet say. I know that in many seasons, when wasps seemed scarce up to the end of July, and one congratulated oneself on being able to gather the ripe fruits without covering them with netting, disappointment followed, as the wasps suddenly appeared in large numbers. They may do so this year. Every nest should be destroyed. I have had as many as two hundred nests destroyed within a radius of half a mile of the garden. Some nests were found accidentally, but the great majority were located by tracking the wasps to them.

For the benefit of the inexperienced I will explain my method of tracking, which, though not a new one, is very effective. From the boundary of the garden the wasps are watched in their flight to the point where they disappear, then I followed, and waited a few moments for more, tracking them in like manner, until they entered their nest, when I marked the latter with a stick and a piece of white cardboard. Sometimes several nests were located close together. In the evening, about nine o'clock, all the marked nests were visited and destroyed. There are three ways of effecting the destruction of the wasps. The oldest one that I know of is to use damp gunpowder and flowers of sulphur, with a small portion of dry powder at one end of the squib made. When lighted the damp powder emits a volume of smoke, and the dry pinch explodes, and sends home the smoke and sulphur fumes; then the hole is blocked with a lump of turf.

The other method that I like very much is to roll up some pieces of old calico cloth, forming rolls as large as one's finger, and then soak them in turpentine. The saturated rolls of cloth are simple placed [illegible] down the hole, and the latter is blocked with turf. At the end of half an hour all the wasps will be dead, or sufficiently helpless, as to be easily dug out if the grubs are wanted for any purpose.

A very small quantity of cyanide of potassium placed in the mouth of the hole will kill all wasps as they pass in and out, but this chemical is a deadly poison, and requires the greatest care.

Geo. Garner

ERYNGIUM NOTES.

Of the many notable groups of ornamental perennials, the Eryngiums or Sea Hollies, are deserving of widespread culture in view of the distinct effects they create when grouped in the garden.

The glories of these beautifully formed and coloured umbellifers certainly show to the fullest advantage when they are grouped with the usual subjects in the herbaceous borders. The effect of the masses of blue and silver gleaming with a metallic sheen under the influence of the summer sun, is eminently pleasing, and the curious tones of colour exhibited, contrast delightfully with the mingled hues and gay colourings of the July-August flowering perennials.

The shining blue of E. amethystinum and E. Oliverianum, is, perhaps, the most effective en masse of the whole group. But the entire family is abounding in interest and charm. From the dwarfish silvery native E. maritimum, which occurs at so many places round the coast, to the tall evergreen foliaged E. pandanifolia, which makes so bold a group in sheltered places, with its effective foliage and giant waving flower-spikes, one may note many sterling plants for garden decoration.

E. alpinum is one of the very best of the whole family. With its elegant leafage and exquisitely formed flowers, of a delightful blue-green shade, it provides a telling group in the borders. The Ivory Thistle (E. giganteum) is an ornamental silvery-white species of great merit. It possesses a dwarf, compact habit of growth, which renders it of value for any garden. E. amethystinum, which does not always appear in gardens (inferior forms being sometimes substituted for it) is a glorious glistening blue; it grows about three feet high, and is very effective, and should become even more popular as times goes on.

Taller and more robust than the last-named is E. Oliverianum, which, with its variety, superbum, constitutes a most useful subject for border planting, shrubbery groupings, or the wild garden. E. triquetrum is later than the majority in attaining its full beauty. It is of lighter growth, and attains a height of two and a-half feet. Its blending of blue and silver in the stems and flowers is very striking. E. spina alba is a silvery spinose form, not generally in cultivation, but it will well repay the attention necessary to ensure its full development. One does not dislike the effect produced by E. planum and E. dichotomum. The latter has bluish stems and blossoms and branching habit, while E. planum, with its bronzy stems and small bright blue flower-heads, is very pleasing. Varieties of E. planum include album, a greyish-white, and floribundum, an improvement on the type. One would briefly note the bright distinct steely blue of E. Bourgati, a very effective gem.

A well-manured, deeply-dug loamy soil, inclining to heaviness, seems to suit the majority of the eryngiums to perfection, though for E. maritimum a more sandy medium seems desirable. They are readily raised from seed sown in April and early in May in a cold frame, and plants obtained thus are of suitable size for transferring to the borders in the autumn.

Division of old roots is often resorted to for increase of stock, but this method is somewhat slow on account of the time taken for established plants to admit of division to any extent.

It will be borne in mind that eryngiums are useful for supplying material for indoor decoration during the dull months. The flowering stems are cut just as they reach the zenith of their beauty, and are hung head downwards in a cool, dry place that is free from dust. Treated thus, they will gradually dry, so as to retain the colouring, which is so desirable a feature of the group, and will be found useful for filling large vases, etc., for winter decoration.

P. S. Hayward.

A FINE CROP OF HARDY FRUITS.

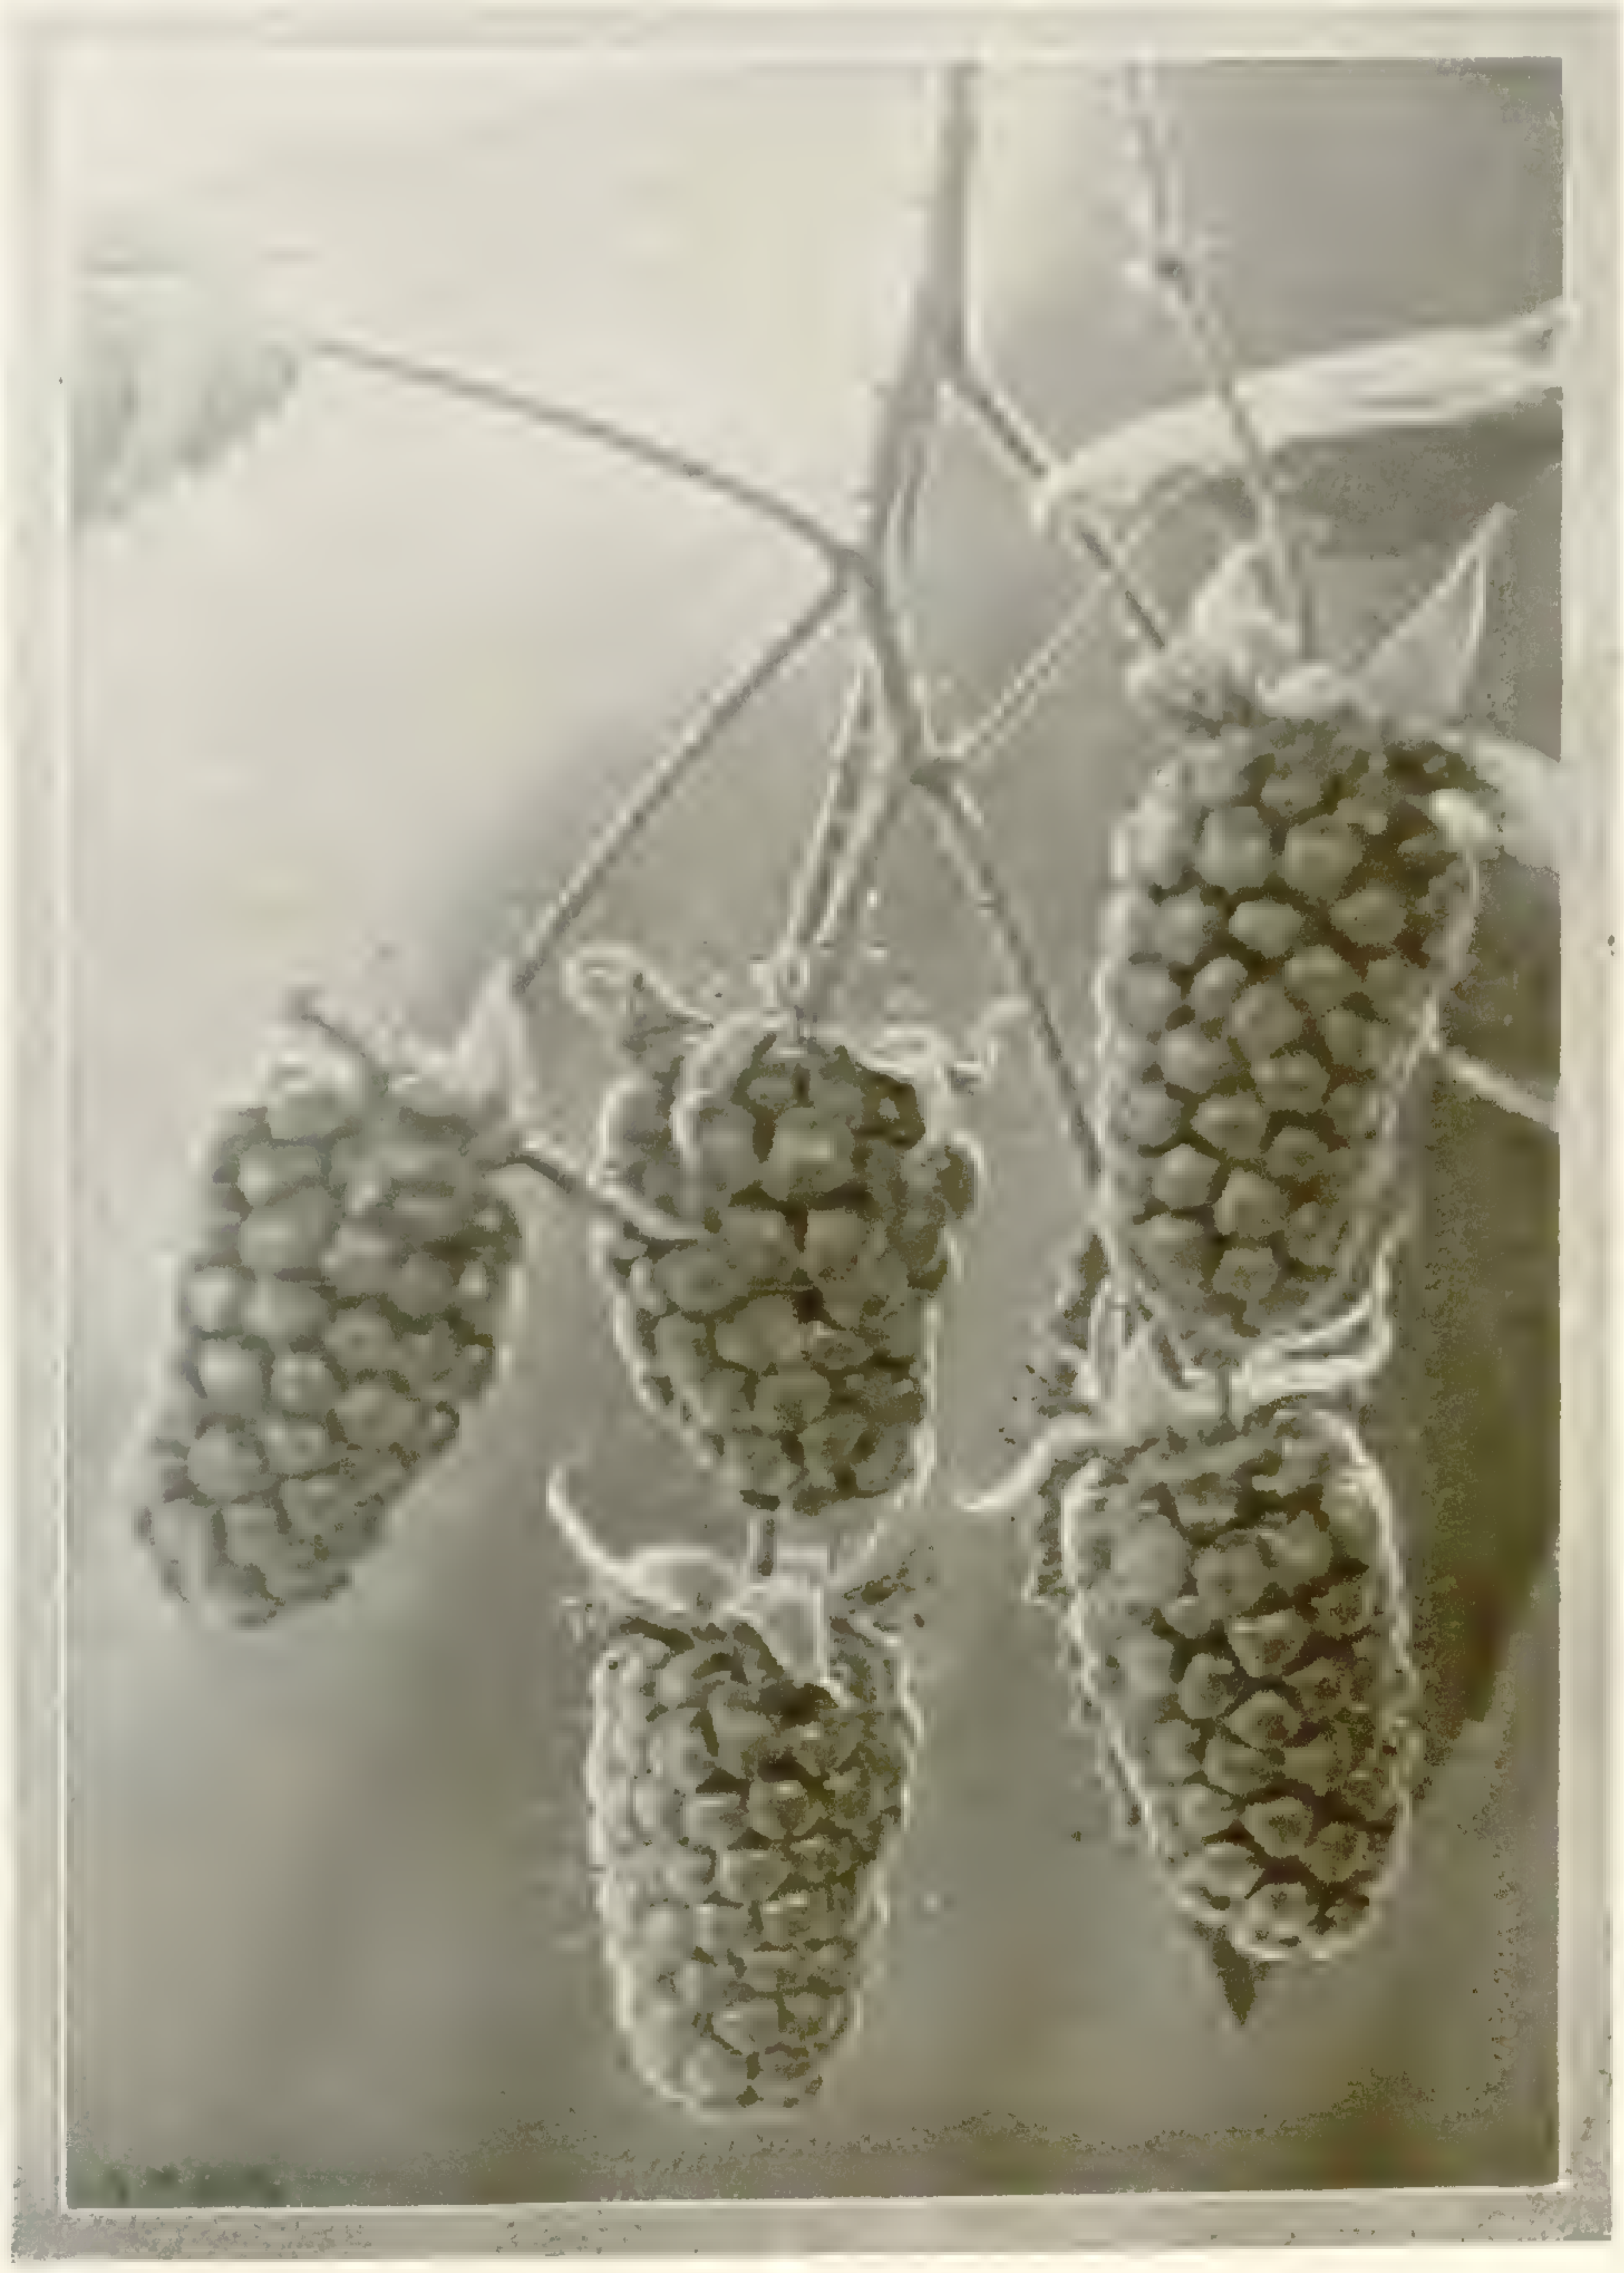
Apples, pears, plums, and cherries, also bush fruits, are growing and fruiting most satisfactorily in the garden of Mr. G. H. Rolls, J.P., Arcadia, Bournemouth. The trees have only been planted about two years, and are growing in a mixture of sand, shingle, and a thin crust of soil, not at all a rich rooting medium. In fact, the ground was previously occupied by fir trees, heather, and ferns, and forms now a part of a fir tree wood, or plantation.

I saw these trees a few days since, and was greatly surprised to see such excellent crops and promising growth. The shoots are clean and healthy, and short-jointed. I said to Mr. Jones, the able head gardener, "You will not be bothered with the work of root-pruning here." "No," he replied, "they cannot get away far." John Downie crab is doing very well in these gardens; fine, healthy bushes are planted in the shrubberies, as well as in the orchard, and all of them are laden with fruits. In the autumn, when ripe, they rival the flowers for beauty of colour and attractiveness.

Geo. Garner.

A NEW LOGANBERRY.

The loganberry, which we received from America some years since, has proved so useful in the augmentation of the supply of soft fruits during the summer months that a new and distinct variety can hardly fail to prove of much value, or to receive a hearty welcome from growers generally. The loganberry, when grown under favourable conditions—and these are not difficult to provide—is highly productive, and the fruits, while suitable for dessert, are especially valuable in the culinary art, more especially for bottling and the making of preserves.



NEW LOGANBERRY, PHENOMENAL.

Raised by Messrs. Stuart Low and Co., and remarkable for its rich raspberry flavour.

The flavour of the fruits of the loganberry is rich, but not equal to that of the raspberry in its highest state of development; yet the fruits are preferred by some because of the seeds being less numerous and softer than are those of the raspberry. The new variety, Phenomenal, which has been raised by Messrs. Stuart Low and Co., Bush Hill Park Nurseries, Enfield, possesses all the characteristics of the type, with the added value of a rich raspberry flavour. The fruits will therefore be available for all the purposes for which raspberries are used, a fact that will not fail to be appreciated by those to whom the hard seeds of the raspberry are objectionable.

The illustration given herewith shows the fruits somewhat below the full size, and it is therefore a point of some importance to mention that they are quite as large as those of the loganberry.

SPRING CABBAGES.

There is probably no vegetable more popular, more wholesome, or more easily cultivated than cabbages available for use during the spring months. Cabbages will succeed in almost any climate, and on any kind of soil, and by selecting suitable varieties, and making various sowings throughout the year, little difficulty will be found in providing a good and continuous supply throughout the twelve months. There is little doubt that cabbages available for use in spring obtain most favour, as they come into use when many of the other vegetables are somewhat scarce, and few people fail to appreciate them when nicely cooked.

Like many other kinds of vegetables, a great improvement in the matter of varieties has been made during recent years, and the newer forms quite supersede many of the old standard varieties, but which, for some reason, are still grown by a few. Every year without exception numerous complaints reach me from various parts of the country with regard to the crops, or a great proportion of them, prematurely running to flower instead of forming hearts. After many years' experience I have come to the conclusion that there are three chief causes for this. The first and most important being selection of bad stocks or varieties; secondly, sowing the seed too early; and, thirdly, a severe check either from bad weather or other causes.

Seed Sowing.

Two sowings at least should always be made, one immediately after the 20th of the present month, and the second, which is the most important, from the beginning to the end of the third week in August. A piece of open ground should be selected that has not been recently manured. This should be broken down very finely, and given a good dressing of fresh soot; sow the seed broadcast, evenly and thinly, over the bed. If the weather is dry give a good watering, and also net securely against birds. The plants should be put into their permanent quarters immediately they are a fair size, and before they become drawn through overcrowding.

Site for Permanent Bed.

I have always practised, and found it to be a capital plan, to let the spring cabbages follow onions, and it generally happens the crop is ready for clearing about the same time as the plants are ready, and nothing is more suitable as a rotation crop. If the ground has been previously trenched for onions, as it should have been, heavy manuring and deep digging will suffice. The ground should again receive a good dressing of soot, the plants should be put out one foot apart from plant to plant, and from eighteen to twenty-four inches, according to the variety, should be allowed between the rows. Plant very firmly, and place a few finely-sifted cinder ashes round each plant. Frequent hoeings should be practised, and any failures made good with plants from the seed bed. Later on in the autumn the plants should be well moulded up, much in the same way as potatoes, pulling the soil well round the heart to protect them against frost. This is all the attention that will be required till early in the spring, when frequent hoeings and slight dressings of some approved artificial fertiliser should be applied to promote quick growth

Any spare plants should be pricked out thinly in a sheltered position, in a skeleton frame for choice, where they can receive some slight protection in case of severe frosts and heavy snowfalls. It is also a capital plan to make a small bed on a south border of some small, quick-maturing variety for very early supplies.

Varieties.

Probably the finest introduction, and the forerunner of many other varieties now largely grown, was Ellam's Early, and, in my opinion, when a true stock is secured there are few to surpass, or even equal it. It combines all the good attributes in relation to a good cabbage. It seldom bolts in the spring, matures quickly, takes up but little room, has a fine appearance, and, above all, the quality is unsurpassed. Sutton's April and Flower of Spring are also of much merit; the last-named is rather later, considerably larger, and a splendid market variety.

E. Beckett, V.M.H.
Aldenham House Gardens.

NOTES FROM KEW.

◆

Xeronema Moorei.

This rare, singular, and beautiful plant is now in flower in the cool portion of the T range. It is a member of the order Liliaceæ, and from a thickened rootstock produces a tuft of sheathing sword-shaped leaves, from the centre of which the flower spike is produced. The general character of the foliage suggests at once an iris of some kind, but the inflorescence is totally unlike that of any other cultivated plant. The flower spike reaches a height of eighteen inches to two feet, but it is only on the upper portion that the flowers are produced. This portion stands almost at right angles to the main part of the stem, and is therefore nearly horizontal. The flowers, which are crowded along this portion, all point upwards, thus imparting to the raceme a very singular appearance. Individually, the flowers are about an inch long, have an erect, brilliant crimson tube, from the centre of which the stamens protrude fully half an inch beyond the mouth. The general appearance of the inflorescence suggests a large, brilliantly coloured tooth brush. This species is a native of the South Sea Islands, from whence it was introduced, or, according to "Hortus Veitchi," reintroduced, by the late John Gould Veitch. It was awarded a First Class Certificate by the Royal Horticultural Society in 1878, and was distributed by Messrs. J. Veitch and Sons in 1889.

Hæmanthus Katherinæ.

Unfortunately, some of the most beautiful kinds of hæmanthus are not very amenable to cultivation, a feature, however, which cannot be urged against this species, as, with care, it grows and flowers freely, and, as may now be seen in the T range, it is when in bloom really gorgeous. The scarlet flowers are borne in a globular head on a sturdy stem eighteen inches or so in height. The prominent anthers also form a notable feature of the inflorescence. This species needs liberal treatment as to soil, heat, and moisture, when growing, but when the flowers expand they last better in a cooler structure.

Littonia modesta.

This is an exceedingly pretty liliaceous plant, native of South Africa, from whence it was introduced in 1853. It has peculiar bifurcated tubers, which suggest those of that well-known tropical climber Gloriosa superba, to which, indeed, it is nearly allied. This littonia is also of climbing habit, reaching a height of six feet or thereabouts. The bright shining green leaves are each terminated by a tendril, with which it holds on to any support and thus mounts upwards. The flowers, borne singly in the axils of the leaves, are bell-shaped, drooping, and of a rich orange colour. This pretty and uncommon climber is now flowering freely in the T range.

Sandersonia aurantiaca.

A near ally of the preceding, but it does not grow so tall, and the leaves are without tendrils. The flowers are borne singly on long, slender stalks, from the axils of the leaves on the upper parts of the shoots, are broadly urn-shaped, nearly an inch in diameter, and of a bright orange colour. Though not very thick in substance, they remain fresh for some time. Also in flower in the T range. Both the littonia and the sandersonia pass the winter in a dormant state, when they should be kept quite dry. Then, in February or March, they must be shaken quite clear of the old soil, and be repotted in a mixture of loam, leaf-mould, and sand. Watered sparingly, they soon start into growth, and as the shoots lengthen more water must be given.

Aphelandra squarrosa Louisæ.

This is a very distinct aphelandra, and so beautiful that it well merits a place among the most select members of the genus. Like all the others, it forms an upright-growing specimen, clothed with oppositely-arranged leaves, and terminated by a spike of blossoms. In this form the flowers and their attendant bracts are of a clear yellow colour, while the leaves are particularly handsome. They are narrower than in many of the others, being about six inches long, and 1½ inches in width. The ground colour is a dark green, while the course of the midrib and principal veins is white.

Crotolaria capensis.

This greenhouse shrub was introduced from South Africa in 1774, and is flowering freely in the cool portion of the T range, and it well merits notice. It bears a certain amount of resemblance to the hardy Bladder Senna (Colutea arborescens). The leaves are trifoliate, and the flowers, borne in terminal drooping racemes, are bright yellow when fully expanded, but in an undeveloped state are freely tinged with green. It is of easy culture, and a succession of flowers is kept up for some time.

Dimorphotheca aurantiaca.

A bed of this comparatively new annual forms a very striking feature in the herbaceous ground. It reaches a height of about fifteen inches, and the entire bed is quite a mass of its orange-apricot coloured flowers. The dark-tinted disc stands out in a very conspicuous manner.

K.

Mimulus cupreus.—Among the most desirable hardy plants for producing an effective margin to a water pool few are worthy of greater prominence than Mimulus cupreus and the variety Brilliant. Their growth is most luxuriant in a wet place, and provided they receive plenty of sun, their flowering season extends over several months, beginning about the end of May and lasting until the early autumn frosts. Brilliant is the more vigorous of the two, carrying large crimson flowers on stems varying in height from 12 to 15 inches. Cupreus has slightly smaller flowers, [illegible] a most effective shade of coppery [illegible] red; both plants are vigorous growers and soon cover yards of ground where the conditions favour their development. I have known these dwarf mimulus employed as carpeting subjects for roses, and if some care is exercised to prevent overcrowding, there is nothing to prevent their culture being extended in this direction, with the happiest results.—Thomas Smith.

PREPARING STRAWBERRY PLANTS FOR FORCING.

Where a large quantity of strawberry plants have to be grown for forcing, it is necessary to obtain strong runners as early in the season as possible. There are various ways of doing this, but the most simple mode that I am acquainted with is to select an open piece of ground, and, after liberally manuring the same, dig it over and allow the soil to settle down. When the requisite number of plants that were layered into small pots have been shifted into their fruiting pots, plant the remainder in rows on the piece of ground that was previously prepared for them. The rows should be at least three feet apart, but the plants in the rows need not be more than nine inches from each other in the row. By planting early they have time to become well established by autumn, and will be ready to start into growth early in the spring.

The object of having the rows three feet apart is to allow of the pots, when the runners are layered, having ample room. Early in spring the soil round the plants should have a dressing of artificial manure to stimulate growth, and the soil between the rows forked over to encourage root action. All flower spikes should be removed as soon as they appear, as this will encourage the production of runners, and, as soon as these are large enough, they should be layered into pots. By adopting this practice, there is no fear of the runners being trampled on, or the varieties being mixed should more than one variety be grown. Take all runners that are produced from the first two rows into the three-feet space between them, leaving the next space free to walk up and down when watering and otherwise attending to the runners. The third space should be again occupied with the runners, and so on through the plot.

When layering there is no necessity to put any crocks in the bottom of the pots; in fact, they are far better without them. The soil used should be of a light rich nature, and the pots ought to be filled with this to their rim. When layering it is a good plan to plunge the pots in the ground, as this will keep them in an upright position, and save much labour in watering should the weather be hot and dry. It is astonishing how quickly the pots become filled with roots when the soil is kept well moistened.

Where ripe strawberries are required early in the year, and a constant supply has to be maintained from that time onward until fruit is ready to gather from the open beds, a large number of plants is needed, and to have the crowns of the first batch of plants well ripened it is essential they be potted up early. In some places it is the practice to keep the plants that were layered in pots the previous summer through the winter in cold frames, and then shift them into their fruiting pots the following July. By adopting this method no doubt fine plants are produced, but it entails much labour in watering while the plants are in small pots, and frequently the crowns split, so that, instead of having one large well-developed crown, there is two or three smaller ones.

I have usually found that runners from young plants are quite early enough, and if these receive due attention in the way of potting and watering, will develop more rapidly than the older plants.

Potting is an operation that requires due care. I have known some people recommend putting a handful of soot over the crocks at the bottom of the pots, others adding so much artificial manure to the soil, but I prefer having the plants well established before any stimulants are given them. If they are put into their fruiting pots in good time, and a rich compost, consisting of good turfy loam, old mushroom bed, or the like, to which a liberal sprinkling of lime rubble has been added, root action will be free enough, but as soon as the roots have reached the bottom of the pots, then will be the time to commence assisting them. When potted they should be stood in an open sunny position on a bed of ashes or gravel. Should worms be troublesome give a sprinkling of soot over the place where the pots are to be stood. The ammonia from this will act as a stimulant to the plants as well as a deterrent to the worms, and in a short time the leaves will cover the pots. For very early forcing they should be rested artificially—that is, where they have to be introduced into the forcing house in December or early in January, sometimes there has not been sufficient frost to arrest their growth. Therefore those that are intended to fruit in February or March should have their crowns ripened by withholding water in November. If they are turned on their sides to the north, the growth will be checked considerably, so that when introduced into heat they will respond more readily to such treatment than plants that have not had a check. There is no difficulty in inducing plants that have been checked by frost starting again freely, but care must be taken not to hurry them too much in their early stages or the flowers will not be thoroughly developed. Some varieties are much easier excited into growth than others, therefore those only should be employed for very early forcing. With us Scarlet Queen does well, but where fruit has to be packed to send to a distance, varieties of the Royal Sovereign type are preferable, as the fruit grows larger, therefore takes up less time in packing.

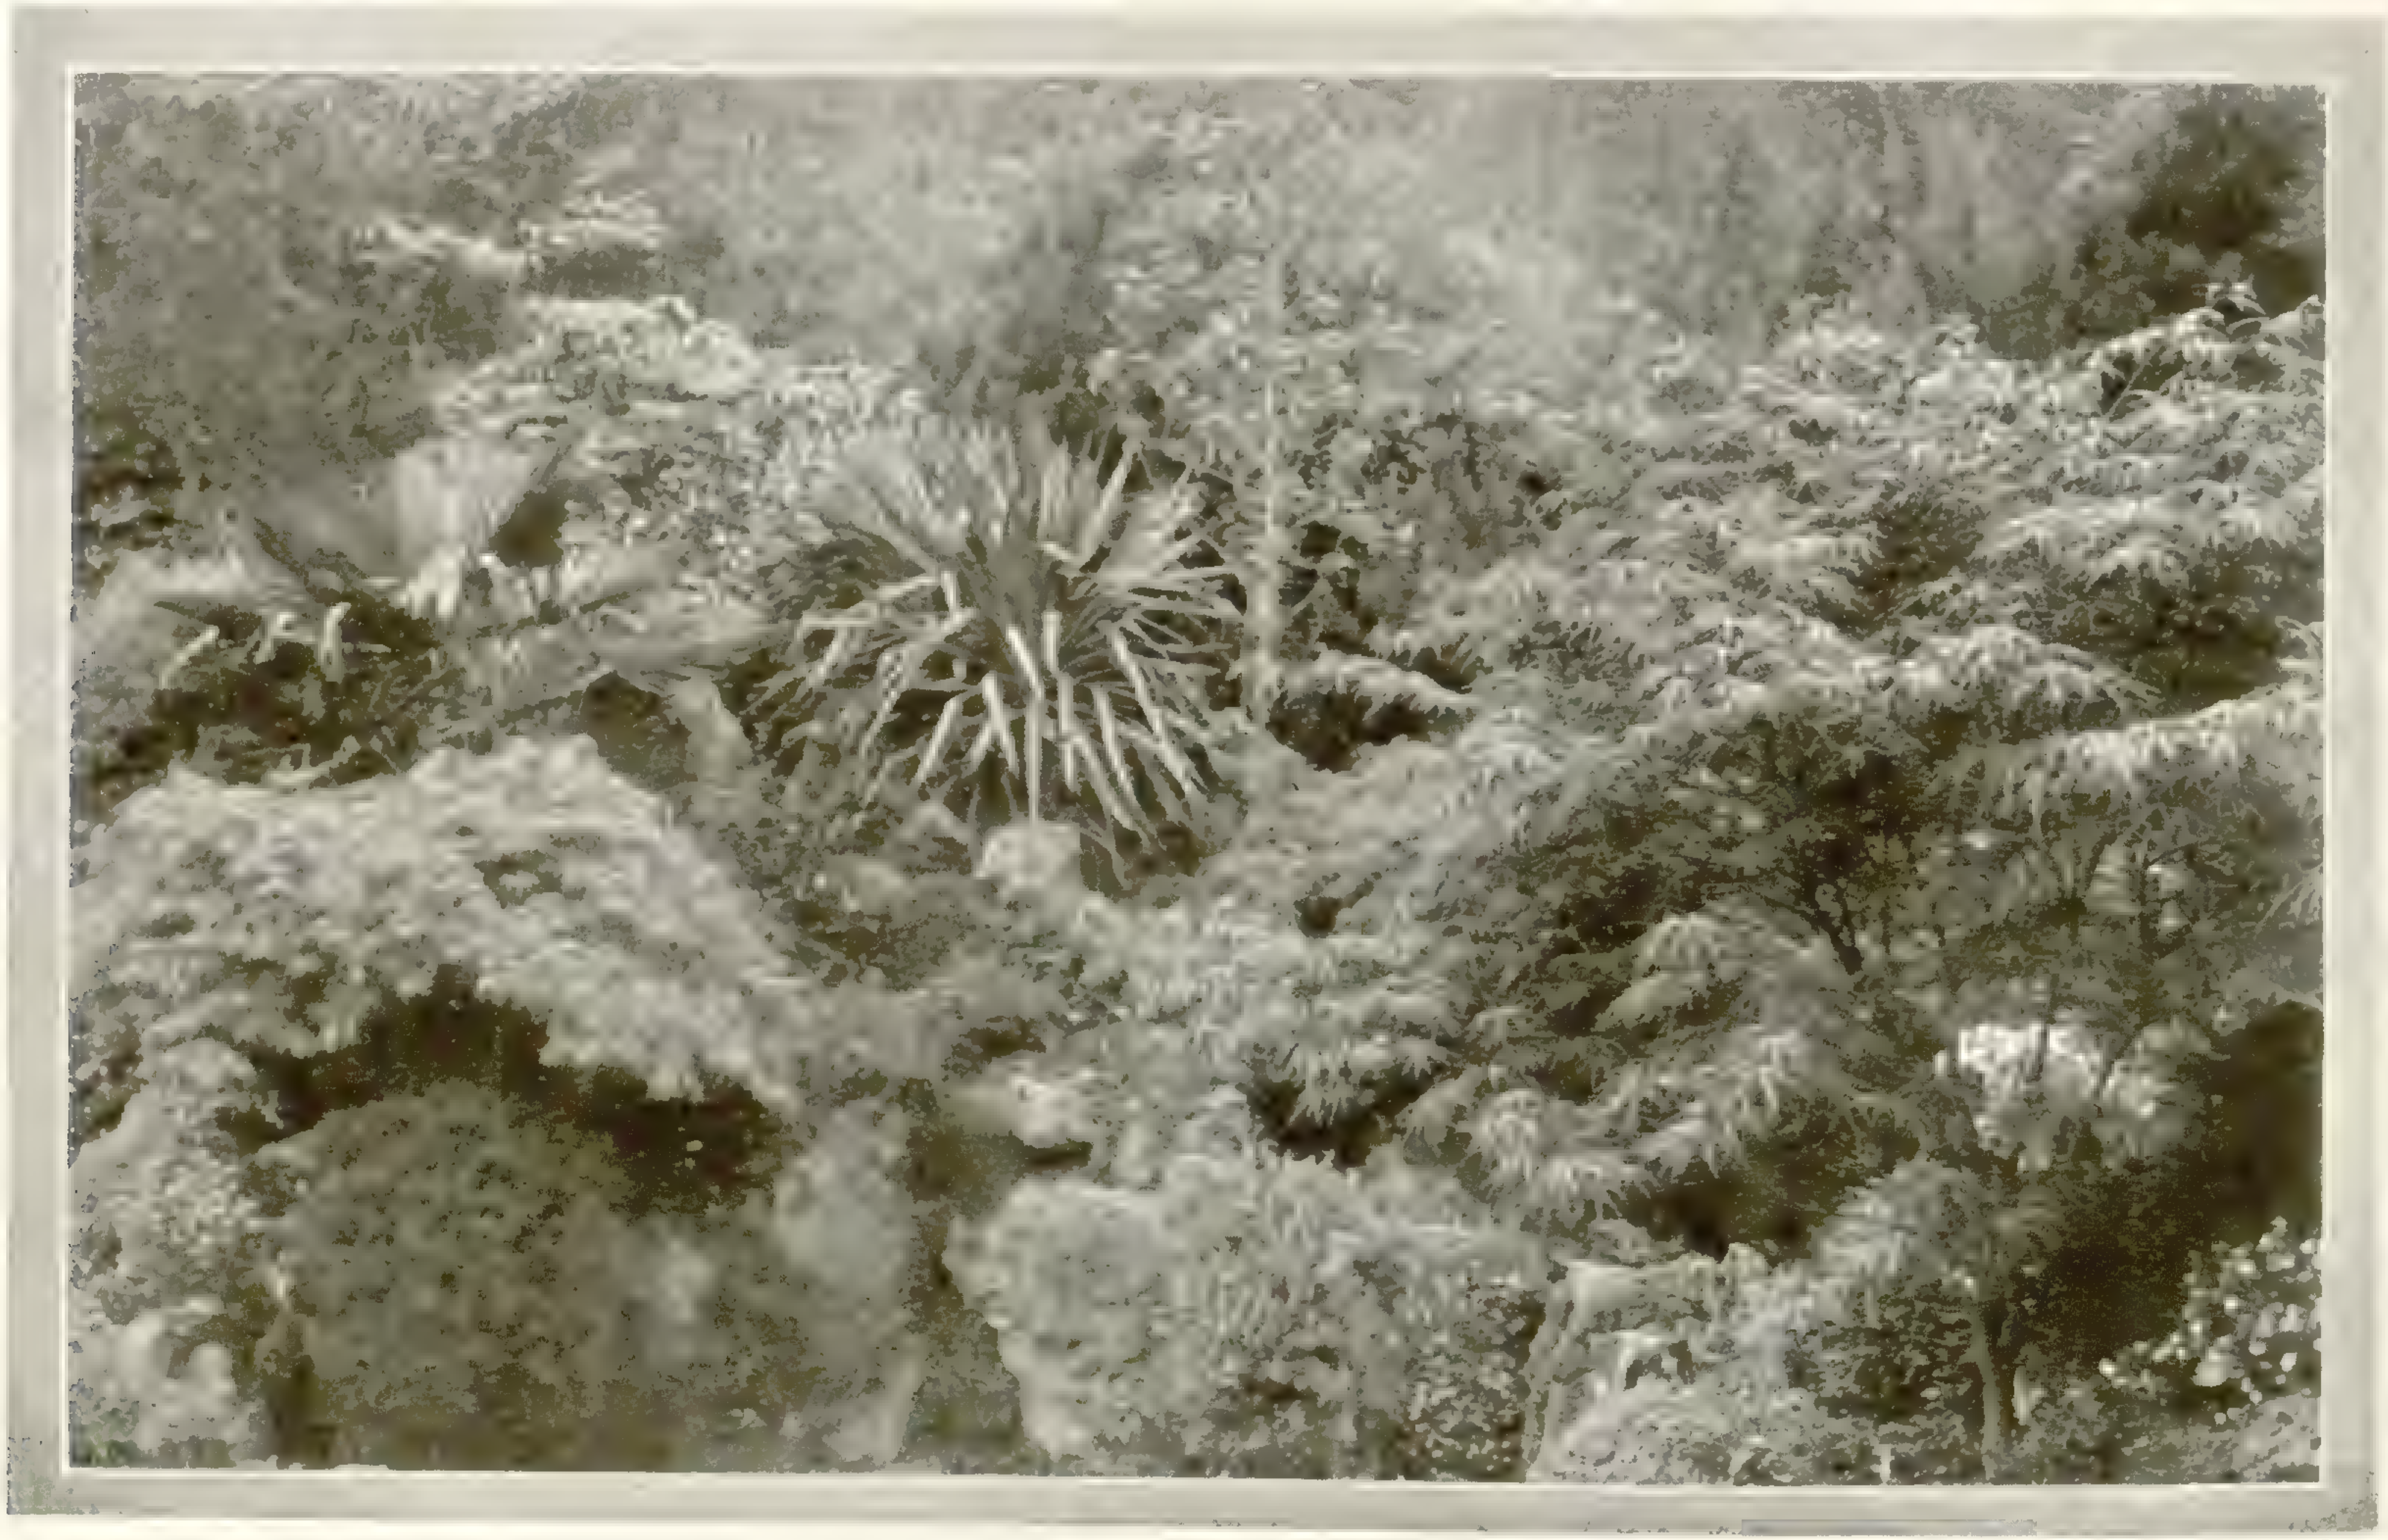
A FLOWERING SPECIMEN OF DRACÆNA AUSTRALIS AT ABBOTSBURY CASTLE.

Peas.—These appear, though late, to be doing exceptionally well this year, and are in many cases growing above their usual height, consequently needing extra support, either by running string on each side of the rows carried by poles, or taller sticks placed thinly, to keep the haulm from damage by bending over. If the last sowings have not already had sticks put to them, they should be seen to before they become too forward. The sticks from the first crops may be available to use again.—Charles Flack, Cholmondeley Castle Gardens.

ABBOTSBURY CASTLE GARDENS.

In the deep valley formed by the sudden declivity of the Dorset Downs on the landward side, and by the steep hill that provides a rampart against the sea winds on the south-west, nine miles as the crow flies from Portland Bill and its turbulent race, and separated from the sea by the high, pebble barrier known as the Chesil Beach, lie the gardens of Abbotsbury, girt about on all sides by groves of evergreen oaks, and thus a sanctuary of peace even when a gale is raging in the West Bay. At all times these sequestered gardens display some special beauty of colour and of form—giant camellias and rhododendrons in flower, magnolias smothered in blossom, tall spires of bloom upon scores of yuccas, huge bushes of pink and blue hydrangeas, or groups of graceful bamboos.



[Photo: S. W. Fitzherbert.

AN EFFECTIVE GROUPING OF JAPANESE MAPLES, PALMS, ETC., AT ABBOTSBURY CASTLE.

Abbotsbury, on account of its sheltered position, can vie with the noted gardens of Devon and Cornwall in the wealth of the exotic and sub-tropical plants that grow within its precincts, and the first thing that strikes the flower-loving visitor is the great size that some of the specimens of rare plants have attained—dimensions that are unequalled in any other spot in the British Isles. The gardens have been considerably enlarged of late years, greatly to their advantage, and there is talk of still further extension.

Some years ago, when resident at Weymouth, I knew the gardens well, but, until last season, had not visited them since the present head gardener Mr. Henry Kempshall, took charge, and, therefore, renewed my acquaintance with pleasure. In the new grounds, where the soil is sandy loam, of a depth of from four to five feet, Pinus insignis has grown to a height of 15 feet in six years. A pretty sight in this portion of the gardens was a hedge of Buddleia variabilis Veitchiana a hundred yards in length, in full bloom. This is cut hard back every year. Three years ago a beautiful picture was presented by 200 spikes of Yucca gloriosa on a bank. Of magnolias there are nearly forty species and varieties. Of these may be mentioned the splendid M. Campbelli, 40 feet in height, which last season bore 160 flowers, some of these, which Mr. Kempshall exhibited at the Truro Daffodil Show last year, created a great impression, and deservedly obtained for him a first prize. Other dimensions are M. Kobus, 20 feet; M. tripetala, 25 feet; M. hypoleuca, 24 feet, this shy-blooming magnolia having flowered: M. Thompsoni, 30 feet; M. stellata, 12 feet in height, and the same in diameter; and M. Delavayi.

Acacias are represented by about 60 species, most of them at present in a small state, as the past two severe winters have killed many of the tenderer forms. Seedlings have been raised of Acacia dealbata, A. melanoxylon, and A. floribunda from seed ripened at Abbotsbury. A specimen of A. dealbata must be fully 40 feet in height. The late hard winters played havoc with the eucalypti, of which there were at one time fifty-two species in the open, but about forty were prepared in pots for planting out last spring. E. coccifera, E. cordata, E. globulus, and E. amygdalina have been raised from seed from trees that flowered in the gardens. E. urnigera has proved to be the hardiest species, as this has been unharmed through the last two winters, which killed fully a thousand eucalypti and acacias.

An example of the New Zealand Ribbon Tree (Plagianthus betulinus), about 50 feet in height and 6 feet in girth, which was believed to be the finest specimen in the United Kingdom, died a few years ago, but the Fiddle-wood (Citharexylon quadrangulare), a native of the West Indies, 20 feet in height, is in the best of health, as is a splendid specimen of Paulownia imperialis 40 feet high. One of the most interesting sights in the gardens is a remarkable specimen of Lagerstrœmia indica 18 feet in height, which is said to flower profusely every year. As a rule, when this plant is met with in West-country gardens it is a little shrub, from 3 feet to 6 feet in height and the example in question is probably unique.

Another surprising thing was a great bush of the pink New Zealand Broom (Notospartium Carmichaeliæ) 7 feet 6 inches in height, and 6 feet through, which, at the time of my visit, was covered with bloom. This is rarely seen except in a small state. Andromeda arborea, planted about 60 years ago, had developed into a tree 18 feet in height and 20 feet in diameter, and Fagus betuloides, the evergreen beech of Tierra del Fuego, was 35 feet high. Another notable specimen was Edwardsia (Sophora) microphylla said to be 70 years old. This had a trunk like a tree, and was 25 feet in height. It was covered with seed pods, and is reputed to flower well every season. Edwardsia Macnabiana, very distinct in habit, with angled shoots, is also grown. Olea excelsa, 45 feet in height, resembles a forest tree; Carya lævigata, with very handsome foliage, is 70 feet high; and a huge specimen of Eugenia myrtifolia is 35 feet in height; while Catalpa himalaicus has attained a stature of 35 feet, and C. Kæmpferi, which was covered with fruit, 20 feet.

Among the oaks are Quercus bicolor, with large and handsome leaves; Quercus Phellos, 25 feet; and Q. glaber, 20 feet. A noteworthy tree is Stransvæsia glaucescens, from the Himalayas, which is 22 feet in height, and the rare Arbutus canariensis is 30 feet high. Among other interesting subjects are Aralia mandschurica, Amyris Plumieri, from the West Indies; Aristolochia altissima, Azara crassifolia, which bears its flowers in little bunches, A. Crippsi, benthamias (Cornus capitata) in numbers, Calycanthus floridus, C. occidentalis, Citharexylon cyanocarpus, Citrus trifoliata, which flowers and fruits freely; the straw-coloured form of Callistemon salignus, 10 feet; variegated chestnut; Clerodendron trichotomum, 18 feet, with a similar spread; Cornus foliosa, with den-cate foliage; C. macrophylla, which colours finely in the autumn; Buddleia Colvilei, B. salvifolia, Daphniphyllum glaucescens, covered with pale blue berries, 12 feet; Deutzia Vilmorinæ, very beautiful, with pure white flowers; Drimys aromatica, 8 feet; D. Winteri, 18 feet; Ehretia serrata, from the East Indies; Exochorda grandiflora, enormous specimens of Fatsia japonica, Halesia hispida, 12 feet; the climbing hydrangea, good specimens of the Maidenhair Tree, Ginkgo biloba.

Lapagerias on a north wall, the rare Laurus canariensis, Liquidambar styraciflua, L. imberbe, Litsea laurifolia, the Alpine Laburnum, Lonicera involucrata, from California, a handsome species with orange-coloured flowers and crimson bracts; Kniphofia Northiæ, Menispermum canadense, Melia Azedarach, 12 feet; Olearia macrodonta, 10 feet; O. nummularifolia, fine examples of the Fan Palm (Trachycarpus excelsus), which flower well; the beautiful Philadelphus mexicanus and P. Coulteri, also from Mexico, which bears large white flowers, pink at the base of the petals; a splendid specimen of the Chilian Philesia buxifolia, probably the largest in the country, 5 feet across and 2 feet 6 inches in height, which was covered with hundreds of flowers; Podocarpus andina, 20 feet; the Pomegranate (Punica granatum), which often flowers well; Rhamnus alpina, 9 feet in height and 12 feet through, very lovely in its foliage; Rhus cotinoides, which assumes brilliant colouring in the autumn; Syringa Emodi, 60 years of age and 20 feet in height; Spiræa Aitchisoni, which has flowered well here for the past three years, though in many gardens it persistently refuses to bloom; Tricuspidaria lanceolata, better known as Crinodendron Hookeri, 10 feet; Vaccinium ovatum, charming in the spring; Viburnum macrocephalum, which blooms well; Vitis Coignetiæ, very beautiful clambering over a fir, and V. orientalis on a wall.

[Photo: S. W. Fitzherbert.

ARUM LILIES GROWING IN THE OPEN AT ABBOTSBURY CASTLE.

The rock garden, which is situated at some little distance from the sub-tropical one, occupies a site on the steep slope between Abbotsbury Castle and the Chesil Beach, and is exposed to the full force of the westerly gales, which fill the air with driven spindrift. In spite of this apparent drawback plants succeed admirably, and a few years ago the mesembryanthemums, of which the finest collection in this country, with the exception of that at the Isles of Scilly, was grown, presented a glorious sight in the spring. Unfortunately, in the severe winter of 1906-1907, when 20 degrees of frost were experienced, the whole of the mesembryanthemums were killed, and, the winter of 1907-1908 being equally hard, the garden was for a time bare of these plants, but a representative collection was put out from pots in the spring of this year.

The rare Primula Palinuri flourishes here, and is a pretty sight when in full flower, with its tall, cowslip-like heads swaying above the green foliage. Among the rare plants in the rock garden are Vella pseudo-cytisus, Myrsine africana, and M. retusa, Genista ferox, and Dasylirion glumaceum, which sometimes flowers. The gazanias, of which there was a good collection, were all killed by the frost, but Zauschneria californica and Convolvulus mauritanicus were in the best of health, as was Potentilla Fredericki. Hydrangea hortensis, in its pink and blue forms, creates a charming picture in the autumn, the walks being margined by great bushes in full bloom.

The Mexican Beschorneria bracteata also makes a fine show, blooming freely, and Senecio clivorum, S. eleagnifolium, and S. japonicum are very effective when in flower. Libertia formosa thrives to perfection, and is grown in quantity, its sheaves of white blossoms having a very pretty effect in the spring. Of bamboos a large number are grown, many having been imported direct from Yokohama. All are in the best of health, and some of the large clumps present a bold appearance and are very ornamental.

The water garden is formed of five pools, connected by a streamlet, which is spanned at intervals by rustic bridges. Here are grown the best of Marliac's and other water lilies, and the margins of the ponds are fringed with arums, gunneras, Indian Rice (Zizania aquatica), papyrus, and a pretty variegated grass, Glyceria aquatica. In the aloe house are some enormous specimens of these plants, and in the winter garden, erected by the Countess of Ilchester about five years ago, there is a fine collection of flowering plants, among which were noticed Mackaya bella, bearing thousands of blooms; Nicotiana glauca, somewhat like a cestrum; Passiflora Banksi, Bignonia aurea, B. jasminoides, B. Ricassolari, B. venusta, Bougainvillea glabra, B. Sanderiana, a fine plant of Lonicera Hildebrandi growing over the roof, Cestrum aurantiacum, C. Newelli, Nicotiana wigandioides, with flower trusses from 3 to 4 feet in length; Luculia gratissima, Eucalyptus ficifolia, with scarlet flowers; Dracæna Draco, Libonia floribunda, Ipomæa Leari, Stephanotis floribunda, Solanum Wendlandi, covered with flower; Jasminum macrophyllum, J. simplicifolium, Trachelospermum jasminoides, Chorozema illicifolia, Melaleuca hypericifolia, Passiflora atropurpurea, Hakea suaveolens, Tacsonia exonensis, scented-leaved pelargoniums, and a collection of succulents.

S. W. Fitzherbert.

Salix annularis is an extremely curious and interesting form of the Babylonian willow, the branches assume the same pendulous habit as the type, but the peculiar character of this plant is very strikingly exhibited in the leaves; the blade of the leaf is rolled backward, so that it forms a kind of ring, while the leaf margins are drawn and twisted in a most curious fashion. The tree grows rapidly in any damp, boggy situation, and although ultimately attaining large dimensions, like the majority of willows, it can by judicious use of the pruning knife, be readily accommodated in gardens of limited extent.—Thomas Smith.

SWEET PEA JOTTINGS.

One of the most pleasant of the functions arranged in connection with the work of the National Sweet Pea Society is that collectively known as "The Outings." These outings have been conducted during several years now, and one is always to the society's trials of sweet peas at Reading. It is impossible to miss the educational value of these visits, or the advantage accruing to the society as a result of the trials and of the meeting together of enthusiasts from all parts of the country.

The visit to Reading was paid on Friday, July 16. There was the usual downpour of rain in the early morning, but the previous day had been fine, and so the Floral Committee was able to get on with its work. Fortunately, the rain kept off during the afternoon and evening of July 16. On this occasion the Floral Committee made no awards, but certain varieties were marked for further consideration, and according to their behaviour during the next ten days the awards will be made. Everyone regretted the absence, through illness, of Mr. Walter P. Wright, whose place as chairman of the Floral Committee was taken by Mr. Martin F. Hitchins, of St. Austell.

NATIONAL SWEET PEA SOCIETY AT MESSRS. COOPER, TABER, AND CO.'S TRIAL GROUNDS, AT WITHAM.

Mr. W. J. Unwin's varieties came out well in the trials. He has a fine waved cream, unnamed in the trials, but it is identical with the finest type of Clara Curtis, both in form and colour, and it is quite true. He has also a good chocolate-maroon self, and the orange scarlet flake that appears to be the same as Mrs. W. J. Unwin, recently exhibited, was very fine.

I quickly picked out Mr. Malcolm's Edrom Beauty in the trials, just as I did at Duns last autumn, when I suggested the title it bears. It is a lovely thing of the Helen Lewis type, and under artificial light it beats the latter easily for colour. George Stark was not so good as last year; it evidently needs a warmer season, as also do several others, Mrs. Andrew Ireland, for instance. A very beautiful white variety, in fact, the best white variety up-to-date, is Stark's White, but as this name cannot stand, the variety will be known as Florence Wright. It has fine form, good substance, exquisite purity, and the pose of the flowers is excellent. At present it is not absolutely true. Messrs. Bide and Sons' Orange King is a glorious colour, vivid orange-salmon, but it is not yet quite fixed.

Some of the novelties were such mixtures that it was difficult to discover the variety. My namesake, from Barnstaple, sent a variety he has named Rajah, and last season it was a fine dark flower, after the style of Hannah Dale, and yet the row at Reading contained not a single plant of Rajah. This is another proof of how new seedlings break up in their second year. Mr. Robt. Bolton has a pretty orange-tinted pink variety, and also a fine bold blush pink, both as yet unnamed.

The American varieties do not show up well in the matter of purity, and Mrs. Routzahn is badly mixed. Splendour Spencer one may regard as a fine stock of Marjorie Willis. Asta Ohn I could not find on trial; it is a good and fairly true waved lavender. As usual, the trials have been well conducted under Mr. Foster's care, and they are now open to inspection by members of the society, who should leave a card with Mr. Drew, Mr. Foster's successor. On the occasion of the visit, Mr. Owen Ridley, chairman of the College Council, once again entertained the party to tea.

On the following day about fifty members visited the trials at Witham, Kelvedon, and Coggeshall. Messrs. Cooper, Taber, and Co.'s grounds were first inspected, but the sweet peas were not yet in bloom, with the exception of a few of the American varieties raised in pots, and the early-flowering Zoolanck and Telemley varieties. Tennant Spencer and Asta Ohn were greatly admired, but it is doubtful whether the former is quite distinct. The sweet peas were disappointing here, and everyone sympathised with Mr. Huggins, Mr. Simpson, and Mr. S. B. Dicks, and blamed the late cold season. But the culinary peas were superb, and there is an extraordinarily fine trial of them, and any members of the N.S.P.S. who are interested in culinary peas are at liberty to inspect the trial on giving a day's notice to Messrs. Cooper, Taber, and Co., Witham.

After being very hospitably entertained to luncheon in the light pea-picking room in the warehouse, the party proceeded to another field to inspect some of the sweet pea seed crops, and here there were many more flowers. Mr. Wm. Deal's grounds at Brooklands, Kelvedon, were soon reached, and here the sweet peas were more forward, and the sunshine made them look all the brighter. Mr. Deal has a great number of seedlings, and his new Colleen and Bertrand Deal came in for a share of admiration; but the greatest interest centred in the seedlings from Helen Pierce, all with the charming marbling shown by that variety, but in a great variety of colouring. One rosy variety is very pretty, and a very dainty pale pink is another good thing. Mr. Deal has waved as well as smooth varieties of those new seedlings. He also has a number of good flaked varieties, quite new and distinct, and he has a lovely pale cerise variety and a brilliant crimson-scarlet self.

Mr. Deal has some lovely pink, salmon, and orange sweet williams, and a charming fringed candytuft, as well as great areas of sweet pea seed stocks and the trials already noticed. Afternoon tea on the lawn behind his pretty house was very welcome after the long walk among the flowers. After tea and a short rest, the party proceeded to Coggeshall, shortened a little by the departure of a few friends, who had a long-standing engagement to meet the Chelmsford horticulturists on Messrs. Dobbie and Co.'s grounds at Mark's Tey.

Messrs. E. W. King and Co. have very extensive grounds at Coggeshall, and grow very large batches of various flowers and vegetable seeds. Their sweet peas cover very many acres; indeed, there are acre blocks of some of the more popular kinds. Very great care is taken to rogue the plots ruthlessly, and Mr. King aims at nothing short of 90 per cent. of purity in his stocks of waved varieties. About three years or more ago I pointed out in these columns that 90 per cent. purity in a variety would prove more profitable than the distribution of unfixed novelties, and Mr. E. W. King, as a business man, holds the same belief.

Among their seedlings the Messrs. E. W. King have a pretty silvery-lavender, and a bright pink that promises well. Great breadths of Mrs. W. King proved to be quite true. Mr. King is growing a stock of Mrs. Routzahn for a customer, but it is so mixed that roguing would reduce the crop to near the vanishing point, and so he suggests the removal of the few purple and red rogues and the disposal of the subsequent crop as a mixture of cream and pink varieties.

The outings serve to show how great is the interest in sweet peas, and the drive through the Kelvedon and Coggeshall districts of Essex brought into view ample evidence of the great trade in sweet pea seeds. Whether this trade continues to expand is a matter largely in the hands of the raisers and growers at home and abroad. If they adhere to the findings of the N.S.P.S., [illegible] for purity of stock, and make up their minds not to split hairs for the sake of a present extra pound or two, then the business will grow. If not, why the end (so far as novelties are concerned) is not far to seek.

One word must be added, and it is our thanks to those who so thoughtfully entertained the party on Saturday. Mr. W. Deal and Mr. E. W. King provided the conveyances from Witham to Kelvedon and Coggeshall and back to Kelvedon station, and in addition to the hospitality already mentioned Mrs. W. King and Miss E. L. King, the mother and sister of Mr. E. W. King, gave us a "strawberry tea" at Coggeshall, and so we returned to our various homes—some were a long way off—amply refreshed after a long day among the queen of annual flowers.

Chas. H. Curtis.

Thyrsacanthus rutilans.—This elegant plant, although not so much seen as in former years, is worthy of a place in every collection, because of its distinct character and beauty when in flower, and not at all difficult to grow. When well established in the pots in which they are to flower, a cold frame occupying a sunny spot will be suitable, and the pots should be plunged in a cool moisture-holding material, provided the drainage is good and risk of stagnant moisture avoided.—Wm. Fyfe, [illegible] Park Gardens.

R.H.S. EXAMINATION IN HORTICULTURE.

At the general examination held on Wednesday, April 21, one hundred and fifty-one senior candidates (over eighteen years of age) entered, of whom nineteen, or upwards of twelve per cent., obtained a place in the first class; sixty-nine, or upwards of forty-five per cent., gained a second class; and sixty, or nearly forty per cent., are placed in the third class. Three candidates only failed to satisfy the examiners.

In addition to these, four students resident in India entered for the examination, the questions set by the other examiners being specially adapted to India by the kind assistance of Lieut.-Colonel Prain, F.R.S., and of these four candidates three obtained a second class, and one failed altogether.

In their report to the Council the examiners (the Rev. Professor George Henslow, M.A., V.M.H., etc., and Mr. James Douglas, V.M.H.), lay stress on the fact that the answers to the questions on the "Principles of Horticulture" were very satisfactory, especially those on physiology, which were certainly the most important, and, they are glad to say, were generally answered. The examiners also report that they were pleased to find that several of the candidates were well instructed in the somewhat new subjects of Ecology and Mendelism.

It is necessary, however, to again urge the importance of candidates studying the instructions printed at the head of their paper before beginning to answer the questions. Fourteen candidates, for example, attempted to answer all the eight questions in "Operations and Practice," instead of confining themselves (as they were instructed) to four, and it is surely needless to say that four answered well are far better than eight answered poorly. In some cases, again, candidates were so prolix in their answers—had so much to say—that they only left themselves time to reply to three questions instead of to four. It is therefore necessary to again urge the importance of candidates practising conciseness in answering questions, otherwise they waste their own time and the examiners' also. The questions on "Practice" were for the most part very well answered.

Although the same questions were this year set to the juniors as to the seniors, an entirely different standard was looked for in their replies.

One hundred and forty junior candidates entered, of whom seventeen, or upwards of twelve per cent., have been placed in the first class; forty-one, or thirty per cent., in the second; and sixty, or nearly forty-three per cent., in the third; twenty-two failed altogether.

With regard to "Principles" the examiners report that as a rule it was only quantity and not quality that was deficient. As far as the students had learnt there were no serious mistakes, and the answers, in fact, were distinctly encouraging.

In "Operations and Practice," again, the examiners report that, considering the age of the candidates, the answers were very satisfactory, and they specially note that many of them showed a very fair knowledge of the different kinds of manures and of their application to the different kinds of soils.

The fact of twenty-two failures out of one hundred and forty should not discourage the students from trying again; all the examiners look for is a quite elementary knowledge of the "Principles" and a fair general acquaintance with "Operations and Practice."

W. Wilks, Secretary.

In the examination of seniors the following were placed in Class I., namely:—

S. N. Frost, Thatcham Fruit Farm, Henwick, Newbury.
J. W. MacCaig, R.H.S. Gardens, Wisley, Ripley, Surrey.
A. R. Iveson, 67, High Street, Shirley, Southampton.
M. K. Milne, Horticultural College, Swanley.
F. W. Bigge, Kingsbury Road, Tyburn, near Birmingham.
J. W. Burnicle, 8, The Knoll, Sunderland.
E. K. Oswald, Studley College, Warwickshire.
W. Miles, R.H.S. Gardens, Wisley, Ripley, Surrey.
M. A. Deacon, Thatcham Fruit Farm, Newbury.
E. L. M. Johns, University College, Reading.
C. Macleod, University College, Reading.
C. W. Mayhew, 11, Claribel Road, near Brixton.
W. Yandel, Longford Castle Gardens, Salisbury.
H. Bramwell, Studley College, Warwickshire.
M. V. Goldie, Studley College, Warwickshire.
N. B. Harrison, Horticultural College, Swanley.
V. Kirby, Horticultural College, Swanley.
W. H. H. Lodge, 3, Viewfield Cottages, Muswell Hill, N.
J. D. Snowden, The Gardens, Shakenhurst, Cleobury Mortimer.

In the examination of juniors the following were placed in Class I.:—

G. P. Boothroyd, Letheringsett Gardening School, Holt, Norfolk.
P. Chisnall, County School of Horticulture, Chelmsford.
L. J. Monk, County School of Horticulture, Chelmsford.
H. R. Amos, County School of Horticulture, Chelmsford.
F. Whiting, County School of Horticulture, Chelmsford.
F. H. Fordham, County School of Horticulture, Chelmsford.
H. H. W. Bowles, County School of Horticulture, Chelmsford.
L. S. Mousley, 10, Lutwyche Road, Catford, S.E.
D. R. Williams, 503, King's Road, Chelsea, S.W.
A. B. Aldridge, 1, Souldern Road, West Kensington.
C. Cooper, White Oak School, Swanley, Kent.
J. Swan, 1, Norval Place, Kilmacolm.
J. W. Seal, Essex Industrial School, Chelmsford.
A. Puddefoot, Kingswood Reformatory School, Bristol.
J. Roiall, Castle Howard Farm School, Welburn, York.
H. Lapitoff, Industrial School, Hayes, Middlesex.
F. Southgate, Essex Industrial School, Chelmsford.

Nymphæas in Summer.—During the height of the flowering season it is important to periodically examine the hardy nymphæas planted in the various ponds and lakes, and where the water area is small measures should be taken to have all spent and decaying flowers and leaves removed. From various causes nymphæas occasionally show signs of deterioration; vermin or water fowl where present will destroy them in a very short time. In some instances the root-stock may either become fasciated, or it produces innumerable adventitious buds, and in either instance the strength of the plant becomes dissipated with the leaves, and flowers developed are quite out of character. Such examples it is best to destroy entirely, and replace with young and vigorous stock. Some varieties of nymphæas are much too prolific in the production of offsets, good examples being found in Marliac's hybrids, many of which increase with marvellous rapidity. May is about the best month for reducing their number, yet many growers defer this work till the present time, and where this operation has been overlooked an early opportunity should be taken to expedite it, the weakest and oldest crowns should be first removed, and if this results in yielding insufficient space between the plants, then a further thinning out of the more vigorous crowns must be resorted to. Overcrowding of hardy water lilies has the tendency—even with varieties whose leaves are normally prostrate upon the water—of forcing the leaves to assume a vertical position, and when these stand clear of the water the result greatly mars the floral effect. New varieties of nymphæas may be purchased and planted this month with every certainty that they will thoroughly establish themselves before winter.—Thomas Smith.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

COOL-GROWING ONCIDIUMS.—There are several species of oncidium that thrive excellently under cool or cool-intermediate house temperature. Some of them are annually imported in large quantities, so that they are easily procured, and at a modest outlay. There are numerous methods by which satisfactory results can be obtained. They may be often found growing in a greenhouse fixed to a piece of rough bark or stump of wood, on rafts, in baskets or pots, while only last year I saw a large specimen of O. flexuosum covered with flowers grown in a tub three feet in diameter. It was exhibited at one of the prominent shows in the North of England, the cultivator being an enthusiastic pitman. They may in all cases be considered profuse-flowering subjects, and it may reasonably be contended that the free-flowering characteristics of some of the species often lead to detrimental effects, especially where the plants have not been relieved of their flower spikes within a reasonable time of their becoming expanded.

The species suitable for cultivation in a temperature normally about 55 degrees, with even 5 degrees lower temperature in winter, are the Brazilian section, which include such well-known and popular species as O. concolor, O. crispum, O. curtum, O. Forbesi, O. Mantini, and O. Marshallianum, practically all summer-flowering kinds, so that the plants may either be procured in flower or in the imported state. I would prefer procuring them when fresh imported. In dealing with imported plants before potting see that all dead and decaying matter is removed from the base and about the roots. Select clean pots or shallow pans just sufficiently large to contain them comfortably. Fill to one-half their depth with clean drainage. After placing the plant in the desired position fill in the remaining space with a compost consisting of about equal portions of fibrous peat, broken oak or beech leaves, and chopped sphagnum moss, with sufficient coarse sand or broken crocks added to render the compost porous. This compost should be pressed moderately firm about the plants.

REPOTTING.—The best time to attend to any repotting requirements is when the new roots make their appearance from the base of the developing growth or recently completed pseudo-bulb. It is not desirable to disturb any of this section of oncidiums for the purpose of repotting more frequently than can possibly be helped, as they usually suffer severely from being disturbed. Care must be observed to thoroughly water as soon as repotting is completed, thoroughly wetting the compost through, shade from excessive sunlight, and keep the atmosphere moist about the plants until the roots have taken hold of the new potting compost.

ONCIDIUM TIGRINUM is one of the most robust of the cool house oncidiums, and it does well grown under the same conditions as that given to the odontoglossums throughout the whole year. There are other allied species which may also be grown under the same conditions, O. unguiculatum, being very similar in habit to O. tigrinum, is sometimes mistaken for it. Both are useful autumn-flowering species, and are useful for decorative and other purposes in private gardens where there is a demand for flowers during the late autumn season; they last a long time in perfection.—H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

MEDINILLA MAGNIFICA.—The growth of this plant will now need to be well ripened, and, therefore, less shading and less moisture, and more air, should be given. A temperature of 65 degrees, with an abundance of light, air, and careful watering, will suit them. This plant is seldom seen in such magnificent form as was the case at the Holland Park Show on July 6 and 7.

WINTER-FLOWERING PLANTS. — No time should now be lost in giving the final shift. Supposing the general treatment is somewhat similar, the principal object should be to secure well-ripened wood, as without fairly matured growth the best results are seldom secured. Unless the plants are well established by the end of the summer or early autumn this cannot be attained. When stakes are used let them be as few in number as possible, otherwise the plants will not be able to assume their natural habit. There are numerous subjects that are useful for winter decoration that are of small size and easily grown, and amongst them are Panicum variegatum, Isolepis gracilis, Ficus repens, Fittonia Pearcei, and several varieties of selaginella. They all root very quickly, and can soon be grown to a decorative size.

EPIPHYLLUMS.—If growth has been produced under slight shade fuller exposure will be necessary, with a more limited supply of water, it being essential to have the growth thoroughly matured by full exposure to light, with plenty of air, in some pit or frame. While resting, place in a structure with a low temperature, and give only sufficient water to prevent the growths shrivelling. Cuttings are easily rooted, and very suitable for baskets, as the drooping habit so essential is thus secured. The varieties are numerous and beautiful, such as E. Guedenye, large white flowers, scented; E. Russellianum Gaertneri, scarlet flowers; E. salmoneum, E. superbum, E. coccineum, E. Metor, E. Shawi, E. Bridgesi, and many others. Perhaps to be seen to the best advantage they should be grafted upon stems 12 to 18 inches high of Pereskia aculeata. Grafting is best done in the spring, and a long season of growth should be given the first year.

CROTONS.—At this season little difficulty will be experienced in finding some well-coloured shoots for propagating. When sturdy young growths are rooted at this season they have the advantage of retaining their foliage down to the rim of the pot, and little artificial heat is required. For cuttings of well-balanced straight shoots of good colour sixty pots are the best, and when the young plants are well rooted four or five-inch pots afford a good shift, but the size and vigour of the plants should determine the size of the pot to be used. When plants are preferred to cut flowers for table decoration few subjects can surpass in effectiveness well-grown crotons. Much depends upon the early stages of growth and the selection of good cuttings. When once established syringe and water freely, for if allowed to suffer from a deficiency of water the lower leaves are almost sure to drop. When the pots become full of roots liquid manure should be freely given.—Wm. Fyfe. Lockinge Park Gardens.

FRUITS UNDER GLASS.

COLOURING OF GRAPES.—This is an all-important point in the production of grapes, whether for the table or exhibition. A good-sized bunch of grapes loses its charm if not coloured perfectly, and it must be admitted that fresh air is one of the principal factors in obtaining a good depth of colour. A border of sweet, fresh soil is not less essential to success. No matter what the conditions, if the colour is bad there is a fault, and the fault should be found. It may be overcropping, a very common error, for it is very much better to have 100 good bunches than 400 that are indifferently finished Fresh air is an essential in colour production, and as soon as the grapes commence to colour this should be most liberally admitted. On all fine warm days plenty of top and bottom ventilation should be given, but avoid too much on damp days and when east winds are blowing, and admit air when you can do so without causing a draught. There are many ways of giving air by which a draught can be avoided, and this should be taught to everyone who has the charge of grape-growing houses. Another important factor is sufficient moisture in the soil. As I have mentioned in former calendars, too much water can hardly be given up to the period of colouring, provided the drainage is good and the soil sweet.

LATE GRAPES.—The laterals should be pinched frequently, so that no great stoppage of circulation of the sap will be felt, as this is one of the reasons of rapid development of shanking. Give air early in the morning. The top ventilators should be opened an inch or two, and the opening be gradually increased as the day becomes warm. Keep the temperature as even as possible by ventilation; it has not been possible to leave off firing this season up to the present, but it is always an advantage to keep a little heat in the pipes, if only at nightfall.

MELONS IN FRAMES.—These should have the laterals pinched out to prevent overcrowding, and the fruits set up on pieces of slate. Give liquid manure once weekly, and syringe thoroughly morning and evening in bright weather. The syringing should be done occasionally from the back, so that the foliage gets the benefit, and if it can be done alternately so much the better. Do not overcrowd; six to nine melons in a light is sufficient, as large fruits are not so much appreciated as those of moderate size Arrange the ripening so that all frames shall be set at liberty for autumn use by the end of September.

LATE PEACHES AND NECTARINES.—Plenty of air will play an important part in retarding the ripening of the late crops, and the late crops may be kept back some days by judicious ventilation, and in the hottest part of the day a thin shading be drawn over the glass. Keep the growths well tied in, and all laterals stopped or pinched entirely out, and see that the old ties are not cutting the bark, as this frequently induces gumming. The foliage and every part of the house must be well syringed twice daily, and damping the floors, etc., several times in addition in hot weather. The earliest trees should be subjected to the same treatment in order to keep them clean. In packing peaches handle the fruits carefully, and wrap them in tissue paper, and then wrap a little wood wool around each, and pack them in a shallow box, when they will travel any distance quite unharmed. The great thing is to pack tightly, so that the fruit cannot shift.

FIG TREES.—These are now furnishing liberal supplies of fruit, and should be well nourished at the roots, and have frequent syringings. The floors damped down frequently; take out all lateral growths, and any growths not required for next year's fruiting.

CHERRIES.—These fruits, now being gathered, should have all the air possible, and if the lights can be taken off this should be done to give the trees the light, air, and rest they require. See that a sufficient amount of moisture be given the roots.—W. A. Cook, Leonardslee Gardens, Horsham.

THE KITCHEN GARDEN.

CARROTS.—During the next week or so a sowing should be made of the Short Horn type of carrot to ensure a supply of succulent young roots over the autumn and early winter months. If, owing to the maggot or through any cause, the main crop of carrots has been damaged and reduced in quantity, a proportionately larger sowing may be made to cover the deficiency. A sheltered border is a good position for this crop, where, if necessary, some slight protection can be given during the severe weather. Before sowing make the soil into a fine and suitable condition, and give a liberal dressing of soot to the surface. The drills should be at least one foot apart and about two inches deep. Sow the seed fairly thickly, and as soon as the plants are nicely up keep a sharp look-out for fly.

SPRING CABBAGE.—Throughout the northern counties, at least, the main sowing of this crop must not be delayed, if to secure strong, well-established plants before bad weather arrives. Choose a sweetened piece of ground, and sow the seed thinly. Where the young plants cannot be promptly removed and pricked out from the seed-bed as soon as the rough leaves are well formed, the system of sowing the seed broadcast has much to recommend it. Better legged plants with less drawn foliage is often the result than if left in rows and allowed to draw up.

VEGETABLE MARROWS are making rapid progress at this season, and are apt to become very crowded and dense in their growth, which is not conducive to the setting of their flowers properly. Have all unnecessary vine removed, and retain the bearing growths, and so place it that light and air can play freely amongst it. The marrows should be cut as soon as they attain the desired size for use, not allowing them to remain to use up the resources of the plants, as is sometimes seen. Waterings of liquid manure once a week will do much to keep up their vigour and prolong them in a bearing state.

CELERY will in most cases be well established and growing freely from the past wet time it has enjoyed. Where the celery fly is making an attack have all affected parts of the leaves removed by hand, and frequently give dustings of soot over the plants. At no time allow this crop to suffer from dryness at the roots. Light sprinklings of salt along the trenches is beneficial on light, dry soils after waterings.

SPINACH.—A substantial sowing of this important vegetable will be found useful if made within the next week or two to provide cuttings through September and October, and probably, if the weather is favourable, considerably longer, and be the means of saving the winter crop from being required till later in the winter months.

TURNIPS.—Within the next fortnight a large batch of winter turnips should be made. Many families prefer a yellow-fleshed turnip, and, if so, the variety known as Orange Jelly is excellent, but in many cases north it is sown too late for the best returns. The variety All the Year Round is also a reliable turnip for autumn sowing. Chirk Castle Black Stone can also be recommended for a white-fleshed variety, and it is very hardy. A high border that has carried a crop of early peas or potatoes will provide an excellent site for winter turnips. In this position they grow on later in the autumn than in lower situations. Sow the seed in drills at about one foot apart rather thinly. As soon as the young plants are nicely up thin them out to about nine inches apart, and encourage them with light applications of artificial manure till they are safe from the ravages of the turnip fly.—Charles Flack, Cholmondeley Castle Gardens.

EARLY PEAS.

This has been an ideal season for testing the hardiness of peas and their qualities and usefulness in furnishing early supplies. At one period in May the crops were late, at another they were early, and now in June and July they are late, and the majority of varieties are growing too tall, owing to the continued wet and dull weather. Carter's Eight Weeks was, perhaps, the earliest pea, as, sown twenty days later, it came in equal with Reading Wonder. These two varieties I consider the two best early peas, for both are very fine in quality and quite distinct.

Pioneer followed remarkably close, and is a much larger-podded pea. It has a strong constitution, and is about 1½ft. high, and bears immense pods. Green Gem (Sutton's) is a fine early variety with large pods, which are broad and green, and well filled with peas of delicious quality; in fact, the quality is remarkable for a pea of only 1½ft. in height. Early Morn and Early Giant closely follow the last-named, and both are so well known that all I can say is, no one can wish for better varieties. Although it may be said that there are dozens of varieties of peas that should be weeded out, it must be remembered that some varieties grow better in one district than another. Surely some of the new varieties of proved excellence should supersede the old round-seeded varieties.

W. A. Cook.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

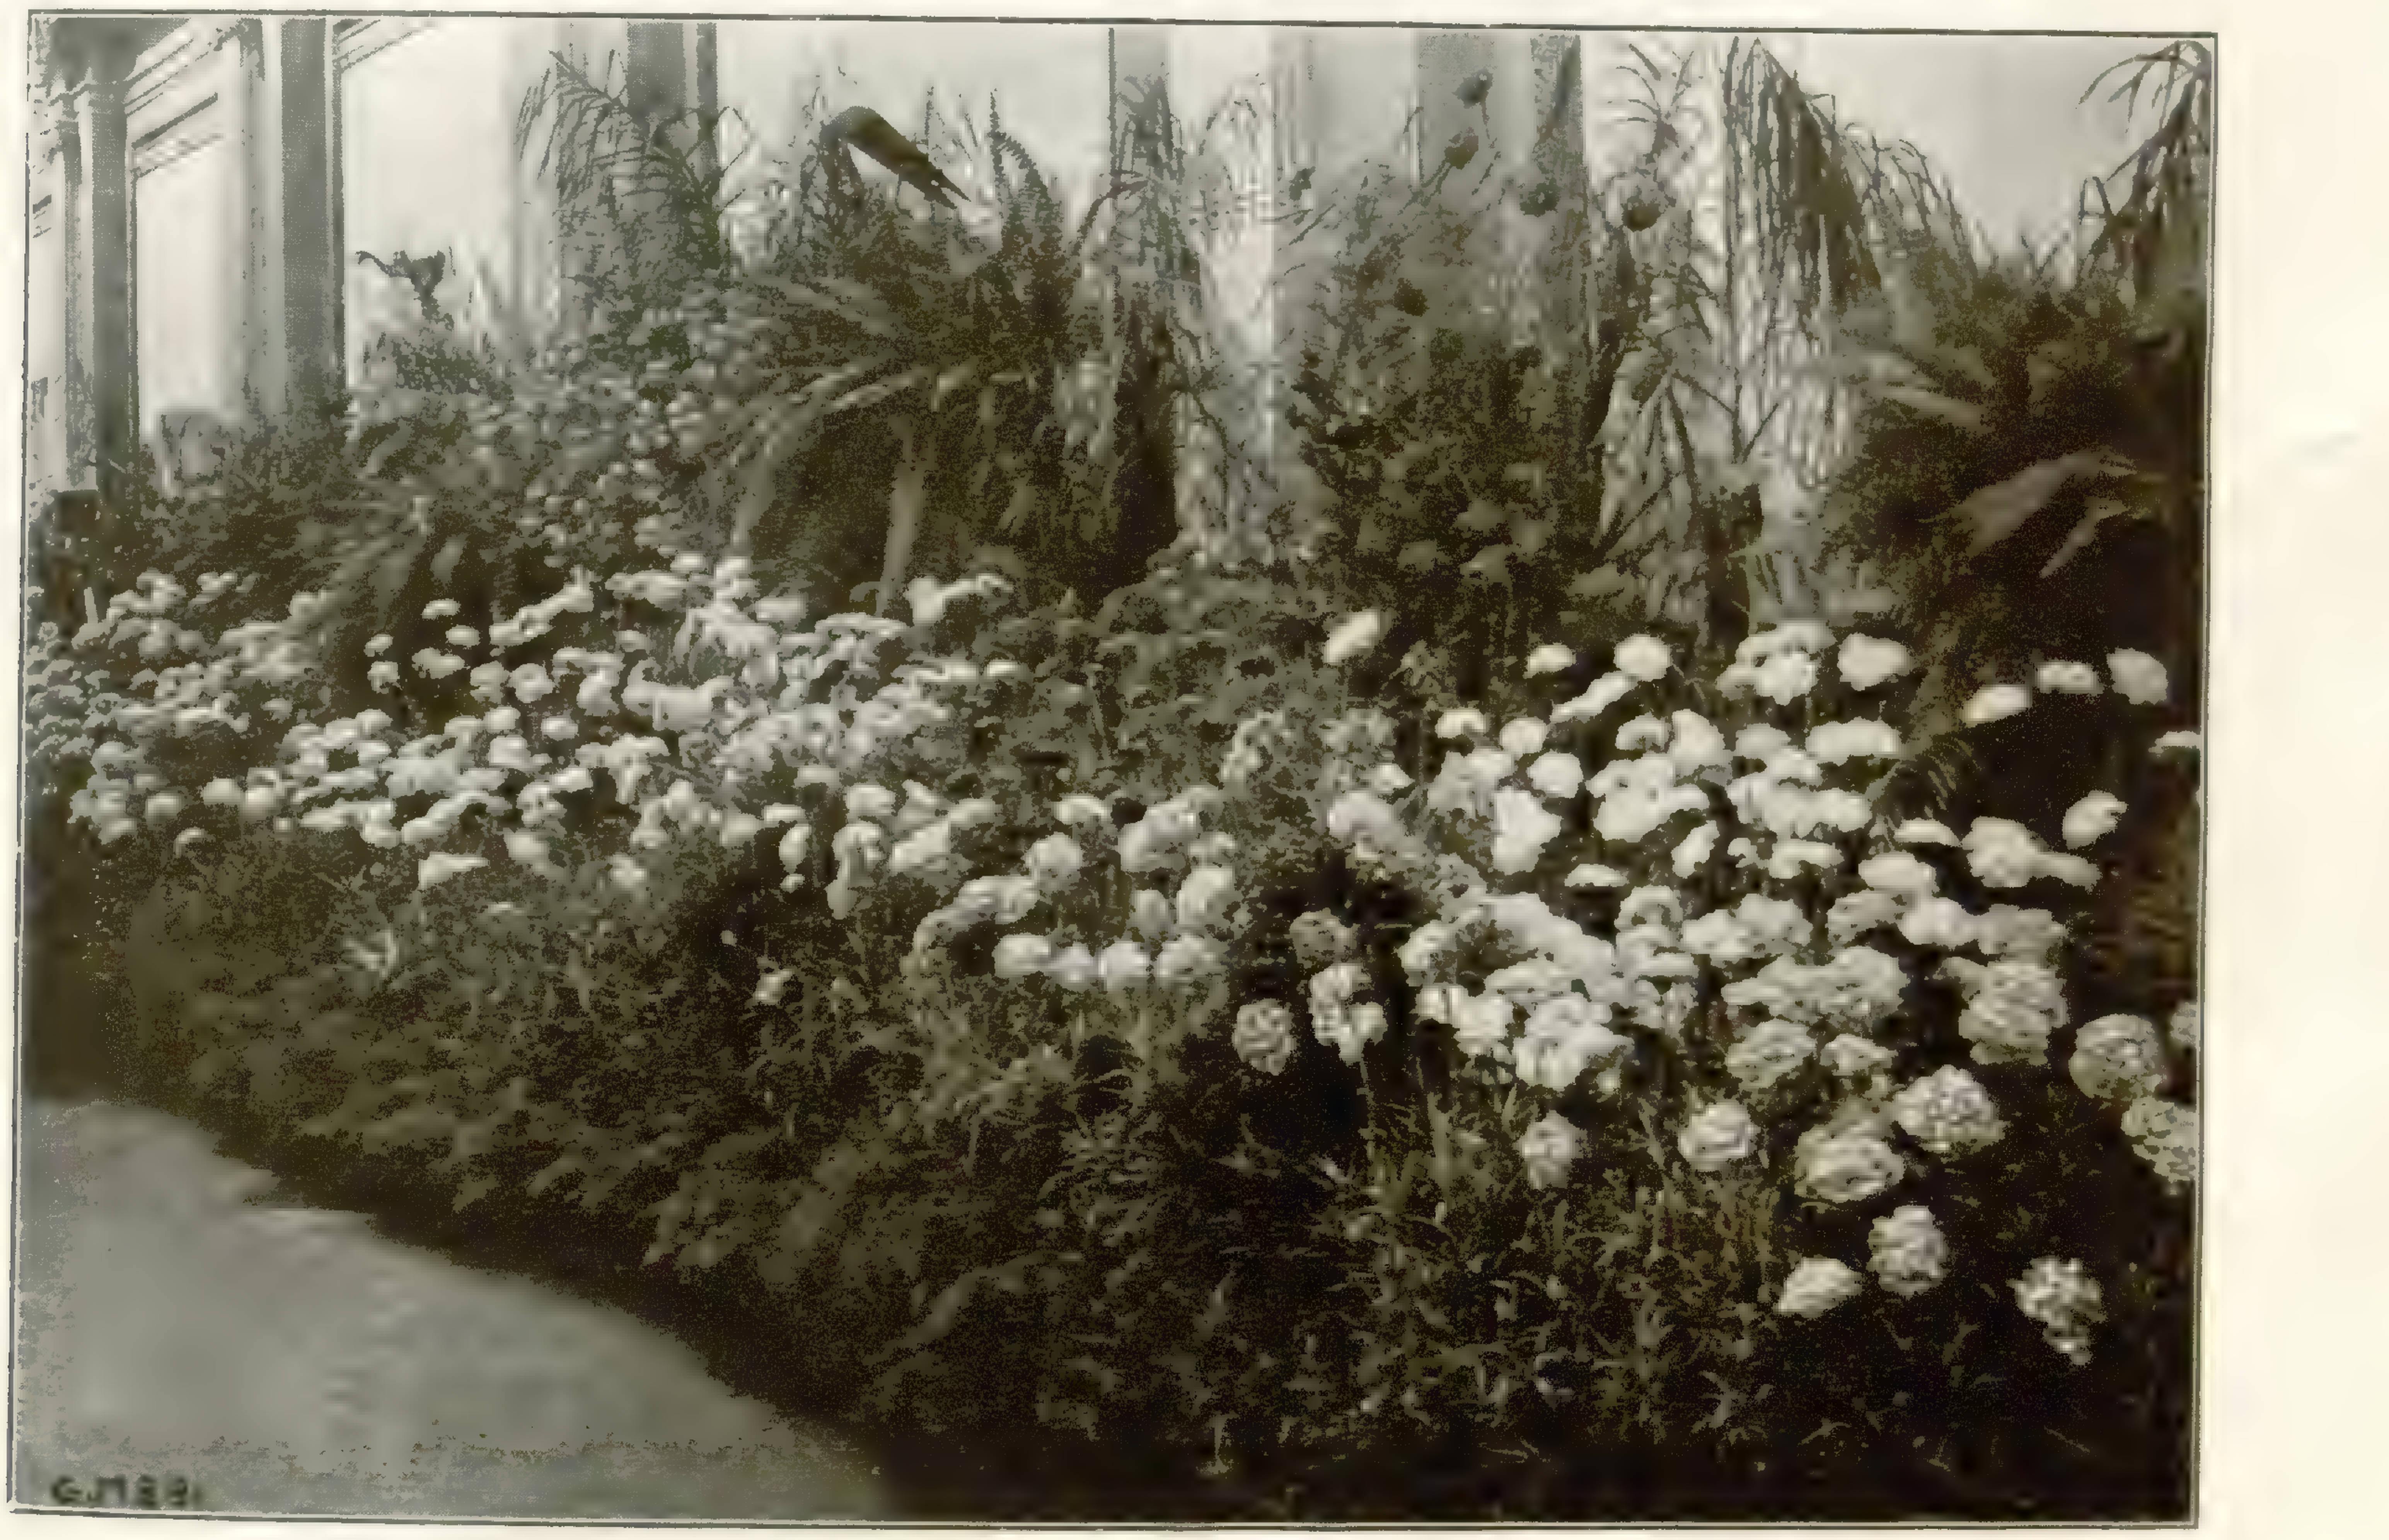
◆

Royal Horticultural Society.

There was a full meeting on Tuesday, July 20, but the number of visitors was smaller than usual. Hardy flowers were greatly in evidence, but the outstanding features were Messrs. Wm. Paul and Sons' new rose Juliet, and Mr. F. Smith's Delphinium Nulli Secundus.

FLORAL COMMITTEE.

Messrs. R. Wallace and Co., Colchester, had a display of hardy flowers that consisted chiefly of eremuri, the kinds being E. Shelfordi, E. Sir Michael, E. Olgæ, E. Bungei, and improved forms of E. Bungei with enormous length of stem. Most of these are of the late Sir Michael Foster's raising. With the eremuri were Lilium auratum platyphyllum, L. Browni, L. elegans Orange King, and some lovely varieties of Iris Kæmpferi. Carnations were splendidly shown by Messrs. W. Cutbush and Son, Highgate, who had a lovely display, and set up fine stands of White Enchantress, Enchantress, Victory, Mr. T. W. Omwake, Mrs. Burnett, Jessica, Beacon, Mercia, etc., and the flowers were in fine form.



THE MAGNIFICENT COLLECTION OF CARNATIONS

For which Mr. A. Grubb, gardener to Cecil F. Raphael, Esq., Porter's Park, Shenley, Herts, was awarded the gold medal of the Royal Horticultural Society at the R.H.S. Meeting on Tuesday last.

A handsome display of roses was made by Messrs. R. Harkness and Co., Hitchin, their stands of Edu Meyer, Mrs. T. Roosevelt, Hugh Dickson, Lady Ashtown, and Mrs. Sharman Crawford showing up well. Mr. W. E. Chaplin, Joyning's Nursery, Waltham Cross, displayed fine flowers of such roses as Frau Karl Druschki, Caroline Testout, Duke of Edinburgh, Earl of Warwick, etc. Mr. A. Charlton, Tunbridge Wells, contributed a bold group of hardy flowers, staging a fine lot of delphiniums. From the Guildford Hardy Plant Company came a selection of hardy flowers, and Messrs. G. and A. Clarke, Dover, had an extensive exhibit wherein Lilium Krameri and Gilia coronopifolia figured conspicuously.

Mr. James Douglas, Great Bookham, Surrey, set up a beautiful lot of carnations, and had vases of fine blooms of T. E. Henwood, Ellen Douglas, Sir Galahad, Agnes Sorrel, Lady Roscoe, Cupid, and Cecilia. A very large exhibit of delphiniums was well arranged along the top of the hall by Mr. Amos Perry, Enfield. These showed a fine range of colour, from deep purple-blue to pale porcelain-blue. A large number were named, and these made up a grand selection of these stately garden flowers. Malmaison, border, and perpetual carnations, growing in pots, were set up boldly by Messrs. Jas. Veitch and Sons, Chelsea, and with these were the fine Lilium miriophyllum, Romneya Coulteri, Solanum Wendlandi, and fine varieties of cannas.

Messrs. Carter Page and Co., London Wall, were represented by a very large and effective display of sweet peas, and they showed all the leading varieties in big masses. Messrs. Jas. Carter and Co., Holborn, set up a very effective double arch of sweet peas, that was greatly admired for its design, its furnishing, and its flowers. Roses were shown by Messrs. Stuart Low and Co., Bush Hill Park, Enfield.

A splendid group of well-grown Malmaison carnations was arranged opposite the entrance by Mr. Grubb, gardener to Cecil F. Raphael, Esq., Porters' Park, Shenley. Old Blush, Princess of Wales, King Oscar, Maggie Hodgson, and The Colonel were shown in large numbers, and all were in pots, as grown, and associated with ferns and palms. At the back of the centre of the display there was a fine batch of the yellow Mrs. Audrey Campbell. Messrs. Jas. Cheal and Sons, Crawley, showed sweet peas and herbaceous flowers in quantity. Mr. W. J. Unwin, Histon, Cambs., staged a beautiful lot of sweet peas, and showed good bunches of the new Mrs. W. J. Unwin, the lavender Frank Unwin, the very bright Edna Unwin, and the pink Gladys Burt, as well as many of the popular varieties. Mr. Frank Lilley, Guernsey, brought over a selection of early gladioli, of the Colvillei section, but did not stage them particularly well.

Cacti in great variety, from Messrs. H. Cannell and Sons, Swanley, made an interesting group. The central circular display on this occasion was of Malmaison carnations arranged over moss by Messrs. Stuart Low and Co., Bush Hall Park, Enfield. Messrs. R. and G. Cuthbert, Southgate, brought forward a selection of the best ivy-leaved pelargoniums, and arranged these with hydrangeas and pink spiræas. Roses were very largely and beautifully shown by Messrs. Wm. Paul and Son, Waltham Cross, and, though they had large boxes, baskets, and stands of their own and other popular varieties, the great interest of their effort centred in their new rose named Juliet (A.M.), a lovely variety that comes as nearly to bright scarlet as we yet have in roses. The petals are soft scarlet with a golden yellow base to each petal. The parentage is said to be Soliel d'Or and a H.P. variety. Anyway, it is a lovely thing, and very fragrant.

Messrs. Kelway and Son, Langport, Somerset, set up delphiniums, but arranged them very stiffly, and thus reduced their beauty; they also showed gaillardias and sweet peas. Messrs. H. B. May and Sons, Edmonton, sent forward ixoras, abutilons, acalyphas, variegated oleanders, and a collection of exotic ferns, their Todea superba under a glass shade coming in for a well-deserved share of special attention. Messrs. H. J. Jones, Ryecroft Nurseries, Lewisham, were represented by a large corner group of very well grown phloxes, associated with gaillardias, and backed by bamboos. Mr. L. R. Russell, Richmond, put up a bold group of caladiums. Mr. G. Reuthe, Keston, put up a very interesting exhibit of hardy flowers, and Messrs. Dobbie and Co., Rothesay, set up fine sweet peas, including Masterpiece, Clara Curtis, and Mrs. Andrew Ireland.

A group of very beautiful delphiniums from Mr. F. W. Smith, gardener to G. Ferguson, Esq., Weybridge, was a great attraction, as it contained a large number of new seedlings of very distinct character. Of great merit are the white varieties with dark centres, and the finest of these is Nulli Secundus (A.M.), white, faintly tinged with green, and with a deep blackish-brown centre. Messrs. Thos. S. Ware, Feltham, put up a collection of alpine and rockery plants.

ORCHID COMMITTEE.

Mr. Collier, gardener to Sir Jeremiah Colman, Bart., Gatton Park, Reigate, brought up several interesting botanical orchids, including Masdevallia muscosa, and Bulbophyllum concinum. From Messrs. Charlesworth and Co., Haywards Heath, came some lovely plants of Vanda cærulea, carrying grand blue flowers, Odontoglossum Pescatorei, O. Eleanor, Miltonia vexillaria albiflorum, Sobralia macrantha alba magnifica, and the quaint Bulbophyllum comosum. Mr. Gurney Wilson, Haywards Heath, showed Brosso-cattleya Digbyana-Mossiæ Glenthorne variety carrying four grand flowers. Mr. Menteith Ogilvie sent Odontoglossum crispum Madonna, a lovely form with yellow-marked lip. From Sir Trevor Lawrence, Bart., came a fine box of Habenaria rhodochilum, for which Mr. W. White received a cultural commendation. The pretty heliotrope-marked Odontoglossum ardentissimum Starlight was well shown by Messrs. Sander and Sons, St. Albans, and gained an A.M. Spathoglottis spicata alba, from Gatton Park, gained an A.M.; and Vanda Miss Joaquin, carrying five grand spikes, from Burford Lodge, secured a cultural commendation. Mr. Alexander, grower to Lieut-Colonel Holford, showed L.-c. Radium and L.-c. purpurata Schilleriana, both very fine.

Mr. De. Barri Crawshay sent Odontoglossum Astarte, derived from O. Harryanum and O. tripudians, and O. Nerissa Rosefieldiensis, a graceful flower in the way of O. Phœbe. A fine plant of Odontioda Charlesworthi, carrying two spikes from one pseudobulb, and an aggregate of fifteen flowers, was shown by Mr. W. Stevens, gardener to W. Thompson, Esq., Walton Grange, Stone, Staffs. In Messrs. Sander and Sons' exhibit of orchids the leading features were Vanda cærulea, Cypripedium Lord Derby, Cattleya gigas, Phaius Humbloti, and Odontoglossum crispo-Harryanum Bruggense, a fine bold variety. Mr. Balmforth, gardener to Menteith Ogilvie, Esq., The Shrubbery, Oxford, contributed a fine group of odontoglossums, chiefly crispums, and O. Harryanum; he also had a large spike of a light red odontioda and numerous examples of Cochlioda Noetzliana. Mr. James H. Hill, Burgess Hill, Sussex, sent a small group of miltonias, with Cattleya gigas, etc. Messrs. Wm. Bull and Sons, Chelsea, showed a batch of Lælia xanthina and Cattleya Mossiæ, set in stove foliage plants. Messrs. Stuart Low and Co.'s orchids made up a pretty group, and included Cypripedium macrochilum giganteum, Odontoglossum crispum Annie, O. Pescatorei, oncidiums, and dendrobiums.

FRUIT AND VEGETABLE COMMITTEE.

A goodly collection of lettuces staged by Messrs. Jas. Veitch and Sons, demonstrated the value of the cabbage varieties, while the peas, picked and on haulm, gave evidence of the merits of Gradus, Telegraph, Duke of Albany, Chelsea Gem, Prodigy, and Telephone. Chelsea Gem, as growing, carried a fine crop. Beet, beans, and Cantaloupe melons were included in the exhibit. The trained gooseberries, shown so well by Messrs. Jas. Veitch and Sons, Chelsea, attracted a great deal of attention, and it was wonderful what huge crops of fruit these one, two, three, four, or five stemmed cordons carried. Langley Gage, Pilot, Keepsake, Broom Girl, Langley Beauty, and Trumpeter, carried enormous crops. Equally as fine, and even far more tempting, were the peaches and nectarines in pots, all finely fruited, the nectarines being unusually fine.

Culinary peas were brought up in large numbers by Messrs. Jas. Carter and Co., Holborn, and there was great admiration for the dishes of Quite Content, Early Morn, Giant Empress, Duke of Albany, The Sherwood, Laxtonian, and various new seedlings. Messrs. T. Rivers and Son, Sawbridgeworth, showed some splendid cherry trees in pots, carrying fine crops of fruit. One tree, of Black Hawk, has been in a pot for 40 years, and borne a good crop of fruit each year; other good varieties were Bigarreau Napoleon, Early Rivers, Emperor Francis, and Bigarreau de Schmidt.

The tomatoes from Messrs. Sutton and Sons, Reading, carried famous crops, and notably good varieties were Maincrop, Golden Queen, Magnum Bonum, Satisfaction, A1, Best of All, Early Market, Winter Beauty, and Dwarf Gem.

AWARDS.

Award of Merit.—To Spiræa Veitchi, from Messrs. J. Veitch and Sons, Chelsea; to Sweet Pea Edna Unwin, from Mr. W. J. Unwin, Histon; to Eremurus Sir Michael, from Messrs. R. Wallace and Co., Colchester; to Nymphæa Mooreana, from Leopold de Rothschild, Esq., Gunnersbury; to Rose Juliet, from Messrs. Wm. Paul and Sons, Waltham Cross; to Delphinium Nulli Secundus, from E. Ferguson, Esq., The Hollies, Weybridge; to Spathoglottis plicata alba, from Sir Jeremiah Colman, Bart., Reigate; to Odontoglossum crispum Starlight, from Messrs. Sander and Co., St. Albans.

MEDALS.

Gold.—Mr. Grubb, gardener to C. F. Raphael, Esq., Porters' Park, Shenley, for carnations; Messrs. Jas. Veitch and Sons, Chelsea, for gooseberries and vegetables, etc.

Silver-gilt Flora.—Mr. F. Smith, gardener to G. Ferguson, Esq., Weybridge, for delphiniums; Messrs. Wm. Paul and Son, Waltham Cross, for roses.

Silver-gilt Banksian.—Messrs. J. Carter and Co., Holborn, for sweet peas; Messrs. W. Cutbush and Son, Highgate, for carnations; Messrs. H. B. May and Sons, Edmonton, for ferns, etc.

Silver Flora.—Messrs. H. Cannell and Sons, Swanley, for cacti; Messrs. Carter Page and Co., London Wall, for sweet peas; Messrs. S. Low and Co., Bush Hill Park, for roses and carnations; Mr. Amos Perry, Enfield, for delphiniums; Messrs. Jas. Veitch and Sons, Chelsea, for carnations, cannas, etc.; Messrs. R. Wallace and Co., Colchester, for liliums, etc.; Mr. Menteith Ogilvie, Oxford, for orchids; Messrs. Sander and Sons, St. Albans, for orchids; Messrs. Charlesworth and Co., Haywards Heath, for orchids; Messrs. Stuart Low and Co., Bush Hill Park, for orchids.

Silver Banksian.—Messrs. T. Rivers and Son, Sawbridgeworth, for cherries; Messrs. J. Cheal and Sons, Crawley, for hardy flowers; Messrs. G. and A. Clark, Dover, for hardy flowers; Mr. Lilley, Guernsey, for hardy flowers.

Gloucestershire Rose and Sweet Pea Society.

JULY 13.

Roses and sweet peas were largely represented at the 21st annual exhibition held in the Spa Cricket Field, Gloucester, on the above date. The schedules provided six divisions each, viz., twenty-nine classes for roses and eighteen for sweet peas, the competition being good all through, and the prizes liberal. The weather conditions being perfect, a large attendance resulted.

ROSES.

Of these there were fully 1,000 specimens in the first nine open classes for professionals and amateurs, while an equal number were presented in the other sections. For forty-eight singles, four collections were staged; the champion prize—£5—going to Messrs. Alex. Dickson and Sons, Newtownards, Ireland, for a set of lovely blooms, the premiers being Mrs. T. Roosevelt, J. B. Clark, Princess M. Mertchersky, John Cuff, Countess of Annesley, Mrs. C. West, Colonel Williamson, Mrs. J. Laing, Mildred Grant, F. K. Druschki, Geo. Dickson, Her Majesty, W. Shean, Duchesse de Morny, Countess of Oxford, Mrs. Hubert Taylor, Mrs. Arthur Munt, Helen Keller, Horace Vernet, H. Brocklebank, Duke of Wellington, and Lady Ashtown; the second award was made in favour of Mr. John Mattock, New Headington, for a very level set of bright blooms; the King's Acre Nursery Company third. Three collections were staged in the class for thirty-six single trusses, and Mr. H. Drew, Longworth, Berks, scored a premier for large shapely blooms; Mr. G. H. Towndon, Malvern, a good second; Messrs. J. Jefferies and Son, Cirencester, third. Eighteen trebles were presented by six competitors, Messrs. Alex. Dickson and Sons leading with finely matched blooms; Mr. J. Mattock second, and Mr. H. Drew third. The last named exhibitor was successful in taking the first prize for eighteen teas or noisettes, the blooms large, shapely, and clean; Mr. J. Mattock second; the King's Acre Nursery Company third. For a dozen triplet teas, Mr. H. Drew was the only exhibitor. For the prizes for a dozen blooms of any dark rose, five boxes were staged, and Mr. H. Drew was first with Hugh Dickson; Mr. J. Mattock second with Dupuy Jamain; and Mr. G. H. Towndon third. For a dozen light roses, seven competed, and Mr. G. H. Towndon led with F. K. Druschki; Messrs. Alex. Dickson and Sons second with Mildred Grant; Mr. A. Middlecote, Upton St. Leonards, third.

In the open amateurs' division Mr. Conway Jones, Hucclecote, led for two dozen varieties with high-class blooms of M. Grant, Prince Arthur, W. Shean, U. Brunner, Earl of Warwick, Charles Lefebvre, F. Pemberton, Countess of Caledon, Marchioness of Londonderry, Mrs. M. Kennedy, Victor Hugo, the Lyon Rose, etc.; Mr. W. Garrett Thorpe, Hucclecote, was a worthy second; the third prize was awarded to Mr. G. R. Bonnor, Barnwood. In Mr. Garrett Thorpe's premier box of eighteen varieties was a medal bloom, the variety being Florence Pemberton; Mr. Conway Jones also secured a medal for a remarkably fine bloom of Madame Jules Gravereaux; and Mr. J. G. Orpin obtained a similar honour for a marvellous bloom of Frau Karl Druschki. The remaining classes for city and county amateurs and cottagers were well filled. In the amateur section Mr. Conway Jones led for eighteen singles and a dozen teas; Mr. Garrett Thorpe, Mr. G. R. Bonnor, Mr. Charles Holbrook, Hucclecote, and Mr. A. Middlecote, very largely shared in the awards.

In the open class for a dozen bunches of garden roses, the cards went to Messrs. Fuller and Maylam, Gloucester; Mr. W. H. Frettingham, Beeston Nurseries, Nottingham; and Mr. J. Mattock, in the order of their names, for splendid arrangements; Messrs. J. Jefferies and Son were awarded a special extra prize; while for displays of rambler roses, Mr. J. Mattock headed the list. In the class for nine vases of garden roses, Lieut.-Colonel G. D. Timms, Matson House; Mr. Conway Jones, and Mrs. Ancrum, St. Leonards Court, shared the honours. Cottagers' exhibits were in large numbers, and excellently staged.

SWEET PEAS.

About 200 vases of sweet peas, with possibly an average of twenty stems each, made a bewildering though a pretty display. Mr. W. J. Thorpe was first for eighteen varieties; Mrs. E. Reeves, Stonehouse, for nine; Mr. J. G. Orpin for nine (within the city limit); Mr. A. V. Wright for six (ditto); Mr. W. Gordon Cumming, Hartbury House, for nine (county limit); and Mr. G. R. Bonnor for twelve varieties (Mr. R. Sydenham's prizes). Dinner-tables decorated with sweet peas or briar roses produced six arrangements, the cards going to Miss D. Hatton, Colebridge House, first, light delicate shades of peas; Miss B. W. Smith, second, sweet peas; Miss L. A. Nichols, third, blush rambler roses.

The non-competitive displays included a very elaborate arrangement of sweet peas in four dozen varieties, and eighteen varieties of carnations, from the nurseries of Messrs. J. C. Wheeler and Son, Gloucester; about fourty vases of peas in variety from Messrs. G. Winfield and Sons, Gloucester; and a display of peas in table decoration vases from Mr. R. Sydenham, Birmingham.

Luton Sweet Pea Show.

The rose section of the Luton Show was this year merged into the National Sweet Pea Society's provincial exhibition, so that in these notes we only refer to the sweet peas, etc. It should be added that the enthusiasm for flowers steadily increases, and Messrs. Marks and Staddon continue as hon. secretaries, and Mr. H. Shane still acts as treasurer.

In several of the sweet pea classes there were no entries whatever. In the open amateurs' class for two dozen varieties, Mr. G. Puxtead, gardener to R. C. Peake, Esq., Redbourne, was the only exhibitor, and he was awarded first for a fair set. Premier award for a dozen bunches, distinct, fell to Mr. A. W. Ralph, Bedford, whose best bunches were of The King, St. George, Elsie Herbert, John Ingman, Countess Spencer, and Nora Unwin; Mr. F. B. Ellis, Sharbrooke, second; and Mr. Cresswell, gardener to the Earl of Lytton, Knebworth, third.

In the local class for a dozen bunches, distinct, Mr. E. Gibbons, gardener to A. Collings Wells, Esq., Luton, led with good bunches of Mrs. Collier, Clara Curtis, Evelyn Hemus, Jessie Cuthbertson, Mrs. A. Ireland, Helen Lewis, Countess Spencer, Etta Dyke, Helen Pierce, Mrs. H. Sykes, and Mid Blue; Mr. G. Puxtead second, and Mr. H. L. Sell, Luton, third. Mr. F. Burr, gardener to R. Burley, Esq., Luton, led for six bunches, and was followed by Mr. G. Bowles, Luton. Mr. Sell was the only exhibitor of three bunches, and was awarded a first prize.

For twelve bunches of five sprays each, Mr. E. Gibbons was a good first, showing Mrs. H. Bell, Evelyn Hemus, and J. Ingman in good form; Mr. J. Woodbridge, North Street, Luton, second; and Mr. F. E. Hall, Redbourne, third. Mr. H. Holyoak, Luton, led for six bunches of five sprays, followed by Mr. C. Waller, Luton.

In the single bunch classes there were some excellent blooms, and prizes fell as follows: White, Mr. M. Freeman, Cheverells, for Nora Unwin; pink, Mr. J. Woodbridge, Luton, for Constance Oliver; crimson, Mr. G. Westwood, Harpenden, for King Edward Spencer; rose, Mr. J. Woodbridge, for John Ingman; picotee, Mr. C. Waller, for Mrs. C. W. Breadmore; orange, Mr. Westwood, for St. George; yellow, Mr. Gibbons, for Clara Curtis; lavender, Mr. Waller, for Frank Dolby; bicolor, Mr. Gibbons, for Tweedy Smith; striped, Mr. J. Woodbridge, for Prince Olaf; maroon, Mr. Gibbons, for Prince of Asturias.

For six bunches of eleven sprays, Mr. A. Merry, Luton, scored, and for three bunches of eleven sprays, Mr. Merry was again first.

In the Ead's Challenge Cup class for six bunches of sweet peas, Mr. Collings Wells, again won the cup, showing John Ingman, Helen Lewis, Nora Unwin, Countess Spencer, Elsie Herbert, and Mrs. H. Sykes, in fine form, his bunch of Countess Spencer winning the Hucklesby Challenge Cup for the best bunch in the show. Mr. J. Woodbridge came second, and Mr. Holdstock, gardener to W. Scarth Dixon, Esq., Luton, third.

The Cottagers' Cup for six bunches fell to Mr. H. Clarke, Leagrave, and for six bunches of twenty sprays each, Mr. J. Woodbridge scored.

Miss H. Shane, Cliftonville, Luton, showed the best epergne of sweet peas, and Mr. Holdstock the best lady's spray. Mrs. Ruff, Sharnbrook, Beds, had the best table decoration of sweet peas, showing a dainty arrangement of Evelyn Hemus and Countess Spencer; Mrs. Munt, Stagenhoe Park, second, and Mr. H. L. Sell, third.

NON-COMPETITIVE.

One of the most wonderful and beautiful of non-competitive displays we have seen for a long time was the magnificent group of flowering and foliage plants so admirably staged by Mr. A. H. Metcalfe, gardener to Sir Julius Wernher, Bart., Luton Hoo. This filled the centre of one large tent, and was a fine display of rambling roses, Malmaison and perpetual carnations, crotons and palms, pink spiræas, hydrangeas, cattleyas, odontoglossums, and a host of other well-grown decorative material.

Mr. W. Bentley, Leicester, showed a collection of decorative and other roses, and Messrs. H. Lane and Son, Berkhamsted, had a collection of ornamental shrubs outside the secretaries' tent, and a selection of hardy flowers inside the sweet pea tent.

Messrs. Wm. Fells and Son, Hitchin, contributed an interesting rock garden exhibit, filled with alpines. Messrs. R. Harkness and Co., Hitchin, contributed a collection of roses, Messrs. Laxton Brothers sent a bank of hardy flowers. Mr. F. M. Bradley, Peterborough, showed roses largely.

Penarth Rose Society.

This newly formed society held its first show in Penarth on July 7, and made from every point of view a splendid commencement. Apart from the classes devoted to roses, the schedule embraced many for other subjects, chief amongst them being those for sweet peas, carnations, begonias, and table decorations. Throughout the classes the exhibits generally were of a high standard of merit, and the arrangements were excellent.

ROSES.

In the open division a class was provided for a collection of blooms shown with their own foliage and buds in a space 9ft. by 4½ft. Three collections were shown, the best, which secured the leading prize, being contributed by Mr. Crossling, Penarth Nursery, who had an exhibit of tastefully arranged and beautifully fresh blooms in great variety. Mr. Stephen Treseder, Cardiff, was placed second and Mr. William Treseder, The Nurseries, Cardiff, third, each staging splendid collections in their usual high-class manner. In a class for twelve varieties, five blooms of each, shown in vases, the three exhibitors previously named were the only competitors, and secured the prizes in the same order, Mr. Crossling's set consisting of Mildred Grant, Mrs. J. Laing, La France, Fisher Holmes, Caroline Testout, Ulrich Brunner, W. Shean, Victor Hugo, Frau Karl Druschki, Mrs. S. Crawford, Comtesse de Turenne, and Suzanne Marie Rodocanachi. The Messrs. Treseder staged similar leading varieties. In this class the National Rose Society's Silver-gilt Medal was awarded, in addition to the first prize in cash.

In the class for twenty-four blooms Mr. S. Treseder was the only competitor, and was deservedly awarded the leading prize, having good blooms of Queen of Spain, Frau Karl Druschki, Mamie, White Lady, Marchioness of Londonderry, Mrs. J. Laing, W. Shean, Alice Lindsell, Ulster, Hugh Dickson, and Duchess of Portland. For twelve blooms of any one dark variety Mr. S. Treseder was first with a good set comprising J. B. Clark; Mr. Crossling followed closely with Victor Hugo. In a similar class for any light variety Mr. S. Treseder was first with Dean Hole; Mr. Crossling second. The last-named was the only exhibitor in a class for a shower bouquet of roses, and staged a tasteful arrangement.

In the amateurs' class for eighteen blooms, not less than twelve varieties, there were five entries. Mr. H. Wheeler, gardener to Mrs. Jenner, Wencove Castle, occupied the first place with good blooms of Frau Karl Druschki, Mdme. Wagram, Ulrich Brunner, Her Majesty, La France, and Mrs. J. Laing; J. W. Courtis, Esq., was a good second. For twelve blooms of teas or hybrid teas there were five exhibitors, J. W. Courtis, Esq., taking leading honours, followed by Mr. H. Wheeler; and for twelve blooms, not less than six varieties, for which the National Rose Society's Silver Medal was added to the premier award, H. Hand, Esq., took the lead, followed by E. R. Payne, Esq., and E. R. Moxey, Esq. In a similar class for twelve blooms Mr. H. Wheeler led, followed by J. W. Courtis, Esq., and E. R. Moxey, Esq.; and for six blooms, A. W. Morris, Esq., was placed first and Mr. W. J. Short second. There were six entries for a bowl filled with roses, open only to lady competitors. Miss Parkhurst was first and Mrs. Flint second.

In the class for sweet peas, nine varieties, in which Messrs. R. Sydenham, Birmingham, provided the prizes, there were two exhibitors, Mr. Wheeler leading with good vases of George Herbert, Nora Unwin, Mrs. R. Spencer, Apple Blossom, Frank Dolby, Mrs. H. Sykes, Countess Spencer, Mrs. A. Malcolm, Helen Lewis; Mr. J. Buckland second. In the society's class for nine vases, the National Sweet Pea Society's Silver Medal accompanying the first prize, Mr. Wheeler again led, staging, amongst others, a good new purple variety named May Gerhold, the second position being occupied by H. A. Gerhold, Esq. In a class for nine varieties, open only to growers within the Penarth Urban District, a Challenge Bowl was offered, and was won by Lady Morel, who staged among others Rosabelle Hoar, Constance Oliver, A. J. Cook, Sutton's Queen, King Edward, Countess Spencer, Etta Dyke; J. W. Pyman, Esq., was a close second. In a class for six vases Mr. E. Harvey, Penarth, was first, with Frank Dolby, Evelyn Byatt, Paradise Ivory, Queen Alexandra, Dudley Lees, and Clara Curtis; Mr. Buckland second.

In competition for the prizes for a collection of carnations and picotees, arranged in a space 6ft. by 3ft., Mr. C. Wall, Melrose Nursery, Bath, obtained premier honours with excellent blooms. He also took first prize for six vases; J. W. Pyman, Esq., was placed first for six vases of border carnations and picotees and also for a single vase of fifteen blooms. Trade exhibits were noteworthy, and certificates of merit were awarded to Mr. Evans, Llanishen, for flowers of hardy perennials; Mr. W. Treseder for pæonies and other hardy flowers; Messrs. Young and Co., Cheltenham, for a fine collection of carnations; and Messrs. Norton and Co., Dinas Powis, for specimen ferns.

Chippenham Rose Show.

JULY 10.

The sixth annual competition of the Chippenham and District Rose Society was held on the above date, and proved a first-class exhibition. For the third year, though not consecutively, this young association has had the experience of very wet days, and this year will prove another heavy loss. The ambition of the executive appears to be not to make a gain, but to encourage rose growing, and to pay its way.

Over 2,000 specimen roses were staged in the six divisions, and the open classes gave an opportunity for admiring any number of very superior blooms. In the class for forty-eight singles, seven competed. Messrs. Alex. Dickson and Sons, Newtownards, Ireland, scored a premier with an exceptionally fine collection; it was, indeed, so good as to be equal to anything that firm has yet exhibited; the best blooms were Her Majesty, Mildred Grant, Princess M. Mertchersky, Mrs. W. J. Grant, O. Terks, Geo. Dickson, Mrs. T. Roosevelt, Victor Hugo, Wm. Shean, Bob Davison, Duchess de Morny, Marchioness of Londonderry, Marquise Lita, Queen of Spain, Alice Lindsell, C. Testout, J. B. Clarke, Mad. J. Gravereaux, Francois Michelon, Bessie Brown, Hugh Dickson, Mad. M. Soupert, Mrs. J. Laing, Mrs. Cornwallis West, Geo. C. Waud, K. A. Victoria, Countess of Annesley, Mrs. Bateman, Mad. G. Luizet, F. Pemberton, Mrs. Foley Hobbs, and Countess of Oxford; the King's Acre Nursery Company, Hereford, second, and in the collection were the two N.R.S. medal blooms, viz., Queen of Spain, H.T., and Mad. Jules Gravereaux, T.; Messrs. F. Cant and Co., Colchester, were third; and Messrs. B. R. Cant and Sons were awarded a special prize. For thirty-six blooms eleven collections were staged, and the first prize was awarded to the King's Acre Nursery Company; and second to Mr. H. Drew, Longworth, Berks; Messrs. B. R. Cant and Sons third; and Mr. E. J. Hicks was awarded an extra. There were nine exhibitors of a dozen triplets, Messrs. A. Dickson and Sons leading, and Messrs. B. R. Cant and Sons second. In the class for twelve teas or noisettes, eight boxes were staged, and Messrs. Alex. Dickson and Sons, Mr. Geo. Prince, Longworth, and Mr. H. Drew were the prize-takers. In the corresponding class for twelve blooms of H.P. or H.T., thirteen boxes were staged, and Messrs. Dickson and Sons were first, Messrs. F. Cant and Co. second, and the King's Acre Nursery Company third.

Bouquets of garden roses, in a dozen varieties, produced an attractive display, Mr. J. Mattock, New Headington, Oxford, leading, Mr. G. Prince, Messrs. B. R. Cant and Sons, and Messrs. F. Cant and Co. taking equal second cards.

In the open amateurs' section Mr. Conway Jones, Hucclecote, was most successful, scoring a premier for two dozen varieties, thus securing the King's Acre Challenge Cup and Gold Medal, and in this class the N.R.S. silver medal with a fine bloom of Mdme. J. Gravereaux; the second prize was awarded to the hon. secretary, Rev. T. G. W. Henslow, Stanton Rectory, Chippenham; Rev. R. Powley, Upton Scudamore, Warminster, third. In the next four classes for eighteen varieties, twelve H.P. or H.T., twelve T. or N., and four triplets, Mr. Conway Jones headed the list with superior blooms, the Rev. R. Powley and the Rev. T. G. W. Henslow taking the lower cards; the Rev. R. Powley first for six teas. In the section limited to a ten mile radius, the Rev. T. G. W. Henslow scored a first for a dozen of any sort, with La France; Mrs. Rogers, Rowden Hill, second; and Mr. W. T. Ball third. The class for twenty-four singles was limited to two exhibits, Rev. T. G. W. Henslow first; he also headed the list for eighteen in a stiffer competition, and again for a dozen teas or noisettes, and six H.P. or H.T. In this division Mr. B. de Bertodano, Cowbridge House, Malmesbury (gardener, Mr. Deadman), secured a silver medal for the best H.P., and Mr. W. Smith for the best tea rose, with a perfect White Cochet. Cottagers also showed well in the five classes for roses.

Tuberous begonias were nicely presented by Mr. Deadman, and Mr. Pitts, gardener to Sir Audley Neeld, Grittleton, both single and double, in groups of six, three, and one specimen.

Sweet peas were beautifully set up in eighteen bunches, the cards going to Mr. Geo. Humphries, Kington Langley, and Sir A. Neeld. Hardy cut flowers as collections represented a wide range of varieties, as staged by Colonel M. Neeld, Langley; Sir A. Neeld, and Miss Ashe, Langley. Strawberries were not a large show, but excellent for quality, the premier award going to Mr. Deadman, whose varieties were Leader, Monarch, Bedford Champion, Sensation, The Bedford, and Royal Sovereign; the heaviest berries from the same exhibitor being Monarch variety.

Miscellaneous contributions included a noble display of perennials from Messrs. Barr and Sons, London, and the King's Acre Nursery Company; Messrs. Geo. Cooling and Sons, Bath, staging a fine arrangement of garden roses, and a smaller collection came from Mr. Rowland Adams, Bath.

National Carnation Society.

JULY 21.

The annual exhibition of the southern section of the National Carnation Society was held at the Horticultural Hall on Wednesday last, and was one of the most successful gatherings the society has held. Show flowers staged in the orthodox manner were throughout of remarkably high quality, and the selfs shown with long stems and foliage were staged in large numbers and capital style, and proved a highly attractive feature. The flowers staged in the competitive classes were supplemented by groups of carnations from Messrs. Stuart Low and Co., Bush Hill Park Nurseries, Enfield, Mr. Grubb, and other exhibitors, which are described in our report of the Royal Horticultural Society's meeting, and by numerous groups of miscellaneous plants, of which the greater number had also been left over. The hall was well filled, and presented a bright and attractive appearance, and there was a large attendance, the hall being crowded throughout the greater part of the afternoon.

In competition for the prizes for eighteen carnation blooms, bizarres and flakes, Mr. J. Douglas, Edenside, Great Bookham, was first with splendidly developed blooms of Master Fred, Guardian, J. S. Hedderley, Gordon Lewis (2), W. Skirving, Admiral Curzon, Sportsman, Sarah Payne, Robt. Houlgrave, Admiral Curzon (premier bizarre), Mrs. Douglas, and several seedlings; Mr. Chas. Blick, Warren Nurseries, Hayes, was a capital second with finely finished blooms. For eighteen blooms of self carnations, Mr. J. Douglas was again first, staging Miss Willmott (2), Mrs. Griffith Jones (2), Splendour, W. H. Parton (2), Mrs. T. E. Henwood (4) (premier self), Daffodil (2), Mrs. Geo. Marshall, Ann Hathaway, Mrs. Robt. Gordon, and Cardinal, in superb form. Mr. Charles Blick was second with a fine stand of blooms. Mr. J. Douglas was first also for eighteen fancy carnations, the varieties being Lord Steyning (2), (premier fancy carnation) Highland Lass, Mrs. Arthur Young (2), Pasquin (2), Liberté, Alice Byron Stewart (2), Highland Lassie, Sam Weller (2), King Solomon, Mrs. Penton, Hidalgo, Sir Lancelot, and Grand Dame; Mr. C. Blick followed closely for second place. Mr. J. Douglas obtained premier honours in the class for eighteen white-ground picotees with a stand in which the following were finely represented: Queen of Spain, President, Fortrose, John Smith (2), H. Kenyon (2), Lavinia, Brunette, Little Phil (2), T. Williams (2), Favourite, Mrs. Sharp, Gannymede; Mr. Chas. Blick second with a fine stand, containing a superb bloom of Alcestis, which was selected as the premier heavy-edged white-ground picotee. The post of honour was occupied in the competition for the prizes for eighteen yellow-ground picotees by Mr. J. Douglas. In the collection were finely developed blooms of Flora McIvor (2), Burgomaster, Exquisite, Togo (2), Cymbeline, Lady Freemantle (2), Santa Claus (2), and Archie Brown; Mr. Chas. Blick second with a good set, which included a fine bloom of Her Majesty, that was selected as the premier heavy-edged yellow-ground picotee.

The section devoted to the classes for six varieties, three blooms of each, to be shown in vases with foliage, was a strong one, and the numerous collections produced a large and extremely beautiful display. For six selfs Mr. Douglas was a capital first with Daffodil, Miss Willmott, Cardinal, Mrs. Griffin Jones, Mrs. T. E. Henwood, Mina Sorrel; and Mr. Chas. Blick was second, with excellent blooms. For six fancy carnations, Mr. J. Douglas was again first, staging Mrs. Arthur Young, Lord Steyne, Erl King, Mr. Penton, Pasquin, Highland Lass (premier fancy carnation). The second award was made in favour of Mr. Chas. Blick. For six yellow ground picotees Mr. Charles Blick was first with splendid blooms of Daisy Boston, Colleen Bawn, Her Majesty, F. W. Goodfellow, Princess Juliana, and Miss Winifred; and Mr. J. Douglas was a close second. Mr. J. Douglas occupied the first place in the class for twelve varieties, three blooms of each, to comprise selfs, fancies, and yellow ground picotees, staging finely-developed flowers of Liberté, Daffodil, Mrs. R. Berkley, Agnes Sorrel, Lord Steyne, Cardinal, Miss Willmott, Pasquin, Amy Robsart, Santa Claus, and Peregrine; Mr. Chas. Blick second with a fine set.

The classes for twelve blooms were well filled, and in that for bizarre and flaked carnations Mr. H. R. Taylor, Cheam, was first with fine blooms of Fireman, Admiral Curzon, Joe Edwards, Torchlight (premier flake carnation), Bedouin, Merton, Tom Attrell, Murillo, and Crusader. The same exhibitor was also first for twelve self carnations, staging the following varieties in fine style, Miss Willmott, Much the Miller, Lady Malta, Maud Allan (2), Duchess of Wellington, Cardinal, Snowflight, W. H. Parton, Carabas, Leslie Miles, Caruso; Mr. H. Mathias, Stebbington, was second; and Messrs. Philips and Taylor, Bracknell, third, both having blooms of much merit. In the class for twelve fancies, Mr. Mathias was a splendid first with Lord Steyne, Devonian (2), Hidalgo, R. H. Rowberry, Liberté, Rony Buchanan, Pluto, Merlin, Erl King, Sam Weller, and Orlando; Messrs. Phillips and Taylor, Bracknell, were a good second; and Mr. W. Sydenham, Melbourne, Derby, a close third. For twelve white ground picotees Mr. H. R. Taylor was a capital first, his varieties being Queen of Spain (2), Dora Bright (2), John Smith, Favourite, Lavinia, Little Phil, Fortrose (premier light-edged picotee), Farino, and Kathleen; Mr. H. Mathias was a close second with blooms in a high state of development. The exhibitor last named occupied the post of honour for twelve blooms of yellow ground flowers, with Libra, Ida, Astrophel, Mrs. Hiriot, Styx, Leonora, Togo, Viola, and Libra at their best; Mr. H. R. Taylor was second, and Messrs. Phillips and Taylor third, with blooms of high quality.

The classes in the second division for undressed flowers of four varieties, to be shown in vases, three in each, were well filled, and the large number of blooms in competition produced an attractive display. For four self carnations Mr. H. Lakeman, Thornton Heath, obtained premier honours with superb blooms of Hildegarde, Miss Willmott, Cardinal, and Mrs. Guy Sebright; Miss Skiffner, Lewes, was second, and Mr. H. R. Taylor third.

For four fancy carnations, Miss Skiffner was first with Richness, Rony Buchanan, Juno, and H. Falkland; Mr. R. Morton, Woodside Park, second; and Messrs. Phillips and Taylor third. In the corresponding class for four yellow-ground picotees, Mr. H. R. Taylor was first with Ophir, Onward, and Mrs. W. Heriot; Mr. H. Mathias second, and Mr. R. Morton, Woodside Park, third. There was a very keen contest in the class for nine varieties, three blooms of each, and to include selfs, fancies, and yellow-ground picotees, and Mr. H. Mathias was first with Peregrine, Helen, Merlin, Miss Willmott, Rony Buchanan, Devonian, Libra, and Sam Weller; Mr. H. R. Taylor second, and Mr. W. Sydenham, Melbourne, third. The blooms were throughout of a high order of merit.

The two sets of classes for six blooms were well filled, and in these the most successful of the exhibitors were Mr. J. Fairlie, Acton; Mr. C. A. Linzee, Arlesford; Mr. E. Charrington, Limpsfield; Mr. E. Hooper, Acton; Mr. J. J. Keen, Southampton; Mr. C. A. Philbrick, Reading; Mr. G. J. Shelden, and Mr. E. Grey. In the fourth division for six varieties, undressed blooms, the chief awards were made in favour of Mr. J. H. Lininglen, Newport, Isle of Wight; Mr. L. G. Guyspeerdt, Mr. C. A. Philbrick, and Mr. A. L. Brown. In both divisions the blooms possessed much merit.

The contributions to the open classes for nine blooms of one variety, undressed, and to be staged in vases with carnation foliage, were numerous, and good, and formed a feature at once distinct and attractive. Here the principal prize-takers were Mr. J. Douglas, Mr. R. Morton, Mr. H. R. Taylor, Mr. H. Lakeman, Messrs. Phillips and Taylor, Mr. C. Blick, Miss Skiffner, and Mr. H. Mathias. In the class for nine blooms of a scarlet carnation, Mr. J. Douglas was first with Cardinal, a superb variety that was awarded a silver-gilt medal for its exceptional excellence.

CURE FOR MILDEW.

One ounce of Cyllin Soft Soap to a gallon of water is the surest remedy for mildew, green fly, and all forms of insect blight in the garden or greenhouse.

CYLLIN SOFT SOAP

Is a reliable all-round non-poisonous insecticide and germicide. It does not injure the tenderest shoots, and it cleanses the surface soil, thus safeguarding against further attack.

Particulars from Manufacturers, JEYES' SANITARY COMPOUNDS CO., 64, Cannon Street, London, E.C.

For 50 years we have specialised in the construction of Glasshouses, and our name is now regarded all over the country as synonymous with all that is latest and best in Glasshouse construction.
Contracts are undertaken for the erection and heating of
CONSERVATORIES, WINTER-GARDENS, VINERIES,
and all kinds of Glasshouses.
The most recent improvements in Ventilation, Heating, and internal fittings are introduced.
Plans and estimates will be sent free on receipt of particulars.
Contractors to H.M. Board of Works, H.M. Admiralty, H.M. War Office, etc., etc.

The Horticultural Club.

Thanks to the very kind invitation extended to the members of this club by Leopold de Rothschild, Esq., a party of gentlemen and ladies, numbering between sixty and seventy, spent a most delightful day at his beautiful estate of Ascott, Leighton Buzzard, on Thursday, the 15th instant. Mr. Harry J. Veitch, who undertook the arrangements, saw to the provision of saloon carriages at Euston, and brakes at Leighton, where the party arrived in time to look round the delightful gardens prior to paying less æsthetic attention to the lunch provided for them by Mr. Rothschild. A prior visit was, however, paid to the renowned stud farm, where several of the priceless race-horses were paraded for the visitors enjoyment, the beautiful creatures demonstrating to the utmost the perfection of equine symmetry, condition, and capacity for speed; the staghounds then came in for a share of admiration, the charming little puppies making the best claim to the ladies' attention.

Sir John Llewelyn, Bart., presided at the lunch, and, after the usual loyal toast, proposed the health of Mr. Leopold de Rothschild, and a cordial vote of thanks to Mr. Harry J. Veitch for the admirable way in which he had enabled them to profit by their host's hospitality. Mr. Veitch, in his reply, made a well merited reference to the kind services of Mr. Jenkins, the head gardener, who acted as guide on this occasion.

The weather, fortunately, was delightful, an oasis of summer in a desert of unseasonable rain and chill, the only reminder of which was a few minutes of threatening misty rain when after lunch the party was driven over to Mentmore, the Earl of Rosebery's estate, the imposing towers of whose mansion formed a salient feature in the broad landscape visible from the Ascott Gardens. Returning to Ascott, tea was provided, after which the party returned to London full of pleasant reminiscences of another delightful outing added to the list of those which it has been the privilege of the members of the club to enjoy for many years past.

Reading and District Gardeners' Association.

The Reading Gardeners' Association is again to be congratulated on bringing to a most successful issue another "Annual" excursion, on Thursday, July 15, when, by kind permission of Lord and Lady Northcliffe, Sutton Place, their delightful and historic residence near Guildford, was visited.

Special coaches were attached to the 9.55 a.m. S.E.R. train from Reading, and a large party, accompanied by the president, Mr. Alderman Parfitt, J.P., assembled at the station, and was augmented by additions at Earley, Wokingham, and Wellington College.

On arriving at Guildford, brakes were in readiness to convey the excursionists, to the number of nearly 150, to their destination, Sutton Place being reached about 11.45, where they were met by Lord Northcliffe's resident agent, Mr. Kay, and the head gardener, Mr. Goatley. A tour of the extensive and beautiful gardens at once commenced, the visitors being first taken through a portion of the Experimental Farm, which their fellow-member, Mr. Chas. Foster, recently inaugurated for Lord Northcliffe, then into the kitchen and walled gardens, everything seen being in a perfect degree of cultivation. The lawns and pleasure grounds surrounding the mansion were next visited, and a peep into the great hall and other parts of the mansion was much appreciated. Mr. Frederick Harrison in "Annals of an Old Manor House," says:

"Sutton Place was built between the years 1520 and 1530, and probably in the years 1523-1525, by Sir Richard Weston, an able statesman and a favourite of King Henry VIII. It is, if not the earliest, at least one of the very first extant specimens in England of a mansion-house built wholly as a peaceful dwelling, and entirely without any thought of defence. . . . The great hall is fifty-one feet six inches in length, twenty-five feet six inches in breadth, and nearly thirty-one feet in height. The fourteen windows—having ninety-two separate lights in all—are adorned with shields and quarries of painted glass, one coat or set of devices in each light."

Luncheon, generously provided by Lord and Lady Northcliffe, was taken at 1.30 p.m. Mr. Kay presided, and was supported by Mr. Alderman Parfitt, Mr. Leonard Sutton (vice-president, who arrived by motor), Mr. W. Pole Routh, Mr. J. Goatley, etc. At the conclusion of the repast several toasts were submitted, and a telegram despatched to Lord Northcliffe thanking him for his generous hospitality. The company was then conducted by Mr. Goatley to (from a professional point of view) the most charming feature of Sutton Place, viz., the glorious and extensive wild garden, where, note-book in hand, many of the members were content to pass the remainder of the day.

At 3 o'clock a cricket match, the Visitors v. Sutton Place Club, was commenced on the splendid ground in the park, the home eleven being found to be strong but generous opponents. Tea, provided by the noble host and hostess, was taken at 5.15, and at 6.15 the brakes put in an appearance to convey the party back to Guildford, Reading being reached at 8.6 p.m. Perfect surroundings, a gloriously fine day, and generous hospitality, contributed to make the excursion to Sutton Place a red-letter day in the annals of the Association.

Thanks are due to Mr. Kay and Mr. Goatley for their efforts to promote the comfort of their visitors.

United Horticultural Benefit and Provident Society.

The monthly meeting of this society was held at the Royal Horticultural Hall, Vincent Square, Westminster, on Monday, July 12, Mr. Charles F. Harding in the chair. Eight new members were elected. The death certificate of the late Mr. William Colton was produced, and a cheque for £71 10s. 2d. was drawn for his nominee, being the amount standing to the late member's credit in the books of the society. The usual quarterly payments from the Benevolent Fund were made, and two lapsed members' accounts paid out. A cordial vote of thanks to the chairman ended the meeting.

East Anglian Horticultural Club.

"A splendid display of flowers, fruits, and vegetables." Such was the general verdict of the members at the July meeting of this club. Sweet peas predominated; roses, with long stems and otherwise, were grand; strawberries supplied the feature of the fruit section; whilst culinary peas saw several keen contests, and some splendid pods of the Matchless Marrow variety. The educational side of the evening was devoted to an essay competition for under gardeners upon the "Cultivation of the Strawberry." Three very good papers were read, and after a short deliberation the judges gave their awards as follows: Mr. E. Hales, first; Mr. E. J. Ottaway, second; and Mr. R. Bird, third.

The next day a party of nearly one hundred members and friends joined in the annual summer excursion. The rendezvous this year was to the beautiful gardens of Earsham Hall, by kind permission of Captain Meade, J.P., D.L. These gardens have many old associations besides a great many modern improvements, carried out under the superintendence of Mr. Andrews, the present head gardener. What was recently a meadow is now a beautiful lake with hardy flowers, shrubs of all kinds, and pergolas of roses. The bamboo plantations surprised everyone. 'Twas a veritable jungle. Adjacent to these was a rock garden, an acre in extent, and filled with gems from the Alps and other places. It was gratifying to see the note books brought out and jottings made on "this and that" subject, as one knows that interest is evoked then, and that lessons are being learnt. The vineries, peach-house, orchid and stove houses all were visited, and Mr. Andrews complimented on the healthy look of the occupants. Many felt sorry when, after a ramble through the fruit and vegetable gardens, the time had come for departing, but as arrangements had been made for tea at Bungay, two miles away, this was inevitable. Thanks were accorded to Captain Meade and also to Mr. Andrews. Whilst every praise was due to Mr. W. L. Wallis, the secretary, for the splendid arrangements he had made for the comfort of the members.

MARKETS.

COVENT GARDEN.

Flowers.

Sweet peas, roses, and carnations continue abundant, and for flowers of good quality there is a brisk demand at fairly good prices.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

HEDGE CLIPPING.—E. S., Hertford: The present is a good time for trimming up hedges, as the growth subsequently made will be short and stout, and will become hard and ripe before winter.

FEATHERS AS MANURE.—P. G., Nottingham: According to the Board of Agriculture feathers and feather waste have a considerable value as manure, and excellent results are obtained in some hop gardens by using about 20 to 25 cwt. of feathers, and the limited supply (amounting probably to only a few hundred tons a year) is rather keenly sought after. Large feathers are slow in action, the shafts especially taking a long time to decay; a sample containing many of them is not as valuable as one composed mainly of small, more easily decomposable feathers. The ammonia obtained is usually a little over 10 per cent., a not uncommon price being £5 per ton delivered, giving a unit price of 10s. In spite of the generally good mechanical condition, this price is, perhaps, too high. The price naturally fluctuates; farmers have been known to pay £5 15s., while samples have also recently been offered at 70s. to 80s. At these lower prices, where the unit value is 7s. to 8s., feathers must be considered cheap.

PEAT MOSS LITTER.—C. L. J., Yeovil: Peat moss litter is very valuable as a substitute for straw, as it is very absorbent, and prevents the escape of nitrogen in the form of ammonia. The material used for these products is the layer lying between the living vegetation which usually covers the surface of peat moors and the true black turf which is used as fuel. The process of manufacturing moss litter is a comparatively simple one. The peat is first cut by hand, and dried in large stacks in the open air. When dry it is removed to a factory, where it is torn into fragments by machinery and passed over sieves to remove the dust. The litter is then pressed into bales.

FAILING MULBERRY TREE.—W. S., Croydon: Quite often mulberry trees are sadly neglected until they arrive at a condition from which recovery is difficult. Why the mulberry, one of the most prolific bearers, should be left severely alone to take what care it may of itself, is almost past comprehension: and yet it is so left even in otherwise well-kept gardens. The mulberry delights in a deep, moist root-run, and a warm position, and as it bears large crops of fruit for many years, it rarely receives assistance such as apples, pears, etc., receive. Your tree is being starved, and is suffering from lack of moisture as well as food material. The big elms close to it are robbing it of food and moisture, and unless you can provide a rich top-dressing and keep the robber roots away, the tree will steadily die back.

DISEASED SWEET PEAS.—D. L., Salisbury: The plants are not diseased, i.e., attacked by fungi, but are suffering from a collapse due to the recent prolonged cold and wet weather. Very large numbers of plants have died this season, and a very general opinion is abroad that "streak" is the disease from which they have succumbed. This is not the case. We have seen numbers of plants attacked by "streak," and have been interested in this complaint from its earliest appearance among sweet peas, but where streak claims its tens, the yellowing and collapse takes its thousands. High cultivation, very artificial methods of propagation, close in-breeding, always bring difficulties in their train, and a bad season accentuates the difficulties. Pull up and burn

SUBSCRIBER'S ORDER FORM.

Every Saturday THE GARDENERS' MAGAZINE. Twopence.

To W. H. and L. Collingridge,
148 and 149, Aldersgate Street, London, E.C.

I request you to send me the GARDENERS' MAGAZINE by post every week until countermanded, and I enclose ______ for ______ months in advance.

Name ______

Address ______

Date ______

1 Year, **10/6** post free; 6 months, **5/6** post free; to Foreign Countries, **15/-** per annum.

. If a receipt is required for amounts under 10s. a stamped envelope should be forwarded.

the plants; you will find the root system is very poor. Make a small sowing out of doors in the autumn, and another in spring, and you are likely to have little trouble from streak or yellowing, but you must keep slugs and birds away.

CARNATIONS.—A., Hornsey: If the seedlings are layered, and the young plants well grown, the flowers should come finer than in the seed bed; that is to say, they would be larger, but whether they would improve in form and colour we cannot tell. You should grow a few of each variety that appeals to you, and test them another year. Artificial manure should be used very sparingly during late autumn and winter, and only then be used for plants that are flowering. Some of the carnation specialists offer a special manure that is good when used according to directions given with it; you will find addresses in our advertising columns. We do not recognise the variety of grape from the small leaf sent.

FLORISTS AND THE FACTORY ACT.—A. R. L., Lingfield: The matter formed the subject of an Order of the Secretary of State, dated October 13, 1908, and this directed that special exceptions be made to the Factory and Workshop Act of 1901, namely: (a) An exception permitting women and young persons employed in a workshop to have the times allowed for meals at different hours of the day; and (b) An exception permitting women and young persons during the times allowed for meals in the workshop to be allowed to remain in a room in which a manufacturing process or handicraft is being carried on; shall extend to women and young persons employed in florists' workshops, subject to the condition that in every workshop the occupier of which avails himself of this exception there shall be affixed a notice showing the names of the women and young persons employed in the workshop and the times allowed to each of them for meals.

CHRYSANTHEMUM CONFERENCE. — E. J. H., Glasgow: A chrysanthemum conference has been arranged for Wednesday, October 6 next, in the Essex Hall, Strand, W.C., in connection with the Floral Committee meeting of the National Chrysanthemum Society. There will be two sessions, one early in the afternoon, and one after the adjournment for tea. The particulars of papers to be read, etc., are not yet forthcoming.

NAMES OF PLANTS.

F. T., Torquay.—Spiræa Douglasi.

P. J., Towcester.—Melaleuca calycina.

E. M., Teignmouth.—Muehlenbeckia complexa.

S. S., Leicester.—1, Gypsophila elegans; 2, Impatiens Sultani; 3, Gasteria verrucosa.

L. K. B., Yeovil.—1, Kleinia articulata; 2, Althæa ficifolia; 3, Hoffmannia Gheisbreghtiana.

M. E. C., Gravesend.—1, Gilia ciliata; 2, Gladiolus psittacinus; 3, Mimulus glutinosa; 4, Dimorphotheca aurantiaca.

C. J. M., Leyton.—1, Gaultheria procumbens; 2, Statice Gmelina; 3, Peristeria elata; 4, Perilla nankinensis; 5, Solanum jasminoides.

Osmanthus ilicifolius purpureus is a singularly effective shrub, and one that is fortunately making great headway in gardens. It appears to succeed under similar conditions to the type, which it resembles in many respects. The most noteworthy character is the colour of the leaves, which are of a rich glowing purple, and this is most pronounced in those of the current season's growth. Here it is planted near to the coloured forms of Prunus spinosa and P. Pissardi, and the polished leaves of this shrub stand out in marked contrast to these others, the colour alone rendering it most distinct and conspicuous at some distance. It is valuable for use in gardens where winter effect is desired, as although the purple colour is much weaker at that season, it still stands out distinct among those shrubs whose foliage is normally green.—THOMAS SMITH.

Situations Wanted.

HER GRACE THE DUCHESS OF DEVONSHIRE wishes to recommend J. THOMPSON to any Lady or Gentleman requiring the services of a HEAD GARDENER, where several are kept; 20 years' experience in all branches. Holker Gardens, Cark-in-Cartmel, Lancs.

MR BOUVERIE CAMPBELL-WYNDHAM wishes to recommend GEORGE MERREIT as HEAD GARDENER, where two or three are employed. G. Merrett is thoroughly up to all garden work, understands hothouses, vines, and growing of carnations; he is married, no children; leaving for no fault, but to better himself; age thirty. Apply to Mr. Cawte, Head gardener, Corhampton House, Bishop's Waltham.

GARDENER (Head, where two or three are kept or good Single-handed), thoroughly experienced in all branches, Inside and Out; management of cows and poultry, if required; good references; married, two children. A. GOODFELLOW, 94, Sherrard Road, Forest Gate, Essex.

GARDENER (Head Working), thoroughly experienced Under Glass and Outside; also herbaceous plants; excellent character from present and previous employers; married, no children. J. L., 20, Carnarvon Road, Barnet.

GARDENER (Head Working); life experience, Inside and Out; Home Farm if required; age 40; married, no encumbrance. MORRIS, Dytchley Gardens, Brentwood, Essex.

GARDENER (Head Working), good, practical life experience in all branches, Inside and Out, early and late forcing; especially good with Melons, Violets, and Chrysanthemums; nine years with last employer as Head; can have excellent references. H. TURNER, 4, Glenton Street, Peterborough.

GARDENER (Head) seeks SITUATION where three or more are kept; age 30; married, two children; six years Escrick Park, five years Campsall Hall; three years as Head at present situation. SKILBECK, Nunthorpe Hall, York.

GARDENER (Head of two or good Single handed); age 37; married, one child; life experience, [illegible] years present situation; well recommended. J. FARROW, Mepal, Ely, Cambs.

GARDENER (Head of two or three, or good Single-handed); good all round experience; highly recommended; 6 years' excellent character; age 28. C. MEPHAM, Pay Gate, Burwash, Sussex.

MESSRS. LADHAMS, Nurserymen, Shirley, Southampton, can confidently recommend W. GUNSTON, age 35, as HEAD WORKING GARDENER to any lady or gentleman requiring the services of a good all-round man, who is conversant with the requirements of a well-kept establishment; excellent references. Apply as above.

GARDENER (Head or Single-handed); life experience in all branches; good reference; married. A BROWN, 13, Vineyard Terrace, Long Lane, East Finchley.

C. F. EGERTON, Esq., Bulcamp, Halesworth, Suffolk, highly recommends A. IFE as Head Working GARDENER (Single-handed); married, abstainer, 2½ years present place; previous six years Henham Hall Gardens, Wangford, Suffolk. A. IFE, Bulcamp, Halesworth, Suffolk.

AS GARDENER (Single-handed or otherwise); life experience Inside and Out; good references; single; age 44. Address F. GOWER, Springfield Villas, Clarendon Road, Ashford, Staines.

GARDENER (Single-handed); age 27; experienced, Inside and Out; left through death; over five years' good reference. A. RAYFIELD, 1, Haywood Road, Bromley, Kent. (No circulars.)

GARDENER (good Single-handed or with help); some Glass essential; age 28; over three years' excellent reference. Apply GARDENER, care of Mrs. Carter, Foxhills, Radstock, Somerset.

GARDENER (Single-handed or with help); good Second's place not objected to; married; age 36; tall; one child; life experience, Inside and Out; good references. H. WARNER, 17, Salmestone Road, Margate, Kent.

GARDENER, used to Inside and Outside work, Single-handed or with help; good references; age 27. E. GODSON, Ossington, near Newark, Notts.

FOREMAN (Inside), age 29; life experience in Plant and Fruit Houses, Orchid House, and Table Decorations; two years as Foreman, previously three years First Journeyman, Lockinge Park, Wantage; excellent references. JOHNSON, 192, Haverstock Hill, Hampstead, N.W.

MANAGING FOREMAN, age 35; married; London and Provincial life experience in growing Grapes, Cucumbers, Tomatoes, Chrysanthemums, Soft-wooded Plants, Forcing Vegetables and Bulbs, Inside and Outside; Cut Blooms, Wreath-making, Horticultural Building and Heating. FOREMAN, Sterte Nurseries, Poole, Dorset.

MANAGER-FOREMAN (Working); age 40; married; life experience in Market Nurseries; Grapes, Tomatoes, etc. (Iris a speciality); highest references. Address J. PARSONS, Stone Nurseries, Stone, Dartford.

TO-DAY! AND FOR YEARS AND YEARS PAST the XL ALL Specialities are and have been the best on the market. Where is the Gardener who does not pin his faith to one or the other of these celebrated Insecticides or Fertilisers? XL ALL FERTILISER has pleased all who have used it this season. The Sales of XL ALL FUMIGATOR prove that it is more popular than ever. XL ALL LIQUID NICOTINE INSECTICIDE is always spoken of by gardeners and growers as the most deadly to Mealy Bug, Thrip, etc. XL ALL WEED KILLER used once a year "No weeds can live." RICHARDS' ARSENATE OF LEAD for all leaf-eating insects. CUCASA (fungicide), the finest preparation of copper ever offered to gardeners. Please ask your Nurseryman, Seedsman, or Florist for a copy of my small pink list, giving particulars of these and many other XL ALL Preparations, which can be obtained fron the Horticultural Trade throughout the World. G. H. RICHARDS, Manufacturer and Patentee, 234, Borough High Street, London, S.E.

NOTES OF THE WEEK.

Proposed International Horticultural Exhibition.

To those who have had opportunities for taking an active part, as members of jury or otherwise, in the various international horticultural exhibitions that have been held on the Continent during the past quarter of a century, it has been a matter for regret that exhibitions of a similar character have not been held in this country since the memorable gathering in the year 1866. Returning home from the great international exhibitions at Ghent, Paris, Hamburgh, St. Petersburg, Turin, and other places, and impressed with the magnitude and beauty of the display, and imbued with a strong sense of appreciation of the generous hospitality they have received, British horticulturists have been filled with the desire that the time would soon come when they could reciprocate, by giving foreign horticulturists an opportunity of presenting the products of their skill in London, and showing them hospitality of a generous character. However strong may have been the desire, it has been fully recognised that for a considerable period there have been difficulties in the way of its realisation. Certainly no one could have desired that the Council of the Royal Horticultural Society should incur the responsibility of organising an international exhibition on a befitting scale until such time as the society had been provided with a suitable home, and a garden in which experimental work could be conducted on a comprehensive scale. With a lessening of the strain inseparable from the endeavour to place the society in an exceptionally strong position, financial and otherwise, the Council have shown that they are fully alive to the importance of international gatherings as a means of furthering horticultural progress, and also that they recognise the desirability of combining social functions with serious work. We had evidence of this in the Conference on Genetics, held two years since, which proved so great a success as to fill the members of the conference, who came from all parts of the world, with admiration for the great administrative ability of the Council and officers of the society, and for the generous hospitality shown them. Necessarily the conference and the social functions associated therewith were limited to scientists more or less closely interested in plant development. No such limitation would be imposed in the case of an international horticultural exhibition, as all who are engaged in horticultural pursuits, or take an interest in the garden, would be able to participate in the pleasure such a gathering is so well able to afford. We have, therefore, much pleasure in stating that the Council of the Royal Horticultural Society have given further evidence of their desire to promote international gatherings by suggesting that a horticultural exhibition of an international character be held in London two years hence. In a communication having reference to this all-important question that we have received from the Council, it is pointed out that from time to time international horticultural exhibitions have been held at various centres on the Continent, as at Paris, Berlin, Ghent, Turin, etc. The last occasion on which Great Britain took part in these international courtesies was in 1866, and it has occurred to the Council that it is time our country made an effort (say in 1911) to return some part of the hospitality which foreign countries have so often extended to this country during the forty years that have elapsed since such a gathering was held in London. It is further suggested that in connection with it a fourth conference should be held on genetics, or, in other words, on the origin, breeding, and heredity of plants. If this suggestion be acted upon, as, doubtless, it will, science and practice will happily be combined, as was the case at the memorable gathering in 1866. But, as the result of a wider knowledge of the scientific aspect of plant life, the greater breadth of view that is taken of the garden and its occupants, and the forty years persistent effort in plant improvement, the subjects discussed at the conference will differ widely from those which obtained attention at the conference in 1866, and the exhibition will consist chiefly of different classes of plants. Attention is very properly directed to the fact that the first point to be considered is the financial one. In the case of the 1866 international show at South Kensington, the balance-sheet gives an expenditure of £13,000, and, although this was more than covered by the receipts, it is considered only prudent to endeavour to raise such a sum. This the Council suggest may be done, as it was in 1866, by a combination of a general guarantee fund, and a definite subscription fund, every guarantor of twenty-five guineas receiving a ticket to the show on the opening day, and on one other day, and every subscriber of one guinea receiving a ticket admitting on the opening day. The Royal Horticultural Society will, the Council state, in due course call a meeting of horticulturists and others to consider the matter, and, if the suggestion be adopted and an influential general committee be appointed to carry it out on these lines, the Council are prepared to guarantee £5,000, on condition

MR. THOMAS STEVENSON. [illegible]

that all the Fellows of the society receive admission tickets (not necessarily on the first day); one ticket for £1 1s. Fellows, two tickets for £2 2s. Fellows, and four tickets for £4 4s. Fellows. There are many matters connected with an exhibition such as the one which has been proposed, that should in due course be discussed, but there is in our opinion a strong objection to refer to the details until it has been decided that such exhibition shall be held. For the present it will suffice to give publicity to the proposal, to commend it to the careful consideration of our readers, and to express the hope that it will receive the support of all who are interested in gardening.

Mr. Thomas Stevenson, so well known as a successful exhibitor of chrysanthemums and sweet peas, and as the clever gardener at Woburn Place, Weybridge, the residence of E. A. Mocatta, Esq., is the son of another very able gardener, Mr. Stevenson who has charge of the public gardens at Bournemouth, and whose portrait we gave a short time ago. Mr. Thomas Stevenson commenced his gardening career at Purbeck House, Swanage, passing from thence to Branksea Castle, Poole, and then to Canford Manor, when Mr. T. Crasp was head gardener. To Eshton Hall, Gargrave, Yorks, was the next move, and here, as foreman, he took up sweet pea cultivation with spirit and success. From Yorkshire Mr. Stevenson came south again, and was at the Ryecroft Nurseries for a whole season, laying the foundation of success as a chrysanthemum grower. After spending short periods as foreman at Wayfield Hall, Bracknell; Bagnell House, Bicester; and Effingham Hill, Dorking, Mr. Stevenson took up his present position, and he has been with Mr. Mocatta for about eleven years. Woburn Place is not a very large establishment, but it is beautifully kept, as Mr. Mocatta is very fond of his garden, is a generous employer, and has a great love for roses. Mr. Stevenson is an excellent plantsman, and he has raised several good sweet peas, and a fine coleus named Cordelia. As a photographer he is particularly successful both with flowers and garden scenes, while his study of the head of "Old Dickie," a local celebrity, which was included in the last exhibition of the Royal Photographic Society, has gained him fame and honour in the higher photographic circles. At Saltaire, on July 13, Mr. T. Stevenson won the National Sweet Pea Society's Provincial Cup for sweet peas, thus gaining it the second year in succession. Mr. Stevenson won the Eckford Memorial Cup in London in 1907, and again last week, winning with what was probably the finest set of flowers ever staged.

Sale of an Important Scottish Estate.—The fine residential mansion of Galloway House, Wigtownshire, together with 10,000 acres of land, has been purchased from the Earl of Galloway by Sir Malcolm McEacharn, who is at present in residence there. The mansion house, which is of comparatively modern style, dates from the middle of the 18th century, is beautifully situated in the most southern part of Scotland, in the midst of extensive grounds and park, overlooks the waters of the Solway Firth, which together with those of Wigtown Bay, form for several miles in length the south-eastern boundary of the estate. This comprises within its radius some of the most fertile land in Scotland, also two historic castles of great antiquity. One of these, Baldoon Castle, now a ruin, belonged in times long past to the once powerful family of Dunbar, and was brought into prominence in recent times by Sir Walter Scott, as it was here the plots and scenes were enacted that culminated in the production of "The Bride of Lammermoor." The lands mentioned, though forming only a part of the Galloway estate in Wigtownshire, have been in the possession of the family for several centuries. Situated in a purely agricultural district, and considerably off the route of tourists, the estate is less known than many others more favoured in this respect, yet the natural beauties of the district, and the horticultural prominence that Galloway House has enjoyed for many years past, have helped to establish for it a reputation far beyond the county in which it stands.

Veitch Portrait Fund.—In sending us the list of subscribers to the portrait of Mr. Harry J. Veitch, V.M.H., which it is proposed to hang in the Royal Horticultural Society's buildings, Mr. H. B. May and the Rev. W. Wilks inform us that the list of subscribers will be definitely closed on Saturday, August 14. It is suggested that a replica of the portrait should be presented to Mrs. Veitch, and a photogravure of it to every subscriber of £1 1s. and upwards.

Kew Bulletin.—The current issue (No. 6, 1909) of this publication is of much interest, and chief among the contributions are a report by Mr. W. J. Bean, on the effects of the winter of 1908-9 on trees and shrubs at Kew; additions to the wild fauna and flora of the Royal Gardens, and a revision by Mr. A. R. Rolfe of the genus Cycnoches. We are pleased to learn that the 144 plates of cyperaceæ, with corresponding explanatory text, which the late Mr. C. B. Clarke had printed some time previous to his death, are to be issued in book form. With the object of placing at the disposal of botanists a further instalment of the results of the late Mr. C. B. Clarke's prolonged study of this natural order, his executors have decided to issue the plates at a nominal price. They will be published by Messrs. Williams and Norgate, London (price 12s.).

The White Florentine Iris.—The probable origin of the white Florentine iris is the subject of a contribution to "Atti dei Lincei" xviii. 10, from Dr. R. Pirotta and Dr. M. Puglisi. It is stated that forms have been observed with blue spots variously arranged, and that these are not peculiar to individual plants, but may occur on different plants in different countries. It is therefore suggested that Iris florentina is a variety of I. pallida that has become permanent.

Position of the Royal Botanic Society. At a recent ordinary meeting of the Fellows, the position of the Royal Botanic Society was again discussed. Mr. Brinsley Marlay, the treasurer, who presided, said that they had received from the Duke and Duchess of Teck a cheque for £10 10s., and an extra subscription of £20. With regard to the present position of the society, the subscriptions received would enable the society to exist until August 10. This, however, had nothing to do with the future of the society. What they had to consider was what would be the position of the society on December 31 next. The debt of the society on that date would be nominally £6,709, and in order to prevent bankruptcy a sum of £2,022 must be raised, and, naturally, this debt must be met by the Fellows. The sum of £2,077 had been raised, and as this had been supplied by one-third of the Fellows, there were about 600 Fellows who had not yet subscribed. With regard to the debentures there were no means by which these could be paid off, but he believed that if the society could be reorganised the interest on the debentures could be paid. It was decided to alter the date of the annual meeting from August 10 to September 21. On the motion of Mr. A. C. Claudet, seconded by Mr. Rubinstein, a hearty vote of thanks was accorded to Mr. Brinsley Marlay for the services he had rendered to the society.

Forcing Plants with Hot Water.—With reference to the method brought forward by Prof. H. Molisch for using a warm-water bath as a means of forcing plants when in a dormant condition, "Nature" states that in response to inquiries the author has elaborated his paper for publication, with additional illustrations, as a separate pamphlet published by Mr. Gustav Fischer, Jena. The method consists in plunging the plants, preferably inverted, so as to immerse the stems but not the roots, into a water bath maintained at a temperature ranging, according to the plant, from 15 deg. C. to 30 deg. C. After soaking in the bath for about ten to fifteen hours, the plants are placed in a warm, moist chamber, and eventually transferred to the greenhouse. Forsythia, spiræas, syringas, and other plants that are usually forced give good results. Azalea mollis and Camellia japonica did not respond to treatment, and there was no practical result in the case of narcissi bulbs. The precise nature of the action has not been determined, although it is suggested that the stimulus may be compared with that produced by ether vapour.

The Potato Crop is according to the report of the Board of Agriculture very satisfactory. The growth has been vigorous and the tubers are swelling up well. The low temperature that has obtained up to the present time has prevented an outbreak of potato disease, which would unquestionably have been the case had the heavy rainfall been accompanied for any considerable period by warm close weather.

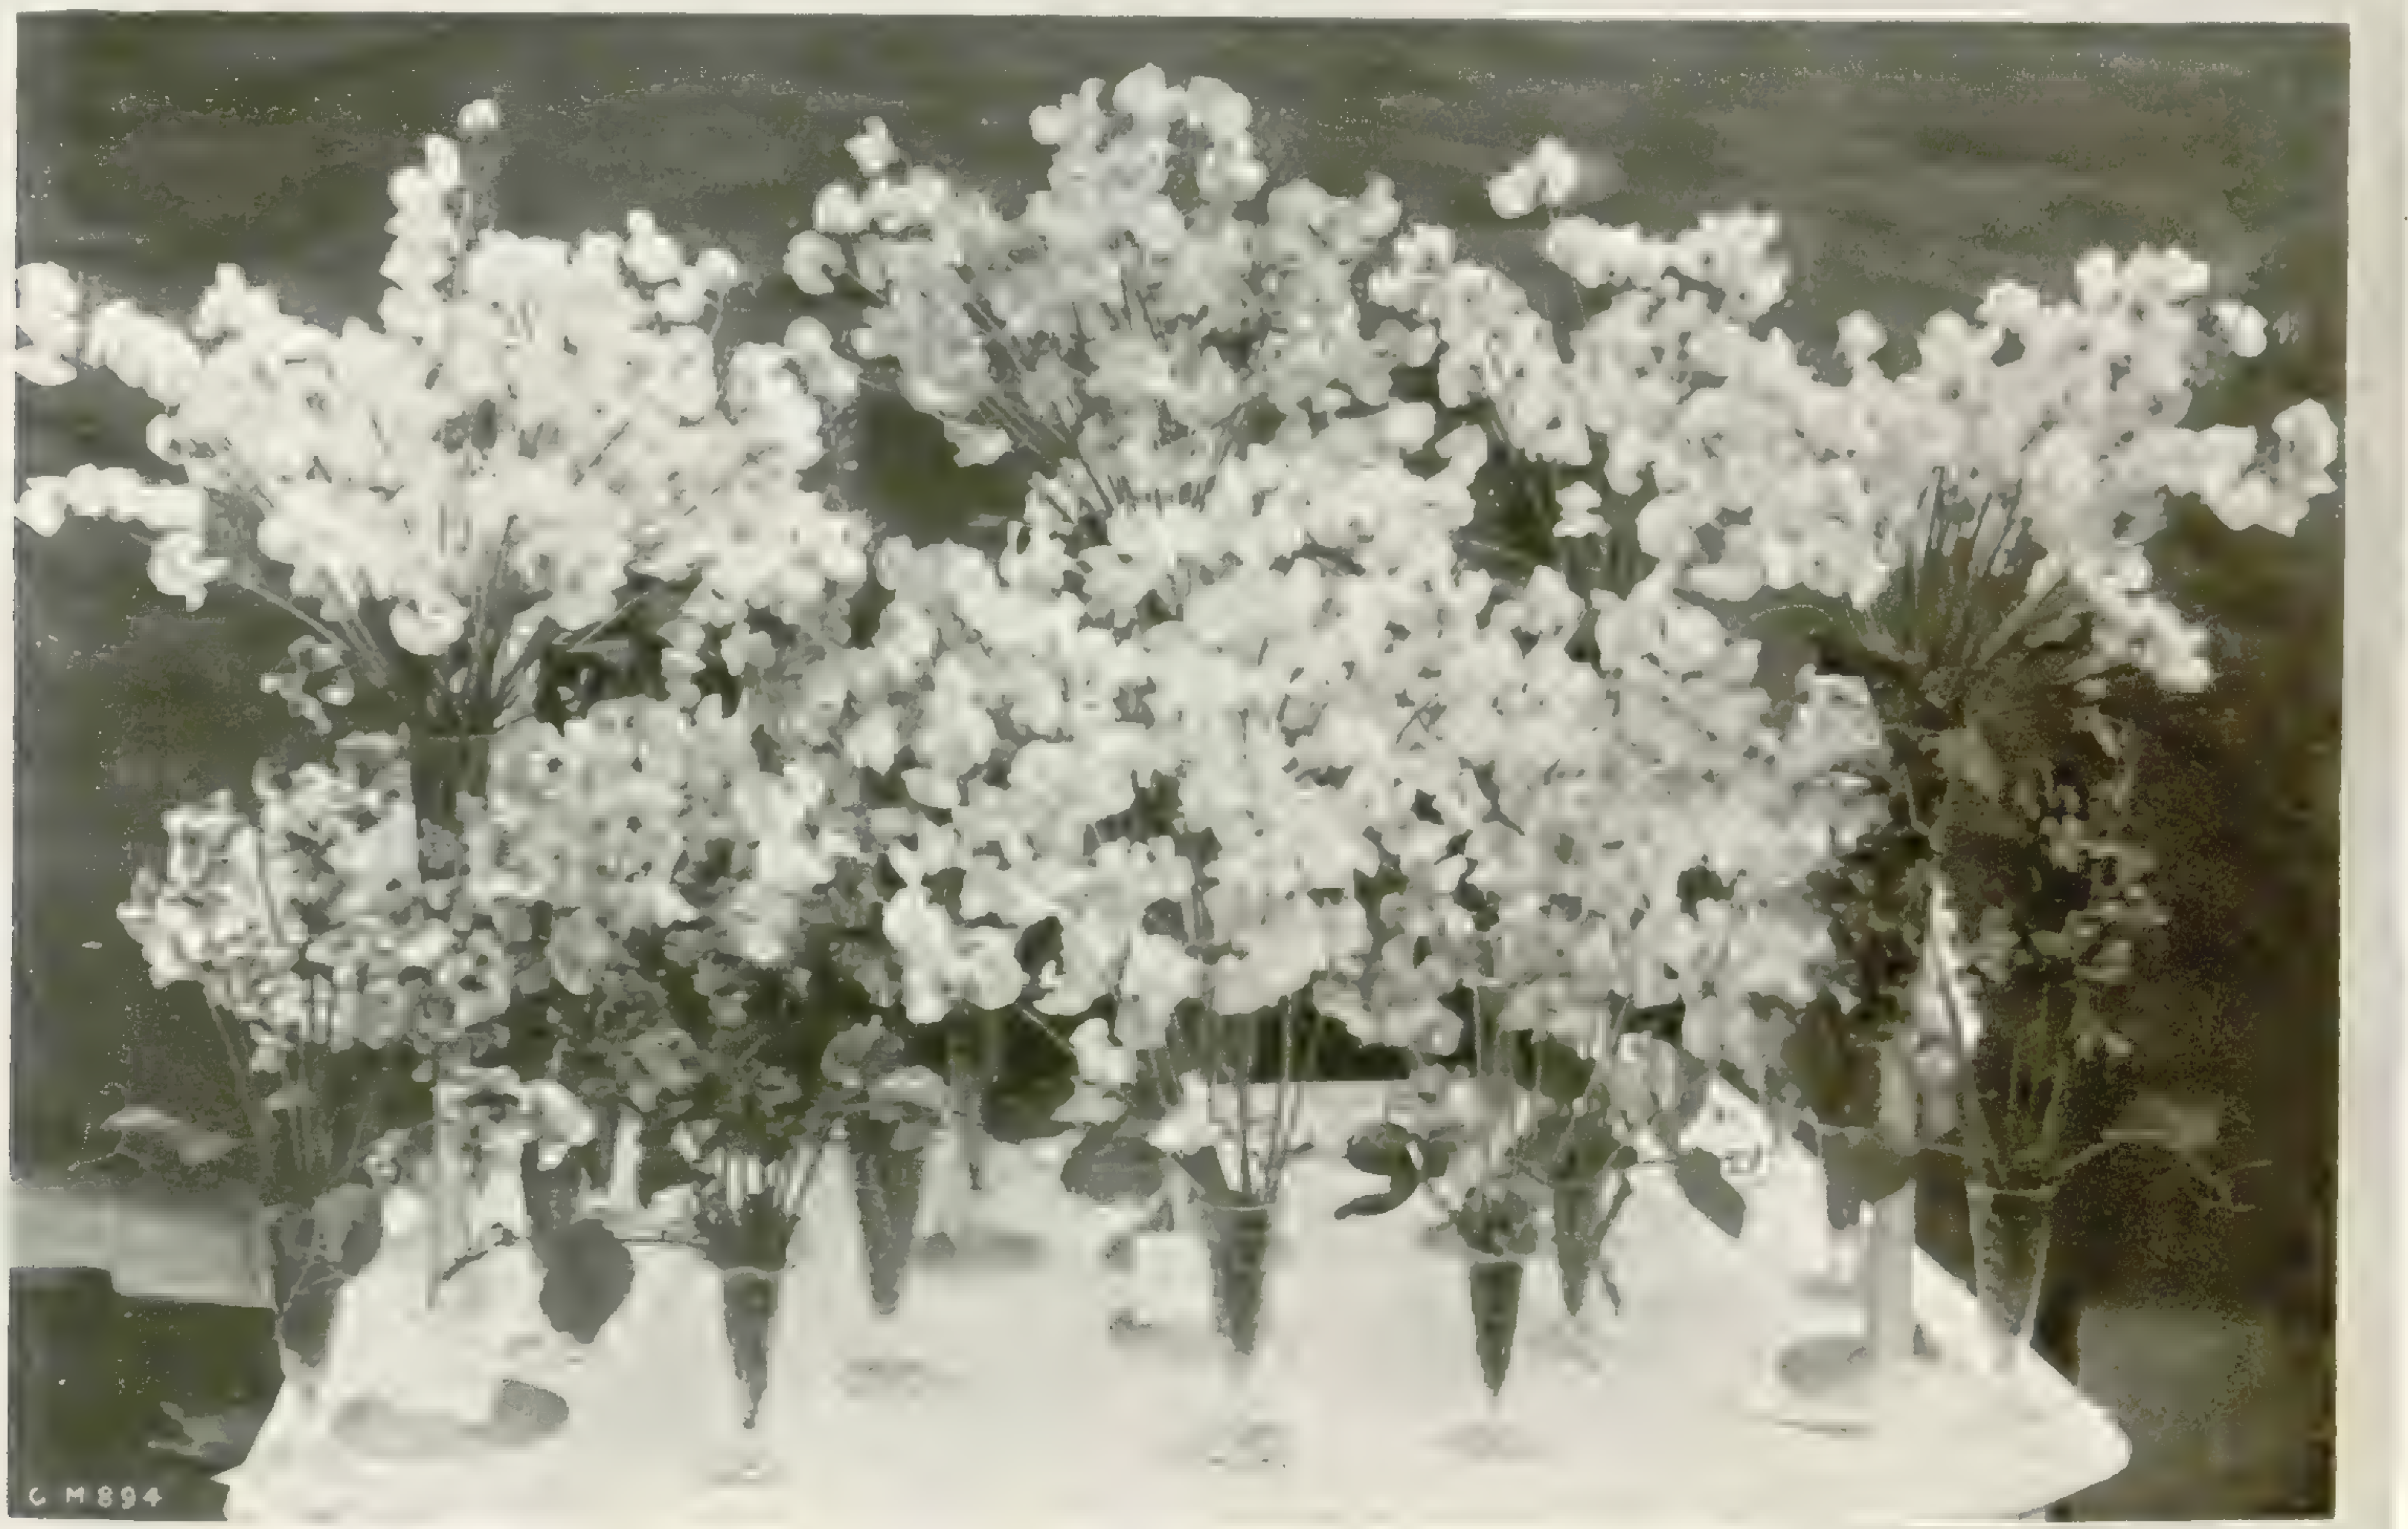
Wages in Royal Parks and Gardens.—In the House of Commons a few days since Mr. Summerbell asked Sir E. Strachey whether he was in a position to state what action, if any, it was proposed to take in regard to the petition received from the Kew Employees Union as to the shortening of the hours of labour worked by such employees. Sir E. Strachey stated in reply that the matter was under consideration, and he was not then able to make any statement relating to the subject. With reference to the appeal made by the employees at Hampton Court and in Bushey and Richmond Parks for an increase of wages to those employed seven days a week, the First Commissioner of Works stated at the same sitting that the matter was under discussion between himself and the Treasury.

A South London Flower Show.—The annual flower show in association with the Robert Browning Settlement, Walworth, was held and proved highly successful. The products of nearly two hundred gardens were exhibited in competition for the prizes and their quality was decidedly high, having regard to the adverse conditions that obtain in the district. The most successful of the exhibitors was a printer's labourer, who was awarded the Royal Horticultural Society's bronze medal for the winner of the largest number of prizes, the first prize for the best garden in Trinity Ward, and the Browning silver medal for the best garden in the whole of Newington.

NATIONAL SWEET PEA SOCIETY.

The ninth annual exhibition of this special floricultural society was held at the Royal Horticultural Hall, Vincent Square, Westminster, on Friday, July 23, and, considering the season, no more suitable date could have been fixed for the show. The display was by far the finest yet held under the society's auspices, and was a great success as regards the quantity and quality of the exhibits and the number of competitors, the latter reaching two hundred. The great hall, annexes, lecture hall, and committee room were all packed with exquisite flowers, making up, as an American lady expressed it, "an ocean of loveliness."

The arrangement of the show was good. The trade displays made a framework for the competitive exhibits. For the first time at a flower show the music gallery was decorated with flowers and plants, and the table decoration and Burpee Cup classes were set down through the centre of the hall. There was a large attendance of members and friends, and £38 10s. was taken at the doors.



MR. ROBERT BOLTON'S FIRST PRIZE TABLE OF WAVED SWEET PEAS (BURPEE CUP CLASS) AT THE NATIONAL SWEET PEA SOCIETY'S SHOW ON JULY 23.

AMATEURS' CLASSES.

In the special audit class, for fifteen bunches of sweet peas, the varieties to be selected from the audit list of 1908, there were seven competitors, and here Mr. Thomas Jones, Ruabon, won the Sutton Cup, gold medal, and first prize with magnificent blooms of Prince Olaf, King Edward VII., Etta Dyke, John Ingman, Evelyn Hemus, Lord Nelson, Frank Dolby, Sybil Eckford, Constance Oliver, Helen Lewis, Clara Curtis, Countess Spencer, Helen Pierce, Mrs. Hardcastle Sykes, and Black Knight. Mr. A. E. Usher, gardener to Sir Randolf Baker, Bart., Ranston, Blandford, Dorset, came second; and Mr. E. F. Usher, gardener to C. K. Wild, Esq., The Grange, New Eltham, third. Five competitors entered in the class for twenty-four bunches, distinct, for the prizes offered by Messrs. C. C. Morse and Co., San Francisco, and here Mr. T. Vickers, gardener to E. Rawnsley, Esq., Well Vale, Alford, Lincs, won the chief award with a very fine set of flowers, in which Helen Lewis, Evelyn Hemus, Menie Christie, Rosie Adams, Lord Nelson, and Mrs. A. Ireland were notable; Mrs. A. Tigwell, Harrow View, Greenford, came second; Mr. J. T. Tubb, Oakbank, Seal, Sevenoaks, third; and Mrs. A. J. Norris, Longshaw, Chipstead, fourth.

There is always a keen competition for the very handsome Henry Eckford Memorial Cup, and this year there were ten contestants. Twelve bunches, distinct, are invited, and the premier set—generally regarded as easily the finest in the hall for quality and colour—came from Mr. T. Stevenson, gardener to A. E. Mocatta, Esq., Woburn Place, Addlestone. His varieties were The Marquis, Countess Spencer, Elsie Herbert, Clara Curtis, Helen Lewis, Lavender George Herbert, Audrey Crier, Rosie Adams, Evelyn Hemus, Prince of Asturias, Mrs. H. Bell, and John Ingman. Mr. Thomas Jones, Ruabon, second; Mr. A. E. Usher, third; and Mr. Hopkins, gardener to F. Wellesley, Esq., Woking, fourth. For a dozen bunches, specified varieties, Mr. J. Haycock, Wagoner's Inn, Gyfelia, Wrexham, won the chief of Messrs. Sydenham's prizes with good examples of Clara Curtis, White Spencer, Frank Dolby, George Herbert, Helen Lewis, Helen Pierce, Jeannie Gordon, Lord Nelson, Mrs. H. Sykes, Mrs. W. Wright, Paradise, and Queen Alexandra; Mr. G. F. Hallett, Easton Neston Gardens, Towcester, second; Mr. E. Keith, Cambo, Morpeth, third; and Mr. J. T. Tubb, fourth. Messrs. Dobbie and Co.'s prizes for a dozen bunches of sweet peas brought out no fewer than thirteen competitors, and here again Mr. T. Stevenson led the way, showing excellent blooms of St. George, Princess Victoria, Prince Olaf, Mrs. Andrew Ireland, The Marquis, John Ingman, The King, Mrs. Collier, Black Knight Spencer, Helen Lewis, and Norah Unwin. Mr. Thomas Jones was a close second; Mr. A. E. Usher third, and Mr. E. Keith fourth.

The Horace Wright Challenge Bowl, for nine bunches of sweet peas suitable for garden decoration, induced nine competitors to enter, and the bowl was won by Mr. A. Basile, gardener to the Rev. W. MacMurdie, Woburn Park, Addlestone, with very fine blooms of Helen Pierce, Countess Spencer, Jeannie Gordon, Nora Unwin, King Edward VII., Dora Breadmore, Helen Lewis, Frank Dolby, John Ingman. Mr. Basile, who has won the bowl three successive years, now holds it entirely. Mr. G. F. Hallett, second; Mrs. F. Wallis, West Byfleet, third; and Mr. M. Y. Green, Eynsford, fourth. The Breadmore Challenge Plate for a dozen varieties, proved a great attraction; there were thirteen entrants, and Mr. Profit, gardener to E. A. P. Broad, Esq., Par Station, Cornwall, led with Paradise Red Flake, Black Knight, Prince Olaf, Etta Dyke, Paradise Carmine, Dora Breadmore, Menie Christie, Primrose Spencer, A. J. Cook, Henry Eckford, Audrey Crier, and Queen Alexandra; Mr. E. Cowdy, J.P., Loughall, Co. Armagh, Ireland, second; Mr. R. Hallam, Radcliffe-on-Trent, third; and Mr. A. F. Blades, Rookfield, Reigate, fourth. Mr. Dipnall's cup and first prize for six varieties fell to Mr. J. Haycock, who staged Mrs. Wilcox, Nora Unwin, James Grieve, George Herbert, Sunrise, and Paradise; Mr. A. E. Usher, second; Mr. A. Lambert, Bartroppe Lodge, Weybridge, third. In another class for six varieties, provided by Messrs. G. and A. Clark, there were twenty-three competitors, the awards falling in order of mention to Mr. F. Fairbairn, Stanhope Park Gardens, Greenford; Mr. E. Lambert; Mr. G. Baldwin, The Gardens, Greenford Green; and Mr. F. R. Castle, Bruncombe Gardens, Foxcombe Hill, Oxford. For one bunch each of Herbert Smith, Jet, Miss Millie Maslin, and Mother of Pearl, the awards were made in favour of Mr. E. Keith, Mr. A. E. Usher, and Mr. M. Z. Green. For one bunch of

The Queen sweet pea Mr. A. T. Paskett, gardener to E. Johnstone, Esq., Burrswood, Groombridge, led, followed by Mr. E. Keith and Mr. A. E. Usher.

OPEN CLASSES.

The classification class, for eighteen bunches of sweet peas, each to represent a distinct colour class, brought out seven competitors. Messrs. Hurst and Sons provide the prizes. Chief honours fell to Mr. Edward Keith, Cambo, who was a good first with The Marquis, Etta Dyke, George Herbert, Queen Alexandra, James Grieve, Frank Dolby, Menie Christie, Mrs. H. Sykes, Paradise, Hannah Dale, Rosie Adams, St. George, Evelyn Hemus, Jeannie Gordon, Mid Blue, Constance Oliver, Helen Pierce, and Sybil Eckford; Mr. A. E. Usher, second; Messrs. Bide and Sons, Farnham, third; and Mr. C. W. Breadmore, Winchester, fourth. Messrs. Watkins and Simpson's prizes for sixteen bunches fell, in order of mention, to Messrs. Jones and Son, Shrewsbury; Mr. A. E. Usher; and Mrs. H. Tigwell, Greenford. Messrs. Cooper, Taber, and Co.'s prizes for twenty-four bunches fell to Mr. C. W. Breadmore, Winchester; Mr. G. Humphries, Chippenham; Mr. W. Marple, Penkridge; and Messrs. G. and A. Clark, Dover. Messrs. Nutting and Son's prizes for a dozen bunches were awarded, in order of mention, to Mr. W. Hopkins, gardener to F. Wellesley, Esq., Woking; Messrs. Jones and Son, Shrewsbury; Mr. A. T. Paskett; and Mr. G. M. Edwards, The Cedars, Addlestone.

C.H. 893

A FINE VASE OF COUNTESS SPENCER SWEET PEA.

From the collection exhibited by Mr. Henry Eckford, at the National Sweet Pea Society's Show. This represents the fixed strain introduced by this famous raiser.

WAVED VARIETIES.

In the President's class for a dozen waved varieties Mr. T. Stevenson scored with Marjorie Willis, Mrs. H. Sykes, Kathleen McGowan, Spencer America, Mrs. H. Bell, Etta Dyke, Helen Lewis, Frank Dolby, Mrs. Breadmore, Paradise Ivory, Countess Spencer, and Black Knight Spencer. Mr. A. T. Paskett second. There were twenty-one competitors in the class for six bunches of waved varieties, Mr. F. Fairbairn coming first with Nora Unwin, Audrey Crier, Mrs. C. W. Breadmore, Helen Lewis, Mrs. H. Sykes, and Fred Fairbairn; Mr. Broad, second; Mr. W. H. Shaw, Horsley Hall Gardens, Gresford, third. For three bunches twenty-three competed, Mr. T. Stevenson, Mr. A. T. Paskett, and Mr. F. R. Castle winning the awards in the order as placed. Mr. W. P. Hammond, Burgess Hill, led for three bunches of Paradise; Mr. A. E. Usher had the best bunch of Lavender George Herbert, the best bunch of King Alfonso, the best bunch of Gordon Ankentell, and the best bunch of Yellow Hammer.

In the open section of this division immense interest centred in the class for a dozen varieties, the premier award being the E. W. King Cup and a gold medal. Honour fell to Mr. Profit, gardener to E. A. Broad, Esq., Par Station, Cornwall, who had splendid bunches of Mrs. H. Bell, Frank Dolby, Prince of Asturias, Helen Lewis, Elsie Herbert, Paradise Ivory, George Herbert, Mrs. A. Ireland, Mrs. H. Sykes, Nora Unwin, St. George, and The Marquis. Mr. Broad's St. George was so fine, and evidently a reselected stock, that he was at first disqualified for having a variety not yet in commerce. Mr. E. Keith was a good second; Mr. G. Humphries third, Mr. R. Hallam fourth, and Mr. W. Marple fifth.

The splendid W. Atlee Burpee Cup, for a table of Spencer varieties, was once more annexed by Mr. Robert Bolton, Warton, Carnforth, with magnificent bunches of Tom Bolton, Clara Curtis, Charles Foster, Mrs. H. Sykes, Fire King, and several seedlings, etc.; Mr. Silas Cole, gardener to Earl Spencer, Althorpe Park, Northampton, second; Messrs. J. Lamb and Sons, Bingham, Notts, third; and Mr. R. Wright, Formby, Liverpool, fourth. Messrs. E. W. King and Sons' prizes for four bunches fell to Mr. R. Wright; Mr. James Box, Lindfield; and Messrs. Jones and Sons. For twelve bunches of American varieties the W. Atlee Burpee prizes were secured by Mr. A. E. Usher, Mr. James Box, and Messrs. Bolton Brothers, Carnforth, in the order of mention. There were six competitors. Mr. W. P. Hammond led for six bunches.

SMALL GROWERS.

The chief class in the small growers' section, where competitors must not employ a gardener regularly, was for twelve bunches of twelve sprays each, and the new Horace Wright Challenge Cup and gold medal were the first prize. There were no fewer than twenty-eight competitors, and the premier position was secured by Mr. G. Stevenson, Chadworth Cottage, Esher, with good blooms of Frank Dolby, Mrs. H. Sykes, John Ingman, Constance Oliver, Prince of Asturias, Mrs. H. Bell, King Edward VII., Etta Dyke, Marjorie Willis, Helen Lewis, The Marquis, and Countess Spencer; Mr. H. B. Howe, Newstead, Bushby, Leicester, second; Rev. J. B. Shackle, Dropmore Vicarage, Maidenhead, third; and Mr. A. Moring, Grove Cottage, Peppard, Henley, fourth. For six bunches, representing distinct colours, Mr. E. Burnett, Cedar Park Road, Enfield, was first; Mr. A. J. Dixon, Culmington Road, Ealing, second; Mr. E. T. Baker, Brigstock Road, Thornton Heath, third; Mr. G. Davidson, Elm Lodge, Quadrant Road, Thornton Heath, fourth. For six bunches of waved varieties, Mr. W. G. Cramp, Fallsbrook Road, Mitcham Lane, Streatham, led, followed in order by Mr. A. H. Harvey, Treyew Villa, Truro, and Mr. G. A. Hill, Bayworth Corner, Foxcombe Hill, Oxford. In the other small growers' classes the competition was equally keen, and the chief prizewinners were Mr. F. Nettle; Mr. E. M. Allen, Formby; Mr. H. A. Gerhold, Penarth; Mr. H. B. Howe, Mr. A. Moring, Rev. J. B. Shac and Mr. L. H. Hatting, Hornchurch.

FLORAL DESIGNS.

Twenty dinner tables were decorated, and chief honours fell to Mrs. A. Robinson, Norhyrst, Park Hill, Carshalton, for a pretty design; Miss Jessie Cuthbertson, The Palmers, Marks Tey, second; Messrs. G. and A. Clark, Dover, third; and Messrs. Jones and Son, Shrewsbury, fourth. Miss Jessie Cuthbertson and Messrs. J. Lamb and Sons were placed equal first for an epergne of sweet peas, Messrs. G. and A. Clark coming third, and Messrs. Jones and Son, fourth. Miss Cuthbertson led for a vase of sweet peas, Mr. H. V. Vokes coming second, Messrs. Jones and Sons third, and Mr. C. W. Bre fourth. For buttonhole bouquets Miss

(Continued on page 603.)

JUNE IN THE ROCK GARDEN

While there are many months in the year wherein something of interest is flowering in the rock garden, there is the greatest diversity of plants in flower during June. It is the month for dianthi, and these plants have been flowering profusely. Among those which have been good may be mentioned Dianthus sanguinea, D. suavis, D. squarrosus, the compact little D. alpinus, D. Atkinsoni, brilliant in colour; D. semperflorens, D. multiflorus roseus, and D. integer. Among lychnis, L. viscosa splendens is one of the showiest.

The various primulas made a good display. Of the Veitchian introductions, P. Cockburniana stands out prominently, a unique colour in this section. In some sheltered spots it may prove hardy, and, as a test, it would be well to try a few plants first. P. Veitchi is a bolder plant, but of a colour which we already have; an effective primula in a mass is P. Sieboldi clarkiæflora. P. japonica and the variety pulverulenta have furnished some grand spikes of bloom.

Phlox carolina ovata is very effective. Ramondias have flowered profusely, and growing in the fissures between the rocks, were very attractive. A distinct sedum is S. averunensis. Crinodendron Hookeri suffered somewhat during the past winter, but it is now carrying several flowers. Tanakea radicans, with its miniature [illegible]-like spikes of bloom, and the daisy-like flowers of Celmisia spectabilis attract attention.

Two distinct alliums are A. Schuberti and A. karatavensis, and though the colour does not appeal to everyone, they are worthy of a place in a rock garden of considerable size. The Chatham Island forget-me-not is a noble-looking plant, and has given some strong spikes of flowers.

Ourisia coccinea is brilliant in colour, and attractive. O. macrophylla we have not yet flowered. The heath-like appearance of Fabiana imbricata will attract lovers of ericas, while its flowering propensities are good.

Lithospermum tinctorum and L. graminifolium are beautiful in colour, as also is Heavenly Blue, which is extremely effective. Amsonia salicifolia is a pale blue flower possessing considerable beauty. The little Lotus siliquosus, which has bright yellow flowers, presents an attractive appearance spreading over the rock. Tropæolum polyphyllum is also excellent for clothing hanging rocks; it thrives in other situations, but appears especially at home in the rock garden. Iris sibirica and I. sibirica alba have flowered freely, and proved highly attractive. Campanula phyctidocalyx is quite a distinct campanula in its flowers and branching spikes. Calceolaria polyrhiza is dwarf in growth, with quaint yellow flowers, have been very attractive. Cypripedium spectabile has furnished some good spikes, which require light shade to enable them to retain the purity of the blooms. The dwarf silenes have been good, and in masses are very effective, especially S. alpestris. Others are S. quadrifida, S. acaulis, and S. pennsylvanica. Wahlenbergia dalmatica is flowering freely, and at a distance somewhat resembles some of the harebells.

Rock roses have been masses of bloom, and are, perhaps, shown to greater advantage in the rock garden than in any other position. A useful dwarf plant for the lower bases of the garden is Smilacina bifolia.

Among yellow-flowering plants are Onosma flavum, linarias in variety, and various achilleas. Of orchis, O. maculata, and O. foliosa, have given good spikes of flowers.

T. H. Slade.

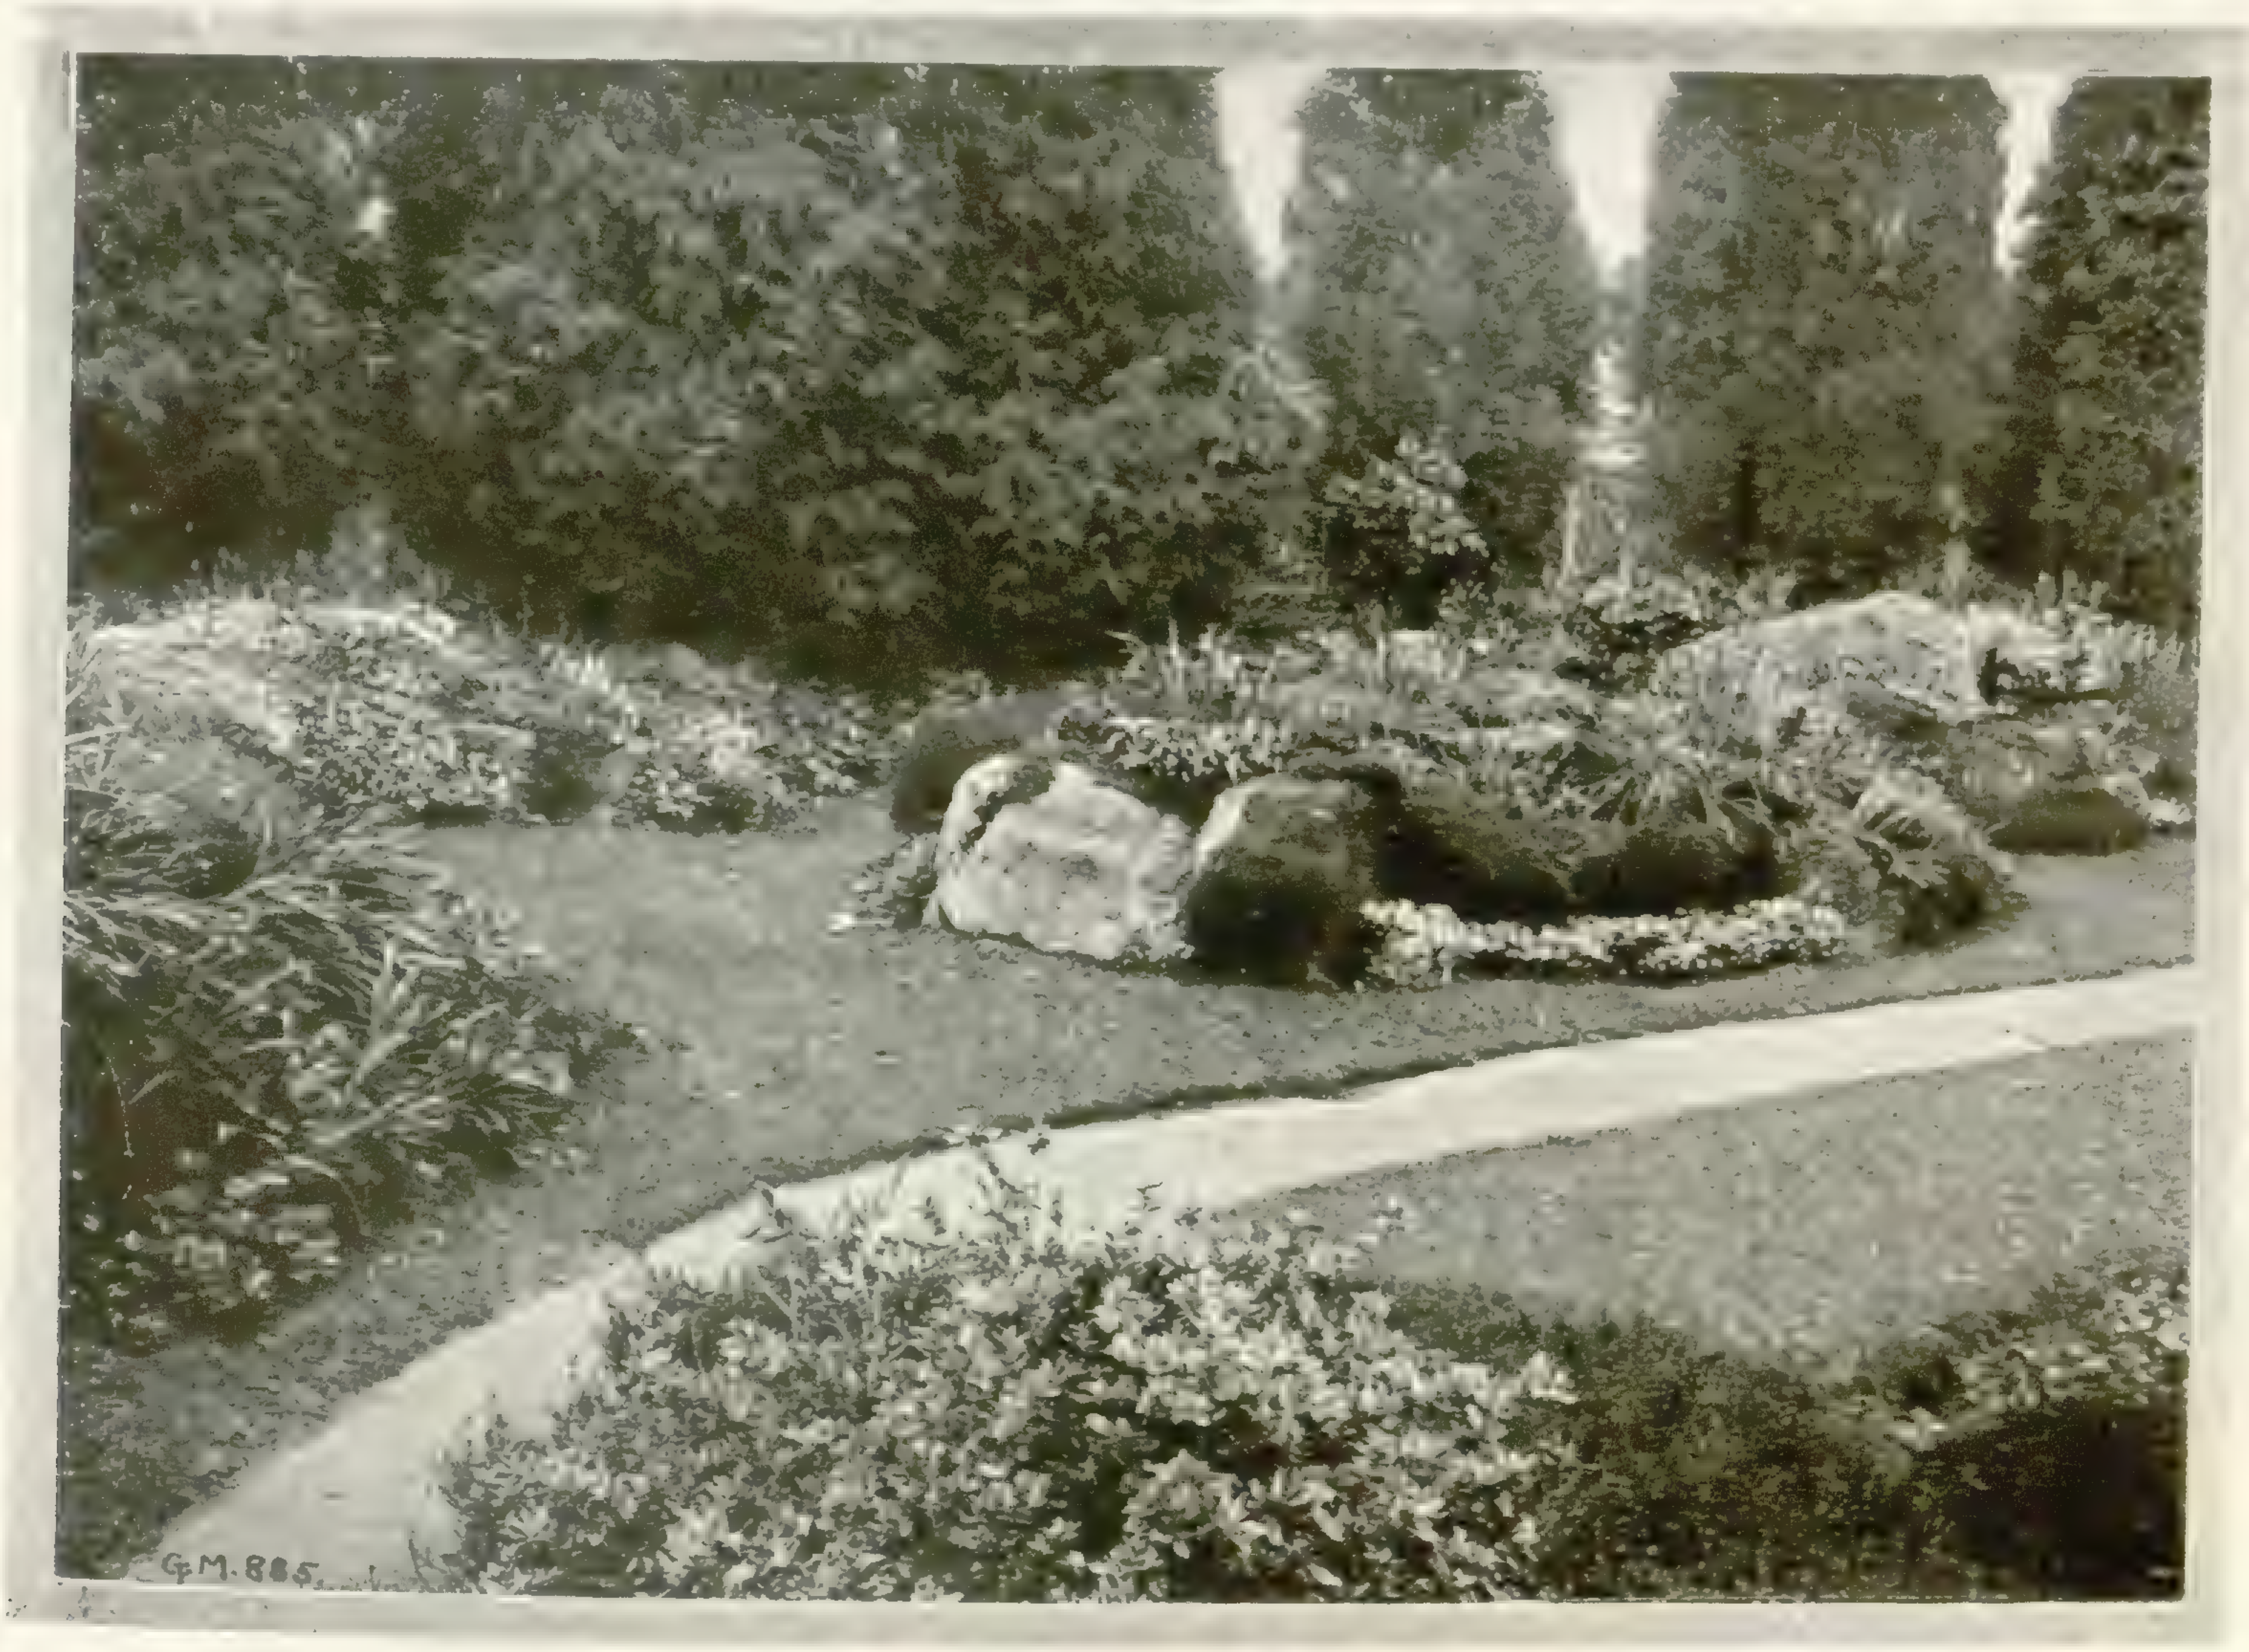
South Lodge Gardens, Horsham.

AUBRIETIAS.

Few spring flowers are more useful or more enjoyed than the aubrietias, which form splendid masses of bloom, and are most admirable for several purposes in the garden. In a mass they make splendid beds; they form brilliant edgings if kept within reasonable bounds; and they are surpassingly effective when hanging over the stones of the rock garden or draping a portion of a wall with their finely-coloured flowers. These flowers have been much improved within recent years, and the original species, deltoidea, with small purple flowers, has been left far behind by its varieties, especially by those introduced within the last ten or twelve years. Larger flowers, with greater variety of colours, have been the goal aimed at by raisers, and the fact that they have succeeded is evidenced by the many fine varieties now in commerce. These are now too numerous for treatment, but a brief account of the most popular may not come amiss at the present time.

One of the finest of all the varieties at the present day is that known as Lavender, a lovely variety with flowers of the hue indicated by the name, and with large blossoms and of pleasing effect as a bedder or on rockwork. It deservedly received an Award of Merit from the R.H.S. in 1908. A plant in a pot is here illustrated.

A favourite variety with those who like flowers of a soft shade of colour, and one not often to be found among the aubrietias, is Bridesmaid, which is a charming plant of compact habit, and having soft blush-coloured flowers. I have grown this for several years, and it is always much admired. Campbelli Improved, a new form of an old aubrietia, is a capital thing, with fine violet-purple blooms of good size. Crimson King and Fire King have both large flowers of a shade called "crimson,"



THE BEAUTIFUL ROCK GARDEN AT SWANMORE HOUSE, THE RESIDENCE OF W. H. MYERS, ESQ.,
On which aubrietias in great variety are most successfully utilised.

as being the nearest to that colour to be found among these flowers. The second is more glowing, but is of more straggling habit. Dr. Mules has some rivals in its colour now, but it is not easily surpassed with its rich, deep violet-purple flowers.

Contrasted, for example, with the citron-coloured variety of Alyssum saxatile, or with a white arabis, the effect is magnificent indeed. Prichard's A1 is a successful rival, but its flowers, although larger, are not so densely produced as are those of Dr. Mules. Mrs. E. M. Crosfield has also violet-purple flowers, and is an excellent deep-coloured variety. Moerheimi deserves to take a prominent place in all spring colour schemes, and is one of the finest aubrietias in more ways than one. Its colour is a beautiful warm rose: its habit is good, it blooms for a very long time, and its flowers are of good size.

Peter Barr is one of the best of the newer purple varieties. Rose Queen has good rosy-coloured blooms, not equal in some characters to Moerheimi, but Royal Purple is an excellent purple variety. Leichtlini is called rose by courtesy, but it is only rose at certain stages of growth, being much deeper at other periods. Souvenir de William Ingram, which has very large flowers, is not such a free bloomer as some, and the flowers are of rose-pink, passing to lilac. Wallacei grandiflora, though comparatively small, is early, and gives pretty light purple flowers. The variegated varieties of Aubrietia deltoidea deserve mention, although their flowers are of little account. They are argentea, with the leaves margined with silver, and aurea, with similar markings, but of yellow.

AUBRIETIA LAVENDER.
A beautiful variety raised by Mr. M. Prichard, producing a profusion of soft lavender coloured flowers.

A pretty aubrietia is the species called A. tauricola, which, some seasons, is herbaceous. It is much closer in its growth than the others, and has pretty little purple flowers. Its variety alba has its flowers white on opening, but they pass off lavender. It is a beautiful little plant, and brings us near the desideratum of many—a good, pure white aubrietia. There is one with white blossoms in the writer's garden which is much superior to A. antilibani, sent out some years ago as a white one, but it came to me without a name, and does not appear to be in commerce.

The aubrietias thrive best in a dryish and well-drained soil, and are kept much more compact and beautiful if they are cut back annually after flowering. Their propagation deserves consideration, inasmuch as they are not to be depended upon to come true from seeds, and a number may be required for bedding.

Old plants of some size may be layered as soon as they have flowered by putting sand and loam over a portion of the branches, taking the latter off when rooted in autumn. Cuttings may also be taken off with a heel of the old wood and struck under glass in sandy soil, and the young growths which push after the cutting back may be struck in a similar way. Some are very unsuccessful with these methods, however, and these may be recommended to put some plants in a frame, and to take off the young growths when they have become a little drawn and soft. These will strike more readily than the harder ones. To have strong plants for spring bedding the cuttings may be struck early—in April or May—and the plants bedded close together in autumn, so as to have a close cover of flower.

S. Arnott.

Apples and Pears.—Thinning the fruits of these, if not completed, should be attended to as soon as possible, or much waste of energy will result. Remove in the first instance all deformed and small fruits, and reduce the others in proportion to the capabilities of the tree. Trees planted last season should not be allowed to carry any fruit this year, and only a few should be left on those which are one year older. A little assistance during the next two months, by the application of a few soakings of liquid manure well diluted will prove beneficial to all trees which are carrying full crops, but trees that have only light crops, or those which are making an abundance of young wood, should not receive any.—Geo. Woodgate, Rolleston Hall Gardens.

THE TALLER CAMPANULAS.

The taller species of campanulas and their varieties are among the most generally useful of plants for garden decoration; they provide splendid masses of colour in the border during June, July, and August, and they are generally appreciated for their beauty as cut flowers, while not a few are among the handsomest of flowering plants when cultivated in pots indoors.

The colours in these campanulas is, on the whole, restricted—lavender, blue, purple, and violet are to be found with singular frequency, while in some species the full cadence from violet to white can be distinctly traced through half a dozen forms or more, each shade paler or deeper than that occurring next in the series. Yellow is rarely represented, the nearest approach being the sulphur-coloured flowers of Campanula thrysoidea. In the aggregate, the beauty of these campanulas is intimately associated with the form which the flowers assume, for, though the fundamental shape and that which predominates bears striking resemblance to a bell—hence Bellflower—yet endless modifications occur, so that much of their charm in garden decoration is ultimately bound up with this of external form.

With the exception of those florists' monstrosities, as exhibited in the Cup-and-Saucer Canterbury Bell, the largest-flowered campanulas (individually) I am acquainted with are the improved forms of Campanula persicifolia. The type is now a poor thing beside "Backhouse's" white form or the blue maxima; to these must be added Moerheimi, a semi-double white, and Smith's (of Newry) two fine semi-double forms; Daisy Hill, lavender; and Newry Giant, white. All the forms of C. persicifolia make first-rate pot plants, if potted up in spring, and their flowering season is doubled if they are placed in shaded positions indoors as soon as the flowers colour, a remark applicable to other species also.

Inferior to the preceding as a border plant, but excelling it as a flowering subject in pots, the forms of C. pyramidalis are familiar to all; the white displays its absolute purity to greatest perfection under glass. The type plant is still the most graceful, but there is a dwarf form known as the Sion House variety, which in some respects is more useful; it is known by its dwarf habit, close set pyramidal spikes, and much larger flowers.

Campanula latifolia is a true border flower, and in the open garden it attains a height of 4ft., and produces nodding blue flowers in July; to this plant C. Burghalti and C. Van Houttei are believed to owe their origin; both are dwarf forms, rarely exceeding 2ft. in height, in each a similarity of form is seen in the flower, the tube being greatly extended, in the former the colour is purple-blue and satiny, while in the latter the blue has a quite rosy tint. C. lactiflora is a vigorous species and generally exceeds 4ft. when established. The early growth is strongly suggestive of mint, the stems are slender and eventually branch into clouds of small starry flowers, which vary in colour from almost pure white to blue.

Campanula alliariæfolia is an interesting species from the Caucasus, attaining a height of 3ft., the nodding white flowers are carried upon slender stems, and are suggestive of fuchsias

C. glomerata produces blue stellate flowers in clustered heads, carried on 2ft. stems; in the form named dahurica the flower heads are rich violet blue; distinct and good.

C. punctata (nobilis) has broad cordate leaves, and large drooping white flowers spotted with red. It is a Chinese species flowering in June and July, and, under favourable conditions, reaches a height of 2ft.

C. mirabilis produces leaves in the form of a rosette from which the pyramid branching spike is produced, carrying pale blue flowers. It is a fine form, but none too general in gardens at present. The flowers are lilac-blue, and produced in August. Though generally dwarf in stature, it will, under favourable conditions, attain a height of 18in.

C. thyrsoidea is a biennial species, producing close-set, erect spikes, crowned with sessile flowers for more than half its length. Well-grown specimens reach a height of 2ft. In this plant one misses the familiar beauty of the campanula. Still, we cannot but admit them to be at least curious and interesting.

Only recently I made the acquaintance of C. Fergusoni outside this garden; it is a hybrid between the dwarf C. carpathica and C. pyramidalis alba, and exhibits the character of the parents tolerably well. I have the same plant growing upon the rock garden here, where it must have originated as a spontaneous seedling.

The cultural requirements of campanulas are of the simplest, those having tufted growth, such as C. persicifolia, benefit by being divided and replanted at least every second year, the soil being enriched previous to planting. Those of a biennial character are best raised from seed every year, a remark which applies equally to the forms of C. pyramidalis. Species like C. lactifolia retain their vigour unimpaired to a great age, calling for no particular treatment except a yearly dressing previous to digging over the ground. With few exceptions campanulas are readily raised from seed, and as seedlings invariably give the best results, this system should always be followed when at all practicable.

THOMAS SMITH.

Walmsgate Gardens.

AN ORNAMENTAL CHINESE PRIVET.

Ligustrum sinense forms a good subject for the back of a shrubbery, an isolated lawn specimen, or a bold group in the wilder parts of the garden, for it is a vigorous growing shrub, which blossoms freely and possesses the additional advantage of bearing ornamental fruit at a later period. Many of the privets are too stiff in habit to be called really ornamental plants, but the one under notice is exempt from that criticism for the habit cannot be objected to at all. Under certain conditions, it assumes the proportions of a small tree, with a trunk of nine inches or a foot in diameter, but more frequently it adopts the habit of a large-headed bush, 16 to 20ft. in height. The leaves are oval, but smaller and thinner in texture than those of the oval-leaved privet. The flowers are borne profusely in elegant panicles, 3 to 4in. long, and are quite white. The flowering time is July. About September, the bushes are again conspicuous by reason of the tiny black fruits which quite cover the branches. As is the case with the majority of privets this shrub can be grown without trouble even in poor soil. It, however, like most other plants, assumes the largest dimensions when given a generous diet. It has been known by a variety of synonyms, of which L. chinense is the commonest. Varieties with variegated leaves and dwarf habit are known, but they are inferior to the type.

D.

NOTES FROM KEW.

A bed of the Swamp Honeysuckle of the United States (Azalea viscosa), near the fern house, at Kew, has afforded a very pleasing July feature, as at that time nearly all the hardy azaleas were over. The flowers are, for the most part, white or whitish, while they are of a peculiarly clammy nature, and so fragrant that their presence is manifest for some distance. It is native of a considerable district in North America, and was introduced in 1734. Early in summer, when so many others are in bloom, this species would not attract much attention, but, owing to its late-flowering qualities, it is very noticeable and of considerable value.

Weigela Eva Rathke.

Very near to the azalea above referred to is a bed of this weigela, which is certainly entitled to a place among the best of the many forms now in cultivation. It is of less vigorous growth than several others, while the flowers are of a bright crimson colour. The most marked feature of this particular variety is its continuous flowering qualities, as it will bloom more or less from spring till autumn. Recently it was quite a mass of flower.

Fremontia californica.

In a sheltered angle outside of the Temperate House this handsome Californian shrub or tree has been flowering very freely. The position there evidently suits it, for it is rarely seen so full of flower. The salver-shaped golden-yellow blossoms are about three inches in diameter. Extensive as is the Sterculia family (to which this belongs) in the warmer portions of the globe, this is about the only hardy member that we have in our gardens. This fremontia was first discovered during Colonel Fremont's expedition to the Rocky Mountains in 1846. A specimen flowered at Chiswick in 1854, and for some years it was regarded as unique. For the general introduction of this ornamental subject we are, I believe, indebted to Messrs. Veitch, whose collector, William Lobb, sent home a quantity of seeds from California

Syringa japonica.

By botanists the different species of syringa in our gardens are divided into two groups, firstly, the true lilacs, represented by Syringa vulgaris, and, secondly, the Ligustrina group, of which Syringa japonica, is an example. The members of this last are distinguished from the true lilacs by flowering later, and by having large panicles of smaller, privet-like flowers. All of them are white in colour. The best of this section is S. japonica, of which a couple of tree-like specimens formed a very notable July feature near the Temperate House. They were simply a mass of white, being covered with their large, branching panicles of blossoms. The fragrance is less pronounced than in the case of the common lilac. At a little distance the name of the group, Ligustrina, is very apparent, as the inflorescence much resembles that of some of the privets, such as Ligustrum lucidum or L. japonicum At all events, Syringa japonica forms a very ornamental small tree for a lawn of limited extent.

Hedysarum multijugum.

A bed of this Mongolian plant flowered freely in the collection of the shrubby Leguminosæ. It is now a well-known subject, having come into general cultivation about a dozen years ago. It forms a loose, spreading shrub, a yard or a little more in height, clothed with pinnate leaves of a greyish hue. The bright purple flowers are pea-shaped, and freely borne in upright racemes. Like many leguminous plants, it will hold its own even in sandy soils.

Æsculus indica.

It is a great pity that the Himalayan horse chestnut is almost, if not quite, impossible to obtain from nurseries. Its all-important feature is the fact that it flowers in July when the common kind has been long past. In general appearance the Himalayan horse chestnut may be likened to the common species, but the leaves are larger, thinner in texture, and more glossy. There is also the fact of its late flowering, while the spikes of blossoms are somewhat longer and narrower than those of the ordinary horse chestnut. Though represented by good flowering examples at Kew, I have searched several nurserymen's catalogues without finding it mentioned. In the Western Himalayas, where it is found at an elevation of 8,000 to 10,000 feet, it is said to form a large tree.

MAKING NEW STRAWBERRY PLANTATIONS.

Strong early runners raised from plants that have not been allowed to fruit, and rooted in small pots, are undoubtedly the best for making new beds, as they will furnish a good crop of choice fruit during the next season. These fruits are much more satisfactory, whether for dessert or kitchen use, when they have been well grown. An open situation should be chosen, and the quarter should have been well cultivated, and the soil in good condition. A piece of ground from which a crop of early potatoes has been taken will in a general way be found suitable. If the soil had been well broken up and liberally manured previous to planting the potatoes, all that will be necessary at this time will be to apply a good dressing of lime, on soils which may be deficient in this constituent, soot, and some wood ashes; also give a dressing of some well-decomposed manure, that from an old hotbed being in every way suitable. The various materials should be thoroughly incorporated with the soil by digging the quarter one spit deep. If the ground is of a light nature it should be made firm by treading when the surface is dry.

As soon as the runners are well rooted remove them from the beds, and stand them on a cool surface in a partially shaded position for a week or ten days. Our mode of planting here is to bed the runners out two feet apart each way. Do not disturb the ball of soil when planting; press the soil firm, and keep the upper side of the ball slightly below, if anything, the level of the surrounding soil. Water each runner thoroughly, and do not let them suffer from drought until they are well established, when they will look after themselves. A light mulch of decomposed manure will be found beneficial in checking the evaporation of moisture. A large number of varieties is not usually necessary, but the requirements of the establishment must be duly considered, the chief aim should be to lengthen the supply of these most useful and delicious fruits as far as possible. We depend chiefly on Royal Sovereign, The Leader, Mentmore, Latest of All, Givon's Prolific, and Laxton's Latest for our main crop, and in smaller quantities, The Bedford, Reward, Progress, Bedfordshire Champion, and the Laxton. Each of the varieties grow and fruit well on our cold, stiff land.

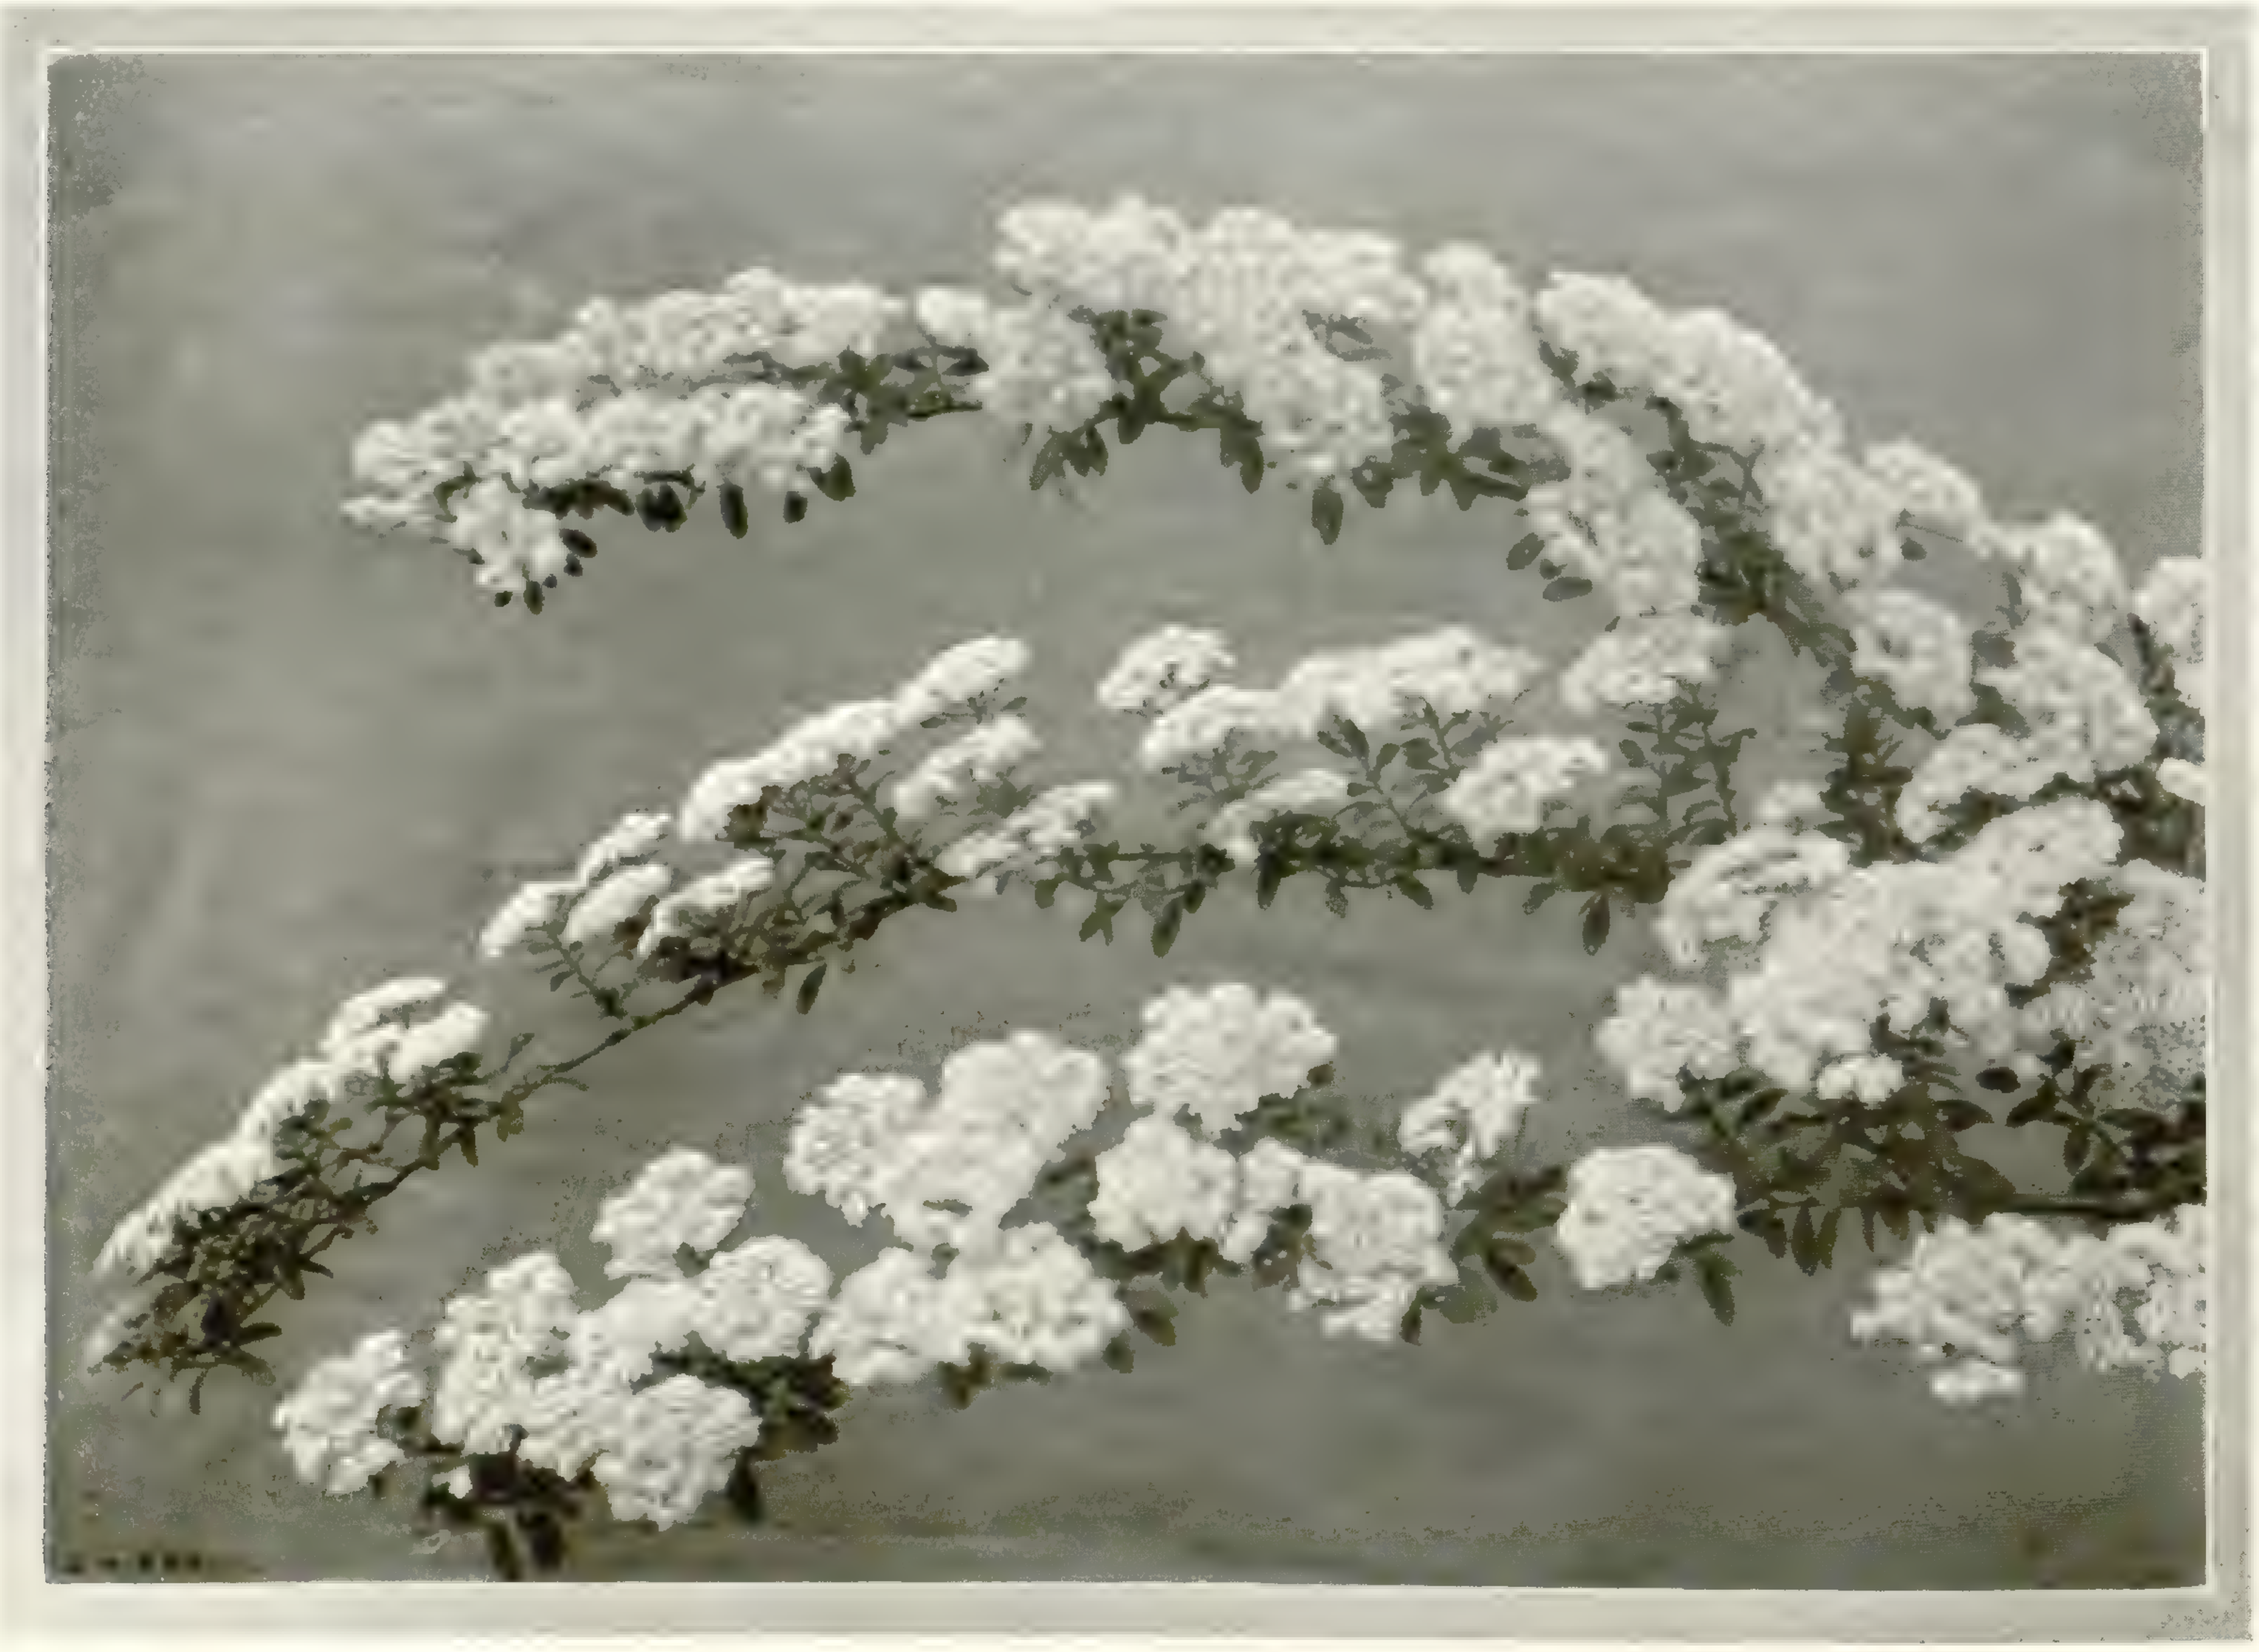
PARROTIA JACQUEMONTIANA.

The various members of the order Hamamelidaceæ form an exceeding interesting group of trees and shrubs, for almost everyone possesses some little peculiarity which induces one to bestow upon it something more than a passing glance. Thus we have the witch hazels, with their curiously twisted flowers, appearing in midwinter; the corylopsis, with their catkins of primrose flowers, a little later; the fothergillas, with dense, upright heads of white blossoms; and the parrotias, which appear to combine the interesting points of several other genera, although the species are but two in number. These species, P. jacquemontiana and P. persica, possess little in common, for they differ in almost every point. The flowers of the Persian species appear very early in the year, before there is a sign of a leaf bud bursting, and the flowers are quite tiny, but conspicuous by being bright red. It is also very beautiful in autumn, for the leaves turn to brilliant shades of orange and scarlet previous to falling. P. jacquemontiana, on the other hand, blossoms during May, when the leaves are half-grown; the inflorescences are quite different in character, and the leaves do not assume any brilliance of colouring in autumn. P. jacquemontiana is a native of the Himalayas, and is said to grow at an elevation of between 2,000 and 8,500 feet. It was first brought to notice by Dr. Falconer, who discovered it in Kashmir about 1836. Under cultivation it forms a small tree, with more or less oval leaves, three to four inches long, and as far across. The flowers are tiny, and borne in dense round heads, each head being surrounded by an involucre of white bracts, which form the showy part of the inflorescence. In the Himalayas and Afghanistan the wood, which is very hard, is said to be used for making walking sticks, tent pegs, etc., whilst the branches, used with clay, are requisitioned for the walls of houses. Both the parrotias thrive in ordinary garden soil, and the one under notice, which is rare, may be grafted on P. persica. Seeds, when they can be obtained, form the best means of increase.

W. D.



SPIRÆA VEITCHI.

This has long arching sprays of white flowers. A.M., R.H.S., July 20. Messrs. James Veitch and Sons, Chelsea. (See New Plants.)

NEW PLANTS, ETC.

◆

SPIRÆA VEITCHI.

This is a very fine, new, and graceful shrubby spiræa from China. It is quite hardy, and produces arching growths, often six feet long, and bearing all along their upper surface corymbs of closely clustered white and fragrant flowers. This excellent introduction is sure to find great favour with those who appreciate shrubs which bloom in summer, at a period when flowering shrubs are comparatively few in number. A.M., R.H.S., July 20. Messrs. James Veitch and Sons, Chelsea.

ROSE JULIET.

Seldom has a rose created so great a sensation at the Royal Horticultural Hall as the new one named Juliet. It is so distinct in colour that it probably marks the beginning of an entirely new group. The blooms are of good size, and have broad petals of a lovely soft scarlet hue, each with a golden base. As the blooms grow older the brilliance fades somewhat, but nevertheless Juliet promises to become a famous garden rose, for almost everyone who saw it desired to have it. The variety is, we understand, descended from Soleil d'Or (an Austrian copper variety) and a H.P. variety, the name of which is at present withheld. It is through Soleil d'Or that Juliet gets its wonderful and distinctive colouring, as well as something of its distinct habit and leafage. A.M., R.H.S., July 20. Messrs. William Paul and Son, Waltham Cross.

DELPHINIUM NULLI SECUNDUS.

A handsome delphinium, bearing stately, columnar spikes of white flowers, each with a central mass of dark, blackish-brown stamens and anthers. A very distinct and striking variety. A.M., R.H.S., July 20. Mr. F. W. Smith, gardener to F. Furguson, Esq., Weybridge.

SWEET PEA EDNA UNWIN.

This may be best described as a glorified St. George; the flowers are of fine rich orange-red colour, and make a splendid display in the bunch. A.M., R.H.S., July 20. Mr. W: J. Unwin, Histon.

NYMPHÆA MOOREANA.

The origin of this water lily does not appear to be known. It was sent to Gunnersbury from Australia as something rather better among yellow varieties than N. Marliacea chromatella. It has deeper yellow flowers than the latter, blooms as freely, and has clear green leaves without mottlings. A.M., R.H.S., July 20. Mr. James Hudson, V.M.H., gardener to Leopold de Rothschild, Esq., Gunnersbury House, Acton.

ODONTOGLOSSUM ARDENTISSIMUM STARLIGHT.

A charming orchid, with large flowers prettily speckled and lightly marked with purple over a lilac-rose ground colour. A.M., R.H.S., July 20. Messrs. Sander and Sons, St. Albans.

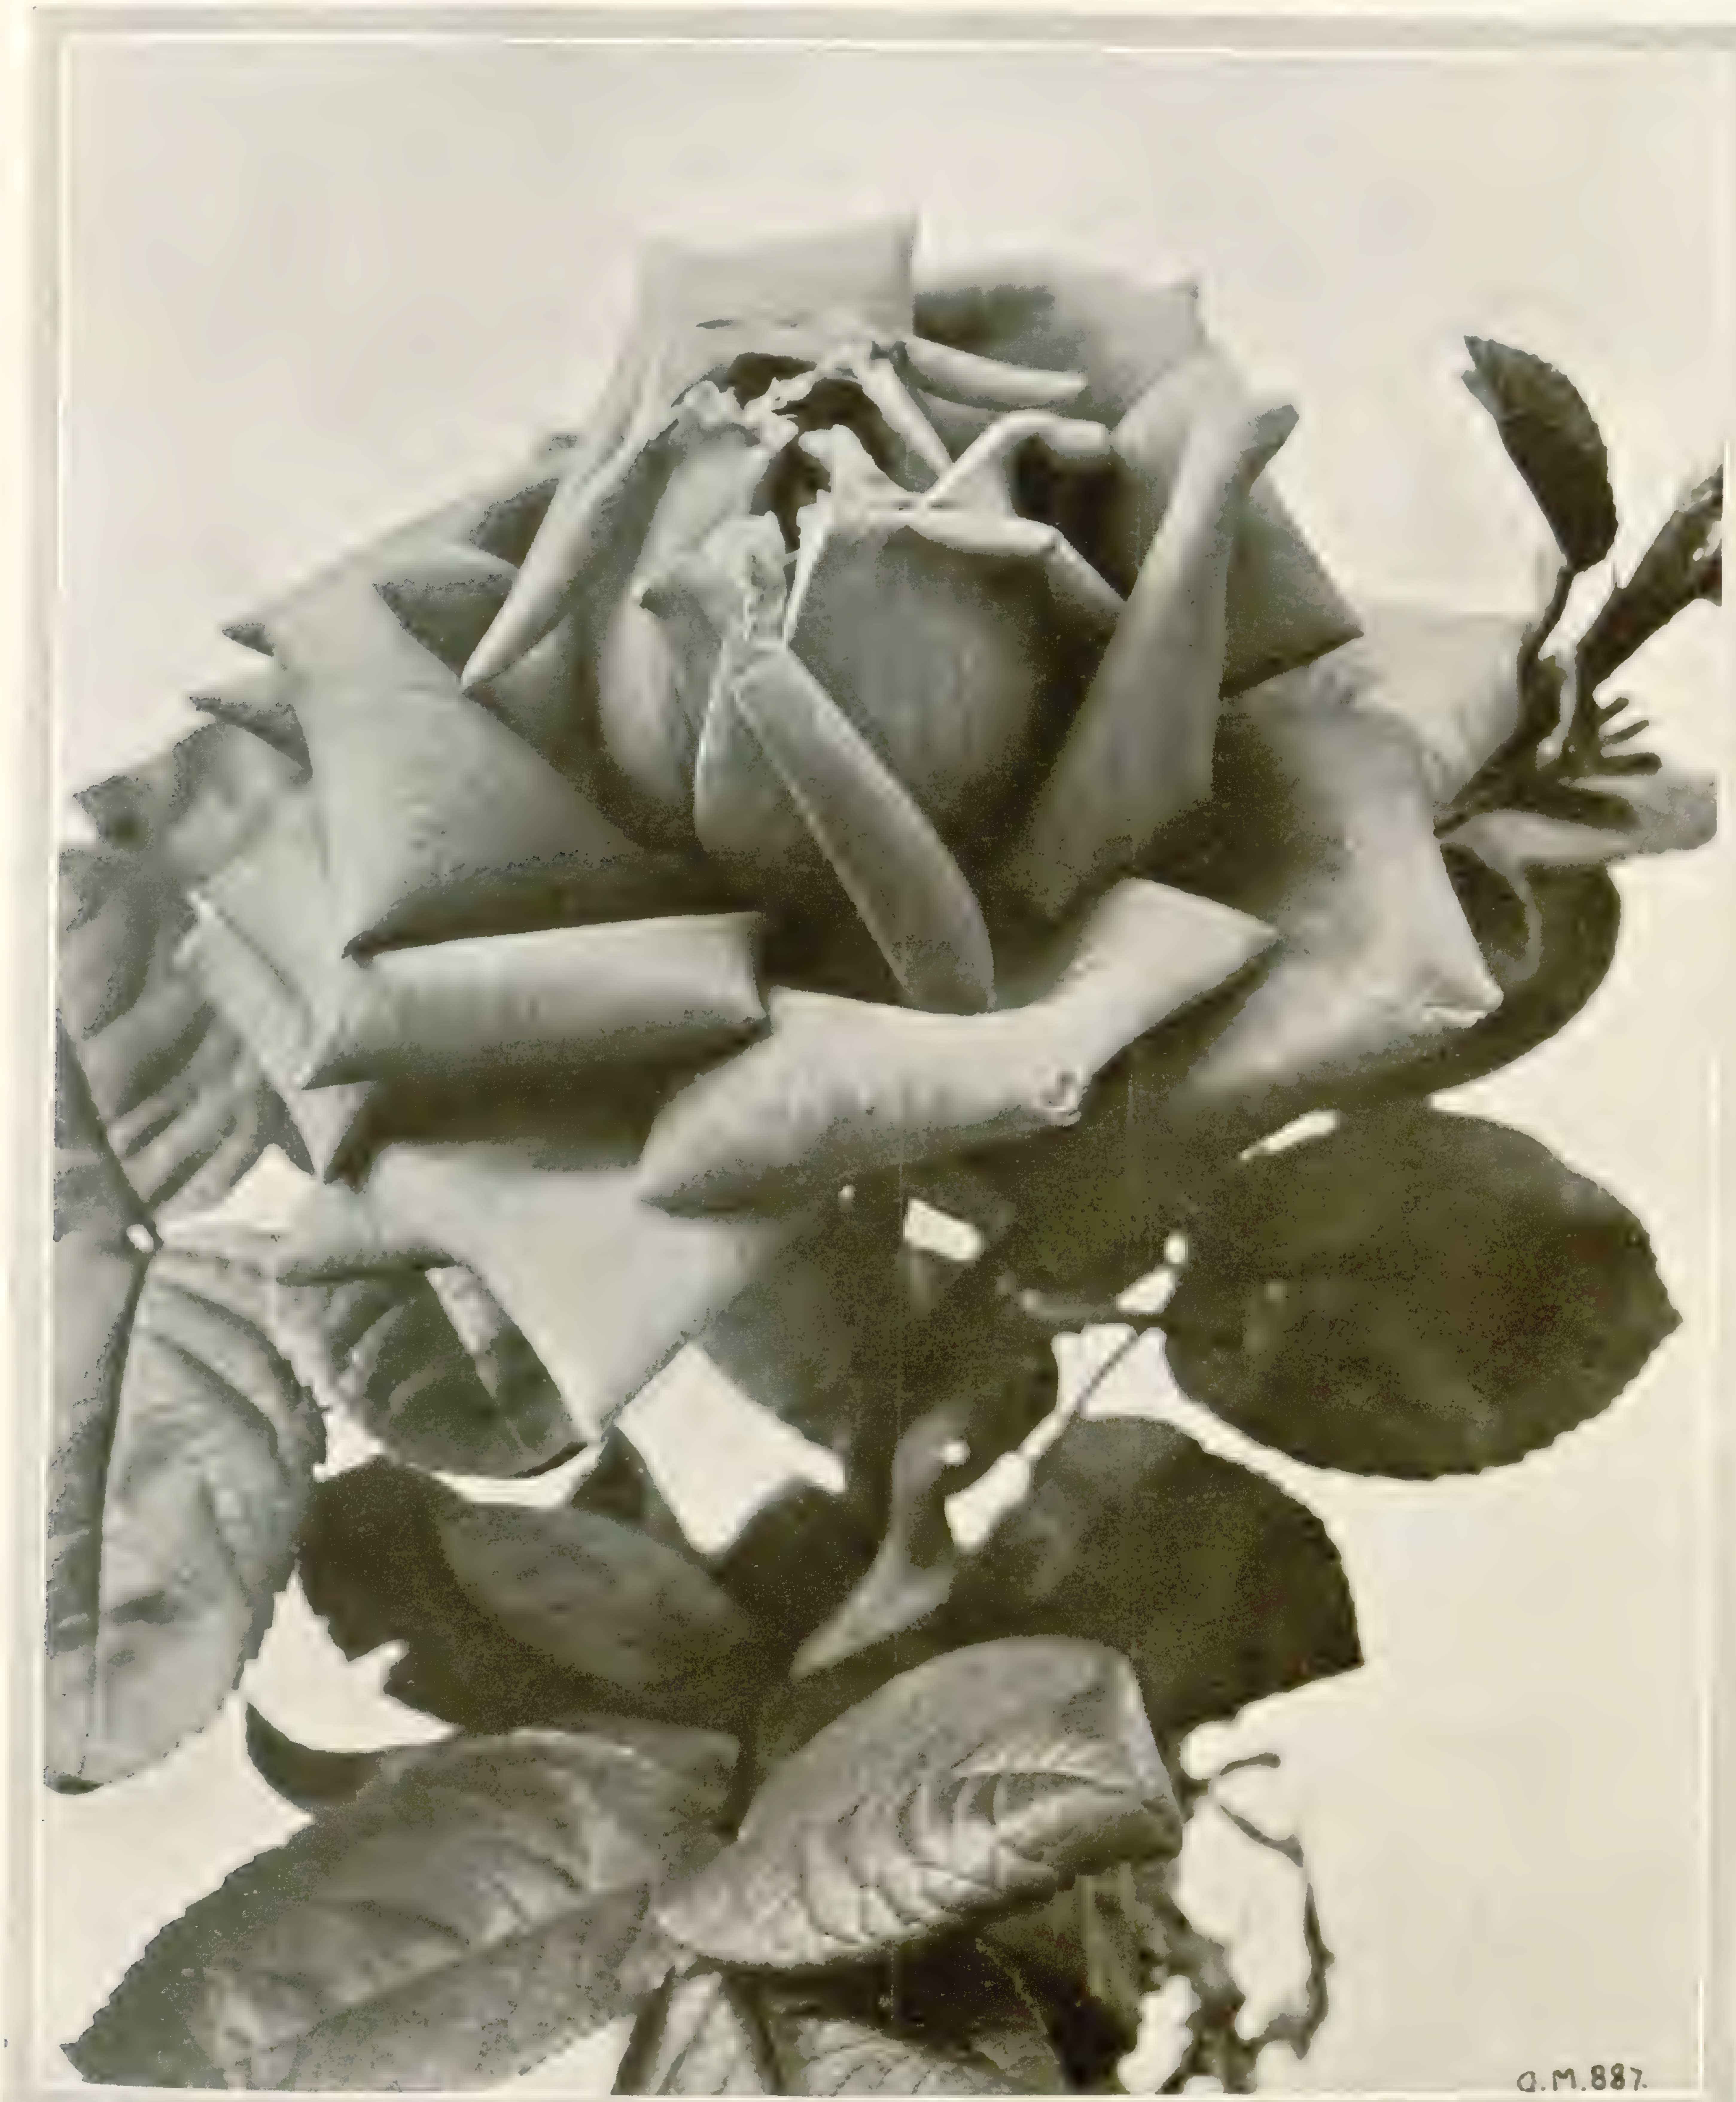
SPATHOGLOTTIS PLICATA ALBA.

Probably an unique plant, being a very beautiful albino form of the well-known old purple-flowered species. It attracted a great deal of attention from those who appreciate other orchids than those with very large blooms. A.M., R.H.S., July 20. Mr. Collier, gardener to Sir Jeremiah Colman, Bart., Gatton Park, Reigate.

THE ABUSE OF THE WATERING POT.

The word "futile" is said to be derived from the Latin word futus, a watering pot, the meaning of our English word describing from one point of view the result of putting water into a vessel simply to pour it out again. The way the watering pot is often used, especially by amateurs in small gardens in the outskirts of towns, where the water supply is brought conveniently near them, is often worse than futile, being decidedly injurious both to the plants and to the soil in which they are growing. Professional gardeners, as a rule, have too much to do to lay themselves open to the charge of wasting much water, but even some of them, for want of proper knowledge, do not use to the best advantage the time which is available for watering. I propose to show first the harm from excessive or too frequent watering, and then the way in which watering may be done more effectively, and, at the same time, with economy both of time and water.

Harm is done in various ways, but I can only point out the most important or frequent. In the case of flower-beds and borders where there is a fine surface, we all know how the water runs off after a few minutes watering, with the result that it is left, and given another watering in a day or two's time. The result is that the roots come to the surface for the moisture instead of going downwards; and then, if watering has to be left for a week or so in hot weather, the plants suffer. And not only that; it is a proved fact, which anyone can verify for himself by pulling up a plant out of wet or marshy ground, that where moisture is abundant, the plants do not build up such an extensive root system as in a drier soil. The result is that instead of the substance of the plant being substantial and solid, it is succulent and watery, and the flowers are not only of poorer quality but in smaller number, as



NEW ROSE JULIET.
A beautiful new hybrid rose, soft scarlet and yellow; of Austrian Briar and H.P. descent. A.M., R.H.S., July 20. Messrs. William Paul and Son, Waltham Cross. (See New Plants.)

the plant has not so much reserve to draw upon. Some plants that are accustomed to a dry climate, such as the zonal pelargonium and the calceolaria, notably run more to leaf than blossom in such circumstances.

The effect of the fine surface of the soil running together, so that it cakes when dry, is that air is excluded from the soil—air which is necessary for keeping the living substance of the growing root tips in a state of health, keeping the soil sweet, and enabling those processes of the soil which result in the production of valuable plant food to be carried on. Lastly, by keeping the surface in a close, or caked, condition, frequent watering may often result in the deeper portion of the soil being drier than if no watering was done at all, the compact state of the surface facilitating the rise of moisture from below to the surface, where it is fast evaporated by the great heat of the midsummer sun. It has been assumed in this case that the watering, though unduly frequent, does not go down into the subsoil. If, however, by reason of the peculiar tetxure, or other peculiarity of the soil or its position, such is the case, then the excessive watering washes the soluble plant food out of the reach of the roots, besides, by reason of the more or less excess of water, keeping out the all-important air. Excessive and improper watering, then, causes a weak and watery growth, lessens the amount of blossom, prevents the proper aeration of the soil, and may even cause the moisture in the subsoil to be less than it otherwise would be; or, in a different soil, permanently lessen the available supply of plant food.

Now as to the watering which is necessary, with due regard to economy of both water and labour. In the first place, we should do what we can to conserve the moisture that is in the soil in the spring by keeping the surface loose directly it begins to get dry, and loosening it again after every heavy rain, as by this means the channels conducting water to the surface from below by capillary attraction will be cut off. By a rigorous observance of this principle, one may often pass through a whole summer with very little watering of established plants, as was the case in 1907 and 1908 in my garden on the London clay, though things were different on some light soils. In the latter year, beautiful though most of the summer was, there came a good deal of rain early in July, after the dry June, just in time to prevent the need of watering where the soil had been properly treated, both by deep cultivation and surface working, and then, again, in late August, when the soil was just getting dry to a good depth. Many people were watering for all they were worth the latter half of June, even with heavy soils. One enthusiastic amateur told me he gave the whole garden a thorough ducking every evening!!!

So much for the negative aspect of the subject. The fact remains that some watering is necessary in most summers, and in some years a good deal. The principle of economy in watering is to see that as much as possible of the water which is applied goes well into the soil, so that it is not dried up by the sun the next day, giving such a quantity as will go down as far as the roots extend, and then it may be left for at least a fortnight, even in the hottest weather. A help to this end is the loosening of the surface soil and the application of a mulch of manure before watering, or the lightly turning in of some short, rotted manure to facilitate the entry of the water and prevent the surface soil running together. This method may be applied to all beds and borders.

If a hose is used, it is better to discard the sprinkler, and let the water run into the soil with as little washing of the surface as possible, so as to saturate the soil to a depth of a couple of feet, only doing this, of course, when it is becoming very dry, and not repeating it for at least a fortnight. Where it is desired to water big things, like shrubs, roses, and climbers against the house or other walls, it is a good plan to sink a flower-pot in the ground up to the rim, previously putting a few pieces of broken pot underneath it, and then pour the water into the pot, which can be done a pailful at a time. A piece of tile or slate should be laid over the top of the pot to prevent evaporation afterwards. **Alger Petts.**

JAPANESE OR RUGOSA ROSES.

These form undoubtedly one of, if not the hardiest class of roses we have. I have never known frost to harm these during a dormant condition, and scarcely any effect is made upon the earliest growth in spring. They are also remarkably free from insects, if we except green-fly, and even this does not infest them so much as in most other classes. Nor have I ever seen them harmed by red rust in the autumn. What has apparently looked like this disease has turned out to be the peculiar way of ripening their foliage. They are early in flowering, and continue in bloom a considerable part of the summer, and end by supplying an enormous quantity of hips that are in themselves ample justification for cultivating these roses, as they produce a very attractive autumnal display. It is the singles that produce these seed pods or hips in greatest profusion. The fruits of atropurpurea are a glowing purplish-crimson, while those of Rugosa alba are a pale primrose yellow. Several shades and sizes of fruits are produced between these.

There are few subjects better suited for game coverts than these roses, affording, as they do, excellent cover, as well as food in autumn, and abundance of shade during summer. Partridges and pheasants are very partial to these fruits, and often invade our nursery grounds in search of them.

Rugosa roses are very freely raised from seedlings, and in a couple of years make good bushes. As their use for covert planting becomes more generally recognised they will no doubt be freely used. The one drawback in this connection is the uselessness of the wood for cutting.

In the garden ample use can be found for the varieties forming the section. They can be pruned or not, at will, and we now have a good selection of colours. In Rugosa alba we have a grand pure paper-white rose, some two and a-half inches in diameter, while R. rubra (sometimes called Regeliana or Ramanas rose) affords us a deep rose with slight shadings of violet of the same size. One of the very best is atropurpurea, a very free flowering variety, with large bunches of blossoms that are blackish-crimson in the bud stage and maroon-crimson as they expand. Calocarpa has a smaller flower, but it is very sweet-scented, and produces immense clusters of small rich scarlet-coloured fruits. Fimbriata is almost white, except for a blush tint during very sunny weather, and sweetly scented. The margins of the petals are beautifully fimbriated, and Delicata and Belle Poitevine give semi-doubles of soft rose colour. Souvenir de Pierre Leperdrieux is a double form of bright vinous red, and that, unlike most of the other doubles, throws a large number of fruits. We obtain some hips from almost all roses at various seasons, but these more particularly under notice are remarkable for the size and quantity they produce.

Conrad Ferdinand Meyer belongs to this section, but, like some others to be mentioned, ought more properly to be styled a hybrid rugosa. Conrad F. Meyer is a wonderfully strong grower, and has all the other good qualities of the section. It is good enough for exhibition, being of similar form to La France, of equal size, and quite as sweetly scented. This is a clear silvery-rose, and there is now a white sport of this named Nova Zemblæ. Mrs. Georges Bruant is another white, a little more than semi-double, and an exceptionally free bloomer, but a little too pendent in habit to appear to the best advantage. Another semi-double white is Blanc Double de Coubert; this is much larger than the previous variety, but it does not continue to flower so freely throughout the season.

The first of the rugosas were introduced from Japan so long ago as 1802, and it is during the last ten or fifteen years that they have been so much improved.

A. Piper.

THE DEEP WELL WATERS OF HARPENDEN.

Harpenden, Herts, lies toward the edge of the chalk basin in the middle of which London is situated. The water supply of Harpenden is derived entirely from wells sunk in the chalk, which chalk in some places comes to the surface, and is probably never more than 25ft. beneath it. The water in the wells is, in the valley, about 60ft., and on the hills about 120-145ft., below the surface. The water level of the district exhibits a rather steep gradient, the underground flow of water being apparently from north-west to south-west. This flow of underground water consists of the mixed drainage of a large area of agricultural land.

In the uncontaminated wells at Harpenden, the proportion of chlorine in the water is practically constant. Eleven per million may be taken as the average proportion of chlorine in the uncontaminated wells of the district. From whence does this chlorine come? The chlorine present in the rain has been determined for many years at Rothamsted. The average proportion is two parts per million. When rain falls upon the unmanured soil of the Rothamsted drain gauges about one-half of the water is evaporated; we should expect, therefore, that the drainage water which passes through the soil would contain four parts of chlorine per million, and this is actually the case.

In the Rothamsted experimental wheat field, where the evaporation is increased by the growth of a crop, the drainage water from the unmanured land contains about six parts of chlorine per million. The proportion of chlorine may be still further increased in the smaller quantity of drainage water obtained from pasture land. It is difficult, however, to see how the mixed drainage of arable and pasture land, from which the well water is derived, can contain a quantity of chlorine approaching eleven parts per million, unless we assume that the chalk still contains in its deeper strata some of the common salt, which was undoubtedly among its constituents when it first emerged from the sea. The comparative poverty in chlorides of the chalk waters at Harpenden would then be due to the situation of the wells in an elevated part of the chalk district (344 to 430ft. above the sea).

The well waters near the edge of the chalk basin must consist chiefly of filtered rain water, while the water found in the wells of the lower part of the basin must consist largely of the underground drainage from the upper part of the basin, which has percolated through vast masses of chalk during its downward journey. Perhaps the strongest argument in favour of the existence of original chlorides in the chalk is furnished by the composition of the chalk waters obtained from beneath the London clay. Where the chalk has been protected by a thick stratum of impermeable clay, and thus has received no direct washing by rain, the water is found to contain about 150 parts of chlorine per million.

Turning to the amount of nitrates in the uncontaminated well waters of the Harpenden district, it is found that the average proportion of nitrogen, as nitrates, in these waters is 4.7 per million. The proportion of nitrates is not so constant as the proportion of chlorides, owing to the fact that every well receives a certain amount of local drainage. The nitric nitrogen, which the vast reservoir of water in the chalk contains, is the final outcome of the drainage of a large area of land under a variety of agricultural conditions.

It may be estimated that the average drainage of the Harpenden district will not exceed 8in. of water per annum; this would give an annual loss of about 8 pounds of nitrogen as nitric acid per acre of land. The average amount of nitrogen contained in uncontaminated spring and well waters in different parts of England is apparently very similar to that found in the good wells at Harpenden.

Harpenden. J. J. Willis.

MESSRS. E. W. KING AND CO.'S LARGE GOLD MEDAL DISPLAY AT THE NATIONAL SWEET PEA SOCIETY'S SHOW ON JULY 23.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

SEASONABLE REMARKS.—At the present season, when so many orchids are in their most active stage of growth, constant observation is necessary on the part of the grower to guard against disease and attacks by insect pests. In a season such as the one we are generally experiencing this year, where, from the lack of sunlight, the growths although vigorous in appearance, are undoubtedly of a soft and sappy nature; and it is only natural that plants in such condition are more subject to the attacks of fungoid diseases. Probably one of the worst enemies the growers of cool house orchids have experienced of late years is the fungus Glœosporium Bidgoodi, which comes as a black smut or mould on the lower side of the leaves of odontoglossums and oncidiums. I am convinced that there is only one remedy to overcome this fungoid pest, and that is to cut away the foliage off the plants and burn it. The pest is spread by the spores, which become matured on the surface of the leaves, and, while we may carefully apply chemical preparations in the hopes of preventing its spreading, I have been obliged to come to the conclusion that cutting away infected parts of the foliage as soon as the disease is observed is the only safe remedy.

CATTLEYA HOUSE.—With regard to the warmer divisions, say the cattleya house, there are few orchid growers who have not had some one or another of their most healthy and vigorous plants suddenly attacked by a bacterial disease, perhaps in the centre of the leaf, or it may be some portion of the newly-developing or developed pseudo-bulb. It appears as a miniature pin-prick perhaps at first, which rapidly increases in size until, in the course of a few days, the growth has become a pulpy mass if no check has been imposed. If allowed to go unchecked the disease will extend through the connecting rhizome to the remaining pseudo-bulbs, and perhaps destroy the whole plant. If any doubt might occur as to this being a form of bacteria, let the operator take a pin and prick the affected portion of this plant, and select another, perfectly healthy, and prick any portion of the foliage he may select, and carefully note the effects. There is no remedy for this but to cut away the whole of the affected parts, if it is desired to save the plants. Even if the leading growth and flowers for a season have to be sacrificed there are generally dormant buds on the remaining pseudo-bulbs, which will secure the future safety of the plants.

INSECT PESTS AND THEIR DESTRUCTION.—It is only a few years ago since I and many of my brother-gardeners, who were responsible for preparing some one or other of the weekly calendars of the horticultural Press, were advocating the claims of the most suitable tobacco-papers with the almost barbarous methods we had to contend with in their use. Horticultural manufacturing chemists have not only done away with the distressing experiences many of us had to suffer, but have given us remedies which, if applied at regular intervals by spraying or vapourising, as the case may be, we are enabled to keep our plants free from the attacks of insect pests. It is at the season of the year when we are subjected to the plants becoming infested from the outside garden that we have most to dread, so that spraying should be regularly done during the next few weeks. Prevention is always a better remedy than the cure.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

AMARYLLIS.—The earlier batches of these plants will be finishing their growth and should be placed in a house where they may have all the light and air possible, gradually withholding water as the foliage dies down. The later batches will still be making growth, and the foliage must be kept clean by syringing. They may also still have frequent applications of liquid manure, not withholding this till the foliage shows signs of drying off, when they may be treated as advised for the earlier plants.

BERRIED SOLANUMS.—These, whether planted out in frames or in the open ground, should be making good growth and flowering freely. Care must be taken to keep them free from greenfly, which is more troublesome this season than we have known it. Therefore, frequent syringings with some approved insecticide will be necessary. Frequent waterings with liquid manure should be given to maintain them in vigorous growth. As soon as the berries begin to set freely, and the plants are large enough, the points of all the shoots should be pinched out, and the impetus thus given to the swelling of the berries will be easily recognised.

FUCHSIAS.—Specimens that may be flowering in the conservatory or greenhouse, or even in semi-shady positions out of doors, should have the seed pods and stale flowers picked off regularly to ensure their continuing in bloom a considerable period longer, and, when possible, a top dressing of soil and manure should be given. If this attention is not delayed too long it will add an extra week or two to the flowering period. This rich top dressing is suggested as an addition to the usual applications of liquid manure.

CARNATIONS.—Most of the Malmaisons will now be layered; in fact, some of the earlier batches may be almost fit for potting up. It is important not to unduly delay this operation for any considerable period, especially if plants for early blooming are required. A good open compost should be used for the young plants, and large 60's or 54's for the stronger plants are the most suitable sized pots.

POTTING should be done firmly, taking care that the soil is pressed very firmly round the collar. After potting return them to a cold frame or greenhouse, keeping them syringed and close for a few days, but as soon as rooting commences give air liberally, as what is most wanted in the cultivation of the Malmaisons is a firm, short-jointed growth. Any of the border varieties that have been blooming in pots should be layered as early as possible, treating them as advised for the Malmaisons.

SEEDLING PRIMULAS, etc.—Cinerarias, calceolarias, primulas, humeas, etc., that have been raised from seed must be pricked off or potted as soon as large enough, taking care not to overcrowd the plants. Do not keep them too close, but encourage a good sturdy growth rather than a tender, sappy one.

ZONAL PELARGONIUMS for the winter should now be well established in their flowering pots, and ought to be stood out on boards or slates where they may have all the sun possible. When well rooted a little soot water may be given them, but avoid the use of any really stimulating manures, as if potted in good soil with bonemeal added it ought to carry them until they are fairly into bloom. The best blooms I have ever seen on zonals were on plants that from their appearance one would call half starved. Continue to take out the points of any strong shoots, or a general stopping of all shoots may be done at once, but not later than the middle of August.—Thomas Stevenson, Woburn Place Gardens.

THE FLOWER GARDEN.

BORDER CARNATIONS.—These are, in common with all other occupants of the garden this season, unusually late. Attend to the staking of the flower-spikes, or they will soon become irreparably damaged. Light dustings of soot during showery weather will greatly benefit the plants, adding vigour and colour to both foliage and flowers, besides rendering the growth distasteful to the ravages of insects.

LAYERING CARNATIONS.—This work should be accomplished at an early date, to ensure well-rooted plants by autumn time. Select the strongest growths for this purpose. Should the ground be hard carefully loosen the surface with a small hand-fork. A supply of finely-sifted soil containing a liberal quantity of silver sand, or, better still, sharp road grit, will be needed. This will form an excellent medium, and will encourage the rapid formation of roots. The layers being selected should be cut through a joint in the usual way with a sharp knife, and well pegged down as nearly equidistant as possible. Give a good watering as the work proceeds, and a sprinkling each night and morning with clear water, when the weather is bright and warm, will be very beneficial. There are numerous varieties, embracing a wide range of colour and variety, but two of the most useful for cut flowers, and still universal favourites, are Raby Castle and the Old Clove.

PINKS.—These are with some people greater favourites than carnations, and this is not surprising when the quantity of bloom produced is considered, and the delicious fragrance of their elegant flowers. Propagation of these is effected by cuttings or pipings, as they are sometimes called. An ideal place to strike these is in a handlight. The cuttings should be made in the ordinary way, with a sharp knife, and dibbled in fairly thick in a compost of finely-sifted soil of a sandy nature. Keep these shaded and close for a time, and when they show signs of rooting gradually increase the amount of air and sunlight. Perhaps of the white varieties the most popular is Mrs. Sinkin, being early to bloom, and the flowers are of large size and good substance. There are many other excellent varieties to select from, and a collection of the best will form an interesting feature in the garden.

THE PROPAGATION OF SHRUBS.—It is an excellent idea to propagate a few of the choicest and maybe less hardy subjects (which will readily strike from cuttings) yearly. By doing this, should the permanent specimens be destroyed by a severe winter, a reserve in cold frames will prevent the risk of the more tender kinds being altogether lost. The end of July and beginning of August is the best season to take the cuttings, as the young wood is then in an ideal state. They are made in the usual way, and dibbled into five-inch pots which will be found a convenient size. Give a watering, and keep them close in a frame, and shade from bright sun. Syringe on all favourable occasions, and admit air to promote a humid atmosphere, which is conducive to their growth. Amongst some of the subjects which can be treated in this way I may mention Philadelphus of sorts, helianthemums, loniceras, cistus, ivies, Olearia stellulata, and others, Aristotelia Macqui variegata, Caryopteris mastacanthus, ceanothus of sorts, Bupleurum fruticosum, calceolarias, spiræas in variety, etc. Many of the choicest varieties of berberis, rhamnus, cornus, rubus, etc., should at this season be layered. For this purpose it is best to fill a few three-inch pots with some fine soil; plunge these up to the rims. Select the bottom branches, and make an incision halfway through a joint, and peg securely down. These should not be cut away from the parent plant until it is quite certain that they have well rooted.—E. Beckett, Aldenham House Gardens.

HARDY FRUITS.

PEACHES AND NECTARINES.—These trees should be frequently examined at this season, training in the new wood, and stopping all sub-laterals to one leaf. The fruits will be swelling up now, after perfecting their stones, and they should be exposed to the light, without which they will not obtain rich colour, which is so essential in both peaches and nectarines. A good practice is to cut off with a sharp pair of scissors so much of the leaf as is found shading the fruit. Trees carrying a full crop of fruit should have some assistance in the way of manure. Alternate waterings with well-diluted drainings from the manure heap, and a sprinkling of a good artificial fruit manure over the border, and washed in with clear water, will be found very beneficial. The latter should be applied about once a week.

INSECT PESTS.—It is imperative the foliage of peach and nectarine trees be kept free from insect pests. Red spider is generally the most troublesome; forcible syringing with soft water in the afternoon, between four and five o'clock, will do much to keep this pest in check, but on the first sign of its appearance spray with the liver of sulphur emulsion on three alternate evenings. To make this emulsion, dissolve one ounce of liver of sulphur in a little warm water, and pour it into a vessel containing six gallons of rain water in which six ounces of soft soap has previously been dissolved.

RIPENED FRUITS.—As soon as the fruits show signs of colouring syringing should cease. If the fruits are required to be packed for sending away they should be picked before they are thoroughly ripe, while for home consumption they may be left on until the fruit parts freely from the stalk. Great care is necessary when handling these fruits, as decay sets in very quickly after the slightest bruise.

STRAWBERRY BEDS.—Where it is intended to destroy old beds as soon as the fruit is gathered, cut the plants off with a spade, and, when the foliage is sufficiently dried up, put the old mulching material and the plants into a heap and set fire to it, spreading the ashes over the surface of the old bed when cool. Remove all runners and trusses of bloom from those which were planted out after having been forced, and keep the surface well broken up and free from weeds by a frequent use of the Dutch hoe. Water the plants whenever necessary to keep them steadily growing, that they may have a good chance to form strong crowns and be well ripened up before winter. Beds that are to remain for another season should have a few of the old leaves trimmed off, also all runners; at the same time remove all weeds and the light, strawy portion of the old mulching material. Loosen the surface lightly between the rows with a garden fork, and, if necessary, give the beds a good soaking of well-diluted liquid manure. See that the ground is made ready for the reception of the young plants, that no delay may be necessary when they are ready for planting. The three varieties of strawberries that we find most useful for the main crop are Royal Sovereign, The Leader, and Givon's Prolific; another promising variety for lengthening the supply is Laxton's Latest.—Geo. Woodgate, Rolleston Hall Gardens.

Scirpus Tabernæmontani zebrina.—Many singular contrivances are employed by Nature in clothing the various forms of plant life with beauty. In Scirpus Tabernæmontani zebrina we have a striking instance wherein the rush-like stems are alternately banded pale green and white, each zone of colour so distinctly marked off from the other that when a quantity of these slender stems are produced together they immediately arrest the attention. The colour is developed in a marked degree when the plants are allowed a scanty root run, and when planted in full sun under these conditions it rarely exceeds four feet in height, in deep rich mud the plant will often reach a height of six feet, but the white bar in the stem is then almost entirely absent. This plant, known commonly as the Porcupine Quill Rush, is of Eastern origin, having been introduced from Japan about the year 1881. It is a thoroughly reliable aquatic, requiring all the sun possible to secure the highest colouring. It is perfectly hardy provided the rootstock is well submerged in winter.—Thomas Smith.

NATIONAL SWEET PEA SOCIETY.

(Concluded from page 594.)

bertson was again first, with Messrs. Jones and Son second, and Mrs. H. P. Cottam, Malling, Kings Langley, third.

NON-COMPETITIVE EXHIBITS.

The extensive and most excellent displays from the leading sweet pea experts occupied the whole circumference of the hall, and, as may be easily understood, constituted an imposing feature of the show. On every stand were to be seen new varieties, or excellent blooms of first-class sorts, and these instructive exhibits naturally were a great attraction to enthusiasts and lay visitors.

In the centre of the hall, and directly opposite the entrance door, Messrs. R. H. Bath, Lim., Wisbech, had a large pyramidal stand, tastefully adorned with a number of the leading varieties, set in elegant glass vases, and arranged to represent a grouping, or classification, of varieties in colour, according to the "Repertoire de Couleurs." This was worthy the prominent position it occupied, and was greatly admired. At the far side of the hall, and also in a line with the door, Messrs. J. Carter and Co., High Holborn, W.C., erected a fine arch, profusely decorated with sweet peas in most of the leading sorts. The design and artistic arrangement of the flowers were all that could be desired. Festoons of smilax hung from the curve of the arch, and were twined among the bunches of flowers. On a table under this arch were displayed the National Sweet Pea Society's fine silver cups, for which the friendly strife of the best growers was waged, and which, consequently, were objects of keen interest.

An extremely beautiful lot of Mr. Henry Eckford's sweet peas kept the name of the pioneer of sweet pea culture to the fore. Large stands of Apple Blossom Spencer, Dodwell F. Browne, and Evelyn Hemus occupied the background, with Henry Eckford, Improved Venus, Sybil Eckford, and many other favourites in the foreground. The collection also included a splendid vase of the fine stock of Countess Spencer originally sent out by Mr. Eckford. The display made by Messrs. Robert Sydenham, Lim., Birmingham, was very tastefully arranged, the "Sydenham" rustic table decorations being used to great advantage. The blooms were fine, and were chiefly of the delicate shades of colour.

Messrs. Isaac House and Son, Westbury-on-Trym, Bristol, showed a number of flaked and fancy varieties of considerable merit. The blue and white "Suffragette" was indeed a too dainty thing to offer as an emblem of those militant ladies who have political aspirations. Mr. Robert Bolton, Carnforth, made a bold display in which a wide-spanned arch played a prominent part. This was decorated with sweet peas in tubes and in baskets suspended from the arch. On either side were tall stands of Constance Oliver and Helen Lewis, with capital vases of many other varieties on the stage. Prominent on the stand occupied by Mr. Wm. Deal, Kelvedon, Essex, was a mass of the new and beautiful Colleen, salmon-rose and delicate lilac-pink. There were plenty of other good things on this stand.

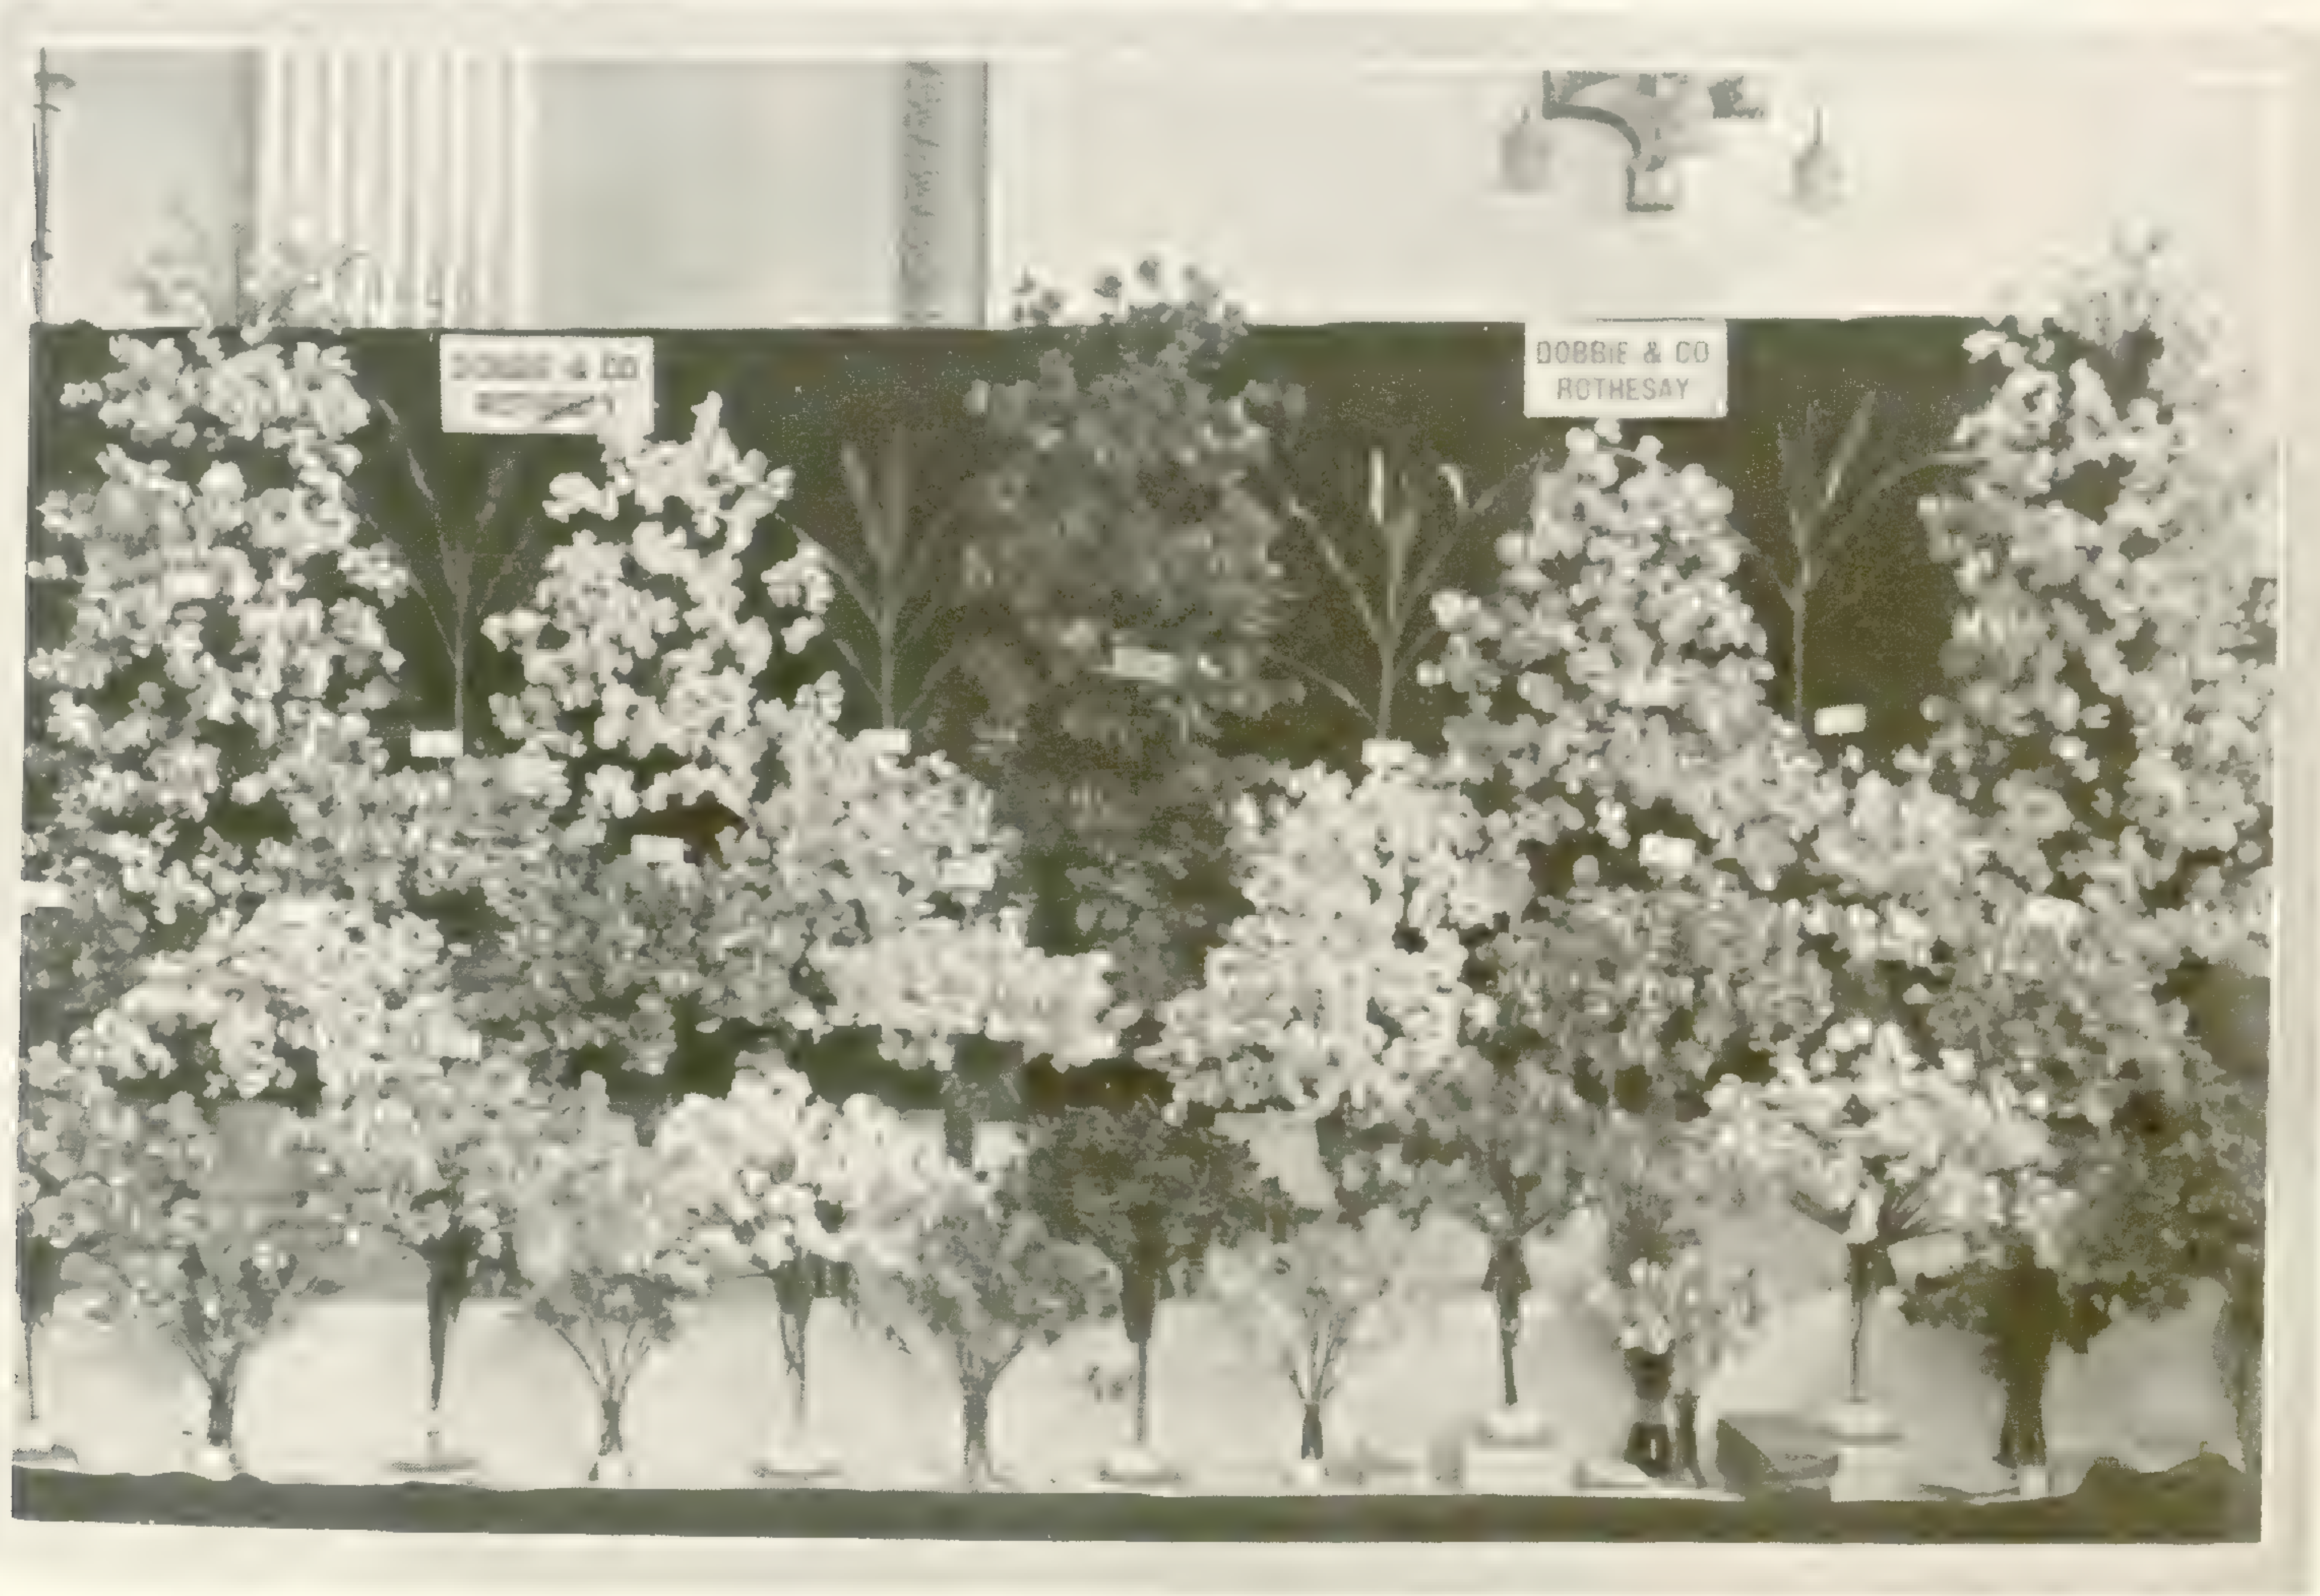
Messrs. Hobbies, Lim., Dereham, staged large bunches of the best-known varieties, good cultivation being evidenced by length of stem as well as size and substance of bloom.

Mr. C. W. Breadmore, Winchester, staged a pretty group, in which Countess of Northbrook, George Herbert, and A. N. Dickson occupied prominent positions. An attractive display was made by Messrs. Bakers, Wolverhampton, Baker's Scarlet, Mrs. Routzahn, Mrs. Charles Foster, and many others being noticeable. Messrs. J. K. King and Sons, Coggeshall,showed clean, well-developed, and nicely-arranged flowers in great variety. Messrs. Jones and Sons, Lim., Shrewsbury, put up a good set, their Anglican Blue being very attractive. Apple Blossom Spencer and John Ingman were also finely staged, the whole exhibit being well arranged. On Messrs. Jarman and Co.'s stand the variety Mrs. Townsend naturally held the place of honour, it being, as is now well known, a fine variety raised at Chard. Sweet peas grown by the aid of the Carlton Sweet Pea Fertilizer were shown by the makers of this special manure, Messrs. W. Voss and Co., Lim., Millwall, London, E. Mr. W. O. Cautley, Bury St. Edmunds, had Betty Cautley in fine style, also Earl Spencer, Mrs. A. Ireland, and other good sweet peas.

Messrs. S. Bide and Sons, Alma Nurseries, Farnham, Surrey, had small bunches of the leading varieties. Capital flowers, well staged, came from Messrs. H. Cannell and Sons, Swanley, Kent, a fine bunch of Mrs. R. W. Cannell being specially noticeable. This is a remarkably fine flower of a clear pink shade. A nicely-arranged stand on the right-hand side of the doorway was set up by Messrs. G. and A. Clark, Lim., Dover. On the immediate left of the doorway was Messrs. G. and A. Stark's stand, and here were flowers of particularly fresh appearance, and in rich colours. James Grieve seemed particularly bright as a yellow, and The Premier is a rich crimson. Messrs. Stark must have been enjoying good weather at Great Ryburgh. Messrs. Gilbert and Son, Dyke, Bourne, Lincs., had a fine lot of seedlings, several of which will be heard of again. Messrs. Kelway and Son, Langport, showed good varieties, but the arrangement was rather formal.

The rural table decorations, eminently suitable for use as receptacles for sweet peas, were shown by Mr. J. Williams, 4a, Oxford Road, Ealing. Mr. W. J. Unwin, Histon, Cambridge, showed a glorious lot of well-grown blooms, conspicuous among them being Edna Unwin, Mrs. W. J. Unwin, and Frank Unwin. Another good stand was that of Messrs. Dobbie and Co., Rothesay. Dobbie's Sunproof Crimson was very bright, and showed up well against such dainty flowers as Elsie Herbert and Mrs. C. W. Breadmore. An immense amount of interest was taken in the very fine display made by Messrs. W. Atlee Burpee and Co., Philadelphia, America. The name suffices as a guarantee of excellence, and we can truly add that the excellence of the flowers staged was such as to uphold the fame of the American sweet pea specialists. Menie Christie St. George, and King Edward positively glowed with colour, and other sorts toned down the brilliancy and added to the beauty of the whole.

A fine bank was set up at the end of the hall by Messrs. E. W. King and Co., Coggeshall. Mrs. Wm. King was grandly shown, and so was E. W. King's Blush, Constance



MESSRS. DOBBIE AND CO.'S LARGE GOLD MEDAL GROUP AT THE NATIONAL SWEET PEA SOCIETY'S SHOW ON JULY 23.

Oliver, and very many more. Miss Hemus, Holdfast Hall, Upton-on-Severn, showed Evelyn Hemus, Constance Oliver, Maggie Stark, and many other good varieties, all capitally grown. The large photograph of peas growing at Holdfast Hall was very interesting, as demonstrative of good culture by this lady specialist. Mr. William Lumley, Dawn Nursery, Havant, had a nice array of small bunches of very effective varieties. Stirling Stent was represented by a few stems bearing flowers of a flaming orange tint. This is a novelty of promise. Mr. James Box, Lindfield, Sussex, had a nice display in one of the annexes, as also had Messrs. J. Lamb and Sons, Bingham, Notts.

The music gallery, over the clock, was very tastefully decorated with trophies of sweet peas, backed by palms, by Mr. H. D. Tigwell, of Greenford, and Mr. C. H. Curtis, of Brentford.

MEDALS.

The following medal awards were made to non-competitive displays:—

Large Gold.—Messrs. Dobbie and Co., Rothesay and Marks Tey; Messrs. J. Carter and Co., Holborn; Messrs. E. W. King and Co., Coggeshall; and to Mr. H. Tigwell and Mr. C. H. Curtis, for music gallery decoration.

Gold.—Mr. W. J. Unwin, Histon; Messrs. W. Atlee Burpee and Co., Philadelphia, U.S.A.; Mr. Robert Bolton, Carnforth; Messrs. R. H. Bath, Lim., Wisbech.

Large Silver.—Mr. C. W. Breadmore, Winchester; Messrs. Bakers, Wolverhampton; Messrs. H. Cannell and Sons, Swanley; Messrs. Jones and Sons, Shrewsbury.

Silver.—Mr. Wm, Deal, Kelvedon; Mr. Henry Eckford, Wem, Salop; Messrs. Stark and Sons, Great Ryburgh.

Raspberries are abundant in the London markets at the present time, and the fruit is for the most part of large size. This abundance cannot, however, be a great advantage to growers, for the other day we saw excellent fruit being sold by a suburban greengrocer at three shillings per twelve 1lb. punnets.

VEITCH PORTRAIT FUND.

◆

List of Subscribers.

The following is the list of subscribers to the fund that is being raised for the purpose of having the portrait of Mr. H. J. Veitch, V.M.H., painted:

Mr. G. Abbey, jun., Mr. Herbert Adams, Sir John Aird, Mr. H. G. Alexander, Mr. C. Allen, Mr. J. C. Allgrove, Mr. C. Alston, Messrs. J. S. Anderson and Son, Mr. W. P. Atkinson, Mr. Wm. Atkinson, Mr. Elijah Ashworth.

Mr. W. Bain, Mr. W. Y. Baker, Mr. W. G. Baker, Professor Bayley Balfour, Mr. H. Ballantine, V.M.H., Mr. H. F. Barnes, Messrs. Barr and Sons, Mr. W. Barnes, Mr. F. Barwell, Mr. John Basham, Mr. W. Bates, Professor Bateson, F.R.S., Mr. F. C. Bause, Mr. E. Beckett, V.M.H., Mr. T. Bedford, Colonel Beddome, Mr. W. Bennett, Mr. W. A. Bilney, Mr. Peter Blair, Mr. E. A. Bowles, Mr. W. Boxall, Mr. S. W. Braggins, Mr. Albert Brassey, Mr. J. W. Briscoe, Mr. A. J. Brown, Mr. A. Bullock, Mr. Geo. Bunyard, V.M.H., Mr. J. Butler, Mr. W. Waters Butler, Messrs. Byvort Bros.

Mr. T. Challis, V.M.H., the Right Hon. Jos. Chamberlain, M.P., Messrs. Charlesworth and Co., Mr. J. Cheal, Mr. F. J. Chittenden, Professor Church, Messrs. Clay and Son, Mr. Walter Cobb, Mr. F. J. Collier, Sir Jeremiah Colman, Bart., Mr. T. E. Cook, Mr. Norman Cookson, Mr. T. Coomber, Mr. T. Cooper, Mr. H. G. Cove, Sir Frank Crisp, Mr. W. Crump, V.M.H., Mr. Lawrence Currie, Mr. C. H. Curtis, Mr. G. Cuthbert, Messrs. J. Cypher and Sons.

EXHIBITIONS AND MEETINGS.

◆

Walsall Florists' Society and Midland Counties Sweet Pea Show.

JULY 19.

The thirtieth annual exhibition of the Walsall Florist Society was held on the above date under the most favourable auspices, so far as the weather was concerned, in the spacious and highly picturesque Arboretum (Walsall's Corporation park), and was visited by thousands of delighted spectators. The interest of the occasion was greatly enhanced by the fact that the Midland Counties Second Sweet Pea Show was held in conjunction with it, the initial show having been held at Wolverhampton last year. Five capacious marquees were provided, one of which, about 150 feet long, was devoted to the sweet pea exhibits.

OPEN CLASSES.

There were four groups of miscellaneous plants, arranged for effect, and the premier honours were annexed by Mr. W. Vause, Leamington; Mr. W. R. Manning, of Dudley, a close second; and Mr. Cartwright, Dudley, third. The specimen pot plants did not merit particular mention. Exotic ferns, however, were highly creditable, the respective winners being Mr. William Brace, Walsall; Captain A. D. Cozens (gardener, Mr. J. Smith), and Mr. W. H. Hamerton, both of Walsall. Roses were the best yet exhibited at Walsall. In the class for forty-eight blooms, distinct, the premier honours fell to Messrs. Perkins, Coventry, for really exquisite flowers; Messrs. Prior and Son, Colchester, second; and Messrs. W. H. Frettingham, Nottingham, third. For twenty-four blooms, Messrs. Prior and Son were to the fore; Messrs. Perkins and Sons, second; and Messrs. W. H. Frettingham, third.

Sweet peas were a striking feature, of fine quality, and well staged, comparing, as they did, favourably with their compeers in the Midland Counties display. In the class for six bunches, distinct varieties, Mr. Chipman, Erdington, led with fine examples of Countess Spencer, John Ingman, Mrs. Hardcastle Sykes, Helen Lewis, The King, and Dorothy Eckford; Mr. E. Shorthouse, Hammerwich, second; and Mr. W. H. South, Walsall, third. In the special class provided by Messrs. Bakers, Wolverhampton, for six distinct varieties (25 stems each), Mr. E. Shorthouse scored with Clara Curtis, Mrs. H. Sykes, Nora Unwin, Helen Lewis, Emily Hemus, and John Ingman; Mr. John Norreys, Wolverhampton, second. One of the most attractive features was made up by the four collections of pansies and violas, shown in glasses; each contestant employed a large mirror at the background, which much enhanced the effect. The premier prize was awarded to Messrs. William Pemberton and Sons, Walsall, for an ideal arrangement; Mr. Chipman, Erdington, was a close second; and Mr. White, Harden, third.

Herbaceous cut flowers were very well staged by Messrs. Chipman, Pemberton, and J. F. Simpson.

Numerous other classes for plants, cut flowers, fruit, and vegetables were well represented, but space forbids further mention, except, however, the exhibits in the special class for vegetables, where, for six dishes, distinct, Mr. A. Ashwell, Walsall, easily won with fine examples; Mr. E. Deakin, Hay Mills, second; and Mr. E. Shorthouse, third.

MIDLAND COUNTIES' PRIZES.

Compared with the number of entries at Wolverhampton last year there was a material falling off, doubtless partly owing to the lateness of the season and to the day (Monday) being an inconvenient one.

In addition to the marquee already mentioned, an extra one was devoted to trade exhibits of sweet peas, no exhibitor being allowed more than 20 feet run of tabling, and honorary awards only to be made. There were only two exhibitors, viz., Messrs. W. H. Simpson and Sons, Birmingham; and Messrs. Bakers, Wolverhampton, both showing artistically arranged and elaborate displays.

Iu the open class for twenty-four bunches, distinct, Mr. W. Marple, Penkridge, was allocated the premier prize for a splendid lot of blooms; his was the only exhibit. For twelve bunches Mr. Marple was again victorious; Mr. Davies, Tettenhall, Wolverhampton, second; and Mr. David Green, Ash Hill, third. For eighteen bunches (trade excluded), Mr. George Kertland, Wolverhampton, won with an excellent lot; Mr. John Cudwick, Tettenhall, second; Mr. H. Wakeman, Finchfield, third. For twelve bunches, Mr. A. Langston, Droitwich, led with fine examples; Mr. W. J. Jukes, second; Mr. H. Wakeman, third. For nine bunches Mr. A. W. Thorpe was first, Mr. J. Perks, Tettenhall, second; and Mr. E. F. Flower, Wolverhampton, third.

In the single bunch classes Mr. John Culwick led with Etta Dyke (white); Mr. G. Kertland with Mrs. H. Sykes (blush); Mr. A. W. Thorpe, with Queen Alexandra (scarlet); Mr. E. Shorthouse, with John Ingman (carmine); Mr. T. G. Dalton, with Helen Lewis (orange); Mr. E. Shorthouse, with Mrs. Collier (yellow); Mr. J. Perks, Tettenhall, with Frank Dolby (lavender); Mr. E. Shortwick, with Lord Nelson (blue); Mr. A. Thorpe, Lichfield, with Tom Bolton (maroon); Mr. A. Langston, with Mrs. A. Ireland (bicolor); Mr. F. W. Kendrick, with Helen Pierce (marbled); Mr. G. Kertland, with Mrs. Routzahn (fancy).

Messrs. Bakers, Wolverhampton, offered substantial prizes for twelve distinct varieties of sweet peas, not less than twenty or more than thirty stems in a vase, and here Mr. G. Kertland was first, Mr. J. E. Culwick second, and Mr. J. T. Money third. Mr. Robert Bolton, Carnforth, offered prizes for three bunches of sweet peas, and Mr. F. W. Hardwick, Tettenhall, was the only exhibitor. Messrs. Robert Sydenham, Lim., Birmingham, offered prizes for nine distinct varieties, Mr. G. Kertland coming first, and Mr. E. Dalton second. Messrs. Webb and Sons, Wordsley, also offered prizes for nine bunches, and Mr. H. Shaw, gardener to Alfred Ashworth, Esq., was accorded the first prize; he was the sole exhibitor.

Manchester Rose Show.

This important Northern fixture was held on July 21, in the gardens at Old Trafford. The Palm House was utilised for the purpose, but the accommodation for exhibits was not quite so good as in former years. The recent stormy weather and heavy rains prevented a number of leading exhibitors putting in an appearance, nevertheless there was a good display, and the quality of the blooms may be described as up to the average.

There was nothing particularly novel in roses; all the best-known show varieties were well represented. A display of Horace Vernet by Messrs. Prior and Son, Colchester, was well worthy of notice, the blooms exhibited being excellent in build and colouring. Madame Jules Gravereaux was selected as one of the best roses in the show, and it is pleasing to learn that this beautiful rose has a strong constitution, and is a very generous subject to deal with. The exhibits in light-coloured roses were fairly numerous, and there were excellent boxes of Frau Karl Druschki, which seems to have taken a strong place with all growers, also some good exhibits of Bessie Brown.

NURSERYMEN'S DIVISION.

For sixty distinct single trusses Messrs. D. Prior and Son, Colchester, were first; Messrs. G. and W. H. Burch, Peterborough, second; and the King's Acre Nurseries, Hereford, third. For thirty-six distinct single trusses Messrs. D. Prior and Son, Colchester, first; Messrs. G. and W. H. Burch, second; Mr. George Prince, Longworth, third.

In the class for twenty-four teas or noisettes, Mr. George Prince was first, Messrs. D. Prior and Son second, and the King's Acre Nurseries third. Mr. George Prince was first for twelve teas or noisettes, Messrs. D. Prior and Son second, and Messrs. G. and W. H. Burch third.

In the competition for twelve single trusses of any white or yellow rose Messrs. W. and J. Brown, Peterborough, were first; Messrs. Prior and Son, second; and the King's Acre Nurseries, third; each exhibitor in this class exhibited Frau Karl Druschki. In the class for twelve single trusses of any light-coloured rose, other than white or yellow, Mr. George Prince was first with Dean Hole; Messrs. G. and W. H. Burch second, with the same variety; and Messrs. Prior and Son third, with Mrs. John Laing. For twelve single trusses of any crimson rose, Messrs. Prior and Son first with Horace Vernet, Messrs. W. and J. Brown second with the same variety, and the King's Acre Nurseries third with Hugh Dickson.

AMATEURS' DIVISION.

In competition for the prizes for twenty-four distinct single trusses E. B. Lindsell, Esq., Bearten, Hitchin, was first; T. Park, Esq., Bedale, second; and H. V. Machin, Esq., Worksep, third. For twelve distinct single trusses R. Foley Hebbs, Esq., Worcester, first; T. Park, Esq., second; and H. V. Machin, Esq., third. For eighteen teas or noisettes, distinct, single trusses, Conway Jones, Esq., Hucclecote, Gloucester, first; T. Park, Esq., second; R. Foley Hobbs, Esq., third. In competition for the prizes for twelve teas or noisettes, distinct, single trusses, Rev. J. A. L. Fellowes, Bunwell Rectory, Attleborough, Norfolk, first; R. Foley Hobbs, Esq., second; T. Park, Esq., third.

In the class for twelve single trusses of any white or yellow rose the Rev. J. H. Pemberton, Havering-atte-Bower, Essex, first, with Madame Jules Gravereaux; R. Foley Hobbs, Esq., second, with the same variety; Conway Jones, Esq., third, with Comtesse de Nadaillac. For twelve single trusses of any light-coloured rose, other than white or yellow, R. Foley Hobbs, Esq., first, with Bessie Brown; H. V. Machin, Esq., second, with Her Majesty; and the Rev. J. H. Pemberton, third, with Florence Pemberton. In the class for twelve single trusses of any crimson rose, the Rev. J. H. Pemberton, first, with Hugh Dickson; H. V. Machin, Esq., second, with Horace Vernet; T. Park, Esq., third, with A. K. Williams.

DISTRICT-GROWN ROSES.

In the classes open to amateurs within twenty miles of Manchester there was a brisk competition for twelve distinct single trusses. A. M. Buxton, Esq., Oak Bank, Bramhall, first; T. G. Russell, Esq., Oak Cottage, Bramhall, second; E. B. Russell, Esq., Grove Lane, Cheadle Hulme, third. For six distinct single trusses, A. M. Buxton, Esq., first; J. Holt, Esq., Mobberley, Cheshire, second; E. B. Russell, Esq., third. For six distinct single trusses, teas or noisettes, J. Holt, Esq., first; C. Burgess, Esq., Lower Peover, second; and T. G. Russell, Esq., third.

OPEN CLASSES.

For twelve bunches of roses, suitable for buttonholes, not less than six varieties, or less than three trusses to a bunch (open), Mr. George Prince first, and Messrs. W. and J. Brown second. For a display of roses arranged for effect Messrs. W. and J. Brown were first, and Mr. George Prince second.

Messrs. D. Prior and Son were awarded the silver medal for the best tea rose in the show, the bloom selected being Madame Jules Gravereaux. Messrs. W. and J. Brown, Peterborough, were awarded a silver medal for the best hybrid tea rose, the bloom selected in this case being the crimson C. J. Graham. In the class for sweet peas Mr. J. L. Welch, Cloverley, Timperley, was first; Mr. C. Burgess second, and Mr. G. A. Ashworth third.

Southampton Carnation Show.

JULY 23.

The annual exhibition of the Southern Counties Carnation Society was held on the Royal Pier, and was a decided success. The competition was keen, and the blooms of good quality. Thirty-five classes are included in the prize list, the latter being thoroughly representative of all sections of carnations.

The leading class for carnations was that for twelve distinct varieties, flakes and bizarres, and in this five competed. Mr. H. R. Tayler, Oakleigh, Cheam, won the first award with desirable blooms of Fireman, Merton, Joe Edwards, Torchlight, Murillo, Tom Atterill, Crusader, Bedouin, Gordon Lewis, Admiral Curzon, and two seedlings. Mr. J. Douglas, Edenside Nurseries, Great Beckham, Surrey, was a close second with Recorder, Master Fred, and George Melville. For six distinct, Mr. C. Linzee, Brandean Lodge, Alresford, was the only competitor, staging good blooms of G. Melville, Thalia, W. Skirving, R. Houlgrave, and Sportsman.

Five entered in the class for twelve fancies, distinct, Mr. Douglas securing the premier award with a handsome set, comprising Hidalgo, Mrs. Penton, Sam Weller, Liberté, Mrs. Gardiner, Lord Steyne, and several seedlings. Mr. Hayward Mathias, Medstead, Hants, secured second with Pluto, Liberté, Hecla, and Devonian, especially fine; Mr. C. Linzee won for six with King Solomon, Sam Weller, and Lord Steyne in good order; J. A. Fort, Esq., Kingsgate Street, Winchester, second.

In the class for twelve selfs, distinct, there were five entrants, Mr. Taylor winning with delightful blooms of Caruso, Snowflight, Maud Allan, Daffodil, Cardinal, W. H. Parton, Miss Willmott, and Sultana; Mr. Hayward Mathias second. Mr. Linzee was again successful in the smaller class for six with desirable specimens; Mr. Fort second. Prizes were offered for three blooms, one variety, in distinct colours, staged in vases, well illustrating the value of the flower for decoration. Mr. Arthur R. Brown, Wychall Lane, King's Norton, Birmingham, won with Snowdrop as the best white; Mr. E. C. Goble, The Nurseries, Ryde, with Blushing Bride as a blush or pink, won similar honours. Mr. H. R. Taylor secured first for a salmon self variety, as also he did for a scarlet. Messrs. Phillips and Taylor, Lily Hill, Bracknell, won for yellow; Mr. H. R. Taylor was again successful in the terra-cotta and dark self classes.

Mr. Dutton, Iver Nurseries, Bucks, offered prizes for three varieties of American tree carnations. Mr. G. Ellwood, gardener to W. H. Myers, Esq., Swanmore Park, Bishop's Waltham, won with good specimens of Beacon, Mrs. Lawson, and Fair Maid.

PICOTEES.

For twelve white ground picotees Mr. A. R. Brown was again successful against three others with capital blooms of Queen of Spain, Hon. Mrs. Kenyon, Favourite, Mrs. Holden, Mrs. Chaundy, Mrs. H. Hosier, Excelsior, John Smith, and Myra as the best; Mr. H. R. Taylor a close second with Dora Bright, Little Phil, Fortrose, and Favourite especially good. For six Mr. Linzee won with a good set, Mr. Fort following closely.

Mr. James Douglas was first for twelve yellow grounds, in not less than six varieties, with superb blooms of Margaret Leunose, Exquisite, Solomon Gilles, Lady Freemantle, Burgomaster, Archie Brown, Santa Claus, Oberon, Cymbeline; Mr. Hayward Mathias a good second, Mrs. Heriot, Libra, and Togo extra good. Mr. Linzee won for six; Mr. J. J. Keene, Southampton, second.

Undressed, or border flowers were not largely shown, but two entered in the class for twelve distinct carnations or picotees, the object being to show their utility as border flowers. Mr. Hayward Mathias was the most successful with Sam Weller, Lord Steyne, Viola, Douce Davie, and Mrs. F. Wellesley; Mr. E. Goble second. In the class for six there were but two entrants.

Mr. H. R. Taylor, first; Mr. J. H. Linington, Southlands, Newport, I.o.W., second.

For the best decorated dinner table with carnations or picotees there were eight competitors, making an attractive display. Mrs. E. Ladhams, Alresford House, Southampton, was distinctly ahead with an effective light arrangement; Mr. F. G. Bealing, nurseryman, Bassett, Southampton, second. Mr. W. Palmer, Andover Nurseries, had the best bouquet. Mrs. Ladhams secured the coveted award in the class for an epergne or stand open to ladies only; Mrs. Bealing second.

SWEET PEAS.

For Mr. Sydenham's prize for twelve bunches, distinct, Mr. J. Hughes, gardener to A. P. Ralli, Esq., Twyford Lodge, Winchester, was well first with excellent vases of Evelyn Hemus, George Herbert, Audrey Crier, Apple Blossom Spencer, Mrs. Hardcastle Sykes, Mrs. C. Foster, and Helen Lewis; Mr. H. Mattingley, gardener to Admiral Sir J. Hopkins, Greatbridge House, Romsey, second; three competed. For Messrs. Toogood's prize for nine bunches as many as eight entered. Mr. F. Green, Inverary, The Polygon, Southampton, was first with a delightful set of blooms—King Edward VII., Countess Spencer, Evelyn Hemus, John Ingman, Etta Dyke, and Dorothy Eckford, were the best; Mr. Hughes second. For Mr. H. Eckford's prizes for nine varieties Mr. D. Grant, gardener to G. H. Kitchin, Esq., Compton End, Winchester, was first with splendidly developed flowers. Mr. F. G. Bealing had the best decorated table with sweet peas amongst seven entrants; Miss Hettie A. M. Vokes, Birch-Lawn, Sholing, second.

Liverpool Horticultural Association.

JULY 21.

A pleasing change was made by this society in the holding of an exhibition of popular flowers, including roses, sweet peas, and carnations. The show was held at the Corn Exchange, where there is an admirable hall both as regards position and light.

Unfortunately, the unfavourable weather that had previously been experienced told heavily against the exhibits, especially roses, but sufficient were staged to produce a large and beautiful display and afford abundant enjoyment to the large number of visitors.

Sweet peas were remarkably good, and in the class for eighteen varieties Mr. R. Wright, Formby, was the first prize winner, staging good flowers, well set up, the best being George Herbert, Prince of Asturias, St. George, and Marjorie Willis. Mr. Ernest Jones, gardener to G. H. T. Robertson, Esq., was a good second. For twelve varieties Mr. E. Jones, Mr. W. Davies, gardener to J. E. Phillips, Esq., Malpas, and Messrs. S. Salisbury and Son, were first, second, and third respectively. In competition for the prizes for twelve distinct varieties with waved standards, Messrs. W. Davies and E. Jones were first and second.

Mr. S. Bell, gardener to J. U. Hodgson, Esq., obtained premier honours in the class for eighteen roses, distinct, and Mr. E. Jones was second. For twelve blooms of hybrid perpetuals Mr. E. Jones was first, and for twelve hybrid teas, the prizemen were Messrs. S. Bell, E. Jones, and W. Davies.

For twelve vases hardy flowers Mr. E. Jones occupied the first place. In the classes for twelve blooms and six blooms of border carnations the first and second winners were Mr. P. Cornelius and Mr. C. Russell. For twelve Malmaisons, Mr. G. Haigh, gardener to Sir W. H. Tate, Bart., was first with a nice stand.

The class for a table of sweet peas was a good one, and Miss S. Parslow, Formby, Mr. E. Jones, and Mr. J. Williams, gardener to C. J. Procter, Esq., were the successful competitors. In the class for twelve vases of sweet peas, in which the competition was limited to amateurs, Mr. Edgar Allen obtained premier honours, and for six varieties the prize-takers were Messrs. E. Allen, G. Grant, and G. Faulkner. For six varieties with waved standards, Messrs. E. M. Allen, G. Faulkner, and G. Grant, jun., were the winners. For a dinner table decorated with sweet peas, Miss L. Parslow, Miss Newsham, and Mrs. S. Marsh were the prize-takers in the order of their names. For six roses hybrid perpetuals, first, Mr. L. Thomson, Formby; second, Mr. H. Broombill.

Non-competitive exhibits were numerous, and contributed largely to the success of the show. Awards of merit were given to Mr. H. Eckford, Wem, for a beautiful display of sweet peas; to Messrs. W. Conway and Sons, Halifax, for a fine collection of hardy cut flowers; to Mr. R. Wright, Formby, for sweet peas; to Messrs. R. P. Ker and Sons, Aigburth, for a large and beautiful collection of hardy flowers and sweet peas, etc.; to Messrs. Youngs, West Derby, for a liberal contribution of choice cut carnations; to Mr. R. Manson, Gateacre, for cut roses; to Messrs. Thomas Davies and Co., Wavertree, for cut flowers of liliums and other bulbous plants; to Mr. H. Middlehurst, Liverpool, for sweet peas; and to Mr. J. Lee, Bebington, for a collection of gooseberries.

Carlton Amateur Rose Society.

The annual meeting of this society was held on Thursday, July 15, at Gateford Hill, the residence of H. V. Machin, Esq., vice-president of the N.R.S., the weather was delightful and the numerous visitors very heartily enjoyed the privilege of inspecting the very extensive rose gardens, which are now so famous, and which have in the past brought this amateur rosarian a wealth of prizes from many leading exhibitions. The arrangements were carried out with admirable ability, and everything done to make the day thoroughly enjoyable.

Owing to the lateness of the season, many varieties of roses were only just beginning to bloom, such as the ramblers and Wichuraianas, but Lady Curzon, the lovely single damask, was charming. Papillon was lovely, and in a bed of Mrs. W. J. Grant one could easily have found half a dozen blooms worthy of the coveted silver medal. There were also fine blooms in the rows of A. K. Williams, Mrs. John Laing, Hugh Dickson, Pharisaer, Mrs. Aaron Ward, Earl Warwick, Dean Hole, and many others, and in a pretty, secluded enclosure, were to be found fine beds of Gustave Regis, Madme. P. Ducher, Comtesse du Cayla, and Polyantha and china varieties well in bloom, with a background of hedges of Crimson Rambler just opening out into flower.

A very extensive collection of sweet peas was, unfortunately, late, but will make a very brilliant display later in the season.

The classes for roses were well filled, and contained many fine specimens; and the classes for displays of roses were good, and included many of the popular kinds of the early-flowering varieties. Hardy flowers, fruit, and vegetables were all well shown.

Birmingham Botanical and Horticultural Society.

The second of the two summer exhibitions of the present year, promoted by this society for the ostensible object of popularising the cult of flowers in and around Birmingham, was held on the 21st inst., under ideal conditions as to weather. The favourable climatic conditions materially augmented the success of the show by tempting a large concourse of visitors, not only to admire the flowers, but to enjoy the beautiful grounds, and listen to the strains of the famous Birmingham Police Band stationed on the spacious sloping lawn, in front of the exhibition hall. The latter was well filled with an excellent display, which consisted chiefly of trade and other non-competitive exhibits, there being but few competitive exhibits, such as roses, sweet peas, and hardy herbaceous flowers. That there should have been a poor competition is very strange, considering the liberal prizes offered by the society. Fortunately, the energetic hon. secretary (Mr. T. Humphreys), and his committee had their efforts rewarded by the grand array of non-competitive exhibits, and the large attendance of visitors.

The great feature of the show was incontestably the magnificent and huge display of Malmaison, perpetual or tree, and border carnations from Highbury. The collection was most effectively arranged in exhibition style by Mr. John Deacon, the Right Hon. Joseph Chamberlain's gardener-in-chief, the groupings consisting of large masses of Malmaison varieties, embracing Princess of Wales, Nautilus, Draycott, H. J. Jones, and others; Lady Grimston and Old Blush arranged on the ground floor, and backed by a large assortment of the "tree" varieties, including Sam Weller, Lady Hermoine, Lady Hinton, Mandalay, Lady Roberts, Helene, Countess of Radnor, Helmsman, Fair Maid, and the scarlet-coloured King Arthur were in fine form. Several of the Malmaison blooms were distinguished by their immense size and highly developed character. A gold medal was worthily bestowed. An award of merit was accorded to a grand specimen of Lælio-cattleya callistoglossa superba, carrying seven beautiful flowers, having mauve sepals and deep maroon-purple lip, and golden throat.

Mr. C. H. Herbert, Acocks Green, staged a very fine display of herbaceous flowers, elegantly arranged. Mr. Herbert had also an effective display of his perpetual-flowering pink Progress. Mr. Arthur Brown, Kings Norton, contributed an attractive collection of cut roses of the leading varieties; and Mr. Robert Sydenham had a fine contribution of sweet peas; Mr. W. P. Willcox, Moseley, presented a collection of begonias; Mr. James Webb, gardener to W. Byng Kenrick, Esq., Edgbaston, showed a miscellaneous collection, in which were developed gloxinias, begonias, Hydrangea paniculata, caladiums, Lilium speciosum, violas, and border flowers; Messrs. J. White and Co., Worcester, sent a collection of hardy border flowers; and the Lapworth Nurseries Company contributed sweet peas.

FORTHCOMING ENGAGEMENTS.

MONDAY, August 2 (Bank Holiday). — Carshalton Flower Show.
Weybridge Cottagers' Show.
TUESDAY, August 3.—Royal Horticultural Society; Committees meet 12 o'clock. Lecture at 3 p.m. on "Water Plants," by Mr. Fred W. Moore, V.M.H.; Scientific Committee at 4 o'clock.
Leicester Floral Fête (two days).
Thornton Heath Flower Show.
WEDNESDAY, August 4.—Northampton Summer Show (two days).
SATURDAY, August 7.—French Horticultural Society of London.
MONDAY, August 9.—United Horticultural Benefit and Provident Society; Committee Meeting.
TUESDAY, August 10.—Royal Botanic Society's Anniversary Meeting.
Claycross Horticultural Society.
WEDNESDAY, August 11.—Chippenham Horticultural Society.
Taunton Deane Flower Show (two days).
East Anglian Horticultural Club Meeting.
THURSDAY, August 12.—Galashiels Horticultural Society.
Malmesbury Horticultural Society.
SATURDAY, August 14.—Kinellar Horticultural Association.
TUESDAY, August 17.—Royal Horticultural Society; Committees meet at 12 o'clock; Lecture at 3 p.m. on "Bees in Relation to Gardening," by Mr. Walter F. Reid, F.I.S.; Scientific Committee at 4 o'clock.

CURE FOR MILDEW.

One ounce of Cyllin Soft Soap [illegible] water is the surest remedy for [illegible] fly, and all forms of insect blight in the [illegible] or greenhouse.

CYLLIN SOFT SOAP

Is a reliable all-round non-poisonous insecticide and germicide. It does not injure the tenderest shoots, and it cleanses the [illegible] soil, thus safeguarding against further attack.

ANSWERS TO CORRESPONDENTS.

DISQUALIFICATION.—M. E. J., Swanley: The matter is fully provided for in the regulations, and you had your remedy. Why is it that competitors will not, or do not, more carefully study the rules and regulations governing the exhibitions they compete at? The regulation reads: The decision of the judges will be final, except in cases when, after any award is made, the exhibit is not found in accordance with the requirements of the schedule. All matters of protest, disqualification, etc., must be lodged with the hon. secretary, not later than 3 p.m. on the day of the exhibition, when they will be dealt with by an Arbitration Committee, whose judgment will be decisive.

SODA AND SOAP SUDS.—A. R., Notts: These are of little value in the garden as fertilisers, and there is a very great risk of harm from their use, because it is well-nigh impossible to gauge the strength of the solution. For garden purposes the best forms of soda to use are nitrate of soda and common salt, both of which are excellent for certain crops when used with care.

DECIDUOUS CYPRESS.—E. H., Salop: We should like to have further information respecting soil and situation, because these have so much influence upon vegetation. The deciduous cypress loves ample moisture, and the larger it grows the greater are the demands it makes, consequently if the situation is at all a dry one, or is very well drained, the trouble is not far to seek. It may be necessary to top dress the rooting area with decayed manure, pond mud, or similar fertilising material, and a deep trench taken out at the extremity of the feeding roots, and filled in with a rich compost, would, if our surmise is correct, give the tree a new lease of life. However, we wait for further particulars.

R.H.S. EXAMINATION.—J. S., Durham: We strongly recommend you to work up for the next R.H.S. examination in horticulture. Your letter shows that you can write neatly and legibly, and express yourself clearly, while your education in gardening appears to have been excellent. The examination is in two parts, one on the elementary principles on which horticultural practice is based, and the second on horticultural operations and practice. For the purposes of study and observation these parts may be sub-divided, each into about twelve sections. We have not sufficient space to publish these sections just now, nor to indicate the books that would be helpful, but you may obtain all these particulars on application to the secretary, Royal Horticultural Society, Vincent Square, Westminster, London, S.W., enclosing a large addressed and stamped envelope for reply, or, if you know a Fellow of the society who has his "Book of Arrangements for 1909" intact, and will lend it you, you will find full particulars therein.

NECTARINE AND PEACH.—G. J. C., Reading: A nectarine is really a smooth-skinned peach, and though we recognise the two fruits as distinct kinds, it is sometimes possible to obtain nectarines and peaches from one and the same tree, as in your case. Further, one may raise a peach from a nectarine stone; for instance, Early Alfred peach was raised from Hunt's Tawny nectarine, Early Ascot peach from Elruge nectarine, Early Beatrice peach from River's White nectarine, Magdala peach from River's Orange nectarine, Nectarine peach from Grand Moir nectarine, Osprey peach from Pitmaston Orange nectarine, and Prince of Wales from the same source. On the other hand, Prince of Wales nectarine was raised from a seedling peach, and Lord Napier nectarine from Early Albert peach. Bud sports may appear in either case, and if carefully propagated would come true, because bud sports are comparatively rare. You cannot, however, be sure when you sow a nectarine stone of obtaining a nectarine tree, nor, if you sow a peach stone can you be sure of obtaining a peach tree. How far this holds good when every care is taken to cross-fertilise peach with peach or nectarine with nectarine we cannot say, but probably the risk of variation is then very greatly reduced. All this goes to prove that the nectarine is merely a smooth-skinned peach, botanically, although the two are very distinct horticulturally.

FERNS FOR WINTER.—W. A. H., Northwich: Under the circumstances, the best plan will be to select about half the stock, and keep the plants moderately dry for about ten days; then prepare a good compost of loam, sand, and a little peat or leaf-soil, and in it pot up the best portions of the old plants, after shaking the old soil from their roots. Small 48's will be large enough. Place in an intermediate house, and keep close and moist until new roots and growth start, shade lightly, but as growth proceeds, and the days shorten, shade as little as possible, but prevent scorching. The object must be to obtain good growth that is of firm texture for winter cutting. You must endeavour to arrange your stock in about three batches, and as yours is not of the best quality it may save time and trouble if a few good plants are purchased, or you may proceed to raise a new stock from spores. Be very careful not to overwater the newly-potted plants.

FLOWERLESS SWEET PEA.—M., Londonderry: We have this week seen some plants that have practically no tendrils, and are very shy bloomers, but have not, so far, seen a plant that refuses to flower at all. Your plant appears to have reverted altogether to the vegetative condition, and it will, as a consequence, be unable to perpetuate its kind.

CONSERVATORY WITH WEST ASPECT.—A. N. R., Huddersfield: If the piping was better distributed, and there was no objection to the presence of moisture on floor and benches, the conservatory could be used for cool orchids, such as odontoglossums, but as the house is entered directly from the drawing-room there appears to be considerable difficulty in providing suitable atmospheric conditions. Very many kinds of ferns, begonias, fuchsias, and other subjects could be cultivated successfully, provided there are no trees and buildings to greatly obstruct the light. On the whole, we think ferns, foliage begonias, fuchsias, etc., would prove most successful, supplemented by bulbs and other flowering plants brought on in the frames.

NAMES OF PLANTS.

E. S. F., Lechlade.—1, Taxodium distichum; 2, Sequoia sempervirens.

J. W., Merstham.—1, Lathyrus rotundifolius; 2, Thuia dolobrata; 3, Olearia Haasti.

K. B., Leatherhead.—1, Galega officinalis; 2, Campanula isophylla; 3, Veronica spicata; 4, Sidalcea Listeri.

H. M. G., Dunmow.—1, Rhaphiolepis ovata; 2, Begonia fuchsioides; 3, Solanum jasminoides; 4, S. Seaforthianum.

P. S. F., Penarth.—1, Spiræa aruncus; 2, Erigeron speciosum; 3, Lonicera sempervirens; 4, Odontoglossum ardentissimum.

HER GRACE THE DUCHESS of DEVONSHIRE wishes to recommend J. THOMPSON to any Lady or Gentleman requiring the services of a HEAD GARDENER, where several are kept; 20 years' experience in all branches. Holker Gardens, Cark-in-Cartmel, Lancs.

MR. BOUVERIE CAMPBELL-WYNDHAM wishes to recommend GEORGE MERRETT as HEAD GARDENER, where two or three are employed. G. Merrett is thoroughly up to all garden work, understands hothouses, vines, and growing of carnations; he is married, no children; leaving for no fault, but to better himself; age thirty. Apply to Mr. Cawte, Head gardener, Corhampton House, Bishop's Waltham.

GARDENER (Head) seeks SITUATION where three or more are kept; age 30; married, two children; six years Escrick Park, five years Campsall Hall; three years as Head at present situation. SKILBECK, Nunthorpe Hall, York.

GARDENER (Head), age 28, married when suited.—JOHN CARTER, Gardener to Sir Walter Greene, Bart., Nether Hall, Bury St. Eds., highly recommends his Foreman, F. SIMMS, as a thorough practical Man, well up in growing and forcing flowers, fruit, and vegetables.

GARDENER (Head, where two or three are kept or good Single-handed), thoroughly experienced in all branches, Inside and Out; management of cows and poultry, if required; good references; married, two children. A. GOODFELLOW, 94, Sherrard Road, Forest Gate, Essex.

A GENTLEMAN wishes to recommend his HEAD WORKING GARDENER, who is leaving through reduction of staff; nine years in present situation; thoroughly experienced in all branches; married, no family. Apply in first instance, T. WALKER, Esq., Riversdale, Twyning, Tewkesbury.

GARDENER (Head Working), thoroughly experienced Under Glass and Outside; also herbaceous plants; excellent character from present and previous employers; married, no children. J. L., 20, Carnarvon Road, Barnet.

GARDENER (Head Working), good, practical life experience in all branches, Inside and Out; early and late forcing; especially good with Melons, Violets, and Chrysanthemums; nine years with last employer as Head; can have excellent references. H. TURNER, 4, Glenton Street, Peterborough.

GARDENER (Head Working of one or two); 20 years' practical experience; excellent references; life abstainer; disengaged; age 39; one child, age seven. HUGHES, 241, Beatrice Road, Newfoundpool, Leicester.

GARDENER (Head Working, where two or three are kept); life experience in all branches; married; age 35; five years present; well recommended. W. PEAGRAM, High Street, Botley, Hants.

GARDENER (Head of two or good Single handed); age 35; married, one child; life experience; 3½ years present situation; well recommended. J. FARROW, Mepal, Ely, Cambs.

GARDENER.—W. H. ALEXANDER, Pickhurst Manor Gardens, Hayes, Kent, highly recommends C. MEPHAM as Head of two or three, or good Single-handed; good all-round experience; 6 years' excellent character; age 28.

GARDENER (Head, or good Single-handed); life experience all branches; age 30; married, no family; good references. W. WILSON, 15, Hogue Street, Vickerstown, Barrow-in-Furness.

AS GARDENER (Single-handed or otherwise); life experience Inside and Out; good references; single; age 44. Address F. GOWER, Springfield Villas, Clarendon Road, Ashford, Staines.

MESSRS. LADHAMS, Nurserymen, Shirley, Southampton, can confidently recommend W. GUNSTON, age 35, as HEAD WORKING GARDENER to any lady or gentleman requiring the services of a good all-round man, who is conversant with the requirements of a well-kept establishment; excellent references. Apply as above.

GARDENER (Single-handed or otherwise); 8 years' experience, Inside and Out, chiefly outside; good references; age 25, single. J. CHARMAN, Titness Park, Sunninghill, Berks.

GARDENER (Single-handed or with help); good Second's place not objected to; married; age 36; tall; one child; life experience, Inside and Out; good references. H. WARNER, 17, Salmestone Road, Margate, Kent.

MANAGER-FOREMAN (Working); age 40; married; life experience in Market Nurseries; Grapes, Tomatoes, etc. (Iris a speciality); highest references. Address J. PARSONS, Stone Nurseries, Stone, Dartford.

FOREMAN (Inside), age 27; thoroughly experienced in Fruit and Plants, House and Table Decorations; excellent references. A. CARRINGTON, 118, Stowe Street, Lichfield, Staffs.

FOREMAN; married, no children; highest experience Inside and Out; good references; disengaged when suited; age 28. A. E. FOX, Overstone Park Gardens, Northampton.

MR. G. DUNCAN, Merstham House Gardens, Merstham, Surrey, would be pleased to recommend C. DEWEY as FOREMAN (Outside); age 28.

GARDENER (24) seeks SITUATION as Foreman, Inside; 10 years' experience; 6 years 10 months present place; good character; Bothy preferred. T. JARRATT, Waverley Road, Weybridge, Surrey.

MESSRS. CYPHER and SONS, Exotic Nurseries, Cheltenham, will be pleased to recommend J. COMPTON to any Gardener requiring first-class Man as SECOND (Inside ahd Out); age 28; abstainer; excellent references; Bothy objected to; five years Foreman at Lypiatt Park, Stroud, under Mr. Savegar, who can with confidence highly recommend him.

GARDENER (Second), age 26; 12 years' all-round experience; three years here; can be well recommended; leaving through place being sold. Address G. DALMON, Dunolly, Morden Road, Blackheath, S.E. (No circulars.)

GARDENER (Second), Inside and Out, where three or four are kept; thorough knowledge of gardening generally; excellent references; abstainer; age 22. J. STEPTOE, The Lodge, Hill House, Mitcham, Surrey.

AS GARDENER, with help; thorough practical all-round Man, Inside and Out, and French gardening; married; age 40; one son, 15; excellent reference. MAYLETT, Bramcote, Notts.

THE REV. G. H. ENGLEHEART can recommend his GARDENER, leaving for no fault, as steady, industrious, and capable; good Single-handed or over one or two; age 39; married, no family. Address F. E. BROOKS, Dinton, Salisbury.

GARDENER seeks SITUATION on Pleasure Ground and Kitchen Garden; very good experience; can be well recommended; age 29; married when suited. G. LAWSON, Starrock Cottages, Chipstead, Surrey.

JOURNEYMAN requires SITUATION in Pleasure Grounds or Inside; six years' experience. Apply E. ARCHER, Audrey Cottages, Renters Lane, Highfield Farm, Hendon, Middlesex.

J. POWELL, Head Gardener, Ilsington Gardens, Dorchester, Dorset, wishes to recommend GEORGE EADY as JOURNEYMAN (Inside); age 23; abstainer; leaving through death of employer.

MR. F. W. KEMP, Eastcourt House Gardens, Malmesbury, Wilts, can thoroughly recommend F. BUTLER as JOURNEYMAN, Inside and Out; age 23; 3 years here; abstainer; Bothy preferred. Apply as above.

GARDENER (Under) seeks SITUATION; five years last place, and can be well recommended; age 21; disengaged. Address R. P., 113, Nutley Lane, Reigate. (No circulars.)

GENTLEMAN wishes to recommend YOUNG MAN as UNDER GARDENER; 7 years' experience Inside and Out; age 22; good references. N., Red House Gardens, Heatherside, Camberley, Surrey.

AS IMPROVER, age 20, experience of Fruit Growing, Inside and Out, and Market Gardening; excellent references. J. R. A., 12, Pownall Gardens, Hounslow.

CARPENTER and JOINER, single, seeks SITUATION on Estate, or as House Carpenter; abstainer; excellent references; own tools. FEARN, Moseley Terrace, Rolleston, Burton-on-Trent.

CARNATIONS (Private or Trade).—Young Man (22) seeks SITUATION in perpetual-flowering Carnations; 6½ years' experience; London preferred. A. LENTON, High Street, March, Cambs.

GARDENER'S SON, age 17, requires SITUATION as IMPROVER in good Garden; good references; Bothy preferred. Apply A. KIRCHIN, Ashwell, near Baldock, Herts.

MR. W. MOORES, The Gardens, Orwell Lodge, Ipswich, would be pleased to recommend YOUNG MAN, age 20, Inside and Out; five years' experience.

SITUATION WANTED, where more are kept, 21 years' Scotch experience in all branches, Orchid included; age 35; married, three children; clear by Sept. 30, or when suited. Place sold. References from R. LINDSAY, Gardener, Ballenock, Skelmorlie, N.B.

SITUATION required by HANDYMAN; assist Gardener; understands Bees (certificated expert); handy with carpentering tools, painting, etc. Total abstainer; Single. SHORT, Langton Lodge Farm, Blandford, Dorset.

WANTED, SITUATION as an IMPROVER, age 17½; strong and willing; has been in present situation 4 years; total abstainer. Bothy preferred. A. HYLAND, Woodlands, Ticehurst, Sussex.

TO-DAY! AND FOR YEARS AND YEARS PAST the XL ALL Specialities are and have been the best on the market. Where is the Gardener who does not pin his faith to one or the other of these celebrated Insecticides or Fertilisers? XL ALL FERTILISER has pleased all who have used it this season. The Sales of XL ALL FUMIGATOR prove that it is more popular than ever. XL ALL LIQUID NICOTINE INSECTICIDE is always spoken of by gardeners and growers as the most deadly to Mealy Bug, Thrip, etc. XL ALL WEED KILLER used once a year "No weeds can live." RICHARDS' ARSENATE OF LEAD for all leaf-eating insects. CUCASA (fungicide), the finest preparation of copper ever offered to gardeners. Please ask your Nurseryman, Seedsman, or Florist for a copy of my small pink list, giving particulars of these and many other XL ALL Preparations, which can be obtained from the Horticultural Trade throughout the World. G. H. RICHARDS, Manufacturer and Patentee, 234, Borough High Street, London, S.E.

Situations Wanted.

HER GRACE THE DUCHESS of DEVONSHIRE wishes to recommend J. THOMPSON to any Lady or Gentleman requiring the services of a HEAD GARDENER, where several are kept; 20 years' experience in all branches. Holker Gardens, Cark-in-Cartmel, Lancs.

MR. BOUVERIE CAMPBELL-WYNDHAM wishes to recommend GEORGE MERRETT as HEAD GARDENER, where two or three are employed. G. Merrett is thoroughly up to all garden work, understands hothouses, vines, and growing of carnations; he is married, no children; leaving for no fault, but to better himself; age thirty. Apply to Mr. Cawte, Head gardener, Corhampton House, Bishop's Waltham.

GARDENER (Head) seeks SITUATION where three or more are kept; age 30; married, two children; six years Escrick Park, five years Campsall Hall; three years as Head at present situation. SKILBECK, Nunthorpe Hall, York.

GARDENER (Head), age 28, married when suited.—JOHN CARTER, Gardener to Sir Walter Greene, Bart., Nether Hall, Bury St. Eds., highly recommends his Foreman, F. SIMMS, as a thorough practical Man, well up in growing and forcing flowers, fruit, and vegetables.

GARDENER (Head, where two or three are kept or good Single-handed), thoroughly experienced in all branches, Inside and Out; management of cows and poultry, if required; good references; married, two children. A. GOODFELLOW, 94, Sherrard Road, Forest Gate, Essex.

GARDENER (Head), or GARDENER and BAILIFF; life experience; thoroughly efficient in all branches, Inside and Out; including Orchids; land, stock, and bees; three years present situation as Head; age 35, married, one child. C. JONES, The Gardens, Woodview, Watford, Herts.

GARDENER (Head Working, or good Single-handed); life experience, Inside and Out; age 28; married, no family. 23, Colweil Road, Lordship Lane, East Dulwich, S.E.

A GENTLEMAN wishes to recommend his HEAD WORKING GARDENER, who is leaving through reduction of staff; nine years in present situation; thoroughly experienced in all branches; married, no family. Apply in first instance, T. WALKER, Esq., Riversdale, Twyning, Tewkesbury.

GARDENER (Head Working), thoroughly experienced Under Glass and Outside; also herbaceous plants; excellent character from present and previous employers; married, no children. J. L., 20, Carnarvon Road, Barnet.

GARDENER (Head Working); married; age 36; one boy, age six; life experience in good places; good reference; wife Dairy or Poultry if required. GARDENER, 23, Kensington Square, W.

GARDENER (Head Working), good, practical life experience in all branches, Inside and Out; early and late forcing; especially good with Melons, Violets, and Chrysanthemums; nine years with last employer as Head; can have excellent references. H. TURNER, 4, Glenton Street, Peterborough.

MESSRS. LADHAMS, Nurserymen, Shirley, Southampton, can confidently recommend W. GUNSTON, age 35, as HEAD WORKING GARDENER to any lady or gentleman requiring the services of a good all-round man, who is conversant with the requirements of a well-kept establishment; excellent references. Apply as above.

GARDENER (Single-handed or otherwise); 8 years' experience, Inside and Out, chiefly outside; good references; age 25, single. J. CHARMAN, Titness Park, Sunninghill, Berks.

GARDENER (Single-handed), age 32; married, one child; 14 years' experience Inside and Out, including Orchids; good testimonials. T. BASS, Daisy Cottage, Kew Green, Surrey.

GARDENER (Single-handed with help, or Second in good establishment where three or more are kept).—R. STEVENS, Esq., highly recommends H. STEDMAN; age 33; married, one child; life experience Inside and Out, Stove and Plant Houses, Flower and Kitchen Garden; good references; life abstainer. STEDMAN, Sandy Cross, Seale, Surrey.

GARDENER (Single-handed or with help); good Second's place not objected to; married; age 36; tall; one child; life experience, Inside and Out; good references. H. WARNER, 17, Salmestone Road, Margate, Kent.

GARDENER (Single-handed or otherwise); life experience in Kitchen Garden, Flower, Greenhouses, etc.; can be well recommended; good references; single; age 44. Address GARDENER, 122, Grove Road, Hounslow.

FOREMAN (Inside), age 27; thoroughly experienced in Fruit and Plants, House and Table Decorations; excellent references. A. CARRINGTON, 118, Stowe Street, Lichfield, Staffs.

G. H. COOK, of Woodseat, Uttoxeter, Staffs., confidently recommends Young Married Man as FOREMAN on Pleasure Grounds or HEAD where two or three are kept. Apply as above.

MESSRS. CYPHER and SONS, Exotic Nurseries, Cheltenham, will be pleased to recommend J. COMPTON to any Gardener requiring first-class Man as SECOND (Inside and Out); age 28; abstainer; excellent references; Bothy objected to; five years Foreman at Lypiatt Park, Stroud, under Mr. Savegar, who can with confidence highly recommend him.

GARDENER seeks SITUATION; good all-round experience, including glass, bees, poultry; 6½ years' present place; married, age 42; three children; disengaged when suited. BRITCHER, The Gardens, The Rectory, Carshalton, Surrey.

JOURNEYMAN (First, Inside) age 23; 8 years' experience in present place; good reference; Bothy preferred. H. JONES, Warens Gardens, Bramshaw, Lyndhurst, Hants.

JOURNEYMAN (Inside), age 22; willing to learn Outside; leaving for improvement; 7 years' good reference at present place. H. HART, 40, East Street, Faversham, Kent.

MR. F. W. KEMP, Eastcourt House Gardens, Malmesbury, Wilts, can thoroughly recommend F. BUTLER as JOURNEYMAN, Inside and Out; age 23; 3 years here; abstainer; Bothy preferred. Apply as above.

GARDENER (Under). YOUNG MAN, abstainer, age 18, seeks SITUATION in either department; can be recommended by Head Gardener. Apply to WILLIS KING, Nomansland, near Lyndhurst, Hants.

GARDENER (Under) seeks SITUATION; five years last place, and can be well recommended; age 21; disengaged. Address R. P., 113, Nutley Lane, Reigate. (No circulars.)

GENTLEMAN wishes to recommend YOUNG MAN as UNDER GARDENER; 7 years' experience Inside and Out; age 22; good references. N., Red House Gardens, Heatherside, Camberley, Surrey.

AS IMPROVER, age 20, experience of Fruit Growing, Inside and Out, and Market Gardening; excellent references. J. R. A., 12, Pownall Gardens, Hounslow.

CARPENTER and JOINER, single, seeks SITUATION on Estate, or as House Carpenter; abstainer; excellent references; own tools. FEARN, Moseley Terrace, Rolleston, Burton-on-Trent.

LAD, age 16, wishes SITUATION as APPRENTICE to Gardener; a little experience. A. DRYSDALE, Newbattle, Dalkeith, N.B.

WANTED, SITUATION in Nursery or Private Garden; 12 years experience in growing Cucumbers, Tomatoes, Bedding Stuff, Sweet Peas, etc., for exhibition and market; good references. J. BARRETT, Wickham Heath, Newbury, Berks.

YOUTH, 17, seeks SITUATION (Inside or Inside and Out); 3 years at Wokefield Park. P. Brown, Yew Tree Cottage, Wokefield Green, Mortimer, Berks.

YOUNG MAN (24) seeks SITUATION, Outside, or Inside and Out; 10 years' good all-round experience; good reference. ASPLIN, Goodnestone, Dover.

YOUNG MAN (22) seeks RE-ENGAGEMENT to drive milk cart and serve round; good experience and good references. A. J. WRIGHT, Church End, Gamlingay, near Sandy.

YOUNG MAN seeks SITUATION as IMPROVER, in good garden; age 18; good reference; 4 years present situation. A. SMART, Syston Court Gardens, near Bristol.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Lavish Nature.

Now that the reign of the flowers is beginning to be succeeded by the harvest of seed, the marvellous fecundity of Nature must strike every intelligent observer. Strolling round the garden, it is, perhaps, the poppies of various kinds which strike one first, so great is the number of seed-vessels produced and so numerous are the seeds contained in each. Hundreds of thousands of the tiny black seeds may represent in a single plant the provision which Nature has made for the safe succession of its kind, although we know that a single one is capable of replacing the parent plant, and thus preserving the normal balance. We shall remark, however, that in the number of their seeds the annual poppies far and away surpass the perennials, whose established root-stocks provide a sufficient guarantee of permanence, while the ephemeral annuals have only their seed with which to bridge over the winter and re-establish themselves anew the following year. All through Nature we find the handicap of minuteness of reproductive material counterbalanced by lavish provision as regards numbers; the spores of cryptogamic plants, such as the fungi, mosses, and ferns, may be reckoned by the million, and by the billion in some cases, and yet each one is perfectly fashioned to reproduce the individual, and in each minute body there is incorporated all the potencies of its race, so that, given the one chance in the million or billion, the succession is ensured. We need not, however, confine the consideration of Nature's lavishness to the minute. The gigantic oak we may find in the autumn to be bearing substantial acorns by the thousand and scores of thousands on its intricate canopy of far-spreading branches. Our fruit trees in seasons of abundant harvest are equally fertile. The strawberry we devour at dessert has every berry dotted over with innumerable seeds, and the pips in a crop of luscious grapes would involve a good deal of counting. Returning, however, to the world of the minute, since it is here that numbers defy computation to the utmost, we may take the ferns as a particular example, since not only do they produce their spores by the million or hundreds of millions individually, and every season in the case of large species, but every one of these spores before it produces a fern develops an enormous number of fertilising organisms or antherozoids, probably several thousand per spore. In each of these again we have the racial potencies embodied, and as only one is really needed to produce the subsequent fern, and the number of ferns may be taken to remain more or less the same from season to season, while practically all are perennial and long lived, we are forced to the conclusion that we must multiply the number of spores produced by the number of antherozoids, and this again by the average duration of fern life, forming a formidable total indeed, in order to arrive at the proportion of chances which one antherozoid has of fulfilling its mission and producing an adult fern. Lavishness, indeed, seems but a weak word in such a connection. In some coal measures, the result, as we know, of the concretion of remains of ancient forests of ferns and their allies, we may find solid coal composed of spores or spore pods, which have sufficiently retained their individuality to be recognised. Myriads are here concerned, and yet even these must be multiplied by the number of fertilising organisms each would have produced had it had the chance, in order to arrive at the full number of lost chances involved. On a smaller scale, but yet on a striking one, we may see the same lavishness in our gardens when we examine the pollen which is an essential to seed production. For every fertilised seed an enormous number of unsuccessful pollen grains must be taken into account even where a certain amount of economy is secured by insect mediation. What, however, must be the proportion in the case of wind fertilisation, when, as in the case of some fir forests, a sudden breeze may fill the air with a dense mist of scattered pollen, so abundant that it has been seen washed up in heaps on the shores of adjacent lakes bordered by the forests concerned. Verily, it would take a clever calculator to estimate the chance here of an individual pollen grain reaching a stigma and fulfilling its function of fertilisation.

G.H. del

MR. JAMES DAY.

Mr. James Day, of Galloway House Gardens, Garliestown, Wigtownshire, is well known to our readers through his contributions to these pages. He has held the position of head gardener at Galloway House for nearly thirty years under two Earls of Galloway, and now under the new owner, Sir Malcolm McEacharn, he continues that position, and will also have charge of the woods and policies on the estate. Mr. Day's experience as a gardener has been varied, and he has served at Waltham Abbey, Essex; Bromley Hill, Kent; Crichel House, Dorset; and Hatfield House, Herts, and at the latter garden he was decorator and plantsman under the late Mr. George Norman. Mr. Day is well known as a most successful grape grower and cultivator of hardy fruits. Muscat grapes, both white and black, he has been especially successful with, and has won a very large number of prizes with them, while for eight years in succession he has won the first prize at the Royal Caledonian Horticultural Society's autumn exhibition for twelve dishes of hardy fruits grown in Scotland. Galloway House is in a favoured position climatically, and in the gardens many choice subjects that are not easily managed in the drier southern and inland counties of Great Britain do wonderfully well. All who know Mr. Day will join with us in hoping he will long be spared to carry out his duties at Galloway House for his new employer.

Interesting Sweet Pea Matters.—At the recent meeting of the R.H.S. Scientific Committee, Mr. C. E. Shea showed specimens of sweet peas with the stripe disease, the cause of which is unknown; Mr. Shea thought that possibly the disease was constitutional, or carried in the seed. Mr. Chittenden exhibited a sweet pea flower with three standards; the only flower so formed on the plant. Mr. E. A. Bowles drew attention to Mr. Unwin's exhibit of sweet peas, in which all the tendrils were replaced by leaflets, a condition said to be fixed.

Plants for Public Parks.—At the recent meeting of the American Association of Park Superintendents, the question was debated, "Is it more advisable for a park in a small city to own its own greenhouses than to purchase its tender plants from local florists?" A considerable diversity of opinion was expressed in the course of the discussion, which had to be adjourned to a second sitting. One speaker deprecated so much attention being given to tender bedders, and quickened the interest in the debate when he said, "I am of the opinion that instead of superintendents giving so much thought to the temperature and the soil that plants require in the greenhouse, it is better for them to hunt up hardier and choicer selections of trees and shrubs. Instead of studying the temperature and other things of different plants in a small park, he had better put in more time in the analyzation of the earth that his trees outside require, and I believe it will pay him better. Instead of giving so much attention to the greenhouse or hotbed, let him learn his trees. The first thing is the vegetable kingdom as it lies hardy outdoors, winter and summer."

Viola Trials at Rothesay.—On July 31 a party of about thirty members of the Scottish Pansy and Viola Association visited Messrs. Dobbie and Co.'s nurseries at Rothesay, to inspect the trials of about eighty varieties of bedding violas, and in our next issue we hope to publish the decisions arrived at by this body as to the best varieties in the respective colour classes. The party was a very representative one, and, after inspecting the trials and making the round of the nurseries, the members were hospitably entertained by the Messrs. Dobbie.

Economy of Matter.—In his address to the combined sections of the International Congress of Applied Chemistry, Professor Otto Witt made an interesting reference to the remarkable economy of matter in animal and plant life. He, said: "If we study the life of plants and animals we are struck by the marvellous economy reigning everywhere. There are few physiological processes which can be called wasteful. Every bye-product of the more important chemical reactions that take place in the organisms of plants and animals is utilised and made to serve some purpose. In plants, for instance, the refuse of the chemical work of the protoplasm seems to be deposited as encrusting material in the enclosing cellulose. The encrusted cell is then made to serve as a mechanical support for the body of the plant, whilst new and more vigorous cells are formed to fulfil the functions of life. Some of the bye-products of the chemical work of the plant are transformed into dye-stuffs, others into perfumes, both with the object of attracting the insects which are necessary for fertilisation. Everywhere in animated nature we see the principle of storing up food, either to serve in cases of need or to provide for a future generation. Even in those cases where Nature seems to be wasteful, as, for instance, in producing germs and seeds in far greater numbers than seem to be required for the continuation of the species, the seeming superabundance is merely a wise calculation of the probabilities for the development of the germs. More marvellous, perhaps, than any of these examples is the economical use of the energy required for sustaining the functions of life. So far as I am aware, there is not a single engine of human invention which can utilise the energy supplied to it in so perfect a way as, for instance, a horse utilises the calorics contained in its food for the production of mechanical power; and though the mechanical equivalent of light as a form of energy is, so far as I am aware, yet an unknown constant, we may safely say that the perfection with which living plants utilise the energy of sunlight for carrying out the endothermic reactions upon which their nutrition and growth depends is far superior to the methods which we have so far discovered for similar purposes."

Veitch Portrait Fund.—Subscriptions to this fund have also been received from the following: Mr. John Heal, V.M.H., Mr. T. A. Barnett, Mr. C. N. Davey, Mr. W. A. Hassell, Mr. Harry Short, Mr. W. Davis, Mr. W. Cowell, Mr. A. H. Kent, Mr. G. Tivey, Mr. A. Dawkins, Mr. C. Archer, Mr. G. Harrow, Mr. C. Weeks, Mr. F. Griffiths, Mr. D. Kirby, Mr. E. Gilman, and Messrs. Pope and Co. The fund closes finally on Saturday next, August 14.

Care of Fruit Trees.—The importance of proper attention being paid to orchard trees is clearly shown in a bulletin recently issued by the Michigan State Agricultural College. It is stated that upon many farms in Michigan there are old orchards that have been so long neglected that the trees have produced but little fruit, and that of so poor a quality as to have no commercial value. An exhaustive account is given of the means by which three such orchards have been brought into a fertile state and made to yield an average net profit of over £25 per annum for a period of five years. Pruning, spraying, and soil cultivation were the means by which the improvement in the condition of the trees was effected. There is, of course, nothing new in the method adopted, for it is similar to that which we have long advocated in the case of orchards in this country that have been allowed to become unprofitable through neglect.

Wild Bird Protection in Norfolk.—An order has been made by the Home Secretary (upon application by the Norfolk County Council) to be known as "The Wild Bird Protection (County of Norfolk) Order, 1909," prohibiting the killing or taking of wild birds throughout Norfolk between March 1 and September 1, so far as regards all birds mentioned in the schedule of the Wild Birds Protection Act of 1880, except woodcock, the close time for which is extended so as to be between February 1 and August 13, and snipe, teal, and all species of wild duck, the close time for which is to remain as fixed by the Act of 1880. The Order also provides that the Act shall apply within Norfolk to the following wild birds, as if those species were included in the schedule to the Act: Great bustard, crossbill, sand martin, bearded tit (reedling or reed pheasant). Between August 31 and March 2 following, the killing or taking of the bittern, little bittern, great bustard, goldfinch, kingfisher, owl (all species), and bearded tit, is prohibited throughout the county. All birds are protected on Sundays in certain areas

Soil Survey in America.—The U.S.A. Department of Agriculture is, by means of its Soil Survey Bureau, doing most excellent work in surveying and charting the soils of the country. The Department has already surveyed and mapped 200,000 square miles of territory, showing the qualities of the soils and consequently the crops to which they are best adapted under the climatic conditions existing in the several localities where the survey and mapping have been completed. The work is to be continued till the whole country has thus been covered. 40,000 square miles in Texas are under investigation at the present time. No work can be more valuable to the agricultural and horticultural people. It supplies them with information that is reliable, and it will aid them in selections of what they should plant in their respective localities. Having this scientific information to start with the prudent and intelligent cultivator will be able from time to time to resupply with good judgment the elements taken from the land in the growing of crops.

Bank Holiday was not an ideal holiday, owing to the presence of a cool wind. In some districts there were showers, and in a few places there was sunshine, but, on the whole, the day was dull and gusty, with not enough rain to cause discomfort. Kew, Hampton Court, Windsor, Virginia Water, Epping Forest, and Hampstead Heath were all extensively patronised, and almost everywhere there was evidence of the great hold that an outdoor holiday and amusements have upon the public.

Birmingham Botanical Society.—At the annual meeting, held on July 30, over which Mr. Neville Chamberlain presided, it was stated that the financial year commenced with a deficit of £63 10s. 9d., and finished with a total deficit of £126 12s. 6d. Under the head of income the largest item was derived from annual subscriptions, which this year represented a fall of £62, and compared with the past ten years this source of income had gradually declined from £1,100 to £900. It was clear, the committee stated, that to restore the finances of the society to a healthy condition the income derived from subscriptions must be increased. Looking round for new sources of income the committee had considered and now proposed two schemes, i.e., the erection of a new tea-room and the enlargement of the floor of the exhibition hall.

Cœlogyne venusta, a species from Yunnan, that first flowered at Glasnevin in 1904, is the subject of a double-page illustration in the recent issue of the "Botanical Magazine." Other plants illustrated in this issue are Aloe rubrolenta, a showy species from the Kalahari desert; Rubus canadensis, the "Thornless Blackberry," of North-East America; Pyrus Ringo, a beautiful little tree with reddish flowers, followed by a profusion of yellow fruits, each an inch wide by an inch and a-quarter long; and Mahonia arguta, a half-hardy species, with racemes of greenish-yellow flowers.

LEICESTER FLORAL FÊTE.

The annual flower show at Leicester, which has long occupied a foremost position among the great horticultural gatherings in the provinces, was held on Tuesday and Wednesday, August 3 and 4, and proved a magnificent success. There were enormous displays of flowers, fruits, and vegetables, a huge marquee devoted to groups arranged for effect, and an admirable demonstration of the art of floral decoration. The show was, as usual, held in the Abbey Park, and the arrangements testified to the ability of the Parks and Gardens Committee (of which Mr. Hawkes is the chairman), Mr. J. Burton, the superintendent of the parks; and of Mr. J. Stayens, the hon. secretary of the show.

GROUPS AND PLANTS.

Groups of plants arranged for effect constituted a glorious feature of this great gathering, and proved immensely attractive. Each group occupied a space of 160 feet superficial measure, and the first prize of £20 was worthily won by Messrs. J. Cypher and Sons, of Cheltenham, who were, as usual, in splendid form. The arrangement, while by no means a replica of previous groups shown by this firm, was carried out on somewhat similar lines to those of the best of their recent efforts. In the centre of the space was a bold mound of flowering and ornamental-leaved plants, and this was surmounted by a large and handsome palm with feathery leaves. At each corner of the group was a rather tall croton with single stem, and furnished with richly-coloured leafage from the apex to the rim of the pot. Between these, on the margin of the space, were elegant pinnate-leaved palms three or four feet high, and the intervening space was tastefully filled with comparatively dwarf-flowering and fine-foliaged plants, and among the former choice orchids greatly predominated. Mr. W. Vause, Leamington, was placed with an arrangement so rich and tasteful as to merit much praise; and Mr. H. Rogers, Leicester, and Mr. W. H. Manning, Dudley, who were third and fourth respectively, arranged groups that reflected much credit upon them.

Specimen plants were of average merit, but as they consisted, for the most part, of subjects that are well known there is no occasion to speak of them in detail. Ferns in collections of six were especially good, and Mr. Manning, Dudley, obtained premier honours with splendidly developed specimens of Davallia fijiensis plumosum and other fine forms. Mr. F. Oliver, Stoneygate, Leicester (gardener, Mr. Weston), was second with large, well-proportioned specimens.

ROSES.

Roses were shown in large numbers, and in magnificent condition, and formed the finest display of these flowers that has yet been produced at the Leicester exhibitions. The cool and wet weather which has so greatly favoured the development of blooms of exhibition standard had left its mark upon many of the light flowers, but, as a whole, the flowers were remarkably clean, as well as bright in colour, and characterised by freshness. There were five entries in the trade class for thirty-six blooms, distinct, and the premier position was occupied by Messrs. R. Harkness and Co., Hitchin, with superbly developed blooms, among which those of J. B. Clark, Alice Lindsell, Marie Baumann, Comte Raimbaud (premier bloom in the open class), Prince Arthur, Earl of Warwick, A. K. Williams, Ben Cant, Caroline Testout, and Mrs. T. Roosevelt were conspicuous. Messrs. Alex. Dickson and Sons, Newtownards, were a close second, with blooms hardly so large as those in the first-prize collection, but perfect in finish. Messrs. Perkins and Sons, Coventry, third. Very strong also was the competition in the class for twenty-four blooms, distinct, and at the head of the several competitors were Messrs. Alex. Dickson and Sons, who had a collection remarkable for the uniformly high quality of the blooms. Exceptionally meritorious were the examples of Madame Eugène Verdier, Frau Karl Druschki, Hugh Dickson, The Lyon, and Charles J. Grahame. The remaining prizes were awarded to Messrs. Perkins and Sons, and Messrs. Harkness and Co., who were second and third respectively.

Teas and noisettes, as shown in the open class for twelve blooms, were rather weak. The finest of the several stands was that staged by Messrs. A. Dickson and Sons, who had excellent blooms of Molly Sharman Crawford and Mrs. E. Mawley; Messrs. R. Harkness and Co. and Mr. J. Park, Bedale, were second and third respectively. On the other hand, the blooms staged in the class for twelve of any one variety, were of a high order of merit, and the eight boxes produced an effective display. Messrs. R. Harkness and Co. were first with blooms large in size and rich in colour of Hugh Dickson; Mr. W. H. Frettingham, Beeston, and Messrs. Alex. Dickson and Sons were closely matched, and in the result the first-named was placed second with fine examples of the brilliantly coloured Horace Vernet, and the Newtownards firm third with the pure white Frau Karl Druschki. In competition for the prizes for twelve blooms of any one tea-scented variety Messrs. A. Dickson and Sons obtained premier position with superbly-developed blooms of the sulphur-tinted white Mrs. Foley Hobbs, a new variety raised by the firm, and a valuable addition to its class. Mr. W. H. Frettingham was a capital second with excellent blooms of Madame Jules Gravereaux.

Amateur rosarians mustered in strong force and presented a remarkably fine lot of blooms. Six entered in the principal class, which was that for twenty-four blooms, and the premier award was made in favour of Mr. E. B. Lindsell, Bearton, Hitchin, who staged blooms in every way worthy of his high reputation. The blooms of Horace Vernet, Mildred Grant, Helen Keller, Madame Jules Gravereaux, Hugh Dickson, Charles Lefebvre, Mrs. J. Laing, and A. K. Williams were made note of as being of special merit, and the last-named was selected as the premier rose in the amateurs' classes. Mr. F. Dennison, Leamington, was a close second with finely developed blooms; and Mr. T. Park, Bedale, was a third with good blooms, some of which were overdressed.

Equally keen was the competition for eighteen blooms, distinct varieties, open to amateurs only, and Mr. E. B. Lindsell was again successful in taking premier honours. Very fine were the blooms of Mrs. J. Laing, Charles Lefebvre, Mildred Grant, White Maman Cochet, Bessie Brown, Mrs. E. Mawley, and A. K. Williams; Mr. Foley Hobbs, Worcester, followed closely for second place with medium-sized blooms; and the Rev. J. H. Pemberton, Havering-atte-Bower, Romford, was third with blooms of high quality. There was a long run of boxes in the class for twelve blooms, and the prizes were awarded to Mr. E. B. Lindsell, Mr. F. Dennison, and Mr. Foley Hobbs in the order of their names. For six teas or noisettes Mr. Park, Mr. Upton, Leicester, and Mr. F. Dennison were first, second, and third respectively. The best six blooms of any one variety were shown by Mr. Whittle, Belgrave, Leicester, the variety being Bessie Brown; Mr. Lindsell coming second with Alfred Colomb. There was a spirited contest for the prizes for four varieties, three blooms of each, and the most successful of the several exhibitors was Mr. E. B. Lindsell. The local growers of roses contributed liberally of their products, and especially so to the class for eighteen blooms. Here Mr. Speight, Market Harborough, was first with a fine set of blooms; Mr. Whittle second, and Mr. Upton third. For twelve Mr. Upton, Mr. Speight, and Mr. Whittle were the successful competitors.

CARNATIONS AND SWEET PEAS.

The several classes for carnations and picotees were especially well filled, and for twelve bizarre and flake carnations Mr. A. R. Brown, Kings Norton, was first with splendidly developed blooms of the most popular varieties; Mr. W. Sydenham, Melbourne, was a very close second with fine blooms; and Messrs. W. Pemberton and Son, Walsall, were third with meritorious blooms. Very fine were the contributions to the class for twelve self carnations, and the premier set was that shown by Mr. A. R. Brown, Kings-

MESSRS. E. WEBB AND SONS' GOLD MEDAL EXHIBIT OF VEGETABLES, MELONS, AND SWEET PEAS AT LEICESTER.

Norton, Birmingham, the bloom of Her Grace, a beautiful blush-coloured variety, and John Douglas, a superb pink flower, being the most conspicuous; Mr. W. Sydenham, Melbourne, was a capital second; and Messrs. W. Pemberton and Son were third. The white ground picotees were of exceptional merit in the class for twelve. Mr. A. R. Brown obtained premier honours with a fine set of blooms, the ground remarkable for its purity, and the marginal colour for its brightness. Yellow ground picotees and carnations produced a glorious display of colour, and it would be difficult to speak too highly of the splendidly developed blooms staged by Mr. A. R. Brown and Mr. W. Sydenham, who were first and second.

MR. F. BOUSKILL'S GOLD MEDAL COLLECTION OF HARDY FLOWERS AT LEICESTER.

Show and border carnations were presented in considerable numbers in the classes for six blooms. For flakes and bizarres Mr. F. Herbert, Mr. R. Makepeace, and Mr. J. Gumley were the prizetakers. The most successful of the competitors in the classes for white ground picotees were Mr. F. G. Duffey, Mr. J. Rudkin, and Mr. Makepeace. In the corresponding class for yellow ground picotees Mr. J. Rudkin was first with superb blooms, and Mr. F. Herbert and Mr. Makepeace were second and third. Mr. J. T. Ward was successful in taking the premier award for self carnations; Mr. Makepeace was second, and Mr. J. Rudkin third.

Sweet peas were so largely shown in the two classes in which Messrs. Robert Sydenham, Lim., provided the prizes, as to occupy the whole of the centre of one of the largest marquees, and to produce a display of unsurpassed loveliness. There were thirteen collections in the class for twelve vases, distinct varieties, and at the head of this large band of competitors was Mr. Hallam, Radcliffe-on-Trent; Mr. Hallet, Towcester; Mr. Weston; and Mr. H. B. Howe, were second, third, and fourth. There were nineteen entries in the class for six varieties, and Mr. Barsby won the premier prize, and Mr. Tyler, Mr. A. Collins, and Mr. O. Morris were second, third, and fourth.

HARDY FLOWERS.

Mr. F. Bouskill, Market Bosworth (gardener, Mr. G. Hollis), was a splendid first for twelve kinds of hardy flowers, with great sheaves of the scarlet Pentstemon barbatus, the white Madonna lily, Alstrœmeria aurantiaca, Cimicifuga racemosa, Veronica spicata alba, and Lychnis chalcedonica; Messrs. Warner, Wright, and Son, Leicester Abbey, were a good second with well-arranged vases of well-known plants; and Mr. C. P. Oliver, Stoneygate (gardener, Mr. Weston), was third with an excellent set.

For six kinds, Mr. C. H. Mayer, Leicester, was first with good vases of coreopsis, marguerites, gaillardias, and other well-known subjects; Mr. J. H. Hill, Syston, was a close second with a set in which alstrœmerias, aconitums, and phloxes were conspicuous; Mr. Widdowson was third.

Mr. F. Bouskill, Market Bosworth, exhibited, not for competition, a magnificent collection of hardy flowers, which formed a bank of flowers between fifty and sixty feet in length, and ten or more feet in height. The arrangement was, perhaps, a trifle too formal for the production of a picturesque display, but the great sheaves of splendidly-developed flowers produced a striking effect, and powerfully impressed the visitor.

MESSRS. WARNER, WRIGHT, AND SON'S GOLD MEDAL GROUP OF PLANTS AT LEICESTER.

FRUITS AND VEGETABLES.

Both fruits and vegetables were shown in much larger quantities, and of finer quality than we have previously seen them at the Leicester exhibitions. Especially attractive was the large array of dessert tables. Here the fruit and decorations were judged separately, and two sets of prizes awarded. In the class for nine dishes of fruit Mr. J. Drake, Orford House, Market Rasen (gardener, Mr. W. Parker), was first with fruit and third for decorations. The fruit comprised magnificent clusters of Black Hamburgh and Muscat of Alexandria grapes, splendidly coloured Gross Mignonne and Royal George peaches, Pine Apple nectarines, and good Brown Turkey figs. Mr. J. H. Goodacre, Elvaston Castle Gardens, Derby, was second for both fruit and decorations, and Mr. Ireland, Newstead Abbey, Notts, was first for decorations and third for fruit. The competition was of the keenest in the class for a dessert table with six dishes of fruit, and Mr. Drake obtained premier honours both for fruit and for decorations.

The contributions to the three classes for collections produced a magnificent display. Mr. J. Hudson, Leicester, was, as usual, in splendid form, as proved by the fact that he was first in the ordinary class for twelve kinds, first in Messrs. Sutton and Sons' class for six kinds, first in Messrs. Webb and Sons' class for the same number, and first in Messrs. Harrison and Son's class for nine kinds. Messrs. E. Jackson, Hurley, and Owen were also successful exhibitors in these important classes.

MISCELLANEOUS COLLECTIONS.

Miscellaneous collections were so numerous and good as to contribute materially to the interest and attractions of the exhibition. The following awards were made:

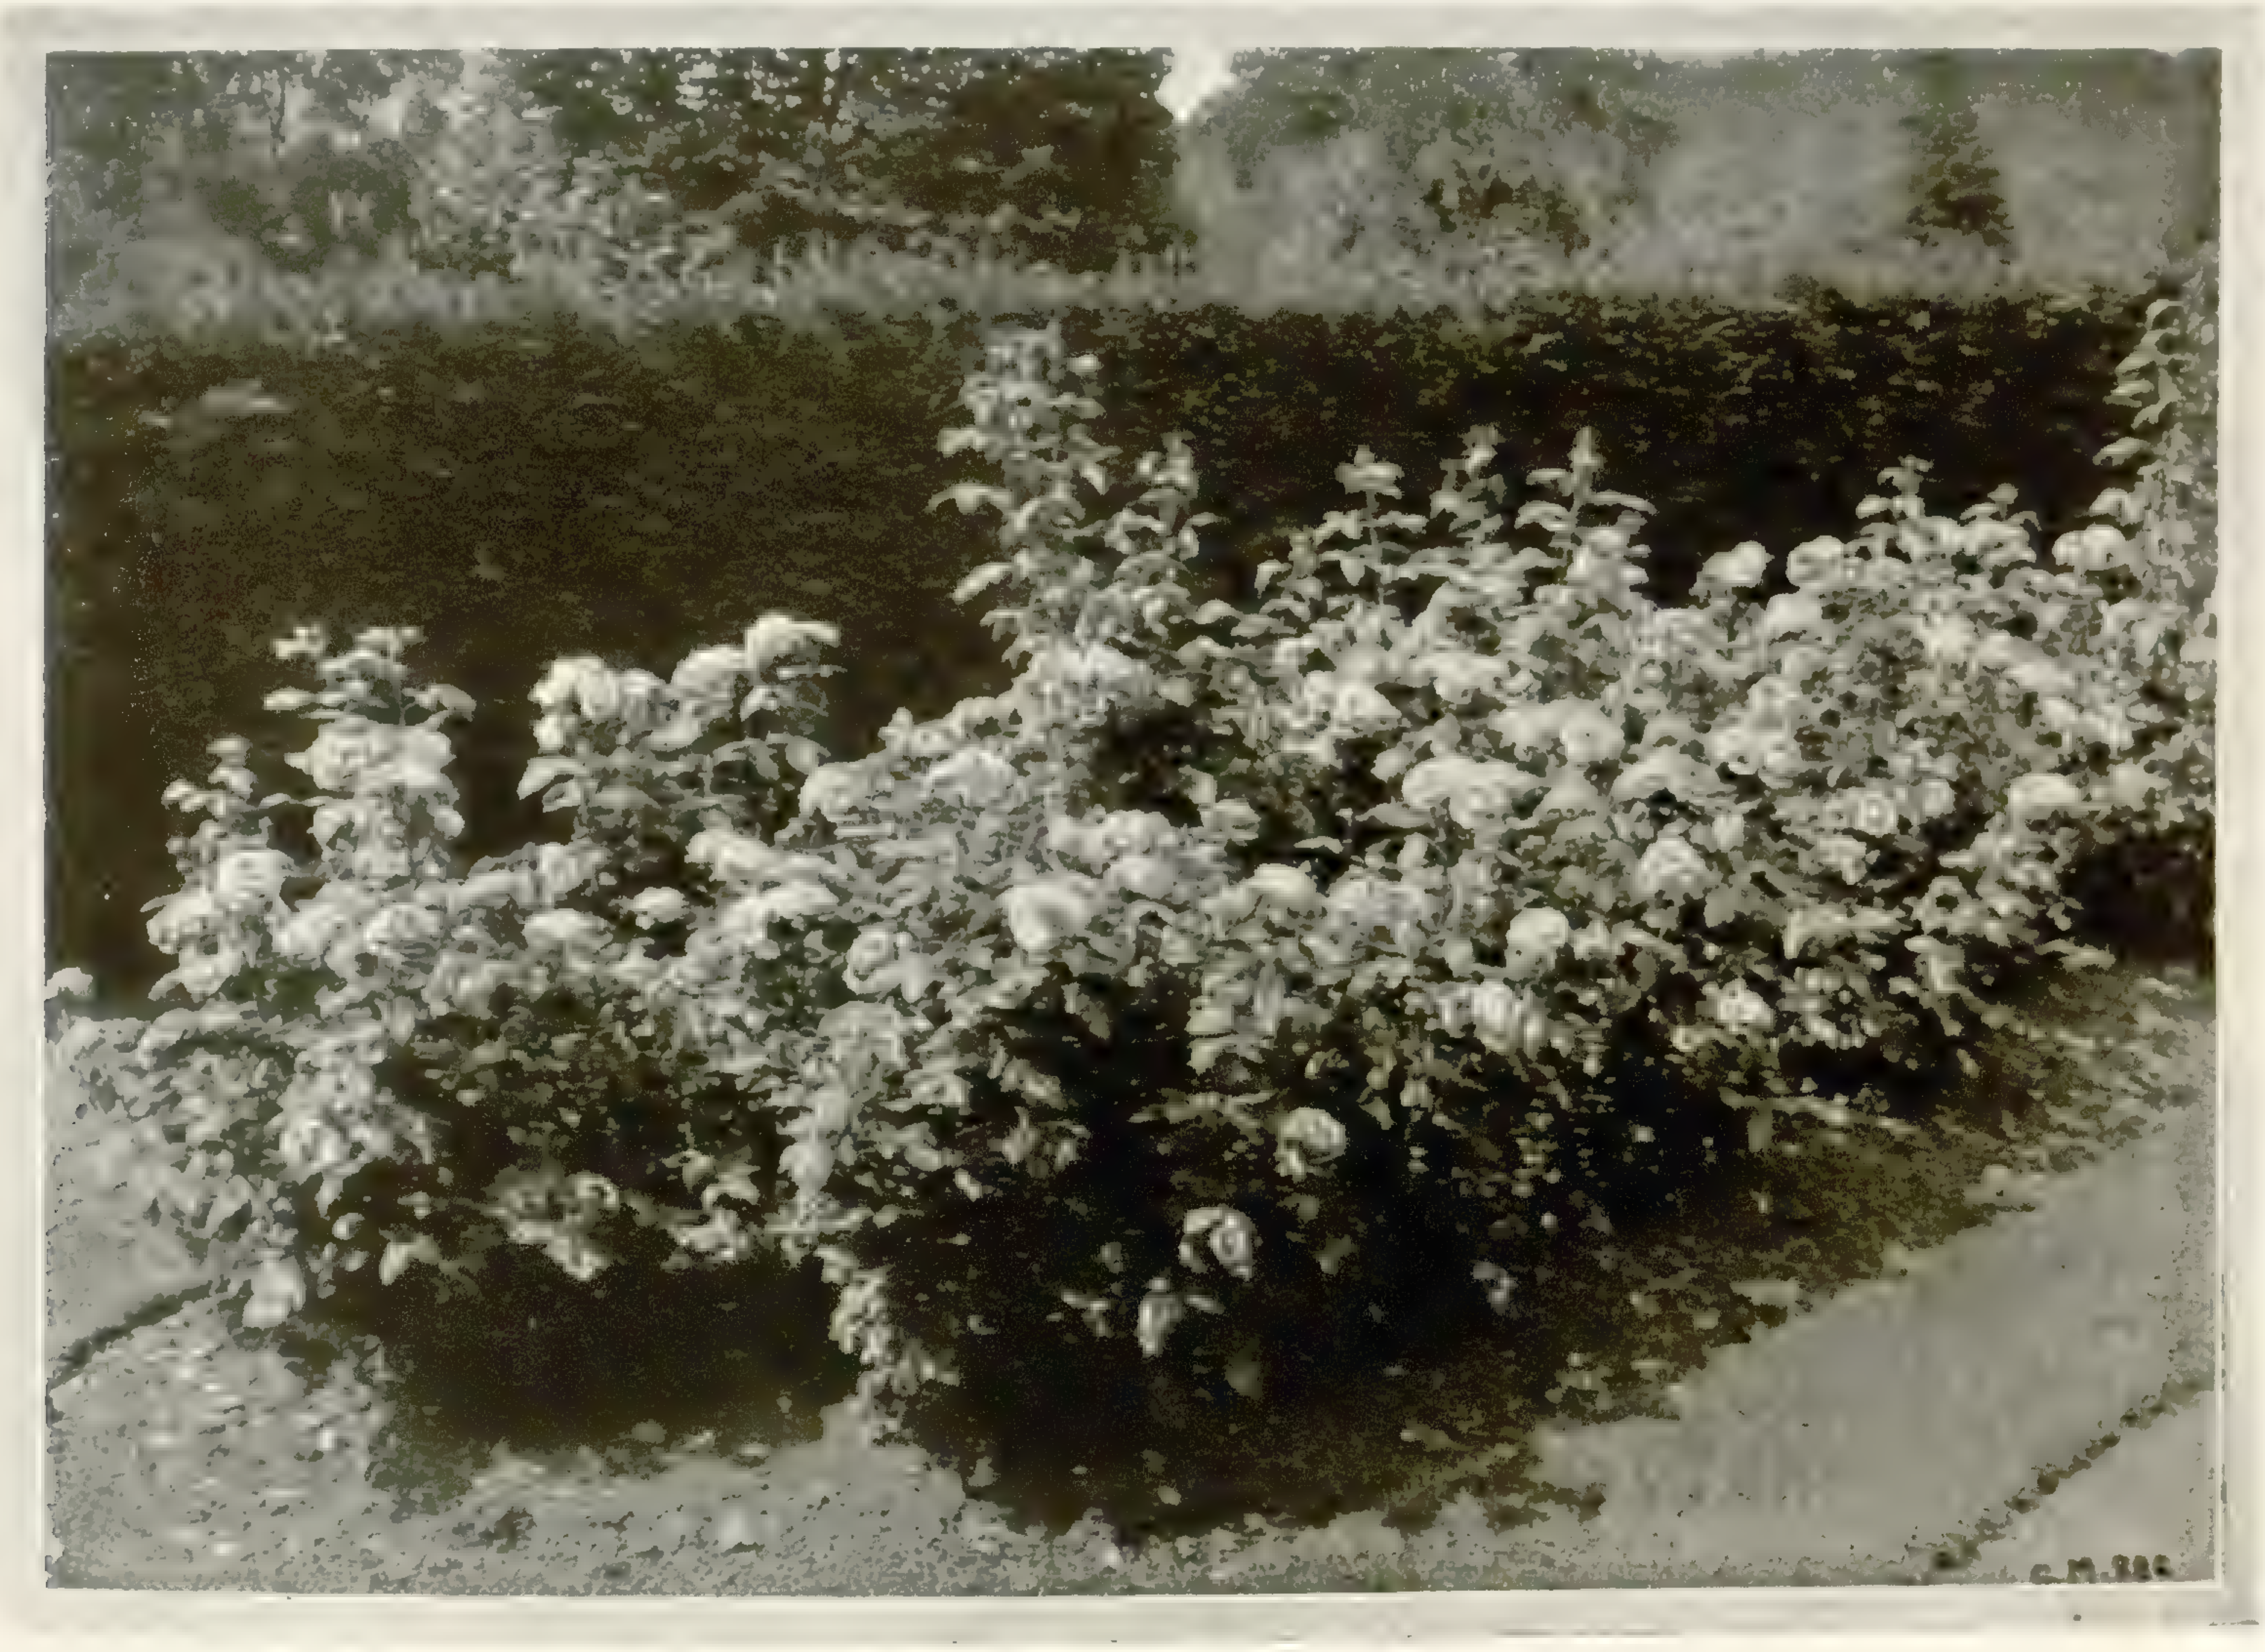
Gold Medals.—To Messrs. E. Webb and Sons, for a remarkably fine arrangement of melons, vegetables, sweet peas, and other flowers. The sweet peas comprised the greater portion of the finest varieties in cultivation, and the vegetables included a goodly number of the fine types with which the name of the firm is closely associated. The melons included such meritorious varieties as Beauty of Wordsley, Royal Sovereign, Epicure, and Webb's Masterpiece. To Mr. F. Bouskill, for his magnificent collection of hardy flowers. To Messrs. Warner, Wright, and Co., for a large and effective arrangement of plants, in which finely-developed begonias were conspicuous; and to Mr. W. Bentley for a beautiful collection of roses.

Silver Medals.—To Mr. J. Barrow, Rose Gardens, Oadby, for a collection of roses; to Mr. W. Wright, jun., Church Lane Gardens, Leicester, for hardy flowers; to Mr. G. Underwood, Saffron Hill Nurseries, Leicester, for sweet peas and violas; to Messrs. Harrison and Son, for a fine collection of vegetables and cut flowers; to Mr. Ellison, West Bromwich, for a collection of ferns; to Mr. C. Holden, Messrs. J. Lamb and Sons, Bingham, Notts; and Messrs. Merriman and Futton, Leicester, for sweet peas; and to Mr. H. Rogers for plants.

ROSES FOR MASSING.

In some gardens masses of roses in distinct colours for effect are required. For this purpose they should be free flowering and of dwarf growth, and also they should be of uniform height. Varieties that grow irregularly, that is, some plants in one bed of the same variety, owing to their great vigour, often produce robust shoots, hiding, to some extent, the masses of blossom below. Such varieties are not the best for a garden display. Indeed, some owners of gardens have a strong objection to such varieties, and discard them for those of uniform height.

The following admirably meet the requirements of those who grow dwarf roses for garden effect, namely:



HYBRID PERPETUAL ROSE MRS. JOHN LAING.

One of the best of the Hybrid Perpetual roses for beds and masses, being neat in growth and profuse in flowering; the colour rich cherry rose.

Viscountess Folkestone, creamy-pink, centre deep salmon-pink, is charming in its colour combination, and produces huge clusters, sometimes containing as many as ten blooms in each. Caroline Testout is quite one of the best pink roses for massing, growing quite evenly, and flowering abundantly; bright satin rose with a richer centre. It is quite without an equal in its colour. Killarney is remarkably effective, producing a profusion of its pale pink flowers; these are large, with shell-like petals, and the buds are long and pointed. The plants are furnished with robust foliage, and with its other attributes the variety is a gem for massing. Madame Abel Chatenay has flowers carmine rose, shaded with salmon, and it is not only a gem for massing, especially when planted thickly, but it provides an abundance of blooms for indoor decorations with long, stiff stems. Betty is ruddy gold, with a coppery-rose shading, and is very distinct and beautiful. Dr. J. Campbell Hall, coral-rose, is very free and attractive.

Richmond is a glorious rose in a mass, the large shapely flowers have long stems, and are most useful for decorative purposes in a cut state; the colour is red-scarlet. This rose is also valuable for its propensity to flower well into the autumn. Lady Battersea, cherry-crimson, is an almost perpetual flowering variety, and of much value. Lady Ashtown, rose, with a silvery-pink shade. La France cannot be omitted from any list of roses for massing, its silver rose-pink, shapely, and richly-perfumed blooms being so highly appreciated.

The foregoing roses belong to the hybrid tea section, and attention may now be directed to the following hybrid perpetuals: Frau Karl Druschki is far and away the finest white rose we have for massing; the foliage is ample, and makes a good setting for the pure white blooms above. A dwarf standard of this fine rose planted in the centre of a circular bed, materially enhances the appearance of the mass by relieving the flatness, and providing additional flowers. Tom Wood has cherry-red blooms, perfectly formed, and flowers abundantly, the trusses being large, as many as six shapely blossoms being frequently produced in each; the foliage, too, is deep green and healthy. Mrs. John Laing has much to recommend it; the growth is remarkably uniform, and the flowers produced freely, as so well shown in the accompanying illustration. The blooms are rather large, and the colour rich rose-pink. Mrs. R. Sharman Crawford, rosy-pink, the outer petals paler; free and good in every way. Ulrich Brunner, cherry-crimson, very profuse, and highly fragrant. Captain Hayward, scarlet-crimson, is one of the finest varieties in this section for massing, flowering in huge clusters, dwarf in growth, and very neat. Baroness Rothschild, pale rose, of well-known robust growth, and free flowering, producing huge blooms. Dupuy Jamain, bright cerise, free and open in growth, good perfume. General Jacqueminot, bright crimson, very fragrant, and good in every way. Hugh Watson, crimson, shaded carmine, with large smooth petals, of even growth. Suzanne Marie Rodocanachi, rich pink, those who are in quest of a really first-class pink variety would do well to give this a trial. In every way it is a good rose.

E. Molyneux.

VERBASCUM NOTES.

The question of the utilisation of verbascums for garden decoration is of considerable range and interest. At present these most useful plants seem to be under a cloud, as far as popular favour is concerned, though the reason for this would be hard to find. The decorative value of the tall verbascums is fully apparent to all observers, for, with their bold appearance, their stature, and their wealth of blossom, they are certainly entitled to a place in many gardens where at present they are conspicuous only by their absence. As regards their inclusion in the herbaceous borders, one notes the grand effect produced by isolated groupings, or of bold single specimens.

Some of the biennial species are wonderfully attractive, and even if they are extremely prodigal in their distribution of seed (necessitating the use of the hoe among the offspring), yet it would be folly to exclude their simple grandeur from the garden for this one reason. V. Olympicum, for instance, is a typical subject for illustrating the intense value of the family. Given plenty of space to develop, and a fairly open situation, the broad leafage and the tall spikes of golden blossom (each central flower stem being surrounded by the candelabra-like setting of minor flower stems), which show to the keenest advantage, and will contrast effectively with tall perennials of other colours. A grouping of the sterling perennial species, and Chaixi, with some good hybrid delphiniums, has emphasised itself as decidedly pleasing. The spikes of bright yellow blossoms (rendered more showy by the purple filaments) seem to light up the range of blues, which one gets among the delphiniums, and the mingled display is certainly noteworthy. A plant not often seen in gardens is V. Chaixi alba, the white-flowered variety of the preceding. It is worthy of inclusion in a collection of perennials, and may be regarded as the best of the white-flowered mulleins.

Other white verbascums include V. Blattaria alba, the white form of the northern mullein, a tallish, slender-stemmed plant of useful habit; V. Lychnitis, a sterling native, with creamy-white blossoms, borne upon tall, branched stems; V. nigrum album, the pretty white variety of the dark mullein, another native plant of perennial duration; and the pleasing white form of V. phœniceum, which is just as useful as the specific form, and provides a very distinct feature in the garden.

Of V. phœniceum one might speak in favourable terms, seeing that its light, graceful habit, and its interesting range of varieties make it well deserving of popularity. I would advocate its use in covering dry banks, and for beautifying rock ledges and old walls. It is persistent in blossom, and its purple, rose, blush, lilac, and white forms show to good effect. V. phœniceum has also assisted in the origin of several good hybrid varieties, and among those usually accredited with the influence of that species are V. cupreum, an exquisite coppery-purple, of delightful habit, Daisy Hill, a dainty bronzy-orange, with slender, continuous spikes of blossom; and Lewanika, a bronze-purple form, with a light, graceful habit, which usually attains a height of two feet.

Those massive giants, such as V. pulverulentum, a somewhat rare native, with well-branched, pyramidal spikes of blossom; V. longifolium, with its tall, single spikes, and large foliage; V. Thapsus, the dense-flowered, effective native, with its columns of gold; and V. pannosum, a woolly-foliaged variety of V. longifolium, which is perhaps one of the best known in gardens, all call for extended use for wild garden planting. Like the foxgloves, they carry a charm which renders them of equal interest and beauty with the rarest of exotics. In their place they are superb, and the massed glories of the towering spikes of the verbascums, rising from a dry bank, or gleaming through the lightly-planted woodside borders, gives one a picture of the real value of what are usually termed "common things."

It is not my desire to enumerate the whole string of useful verbascums, but rather to attract the reader's attention to the value of this somewhat neglected group of plants. Few plants are more easily grown, or are as simple in their requirements as these mulleins, and for the popular present-day cult of the wild garden they are indeed worthy of note. It would be well to include many of the species and varieties named, and one should also bear in mind the pretty bluish-purple V. Wiedemannianum, and the golden Syrian V. simplex, as typifying the utility of Asiatic forms, which can be used in conjunction with native and other verbascums.

P. S. HAYWARD.

THE ALIMENTARY IMPORTANCE OF MAGNESIA IN THE LIFE OF PLANTS.

When any plant whatsoever is analysed, the presence of magnesia in the ashes is invariably found. When an experimental culture of a plant is made in a sterile soil medium, if a magnesia salt is not added to the artificial plant food with which the plant is watered, the growth will at first be found to be poor, and soon the death of the plant will ensue. Magnesia is, then, one of the most indispensable foods in the life of plants. This element is found in the greatest abundance in the young organs, shoots, and just opening leaves, as also in the reserve organs, such as bulbs and seeds.

In the majority of plants the young tissues exhibit a remarkable constancy in the chemical composition; three grammes of the ashes of these organs always containing just about one gramme of phosphoric acid, one gramme of potash, 0.355 of magnesia, 0.25 of lime, 0.10 of sulphuric acid, and so on—thus magnesia is one of the indispensable elements in the young organs of plants.

The ashes of plants usually contain a greater proportion of lime than magnesia, but in contradistinction to this, lime is mostly found in the older portions of the plants, viz., the hard wood, the leaves, etc. Thus lime is somewhat an element of decay —a passive element. In fact, lime does not seem to be generally necessary to the vital functions of plants. Certainly it appears to be very useful to the higher forms of plant life, but it has been shown by experiment that all the fungi and the algæ which cannot live without magnesia, can prosper perfectly without lime. (Pfeffer.)

The alimentary rôle played by lime is then less important than has been believed. For it would seem that the rôle played by magnesia—an element of which the study up to now has been too much neglected, is far more important. In most plants the mean proportion of magnesia and the mean proportion of phosphoric acid in the same kind of plant is generally constant, no matter what the soil in which that plant is cultivated. Whereas, in the case of lime and potash, the amount usually varies according to the soil wherein the plant has been cultivated.

Magnesia always enters into plants in the form of complex organic compounds, which are absolutely necessary to assure their life by the development of protoplasm in the young cells, whereas the combinations of lime, particularly the oxalates of lime, as well as the oxalates of potash, may rather be considered as the products of excretion or even as the fixing of harmful matter. It was interesting to take note of the needs of the principal horticultural plants for magnesia and to compare those figures with those of their requirements for phosphoric acid—one of the elements justly considered as amongst the most important from the point of view of vegetable alimentation. According to my analyses, I have been able to determine the following results:

	Magnesia. per cent. of ashes.		Phos. acid per cent. of ashes.
Anthemis	7	...	1.1
St. Valery carrot	9.7	...	1.3
Autumn chrysanthemum ...	18	...	2.7
Persian cyclamen	3.30	...	0.2
Dracæna Bruanti	3.90	...	0.46
Erica scoparia	3.90	...	0.46
Gladiolus gandavensis ...	12.1	...	28.1
Hortensia Otaka	13.20	...	2.7
Kentia Belmoreana	0.6	...	0.5
Brown Cos lettuce	20.9	...	5.7
Peppermint	20.1	...	41.8
Nægelia	3.4	...	1.6
Odontoglossum	11.2	...	2.9
Zonal pelargoniums	9	...	13
Peach Amsden	3.2	...	1.6
Rose Ulrich Brunner	18.2	. .	1.6

According to Lawes and Gilbert, Rothhamstead.

Wheat, grain	11.1	...	51.8
Wheat straw	1.5	..	3.8
Meadow hay	6.3	.	5.6
White clover hay	5.8	...	7.8
Lupin seeds	4.5	...	4.3

From these figures one sees at first sight the enormous alimentary importance played by magnesia.

I ought to say that the horticultural plants, other than those already quoted, which seem to contain most magnesia are the amaranths, gaillardias, carnations, godetias; those amongst the vegetables being the beet, Brussels sprouts, peas, and tomatoes.

It seems very probable that the restoration of magnesia to garden soils will be at least as important as the restoration of phosphoric acid, and even more important than that of potash and of lime.

Yet former agricultural works, amongst others those of De Gasparin, say that magnesia is distributed in a uniform and sufficient quantity in all arable soils, and that the addition of magnesia manure to a soil seems unnecessary. This assertion may be questioned, for, after my researches on this point, it appears that magnesia is not always in superabundance in the soils devoted to gardening.

It is besides, quite as interesting to remark that the salts of magnesia are very soluble, and can thus be easily drained away by the rains. Thus, in 22 analyses of garden soils made very recently, I have found 11 soils which only contained non-measurable traces of magnesia.

I may mention that among these soils are the nurseries of Monsieur Camille Defresne, of Vitry-sur-Seine, a very calcareous soil, which is without magnesia; that of Monsieur Margottin, of Pierrefitte, a soil very rich in everything except magnesia; that of Monsieur Gravereaux, Roseraie de l'Hay, the calcareous soil generally rich, but with only traces of magnesia; a sandy soil of Monsieur Cheynes at Alfortville does not contain any magnesia; a soil from Monsieur Stanis de Jarnac (Charente), very rich in all elements—is very calcareous—but does not contain magnesia. Another soil from Monsieur E. Happeaux, of Menigoute (2-Sevres), is very sandy, but contains no magnesia; a soil from Monsieur Belliard at Feteval (Loir and Cher), a very sandy soil, only containing traces of magnesia. The soil from Monsieur Wolfrom, of Sceaux, calcareous, only containing traces of magnesia.

One can only conclude that in most of these cases that to bring magnesia to these soils would be advantageous.

Very recent experiments have confirmed my way of looking at this subject. My attention had been drawn to the large quantity of magnesia contained in the ashes of roses, and I have been able to establish, in addition, that in certain soils of the Roseraie de l'Hay, where the growth of the roses was getting weaker, that the soil only contained traces of magnesia.

Having reached these conclusions, Messieurs Cochet-Cochet, of Coubert, and Monsieur Léon Chenault, of Orleans, the well-known rose growers, have been good enough to make experiments on roses, and, following my instructions, Messieurs Cochet-Cochet have used nitrates of magnesia in solution, and Monsieur Léon Chenault the sulphate of magnesia in a strong dose, varying from 100-200 grammes per square metre. In both cases, the result on the growth of roses has been excellent, and I have also been much struck with the beauty and the vigour of the roses cultivated by Monsieur Adnet, the sympathetic cultivator of Cap d'Antibes.

In consequence of my visit, Monsieur Adnet has been kind enough to send me several of his soils to analyse. I found out that it was precisely those soils in which roses grow the best which were richest in magnesia—another fact which supports my theory. In those soils which come from the disintegration of dolomites, magnesian rocks, the use of sulphate or phosphate of magnesia has given no result, which was to have been expected.

I believe I have now drawn the attention of horticulturists to the alimentary importance of this element, too little studied, magnesia, particularly where it concerns the improvement of soils. On soils where roses have been long cultivated, and the rose growers have a declining growth, they ought certainly to employ a complete plant food, with sufficient nitrates and more alkaline, ought to add to this mixture from 60-100 grammes per square metre of sulphate of magnesia. According to Monsieur Chénault, this can be done without any danger.

I shall be happy if this announcement is of a nature to attract the attention of rose growers, and to cause experiments to be employed which will certainly throw fresh consideration on this question, one of the most modern and one of the most interesting in vegetable physiology.

Versailles. **Georges Truffaut.**

BEAUTIFUL WATER GARDENS.

Probably the most lovely effects in water gardens are those in which some mystery exists, where the vision cannot range over every portion at once, and so the mind confidently believes in greater loveliness not yet revealed. Consequently, to surround a pool with a flat bog garden is a great mistake. By throwing up a few banks, not far from the water, and not so as to surround it, the required mystery is partly achieved, for behind these banks may exist other beauties; better still is it if some groups of shrubs, or trees, exist to intercept the view, and some of these at least can almost touch the water, giving it greater apparent depth, and creating at times those reflections and deep shadows without which lakes, ponds, and river pools lose half their charm.

Giant reeds and polygonums are suitable for groups at the water's verge, or for clothing islands upon large lakes, but it is the smallest type of water gardens, artificial ponds of modest dimensions, that are most difficult to surround with mystery. I have lately seen the needs of the case met in a simple and most effective manner, however. At the end of the pool the ground had been thrown up in a bank about a yard high, and the side that was against the water was made of rockery of natural gray stone, mossy, lichened stones, after the bank had been made thus firm, the upper and side stones having been concreted together in part, some of the innermost portion was scooped away, forming a hollow something like a cave. The water basin was then extended so as to stretch well under this, and the water allowed to flow in.

The rockery nooks of the arch were next planted lavishly with hartstongue and [illegible] ferns, also the delicate little trailing Linaria cymbalaria, with a few variegated vincas, and the rapid growth of these had completed a picture of rare excellence. No eye could discern where the water stopped; it seemed to be flowing beneath a bridge of rockery, and one quite expected to see it emerge upon the other side; while every dainty fern frond was repeated in the darkened pool below. If this result is compared in fancy with that of the usual plain round pond of small size, where a few iris and reeds alone surround the water, and a patch of forget-me-not is the sole attempt to reproduce a natural effect, I think the merit of the arched pool will appeal to all.

Rustic bridges of elaborate type are out of place except in large gardens, yet a simple bridge crossing a small stream, or even spanning a pond, often adds greatly to the scene. The mere plank, with handrail at one side, is invariably picturesque; the three or four plank bridge, with one or two handrails, is suited to the pond. It should be remembered that the shadow of a bridge is a beauty, intensifying the colour, and diversifying the tints of water; in the same way every tall plant, shrub, bank, or tree, alters the hue of the stream or pool.

A very pretty feature to introduce beside water is the tree stump well climbed by ivy; it should not be used hollowed out, as an urn for gay flowers, but a primrose root or two nestling within it will be permissible. Many gardeners known the decorative value of hop poles climbed by ivy or ampelopsis near water; others regard them as too visibly artificial. Yet, if we do not use these, we must go without the elegant pillar of foliage that is so lovely when reflected below, or else employ some dead young tree removed from wood or meadow, and, though this is undeniably natural, it gives a sad suggestion to the scene.

As a rule the boggy earth that meets water is extremely ugly, so we should take care to clothe the ground in every possible way. Plants such as the vincas and hypericums, that will thrive while dabbling their trailing branches in the pool, are exceedingly valuable; then there are hosts of lesser plants that love moisture—the buttercup, sweet woodruff, and white and yellow oxalis, for instance.

Instead of having groups all of one species of iris we should carefully mingle varieties, and so obtain perfect colour harmonies; the ordinary purple German iris and the common yellow flag are familiar examples, that look better when grouped with each other instead of separately, the taller foliage being a fair background to the violet blossoms, and the flowering period of that particular clump being extended. Upon banks so many flowers and ferns will thrive that cannot live in water-level ground, that this is an argument in favour of creating them; the more they can be brought to lean over the water the lovelier will be the shadows and reflections. Wild strawberries and creeping jenny can be recommended for carpeting them, and a few summit groups of purple, yellow, and white foxgloves will greatly add to the landscape; primroses and violets should be exceedingly numerous, with a sufficiency of bluebells, not too many, as the blue colour is somewhat heavy, while the white and pink varieties look so strange that they are better kept to grace obviously cultivated borders.

The common bracken fern I would always have near water, massed by large sheets, and just represented by small ones. Can any colour be more cheering than the gold and crimson of its autumn garb, or any green more bewitching than its early foliage? When garden flowers are grown by lakes, pools, streams, etc., the ordinary kind of Chrysanthemum maximum is an admirable subject, because it is, after all, but a daisy, resembling those of the fields; nodding poppies upon the banks, and royal blue cornflowers, with tall grasses not far away, are equally artistic. A beautiful effect can be gained by having some giant white convolvuluses, either growing on irregular wooden arches spanning the water, or climbing tree trunks or allowed to ramble over hawthorn or other bushes.

Briar roses, the Wichuraianas and ramblers too, are used largely in water gardens now, to form hedges, overhang banks, and canopy seat nooks; the more unrestrained their growth the finer will their appearance be. M. H.

ALPINE PRIMULAS.

These delightful plants rank among the most desirable subjects for rockery planting, and are characterised by elegance and diversity of habit and colouring. Judiciously placed in compact groups they cannot fail to attract very considerable attention, while as pot plants grown in a cold frame they yield a wonderful display of decorative material in the early spring months. It frequently happens that amateurs lose their plants in winter, resulting from being placed in low-lying positions, and consequently subjected to excessive moisture both at the roots and overhead.

These primulas revel in a loamy soil and short manure, and require abundance of moisture during their season of active growth, but in common with many another subject from mountainous districts, resent wet conditions in the dull and dormant season. Bearing this in mind, the groups should be so arranged that overhanging boulders will effectually carry off heavy rains and provide the proper shelter.

I would strongly advise that they be planted in groups of from three to half a dozen, these being much more effective than single specimens. They will, of course, be planted out from small pots, and this may be done in the autumn or in March. Slugs are very fond of the succulent morsels they afford, and not only devour the young foliage and flower spikes, but play havoc with the crowns, feeding upon them in winter if allowed to take up their quarters in their vicinity. Hence the necessity of dusting soot around them occasionally, and of trapping the slugs with cabbage leaves, carrots, turnips, etc.

The following possess much beauty: Primula ciliata, a well-known and popular species; it bears bluish-purple flowers, and grows with great freedom. Extremely beautiful is P. frondosa, whose silvery foliage and large trusses of bright, rosy lilac flowers at once attract attention. Scarcely less desirable is P. marginata, with similar foliage and bluish flowers. From the Tyrol we obtain P. tyrolensis, which has rose-coloured flowers also. P. Forsteri and P. glutinosa, have pink and blue flowers respectively. Well worthy of notice is P. farinosa, which is found growing in a wild state in many parts of the British Isles. P. calycina, a native of the Alps, has purple flowers, while P. Facchini supplies us with a pink shade, the individual flowers being very fine, and altogether out of proportion to the minute foliage. By all means include P. nivalis, of spotless purity; it is worthy of being proclaimed Queen of the section. It is a native of the Caucasus.

Walter H. Aggett.

BULBS.—A practical treatise on the cultivation of hardy, hothouse and greenhouse bulbous and tuberous rooted plants is "Bulbs and their Cultivation," by T. W. Sanders, price 2s. 6d. net, or by post 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

THE MUSEUM GARDENS, YORK.

Remembering the great historical pageant which was presented in York recently, readers of the Gardeners' Magazine will probably be pleased to have a short account of the Museum Gardens, the arena of that pageant.

VIEW IN THE MUSEUM GARDENS, YORK. [Photo: W. Watson.
A portion of the ruins of St. Mary's Abbey is shown in the background.

On the left bank of the Ouse, and on the left hand when you have passed from the railway station over Lendal bridge, are the gardens of the Yorkshire Philosophical Society, generally known as the Museum Gardens. "This society was founded in 1822, and in 1829 (we quote from the official handbook) acquired about four acres of the present site, formerly known as the Manor Shore, which consisted of pastoral land, and on which stood farm buildings. The building of a museum was at once begun, and excavations were undertaken to ascertain the extent and nature of the buildings which formed the Abbey of St. Mary. The grounds belonging to the abbey covered about 15 acres, and of these the Manor Shore formed a part. Extensions have been made at various times to the society's grounds, which now cover over 10 acres." It should be noted that York was the birth-place of the British Association for the Advancement of Science, and that besides its first meeting in 1831, the association has twice since assembled in York, viz., in 1881 and 1906.

The gardens are full of interest, not only to the historian and antiquarian, but to all intelligent visitors. We may briefly mention some of their most conspicuous features. St. Leonard's Hospital, built by Athelstane in 937, and rebuilt and enlarged by Stephen; the Roman Wall; the Multangular Tower, one of the most famous relics of genuine Roman masonry; the Choir and Nave of St. Mary's Abbey ("the remains are those of the third church, the building of which was begun between 1259 and 1299"); the Hospitium, as its name indicates, is believed to have been the guest-house of the abbey, but in course of time its appearance, no doubt, has greatly changed.

The museum itself, built in 1829, has been called "the finest classical building in the North of England." In it are to be found important natural history, geological, and other collections. The antiquities contained in the Museum and Hospitium are of priceless value. As York (Eboracum) was a great Roman city, at which a Roman legion was permanently stationed to keep the Brigantes in order, and was afterwards the temporary residence of quite a number of Roman Emperors, it will easily be understood that the collection of Roman antiquities is worthy of the most careful study. The pageant devoted an episode to the Roman story of York under the title of "Altera Roma," or the second Rome.

On entering the grounds from Museum Street, you have on your right the ruins of St. Leonard's Hospital, with a green lawn in front of them, and a background of trees, which form so perfect a screen that scarce a glimpse of houses is to be seen. (On your left are rhododendron beds with ferns, and another lawn backed by shrubberies and large ash and elm trees inhabited by a colony of rooks). As you go on to the museum itself, you pass a large shrubbery in which a great pyrus is conspicuous. In spring this shrubbery has a many-coloured carpet of crocuses, with here and there a few early daffodils—a delightful sight. (On the opposite side of the path is a graceful specimen of Fraxinus lentiscifolia). Further on, the famous Multangular Tower comes into view.

The ground in front of the museum slopes gently to the river Ouse, and has on the right, as we look towards the river, many fine trees—limes, red-flowered chestnuts, copper beeches, and thickets of rhododendrons and other shrubs, amongst which an occasional tall philadelphus shows its white blossoms. On the left is the observatory, with its screen of shrubs and tall elms and sycamores, and a large border containing such flowers as campanulas, delphiniums, Hemerocallis aurantiaca major, Lilium pardalinum, Iris sibirica and I. graminea (there is a fairly large collection of Iris germanica in other parts of the garden), inulas, gaillardias, violas, and many other plants. Before we descend to the river side (the river-path is only separated from us by a tall and handsome iron palisading) we may notice a great bed of rhododendrons, which serves as a home for colonies of montbretias, heaths, and mimulus. On our right, close to the river, is the Hospitium, and behind it a small botanic garden.

But probably the majority of visitors to the gardens are most delighted with the ruins of St. Mary's Abbey, the north wall of the nave of which (shown in our illustration) served as the background of the arena on which the York Pageant was presented. It would be difficult, very difficult, to find in England a setting more suited in every way for the series of splendid spectacles, from the triumphal entrance of Constantine, clad in white and gold, and borne with the Empress Helena in a gorgeous chariot, to the appearance of Henrietta Maria and Charles I., and a realistic combat between the soldiers of the Parliament and Newcastle's famous Whitecoats. As the spectator faced the arena, he had on his right the museum, and beyond that building shrubs with a broad border of flowers, and beyond them aspen and elm trees; in the actual arena are two fine white hawthorns, a tall elm, and a graceful silver birch. These partially veil the wall of the great Abbey Church before spoken of, behind which there is a row of limes. The western doorway of the church served as one of the entrances of the pageanters, and behind that the tower of St. Olave's Church is just visible.

On the left of the spectator is quite a grove of fine lime trees in all the beauty of their summer foliage, and fragrant with innumerable blossoms.

It must not be supposed that we have attempted to do more than point out some of the prominent features of the gardens. Of the formal flower-beds we have no space to speak, and we can only mention in the briefest way the many fine chestnuts, the weeping wych-elms, the bowling green shaded with flourishing young lime trees, and the abbey gateway. The pigeons and peacocks add much to the illusive charm of gardens such as these, situated almost in the heart of a great city, and they were quite at home at the pageant.

Our illustration, for which we are indebted to the well-known skill and courtesy of Mr. William Watson, speaks for itself. As our readers look at it they will easily understand that with the sunbeams slanting through the leaves, the swallows flying overhead, the many coloured groups of ladies, gay as the brightest flowers and surrounded by regal pomp and martial splendour, with applauding crowds in mediæval dress picturesquely grouped behind them, it has been easy for those who have been fortunate enough to attend rehearsals to imagine themselves in the midst of the "Merrie England" of days long past.

G. Yeld, M.A.

HARDY CYPRIPEDIUMS AND FERNS AT OAKWOOD, WYLAM-ON-TYNE. (See next page.)

THE SUMMER PRUNING OF HARDY FRUIT TREES.

The necessity for carrying summer pruning into effect is everywhere more or less in evidence at the present time, and probably in the whole range of garden operations there is not one that gives rise, among cultivators, to such diversity of opinion as to the best time and methods of procedure.

The cause of this undoubtedly arises from the fact that a system of operations that answer well in one district may prove the reverse in another, owing chiefly to differences of situation, soil, temperature, and weather. The variation of the seasons alone, early or late, as the case may be, often makes a difference of a fortnight or more in the proper time for commencing the work; to which may also be added the vagaries of growth exhibited by the different varieties of a species, necessitating careful forethought and discrimination in order to fix upon the time when the operation may be carried out with greatest benefit to the health and fruitfulness of the trees.

Summer pruning in the first place must by many be looked upon as a necessary evil, as the pruning away of much vigorous growth represents so much wasted energy which, could it be disposed of in some more profitable direction, would certainly be to the benefit of the trees. Growing as these are under restricted conditions, as horizontal, fan, and cordon systems of training, to mention but a few, due thinning out and regulation of the shoots at some time during the growing season is imperative to the maintenance of health and fruitfulness, and in a minor degree the appearance of the trees themselves. In the case of certain fruits, as apples, pears, and plums, planted in the open, and allowed space sufficient to ultimately form large, spreading heads, summer pruning may almost be dispensed with, excepting so far as it pertains to the timely removal of weak or cross growing branches; the leading shoots of such being allowed to extend rapidly tends towards the earlier formation of the trees, and consequent fruitfulness. Trees growing against walls can produce shoots and spurs on one side of the stems or branches only, and as the apportioned space for each tree becomes filled and no further extension can be permitted, redundant lateral growth becomes more and more in evidence, so that to admit the necessary light and air, and afford space for the full and proper development of the fruit buds, a certain amount of summer thinning or pruning is necessary.

Root-pruning

in relation to branch-pruning has a more important bearing than might at first seem possible. Slight consideration, however, must reveal the fact that a fruit tree necessarily much restricted in the matter of top growth, must also have the roots kept within reasonable limits to ensure fruitfulness. This opens up another and still more comprehensive question, that can be but briefly referred to at present, i.e., how best to obtain and preserve for a long series of years that easy balance between root and branch which, while supplying ample nutriment to both foliage and fruit, yet reduces superfluous growth to a minimum, and accordingly the necessity for much pruning in any form.

In former times it may be presumed that the seedling, or, as generally called, free stock, upon which to graft apples and pears, was alone used, and less restriction of top-growth was practised than is customary at present. Aged examples of such trees may often be met with, and, although there are exceptions, the majority present an aspect devoid of beauty, or are useless from a fruit-bearing point of view.

The increased popularity of the paradise and quince stocks, which is largely owing to their moderate vigour and precocious fertility, has brought about a somewhat changed course of summer pruning to that formerly prevailing. As an instance of this, consideration may be given to a cordon-trained tree, grafted on either of the stocks named, which may have one or several branches rising from a single stem. For a few years after planting, close, but very interesting attention must be paid to the leader, first to keep this in a direct line to a given point, whether the direction be upright or slightly slanting; and secondly, by judicious stopping of this, at intervals, to so encourage side shoots or spurs to form that the tree eventually presents a regular succession of these from bottom to top. This attained, the more serious work of

Summer Pruning

commences, and with each recurring season timely stopping of all shoots, that by their free growth show a disposition to assume an undue lead, so that the flow of sap may be as evenly distributed as possible, to the great advantage of those shoots that have, from some not very clearly defined cause, been left behind in the race.

As already hinted, trees grafted upon dwarfing stocks require attention from the time the shoots are six inches in length, which may be towards the end of the month of May, by having the points removed from those disposed to take a lead, and this treatment must be continued at intervals throughout the early summer months, until in August, early or later, according to the season, all shoots previously stopped may be further reduced, leaving, however, not less than four perfect leaves at the base. Large trained trees against walls, as the fan or horizontal forms, especially if grafted upon free stocks, are best operated upon in the early part of August; but in this much depends upon the locality and the season, be this early or late, moist or excessively dry. To prune too early or too closely is risky, as the basal buds, which it is desired to benefit, may be made to break into growth, thus defeating the object aimed at. Where a fairly representative collection of large and stone fruits—apples, pears, plums, and cherries—are cultivated, it is readily observed that there is a wide difference in the habit of growth among the different varieties, some being much more profuse than others in shoot production, and with these a careful thinning of the surplus shoots would greatly benefit those left, and by thus admitting light and air to every part would ensure better maturation of the buds than could possibly be the case where overcrowding exists.

Disbudding

as an aid to summer pruning could hardly fail to be beneficial, and many of the thickly placed, small, or otherwise useless shoots might be rubbed from the branches as soon as discernible, and the trees, thus early relieved of worthless matter, would be better able to concentrate their energies on fruitfulness. In some respects it is unfortunate that this work with fruit trees requires to be carried out at the busiest season of the year, which in very many instances causes it to be deferred until too late to be of much value, or else the work is hurried over, and all trees treated alike. Could sufficient time be spared for this work in summer, it would lessen very considerably the necessity for much winter pruning, greatly to the advantage of the trees in health, vigour, and fruitfulness, as well as to the comfort of the workmen, by reducing very considerably this somewhat tedious task at an uncongenial season.

JAMES DAY.

Galloway House Gardens.

A NEW TOMATO DISEASE.

A leaflet has been issued by the Board of Agriculture dealing with the new disease of the tomato caused by the fungus known as Septoria Lycopersici var. europæa, Briosi et Cavara.

It appears that in 1907 and 1908 tomatoes were found to be attacked by a disease which had not previously been known to exist in this country, but which was first reported from South America, the native country of the tomato. As far back as 1884 it was described by Spegazzini, as attacking tomatoes grown in Argentina. Since then it has appeared in Australia; and shortly after the introduction of tomatoes into Europe it was recorded in Italy, France, Germany, and other continental countries. From its sudden appearance in this country there can be little doubt that the fungus has been introduced from abroad with imported tomatoes. The damage which the fungus is capable of doing is very serious. A crop of outdoor tomatoes in Gloucestershire was entirely destroyed by it in 1907 and it reappeared in 1908. Growers are cautioned to be on the lookout for this pest, which, if neglected, may become one of the most serious sources of injury to the crop.

The fungus which causes the disease is closely related to the "leaf spot" disease on strawberries, apples, pears, and chrysanthemums, but is quite distinct from any of these diseases, and it has been proved that spores of the fungi causing "leaf spot" on the plants named above are incapable of producing this particular disease on tomatoes. In the same way, experiments made with the object of infecting potatoes and other plants with spores from this tomato fungus have not resulted in any injury.

Symptoms of Attack.

The tomato plants attacked show small blackish-green spots on the leaves. These are irregular in shape at first, but soon become concentric and finally confluent, and the leaves, which are rapidly killed, roll up and hang loosely from the stem. The fungus also attacks the stem, the calyx, and finally the fruit itself. When no remedial measures are taken the whole plant may be destroyed within seven days from the first sign of the disease.

Description and Life History.

The spores of the fungus germinate out of doors during June and July, but at an earlier date under glass; the mycelium pierces the surface of the leaves and rapidly branches in the interior. The injured portions quickly discolour, and small spots appear externally. The dead tissues, especially in tomatoes grown indoors, dry up and exhibit spots of a somewhat dark brown colour, which appear hard and parchment-like. In tomato plants cultivated in the open air the spots are softer and black. When the dead portions of a leaf are examined by means of a pocket lens, one can easily detect numerous minute black bodies not larger than the point of a needle all over the surface of the leaf. At the same time one can distinguish a light brown-coloured substance rising from the apex of each small body like a curled, twisted thread. The manner in which this substance rises from the bodies may serve as a character to distinguish this disease from others.

The minute black bodies are the fruiting portion of the fungus, and the light brown mass consists of spores. The spores are exceedingly small, measuring about 1-454th of an inch in length and 1-12,500th of an inch in breadth; they are divided into several segments, numbering from three to eleven. When the leaves dry up the spores fall to the ground, and are carried about by the air, or adhere to the glass, woodwork, poles, etc., of glass-houses, where they pass the winter. They germinate on tomato plants in the following year on finding suitable conditions for their development.

Prevention and Remedy.

Experiment has shown that in order to combat this disease great care must be exercised. The precautionary measures recommended below should be adopted.

(1) Plants once attacked can only be saved by spraying immediately the first signs of disease are noticed. The plants should be sprayed with a 3 per cent. solution of Bordeaux mixture early in the morning every second day for two weeks. The spray should be in the form of a fine vapour falling upon the plants like a natural dew. The method of preparing Bordeaux mixture is described in Leaflet No. 23 (Potato Disease). The ingredients for a 3 per cent. solution would be 3lb. copper sulphate and 2lb. freshly burnt quicklime to 10 gallons of water.

(2) Badly attacked plants should be cut back, or, better still, uprooted and burned.

(3) Any wires and props used in the houses or in the open air should be slowly drawn through fire, in order to kill the spores adhering to them.

(4) The top soil should be removed and mixed with fresh lime in the proportion of one barrowful of lime to five of soil. It can be replaced after the lime has slaked.

(5) When planting young tomato plants, pulverised lime should be scattered on the ground round the stems.

(6) Tomato seed from infected areas should not be used.

HARDY CYPRIPEDIUMS AT OAKWOOD.

At Oakwood, Wylam-on-Tyne, the residence of Mrs. Norman Cookson, orchids are a fine feature, as our readers know full well; but these pages have also shown that ornamental trees and shrubs, and hardy flowers, find favour in this famous Northumberland garden, and are extensively and well grown. In a sheltered portion of the garden there is a small pool of choice water lilies, and around this pool is low rockwork furnished with alpines, and beyond this are some boggy portions where moisture-loving plants thrive, and here the hardy cypripediums provide a pretty picture in their season. One of the best of these, and one that has succeeded here for many years, is the fine Cypripedium spectabile, and our illustration shows this and other charming plants in bloom near the lily pool.

Importation of Horticultural Produce into Italy.—With reference to the importation of horticultural products into Italy, a recently issued Foreign Office Report (No. 673) observes: Owing to the restrictions imposed by the Phylloxera Convention, no plants or seeds can be sent direct from the United Kingdom to Italy, and consequently the trade in roses, seeds, and bulbs is all done by France and the Netherlands. The law is evaded to a certain extent by shipping these goods to agents in France for re-shipment, but this is a clumsy plan, and wastes time, which, in treating of such perishable goods, is the essence of the contract. An inspection of many acres of beetroot would at once persuade any British agriculturist that, even making allowance for the dryness of the Italian climate, much might be done by the introduction of better seed and by the use of artificial manure. Seed potatoes might also be introduced, but it must be remembered that the seed must be imported every year, as it has been found by experiment that after the first year, if the crop is raised from potatoes which have been reared in Italy from British seed, the result is disappointing, the potatoes being no better than those grown from the ordinary Italian seed.

WINTER VEGETABLES.

It is necessary for gardeners to look a long way ahead when arranging for the various crops required during the winter and early spring, for it is during that period the skill of the cultivator is taxed to keep up a constant and varied supply. It is only by a careful study of the requirements of the establishment that he is able to provide the requisite quantities of each and every kind. As a rule, more gardeners come to grief over the supplies of vegetables than anything else. A gardener has at the present time not only to consider the supplies for winter, but in many instances for next spring and early summer also. Of the latter period we have but little to say at the present time, though it may be advisable to remind readers that it would be well to make preparations for sowing cabbage, onions, parsley, lettuce, and such like, in case they might forget that the present season is a backward one, and it is possible that things will not grow as rapidly as they have done in some seasons. At the present time there are crops still occupying the ground that would have been cleared off had the season been a forward one.

Broccoli.

Broccoli was a failure in many places last spring, but this is not always so, and as this is a most useful spring vegetable, a good breadth of the late kinds should be planted as soon as possible, to admit of sturdy growth while the days are of sufficient length. Where the soil is good this usually grows very rampant in the autumn, and the plants ought therefore to be allowed a sufficient space to enable the foliage to become thoroughly developed, without which it is impossible to produce fine heads. With us it is the practice to sow the late broccolis the first week in May, and as soon as the plants are large enough to handle, prick them out nine inches apart each way, when, by the time the ground can be cleared ready for them, they are fine sturdy stuff, which, lifted carefully with a fork, and transplanted, soon become established. It is not always convenient to put them in their permanent quarters just as they are ready in the seed bed, but by pricking them out they become sturdy stuff, and take no harm if not transplanted for a few days, and no time is thus lost. For latest use we have grown several varieties, but have found one named Universal to suit us better than any other, though Omega is a very good one.

The present season so far has been very favourable for the growth of green crops, the soil not having become too hot and parched as in some seasons; but where space is limited, and broccolis have to follow some other early crop, such as peas, there is some delay in planting; but if they are put out now and receive due attention, they will soon become established; and, should the weather be favourable, they will become fully developed by October.

Brussels Sprouts and Kales.

Of Brussels sprouts there are several distinct varieties, some producing sprouts nearly as large as small savoys; but we prefer those of smaller dimensions, as being less liable to injury through frost. Large sprouts look well on the exhibition table, but they are very disappointing when cooked. We prefer a hard, close sprout, about the size of a walnut. Of all our winter vegetables, when well grown, there is none more useful than Brussels sprouts, and none that gives a greater bulk of useful food from the same space of ground. The plants, however, ought to be planted early, and allowed ample room to develop, for when grown closely together the leafstalks are too far apart for the stems to produce a heavy crop. Where space is limited, and a large number is grown, it is a good plan to plant in rows three feet apart, allowing from fifteen to eighteen inches between the plants, and by the time the foliage touches each other in the rows, space may be cleared for the alternate plus plants; and if these are carefully lifted in showery weather and transplanted in rows three feet apart, they will give a succession of sprouts to the first batch. Brussels sprouts are usually sufficiently hardy to withstand the severity of our winters, especially if some of the hardier varieties are grown, and allowed sufficient space to become well developed.

Of kales there are several kinds, but some of them are not very enticing or appetising when cooked. The dwarf green curled and the asparagus kales are the best. There is a variety of the latter known by the name of Favourite, which is of a most delicate flavour and fine colour when cooked. It is, however, not so hardy as some kinds, and requires to be grown on rather poor ground to withstand a severe frost. If liberally treated in the spring, it is astonishing what a quantity of nice tender useful greens may be gathered from a limited space. This variety seems more subject to the attack of the white fly than any other that I have grown, but if watered a few times with quassia water this will be kept in check.

Savoys.

Savoys are always a favourite winter vegetable, but many gardeners make a mistake in sowing the seed too early, and in growing the plants too large. We do not want savoys the same size as cow cabbages, weighing half a hundredweight each, but small, crisp, curly hearts. We sow the seed about the first week in June, and as soon as the plants are large enough to handle they are pricked out about six inches apart; here they remain until the early potatoes are cleared off, when they are planted out. Savoys are seldom called for until other vegetables, such as peas and cauliflowers, are becoming short, therefore there is no advantage in growing them to waste. The small-growing varieties are the most useful, such as Perfection, New Year, and the like. There is a variety of Drumhead known by the name of Miniature, which is very useful, and a few rows of this should be grown in every garden.

Maintaining Supplies.

To have a good supply of green vegetables through the winter should be the aim of all gardeners, and it is incumbent on them to study the requirements of the establishments. There is usually no difficulty in keeping up supplies through the summer and autumn, but it is when severe weather sets in and arrests all growth outside that the difficulty occurs, and unless gardeners have made due preparations beforehand, it is then too late, and trouble begins; first with the cook, and then with the employer. Cultivators are too apt to think that, because they can grow plants or flowers, there is nothing further needed. This may be so in small places near towns, where one can run to the greengrocer for everything required; but in the country the case is far different. It is not easy at all times to provide everything asked for, but it should be the aim of the gardener to do the very best he can with the means at his command. H. C. Prinsep.

Buxted Park Gardens.

WORK FOR THE WEEK.

◆

STOVE PLANTS.

VENTILATION AND SHADING.—Close attention to ventilation and shading will now be necessary after the long cloudy, sunless weather experienced, as in a few minutes plants may be ruined for the season by the scorching of the leaves. The safest plan by far is to always leave a fair amount of ventilation at the top of the houses to allow of the moisture escaping. Keep all plants clean, as growth is injured and not readily replaced when once damaged. Many strong plants repotted early in the year will be assisted with some approved fertiliser, large crotons and palms being much benefited by weak liquid manure, and in warm weather they will require an abundance of root watering. Tree ferns also require copious supplies of water daily at the roots and on the trunks, which should not at any time be allowed to become quite dry.

ALOCASIAS, MARANTAS, etc., will require plenty of water, and the leaves occasionally sponged. Should red spider be troublesome, syringe the underside of the leaves with clear rain water. Caladiums will also retain their beauty much longer if treated in a similar manner, and supplied with liquid manure.

ALLAMANDAS, BOUGAINVILLEAS, and other plants of a similar character may have liquid manure in some form, and borders full of roots may be mulched with manure. Plants of Cissus discolor that are required to make large specimens should be shifted into larger pots.

JASMINUM GRACILLIMUM should be encouraged to make free growth, and it will be an advantage to stop the leading shoots to induce them to make side growth to break.

PLUMBAGO ROSEA if thoroughly established in the flowering pots, will require to be removed to cooler quarters, say a cold frame in some sunny spot. On no account allow the plants to become dry at the roots, or the bottom leaves will turn yellow and drop.

GARDENIAS.—Plants that were cut back in the spring with a view of securing a good supply of flowers at a later period will have made good growth by the present time. Give the plants more ventilation for a short period to ripen the wood and set their flower buds. Remove all the young shoots that are produced alongside the flower buds, as these if allowed to remain divert the energies of the plants from the flower buds, and in many instances cause them to fall. Young plants in need of repotting may be given a shift now; they will become well established before winter. If the potting be carried out without unduly checking the plants, they will quickly root into the new soil. Gardenias enjoy full exposure to the sun, and while making their growth should be given a high temperature and abundant atmospheric moisture; a suitable compost, consisting of about three parts of good fibrous loam, one part leaf-soil, together with some coarse silver sand, and a little well-decayed manure. Every effort should be made to keep the plants free from mealy bug and scale. Paraffin and water may be used as an insecticide with safety on gardenias, adding a wineglassful of the oil to three gallons of water. Lay the plants on their sides out of doors and keep the mixture well agitated with the syringe during the operation. This may be repeated frequently, but should be discontinued when the flowers begin to show.—W. Fyfe, Lockinge Park Gardens.

THE ORCHID HOUSES.

CATTLEYA HOUSE.—Cattleya Warscewiczsi (gigas) is one of the most useful of the late summer and autumn-flowering cattleyas, and is one of the most easily grown of the genus. The plants that have just passed out of flower will now be producing new roots from the base of the recently developed pseudo-bulb. Any repotting requirements necessary should be attended to without delay. We find the plants bloom most freely when grown in a position suspended near the roof-glass, and it is more convenient where the houses are low in structure that the plants should be grown either in baskets or shallow pans, thus affording more head room than would be the case where pots are used. In repotting provide ample clean drainage, and the potting compost should be of a coarse and lasting nature, as it is undesirable to repot more frequently than is absolutely necessary. The plants should remain in the same receptacles for two or three seasons. Keep them shaded, and a humid warm atmosphere about them until the new roots are pushing freely into the fresh potting compost. The greatest difficulty in the successful cultivation of C. Warscewiczi is the secondary growths. There is no cattleya so liable to restart into growth as this species, especially in the case of plants that flower early in the season, and in cases where plants have failed to produce flowers. Where secondary growth commences early in the season the plants are not so difficult to deal with, as by placing them in a warm position, and giving them every encouragement, they are induced to complete their growth before the winter sets in, but where the plants produce a second growth after the middle of August, even under the most favourable conditions, there are difficulties to be anticipated. It is best to avoid these difficulties as far as possible. We find it a good plan to remove the plants to a cooler temperature almost immediately the flowers have been removed or growth completed, unless the plants require repotting; disturbing them for repotting purposes will usually be found to give a sufficient check to prevent their restarting. In the cooler portion plenty of light and free ventilation should be afforded whenever the outside conditions permit.

AUTUMN-FLOWERING CATTLEYAS.—Many of the autumn and winter-flowering species and hybrids of cattleyas and allied genera are now in their most active state of growth, and although we have little to complain of in respect to robustness of growth, there can be no question as to the lack of summer sunshine having rendered the growth soft and sappy. It is certainly far short of the desired hardened and ripened appearance which is required to enable them to produce their flowers satisfactorily, either in substance or the best coloured tints obtainable. As I have no doubt the same experience will be general throughout the country, the necessary steps will have to be taken to counteract these detrimental conditions during the next few weeks before the plants expand their flowers. The conditions for the proper maturing of the pseudo-bulbs is light. The plants should therefore be afforded all the bright light possible, with due regard, of course, to the prevention of their becoming scorched or discoloured in the older foliage. The roof shading should not be put on until there is a danger of scorching, and it should be removed again in the afternoon as soon as it may be done with safety. The roof ventilators may also be brought into use, but as soon as the blinds are dropped it is desirable to reduce the air sufficient to avoid checks by a sudden lowering of temperature inside the houses.—H. J. Chapman, Oakwood Gardens.

THE KITCHEN GARDEN.

ENDIVE.—A large sowing should now be made of this invaluable plant for winter salad purposes. Being of a robust nature it is not very particular as to soil, and will invariably thrive on any land that has been fairly well cultivated. One of the main points to consider when selecting and preparing the site to sow and plant is, that the endive will not stand our winter climate with impunity, and that the crop will require some protection. The more sheltered the position the longer the plants will grow on during the late autumn and early winter months. The broad-leaved Batavian variety is less subject to damping off during the winter than the crimpled varieties, consequently the larger portion of the sowing should consist of the former. Sow in drills about one foot apart.

LETTUCE.—In many establishments a supply of winter lettuce is one of the most important tasks the gardener has to deal with, and a failure means a serious inconvenience. It being impossible to forecast the kind of autumn weather we are to experience, my advice is to sow in different sites, making several sowings throughout this month, including a substantial one on a narrow, high-standing south border. There are many good and valuable varieties now to select from which turn in and heart quickly, as well as being fairly hardy. I am advised by a friend to try two varieties grown largely by French growers, but until I am convinced that something will suit my purpose better for winter use I pin my faith to the following varieties: All the Year Round, Standwell, and Stanstead Park, the last-named being the hardier of the three.

SPINACH.—What is considered the winter and latest crop of this vegetable should be sown without delay. It is essential that the ground should be well tilled and sweetened by being laid bare to exposure for a time previous to sowing, and the quarter should not have just previously carried a crop of the cabbage family. Sow the seeds in drills from fifteen to eighteen inches apart to give ample room for the plants to develop. The prickly varieties are generally considered the most satisfactory for winter sowings. I have on many occasions seen the broad, round-leaved kind do very well and stand the winter without much harm. This crop being often difficult to judge perfectly to suit the season, it is best to make two or more sowings, with short intervals between.

ONIONS.—Small onions are often used during the winter for salading and other purposes, and where they are required sow the seed now, to allow the plants to be of suitable size by October. The sowing to furnish plants for planting out next spring of the Tripoli varieties should also be got in. Do not sow the seed too thickly if placed in rows. Broad-casting the seed evenly and thinly over the bed is much the best, as the plants stand the winter better.

COLEWORTS.—These, if sown as advised, will be of a size suitable for planting out to the permanent bed, and will be found of great value for cutting purposes up to Christmas. Small compact heads in quantity is the result of this crop, and it is not necessary to plant very wide apart; one foot each way is ample.

WINTER CUCUMBERS.—Provision will have to be made for the supply of winter cucumbers by sowing seeds during the next week or two; place each seed singly in a sixty-sized pot filled with porous loam, and pot on the young plants as required until ready for planting.—Charles Flack, Cholmondeley Castle Gardens.

FRUITS UNDER CLASS.

STRAWBERRIES FOR FORCING.—As soon as the plants that are layered in 60's have become well rooted they should be severed from the parent and placed in six-inch pots. They require good soil, firm potting, and clean pots. The soil should be the best loam; the top spit from old pasture land that has been well fed is the best. It should be cut about three inches thick, and stacked nine months before use. To this should be added some good horse manure, a little bonemeal, and a good sprinkling of soot. The runners should be turned out of the small pots carefully, and placed in the centre of the fruiting pot, which should be crocked effectually. Ram the soil tightly, finish off the top of the soil evenly, and allow three-quarters of an inch for water. After potting stand the pots on a firm base of ashes; they may be stood close together at the start, but as soon as the plants begin to grow more room must be given. In dry and windy weather it will be wise to syringe the foliage every day in order to keep it clean and free from red spider. Watering must be done very carefully until fresh roots have been made. Royal Sovereign, Leader, and President are about as useful a set as one can have for forcing.

PEACH HOUSE.—As the trees become freed from their crops take out any unnecessary wood or growths, and expose to fresh air and sunshine as much as possible, and, where possible, take off the lights. At the same time give the roots and foliage plenty of moisture, and a little weak liquid manure will help to plump up the buds, for it is now the foundation is made for another crop, and the trees ought never to be neglected. Give abundance of air to late varieties, and late crops, especially such varieties as Sea Eagle and Princess of Wales, and water freely with liquid manure. If the mulching is getting used up apply a little more, as this will check evaporation. Late nectarines, such as Victoria and Pine Apple, and Princess of Wales, will need a considerable amount of nourishment. Assist the colouring process by pulling the leaves a little on one side, and use small strips of wood to prop the fruits up to the light; all these aid development, and ensure best results.

ORANGES.—Where these are grown in pots they are now swelling their fruits rapidly, and should be syringed twice daily, and have plenty of suitable liquid manure. These fruits respond readily to high feeding, and good fruits obtained quite early in the autumn and winter are, apart from their usefulness, of quite an ornamental character.

PLUMS AND PEARS.—When these are largely grown in pots the results are most gratifying, as the fruits assume a delightful bloom and a first-class size, and several varieties that do not succeed outside generally will do quite well with inside treatment. See that the roots are copiously supplied with water, and in syringing use water that is quite clean or the fruits will be spotted. It is best not to syringe at all after the fruit has commenced its last swelling, especially the black or blue varieties of plums. The gages should be allowed to become quite ripe before being used for dessert, as their best flavour is not developed till that stage is reached; McLaughlin, Early Transparent, Golden Transparent, Late Transparent, Reine Claude de Bavay, Jefferson's, and Kirke's are samples of such fruits. Pears attaining large size should have the fruits tied up with matting to reduce the strain on branches. Should wasps appear wasp-proof netting ought to be used at once around all ventilators, but, fortunately, there appears but few of these pests this season.

PAINTING AND CLEANING. — Any houses that are clear should now be painted, if this is necessary. It is a good system to get the houses empty, and have them cleaned and painted as often as necessary, and there is no better time than late August and September for this, and for any alterations of heating apparatus.—W. A. Cook, Leonardslee Gardens.

ITEA VIRGINICA.

Itea is a small genus allied to escallonia and ribes. Two species only are in cultivation, one being a native of the Eastern United States, and the other a native of China. The American plant, I. virginica, has long been known in gardens, the date of its introduction going back a century-and-a-half. Old, however, as it is, it cannot be said to be a common or well-known shrub, for it is not often met with in gardens. It is a deciduous plant, growing three or four feet high with simple lanceolate leaves, and racemes about three inches long of fragrant white flowers which appear during summer. It thrives in light soil, and is improved by having the old wood cut out each spring, leaving strong shoots of the previous year's growth for flowering. W. D.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Royal Horticultural Society.

The meeting held on August 3 was, comparatively speaking, a small one, and visitors very few. In fact it was a clear demonstration to the Council that neither exhibitors nor Fellows appreciate a show the day after a Bank Holiday.

FLORAL COMMITTEE.

A large and varied display of flowering and other shrubs came from Messrs. J. Cheal and Sons, Crawley, with a few decorative roses. Fine bunches of each kind were arranged in vases. A few of the most striking were Tamarix odessana, Weigela Eva Rathke, Hydrangea arborea alba grandiflora, and Genista tinctoria, while the roses, arranged in bamboo stands, included good examples of Crimson Rambler, Blush Rambler, Dorothy Perkins, Hiawatha, Minnehaha, and Lady Godiva.

Mr. Wilkinson, gardener to Sir D. Gooch, Bart., Hylands Park, Chelmsford, staged a table of Malmaison carnations arranged among ferns. The flowers were fine, and included the following varieties in quantity: H. J. Jones, Calypso, Princess of Wales, Lady Audley Nield, Duchess of Westminster, Lancelot, and Aurora; the exhibit was flanked on either side with a few groups of the perpetual varieties.

Messrs. Kelway and Son, Langport, occupied an entire table with an exhibit of gladioli. The spikes were in fine condition, and were nicely displayed. A few of the most prominent were Marquis of Bath, W. Newcombe, Countess of Limerick, Donatus, Princess Victoria, and Duchess of Norfolk.

A large and brilliant display of hardy flowers was made by Messrs. G. Bunyard and Co., Lim., Maidstone. The flowers were [illegible] arranged in large masses. The spiræas were quite a feature, and extensively staged, while Platycodon Mariesi and its white form were striking, as were also the collection of phloxes, in which were noted Iris, Starlight, Fiancee, White Perfection, Countess of Shrewsbury, and Adonis. Gladioli, Senecio clivorum, pentstemons, and statices were also predominant.

Carnations were a feature of the show; the group from Mr. James Douglas, Great Bookham, contained many fine varieties, which were lightly arranged with their own foliage. The best were Robert Bruce, Splendour, Lady Roscoe, Mrs. G. Marshall, Harlequin, Nomad, Brigadier, Delicia, Daffodil, and Miss Ellis.

Messrs. G. and A. Clark, Lim., Dover, had a fine table of border carnations which had not been disbudded in any way, and gave one an idea of their natural appearance on the plants. A few of the best were Mrs. J. Arkcoll, Fire King, Lady Northcliffe, Mrs. Thomas Moreton, Grenadier, Roy Morris, Bay, and Mrs. Hayward.

Hardy flowers from Mr. G. Reuthe, Hardy Plant Nursery, Keston, were very good, the alstrœmerias, coreopsis, gaillardias, and spiræas being in good form, while a few alpine plants formed a good edging to the exhibit.

Messrs. H. B. May and Sons, Upper Edmonton, had a large miscellaneous exhibit, which included well-grown campanulas in variety, abutilons, and lapagerias, both alba and rosea. The ixoras included well-flowered plants of I. aurantiaca, I. Fraseri, I. Westi, and I. Williamsi. These, with a variety of ferns, palms, and other decorative plants, made a pleasing display.

A group of spiræas from Mr. Charles Turner, Slough, attracted much attention, for they were in such variety and fine condition. A few of the finest were S. Bumalda, S. Fontenaysi alba, S. Froebelli, S. Nobleana, S. sobrifolia, S. callosa, and S. c. alba.

Messrs. H. Cannell and Sons, Swanley, were represented by bunches of the American Pillar rose, which was in fine condition.

Messrs. Blackmore and Langdon, Twerton Hill Nursery, Bath, staged a nice collection of border carnations, which were large and bright, some of the best being Mrs. Nicholson, Twerton Clove, Richness, Mandarin, Merlin, Fiery Furnace, and Mrs. W. H. Taylor. A group of carnations in pots came from Mr. C. Turner, Slough. The plants were in fine condition, and the flowers well grown; especially good were Ethel, Sunbeam, Bendigo, Lady Desborough, Ladybird, Amphion, R. D. Rowbery, and John Pope.

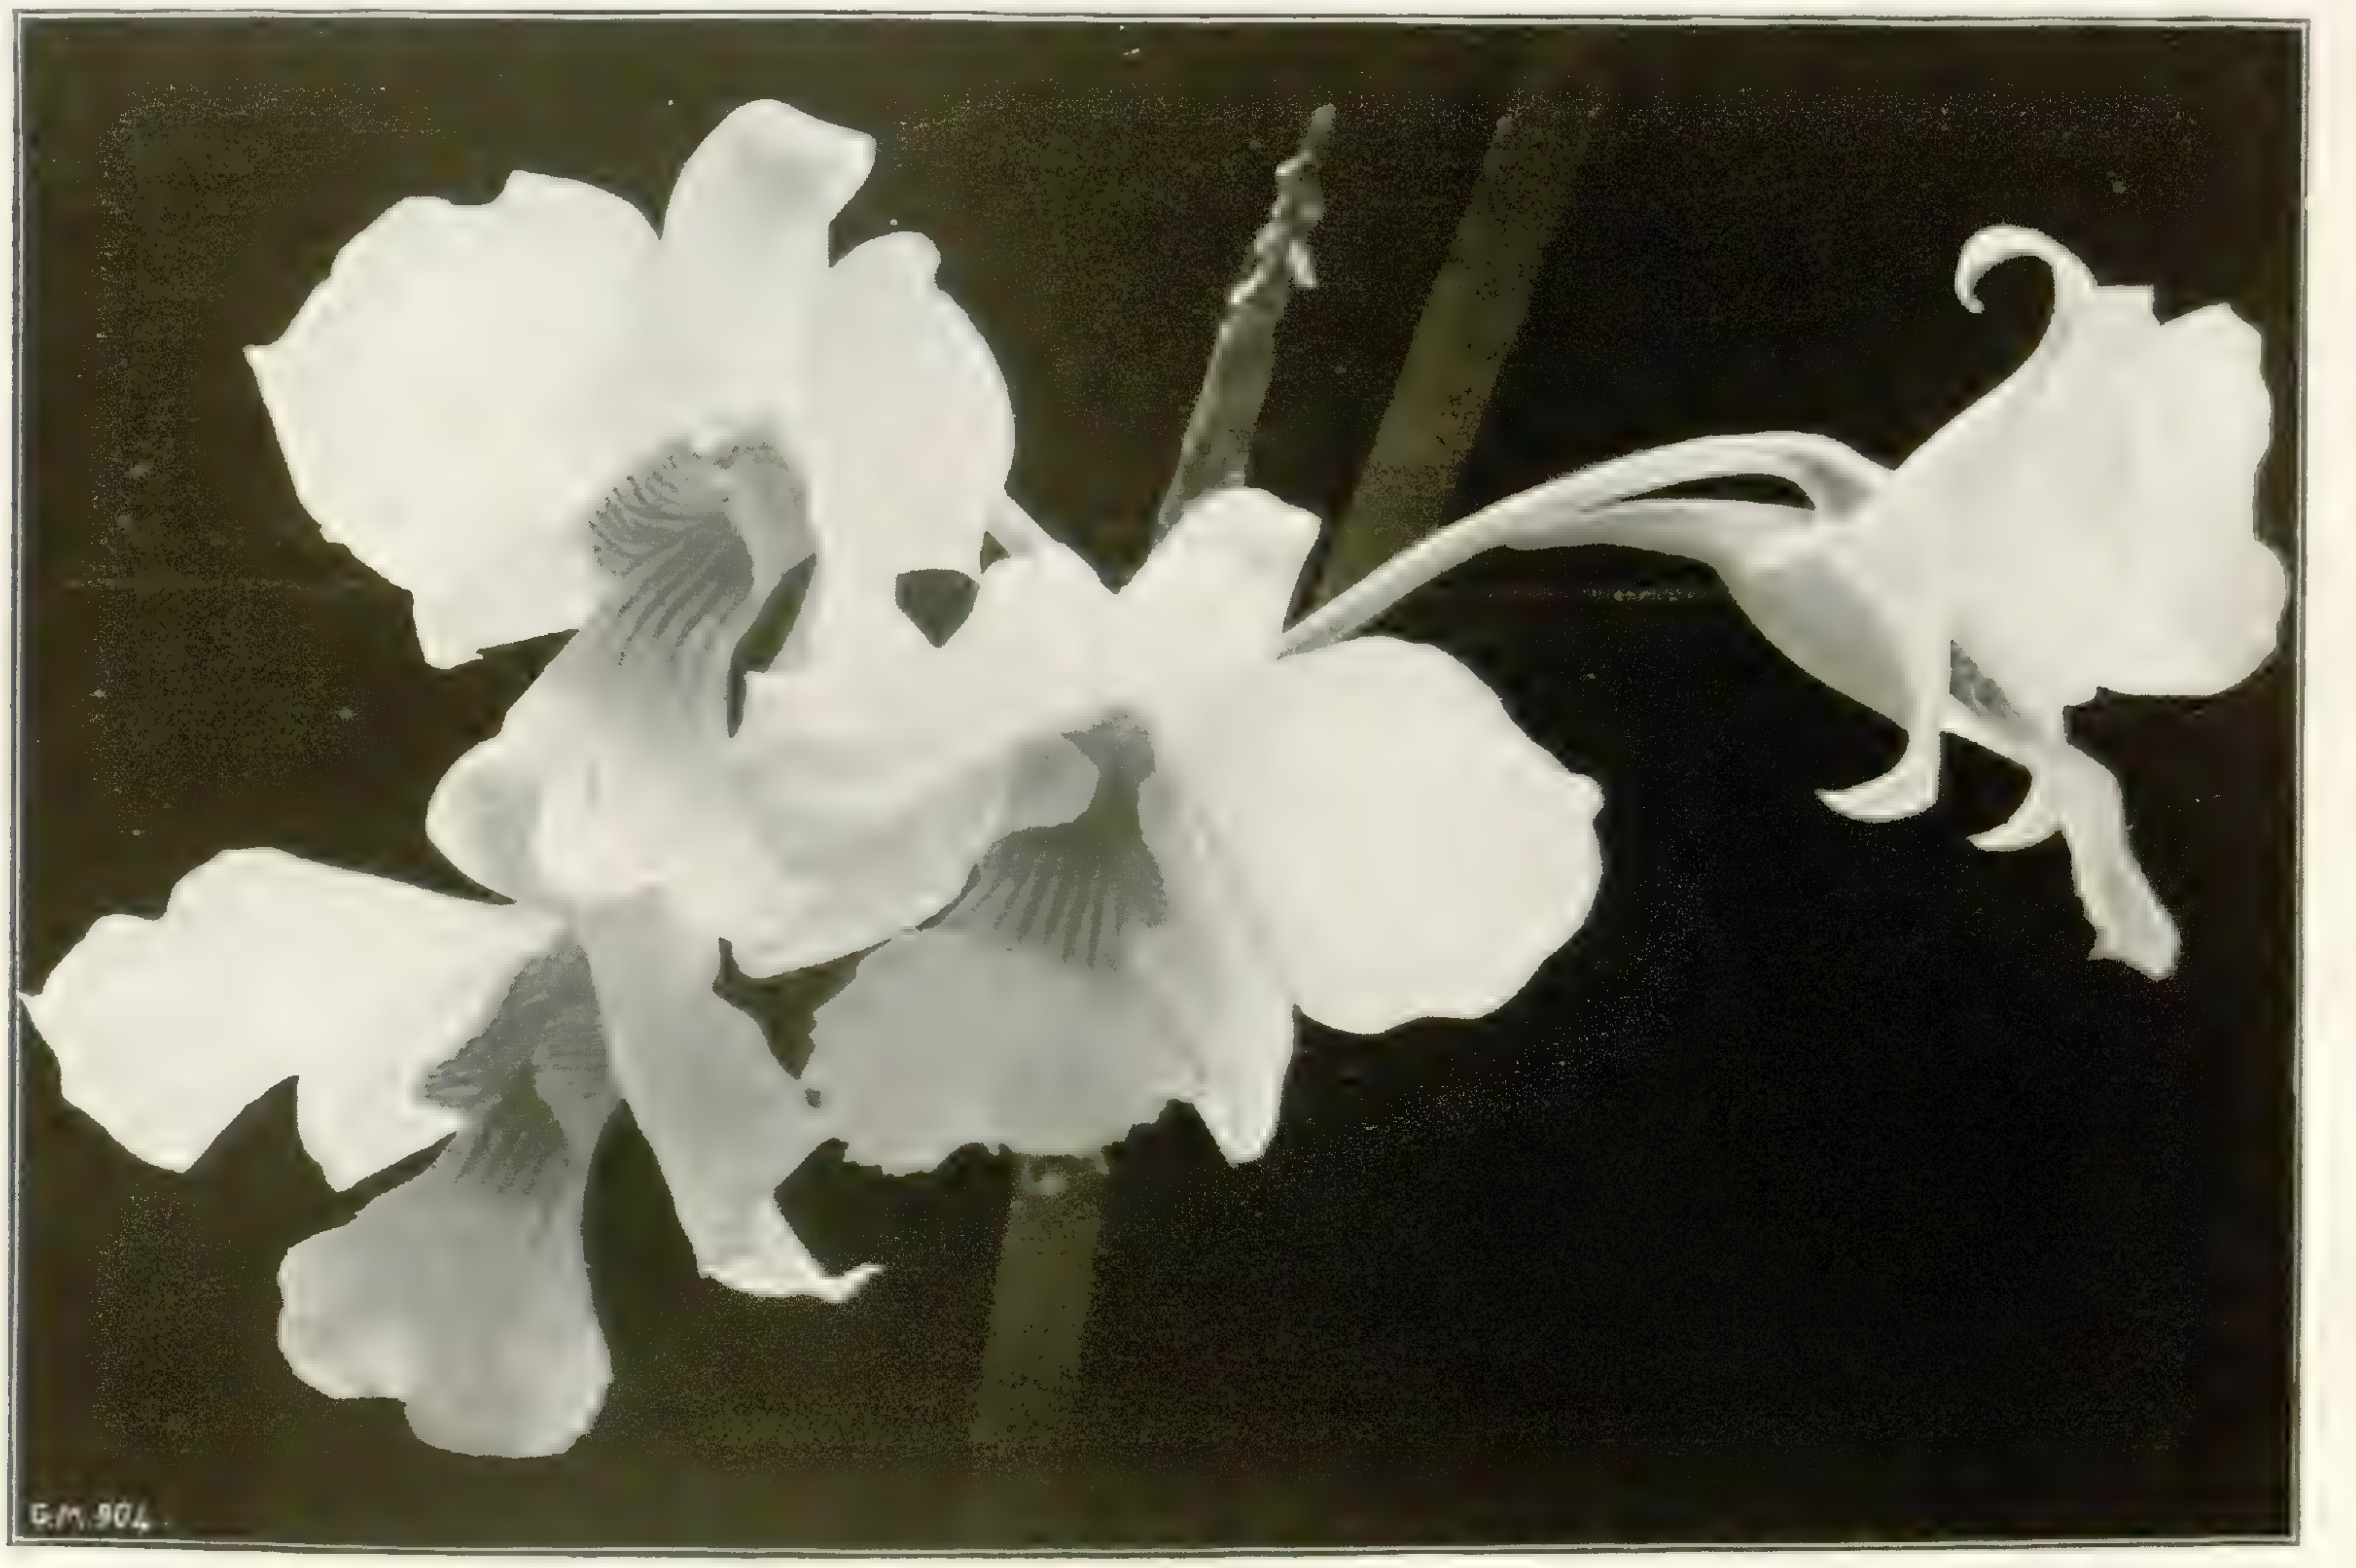
Messrs. James Veitch and Sons, Lim., Chelsea, staged an enormous collection of seedling gloxinias, arranged in groups of colour. The strain is undoubtedly a very fine one, and included all the colours known in this flower; the spotted varieties, too, were equally striking.

From Mr. Charles Blick, Hayes, Kent, came a large collection of carnations, tastefully arranged in vases with their own foliage. Needless to add, they were all quite up to Mr. Blick's fine form. Some of the most striking were George Moreland, Silver Fox, Peter Pan, The Skipper, Mohawk, Agnes, Her Majesty, and Linkman.

Mr. Amos Perry, Hardy Plant Farm, Enfield, arranged a fine group of spiræas on the floor of the hall, large quantities of each kind being utilised in every case. The most prominent were S. venusta magnifica, S. gigantea elegans, S. v. carnea, S. palmata alba, S. gigantea delicata, S. v. Fairy, and a few astilbes in variety, the whole forming a most striking exhibit.

Mr. James Hudson, gardener to Leopold de Rothschild, Esq., Gunnersbury, arranged a group of aquatic and waterside plants, which amply illustrated the lecture on the subject given during the afternoon by Mr. F. W. Moore. Tall reeds and grasses occupied the background, while the water plants were represented by a fine collection of nympheas, the majority of which opened during the day, and included large pans of Nymphæa Froebelli, N. Gloriosa, N. W. Falconer, N. James Brydon, N. colossea, N. ignea, N. stellata Berlin variety, N. Hudsoniana, and N. stellata.

A glorious bank of roses came from Messrs. R. Harkness and Co., Hitchin. At the back there were bamboo stands filled with such varieties as Edward Meyer, Hugh Dickson, in grand form, Dean Hole, Lady Faire, Madame Ravary, Frau Karl Druschki, and Mrs. T. Roosevelt, while in the boxes and vases were capital examples of Duke of Edin-



DENDROBIUM SANDERÆ.

F.C.C., R.H.S., August 3; Messrs. Sander and Sons, St. Albans. Flowers, pale blush-pink with yellow marks in the throat.

burgh, Madame Jules Gravereaux, Dean Hole, Caroline Testout, Mrs. J. Laing, Mildred Grant, Bessie Brown, and a number of decorative varieties.

ORCHID COMMITTEE.

Mr. McBean, Cooksbridge, sent a few odontoglossums, which were very fine, some of the spikes carrying very large solid flowers, while the plants were in the rudest of health. From Messrs. Sander and Son, St. Albans, came a small choice group, in which were noted Vanda cœrulea var. Rex, beautiful in colour and form, Odontioda Devoniana, Lycaste formosa, Lælio-cattleya Pluto, L.-c. Antigone, and the fine new blush-coloured Dendrobium Sanderæ (F.C.C.).

Mr. J. Collier, gardener to Sir J. Coleman, Bart., Gatton Park, Reigate, staged a group of very interesting orchids, such as Masdevallia infracta purpurea, Pachystoma Thomsoni, Sobralia xantholeuca—Veitchi, a beautifully-flowered plant, and Odontioda Bradshawiæ.

Mr. M. Mertens, Mont St. Amand, Ghent, staged a few hybrid odontoglossums, which included some fine spotted forms. From Messrs. Stuart Low and Co. came a small but choice collection, in which were noted Dendrobium sanguinolentum, Oncidium abortivum, O. Krameri, a fine form, Epidendrum trachychilum, and a large variety of quaint forms, chiefly of botanical interest. Mr. J. W. Black, gardener to R. G. Thwaites, Esq., Chessington, Streatham, sent specimens of Odontioda Thwaitesi, a cross between Cochlioda vulcanica and Odontoglossum Harryana. Messrs. Charlesworth and Co., Haywards Heath, staged a small collection of choice plants; Oncidium trulliferum, Catasetum Bungerothi, Chysis lævis, and the quaint Octomeria diaphana being chiefly conspicuous.

Mr. F. J. Hanbury, Brockhurst, East Grinstead, exhibited Cattleya Macænas Brockhurst var., Cattleya Maronaurea, a cross between C. Maroni and C. aurea, also Brassocattleya Joan, a cross between B. Perrini and C. gigas.

FRUIT AND VEGETABLE COMMITTEE.

Messrs. James Veitch and Sons, Lim., Chelsea, occupied an entire table with a grand exhibit of gooseberries. Trained cordons, literally loaded with fruit, formed the background, while the table was loaded with baskets of luscious berries. The finest examples in the red varieties were Beauty, Dan's Mistake, Clayton, Keen's Seedling, London, Lord Derby, Lion's Provider, Lancashire Lad, and Speedwell. In the yellow varieties the most prominent were Langley Beauty, Golden Gem, High Sheriff, Pretty Boy, Railway, Pilot, Tiger, Prince Arthur, and Broom Girl. The best green varieties were Pet, Clifton, Overall, Matchless, Gretna Green, and Green London. The white varieties included fine examples of Langley Gage, White Champagne, Surprise, Transparent, Antagonist, and Careless. A truly fine collection of over one hundred varieties. It will be seen that the collection not only contained the Lancashire varieties, but also the majority of the commercial kinds.

A collection of lettuces came from the Wisley Gardens, and attracted much attention. The best were Stuttgart, Danerhopf, Heartwell, and Giant in the cabbage section, while the most noteworthy in the Cos varieties were Paris Early, Emerald Queen, Covent Garden, Summer White, and Baldwin. Messrs. J. K. King and Sons, Coggeshall, sent a fine collection of culinary peas, which were just in their best condition. A few of the most distinct were Lord Kitchener, Caractacus, Witham Wonder, Alderman, Essex Star, Moneymaker, and Dreadnought.

Mr. James Harris, Blackpill Nurseries, W. Swansea, had a small exhibit of Lady Llewelyn potato, a very fine kidney.

From Messrs. S. Spooner and Sons came a small collection of fruit, which included baskets of well-coloured apples Red Astrachan, Mr. Gladstone, and Red Margaret, also a box of good Morello cherries.

The competition for eighteen dishes of gooseberries, distinct, did not attract much attention from the growers, for the only exhibitors were Messrs. James Salisbury and Sons, The Shaw, Melbourne, Derby, who staged splendid examples of the following varieties: Lord Leigh, Shiner, Mount Pleasant, Surprise, High Sheriff, Norden Hero, Dan's Mistake, Thatcher, Princess Royal, Lord Derby, Lady Houghton, Transparent, Pretender, London, Stockwell, Favonius, Falstaff, and Fascination.

In the smaller class for six dishes, distinct, we had again one exhibitor, Mr. M. Webster, gardener to E. J. Preston, Esq., Kelsey Park, Beckenham, who staged some fine berries in the following sorts: Bobby, Fearless, Lancashire Lad, High Sheriff, Dan's Mistake, and Whinham's Industry.

MEDALS.

Gold Medal.—To Messrs. James Veitch and Sons, Lim., Chelsea, for gooseberries.

Silver-Gilt Flora.—To Messrs. Kelway and Sons, for gladioli.

Silver-Gilt Banksian.—To Mr. Chas. Blick, Hayes, for carnations; to Messrs. G. Bunyard and Co., Maidstone, for hardy flowers; to Messrs. H. B. May and Sons, Upper Edmonton, for flowering plants and ferns; to Mr. C. Turner, Slough, for carnations and spiræas.

Silver Flora Medal.—To Mr. James Hudson, Gunnersbury House, for water plants; to Mr. Amos Perry, Enfield, for spiræas; to Messrs. Sander and Sons, St. Albans, for orchids.

Silver Banksian Medal.—To Messrs. Stuart Low and Co., Bush Hill Park, for orchids; to Messrs. J. Cheal and Sons, Crawley, for roses and shrubs; to Mr. James Douglas, Great Bookham, for carnations; to Messrs. Harkness and Co., Hitchin, for roses; to Mr. G. Reuthe, Keston, for hardy plants.

AWARDS.

First-Class Certificate. — To Dendrobium Sanderæ, from Messrs. Sander and Sons, St. Albans.

Award of Merit.—To melon Barnet Hill Favourite, from Mr. A. Mitchelson, Wonersh, Guildford; to Galega Hartlandi, from The Royal Horticultural Gardens, Wisley; to Spiræa venusta magnifica, from Mr. A. Perry, Enfield; to Carnation Fiery Furnace, from Messrs. Blackmore and Langdon, Bath; to Tunica saxifraga alba plena, from Messrs. Bakers, Codsall; to Carnation Jupiter, from Mr. Charles Blick, Hayes; to Carnation Elizabeth Shiffner, from Mr. J. Douglas; to Carnation King of Spain, from Mr. J. Douglas, Great Bookham; to Nymphæa Earl of Warwick, from Mr. A. Lister, Dunmow; to Gloxinias, Veitch's Strain, from Messrs. James Veitch and Sons, Chelsea; to Cattleya Warscewiczi var. C. Waters Butler, from Mr. Waters Butler, Birmingham.

Handsworth Horticultural Society.

JULY 23 and 24.

The twenty-fifth annual exhibition was held in the public park, and proved a great success, but the boisterous weather raised fears for the safety of the marquees and the exhibits. Fortunately, however, the only damage was the splitting of the roof of the tent containing Messrs. Cypher and Sons' fine specimen stove and greenhouse plants, and the mishap was quickly repaired with a large canvas. The exhibition was opened by Sir Henry Wiggin, Bart., and Lady Wiggin.

There were four contestants in the class for a group of plants arranged for effect, and Messrs. J. Cypher and Sons won the silver challenge cup outright (third time in succession), including the first prize of £20. The tout ensemble of the ornamental foliage plants, orchids, tall lilies in variety, and other charming plants was one of the best created by the Cheltenham firm. Mr. J. V. Macdonald, gardener to the Lord Mayor of Birmingham (Sir George H. Kenrick), Whetstone, Edgbaston, was a very close second, his beautiful and elegant Fuchsia triphylla, with its coral-red inflorescence, giving the group an uncommonly striking effect. The third prize fell to Mr. W. Vause, Leamington; and the fourth to Mr. W. R. Manning, Dudley. In the class for twelve stove and greenhouse plants, not less than six in bloom, Messrs. J. Cypher and Sons were easily to the fore with a fine Statice Gilberti and a superb Ixora Shawi, a fine bright orange-scarlet variety; grand plants of Statice intermedia, Rondeletia speciosa, Bougainvilleas Sanderiana and glabra, Clerodendron Balfouri, Chironia ixifera, Allamandas Hendersoni and nobilis, Ixora Pilgrimi, and a tall Kentia Fosteriana. Mr. Vause came second.

Roses, though not numerous, were notable for their high quality. In the class for twenty-four varieties, distinct, Messrs. Perkins and Sons, Coventry, led with a very uniform lot, the best flowers being Chedane Guinoisseau, Lyon Rose, Earl of Warwick, Queen of Spain, Joseph Hill, and Charles J. Grahame; Mr. F. Dennison, Leamington, second; and Messrs. R. Harkness and Co., Hitchin, third.

For twelve varieties, distinct, Mr. A. Allan, Handsworth, secured first honours with an excellent set; Messrs. Perkins, second; and Mr. W. T. Mattock, Oxford, third. For twelve tea roses, Mr. George Prince, Mr. W. T. Mattock, and Messrs. J. Townsend and Sons were the respective winners, and for twelve bunches of garden roses the same winners were placed in the order named.

Ladies' table decorations were an attractive feature, the principal winners being Miss A. Clarke, Sparkbrook; Mrs. S. Rose, Bearwood; and Miss E. A. Boston, Hamstead Hall, Handsworth. For an epergne of flowers Miss E. Lymonds, Mrs. S. Rose, and Miss M. L. Deakin, Hay Hall, were the respective winners. For a hand bouquet Mrs. T. Burn and Mrs. S. Rose were placed as named.

Sweet peas were excellently represented, and for these special prizes were offered. Messrs. R. Sydenham, Lim., provided substantial prizes for twelve distinct varieties. Mr. Charles Holder, New Oscott, won the premier prize with a very fine lot; Mr. T. Parry, Warwick, second; and Mr. Thomas Perks, gardener to J. Boston, Esq., Hamstead Hall, third. In competition for Messrs. W. H. Simpson and Son's prizes for nine varieties Mr. Charles Holder, New Oscott, was to the fore with fine examples; Mrs. H. Walksman, Wolverhampton, second; and Mr. H. Davis, Stourbridge, third. For Messrs. Webb and Sons' prizes Mr. Charles Holder, Mr. H. Davis, and Dr. Quirks, Engwood Hall, were the respective winners.

Fruit in the first division was sparsely shown, because no prizes were offered except for grapes. There were two exhibitors; Mr. T. H. Goodacre, Elvaston Castle Gardens, with very good Muscats of Alexandria and Gros Maroc (three bunches of each variety), was placed first; and Mr. T. Bannerman, gardener to Lord Bagot, Blithfield Hall, Rugeley, was second with well-finished berries and large bunches of Black Hambro', Muscat of Alexandria, and Alicante.

Vegetables afforded a promient feature throughout all the classes, and there were strong competitions for Messrs. Sutton's, Webb's, Simpson's, Yates', and Dennett's prizes.

The honorary exhibits naturally formed a very striking feature of the show, and a silver cup was awarded to Mr. G. Prince, Oxford, for a fine display of roses. Gold medals fell to Mr. J. Mattock, Oxford, for roses; to Messrs. W. H. Simpson and Sons, Birmingham, for sweet peas; and to Messrs. Hewitt and Co., Birmingham, for a tastefully arranged collection of border flowers. Silver-gilt medals to Messrs. Harkness and Co., Bedale; Mr. J. Simpson, Harborne, for shrubs; and Mr. E. Perrins, Handsworth. Silver medals to Miss S. S. Thompson, Handsworth, for a very choice and large collection of cacti; to Mr. T. B. Grove, Windley Nurseries, Erdington, for hardy flowers; and Mr. A. N. Brinsford for floral effects. Bronze medals to Mr. W. Chipman, Mr. A. Fenwick, and Mr. H. Masters. Mr. A. L. Pattison, Shrewsbury, was awarded a silver medal for violas, and Messrs. Bakers, Wolverhampton, a silver cup for a charming water garden.

Northampton Municipal Flower Show.

AUGUST 4 and 5.

For a long series of years Northampton enjoyed considerable fame for the great excellence of its annual exhibitions of the products of the garden, which were usually held in association with the August Bank Holiday. The numerous huge marquees were invariably filled to repletion with specimen plants from the stove and greenhouse, hardy flowers, roses, fruits, and vegetables, all of which were of the highest quality. To obtain honours at Northampton was regarded by those acquainted with the show as a proof of the exceptional skill of the exhibitors. Then for some reason, possibly a depletion of the funds by a succession of exhibitions held under unfavourable weather conditions, the society declined in vigour, and in the end the annual shows were discontinued, much to the regret of those who know how excellent was the work that had been accomplished. After an interval of ten or twelve years an endeavour has been made to revive the shows, but under conditions different from those which previously obtained. The old shows were held by a society that derived a large part of its income from annual subscribers, but the exhibition which has been held during the past week was carried out by a committee consisting of the members of the Town Council, with the Mayor of Northampton as the chairman. This body is assisted by an advisory committee, consisting chiefly of the leading gardeners in the district. A comprehensive schedule was provided, and in some of the classes the prizes were sufficiently liberal to ensure a brisk competition. Possibly a reduction in the number of classes with some increase in the prize-money would another year be a decided advantage. This is a point for the committee to consider, and, instead of discussing it further, we shall at once proceed to briefly refer to the leading features. The exhibition, although hardly up to our expectations, was of considerable extent, and contained much that represented cultural skill of a high order.

MESSRS. SUTTON AND SONS' LARGE AND TASTEFULLY ARRANGED DISPLAY OF VEGETABLES, MELONS, AND FLOWERS AT NORTHAMPTON.

GROUPS.

Groups arranged for effect had two classes provided for them, and, as the competition was remarkably keen in both, they formed the great feature of the competitive side of the show. In the larger of the two classes Mr. J. V. Macdonald, gardener to Sir George Kenrick, Whetston, Edgbaston, Birmingham, was first with a group equally remarkable for the high quality of the plants, and the taste evinced in their arrangement. Departing from the style usually adopted in exhibition groups, Mr. Macdonald had a bold mound in the centre, and a distinct bank at either end, the intervening space being filled in with quite dwarf plants. The central mound was surmounted by an elegant wide-spreading palm, and in clothing the sides the brightly-coloured Fuchsia triphylla was used with good effect. The two end banks were strong in crotons, which were finely proportioned and splendidly coloured. Mr. W. Vause, Leamington, was second with a bold arrangement, and Mr. Searle, gardener to the Marquis of Northampton, Castle Ashby, Northampton, was third with an effective arrangement, in which the blue and white forms of Campanula pyramidalis were used with much taste. In the second of the two group classes Mr. J. V. Macdonald was again first, and his arrangement was certainly not less beautiful than the one by which he obtained the premier position in the first of the two classes. Messrs. Thomas Perkins and Sons, Northampton, staged a large and remarkably beautiful group, not for competition.

HARDY CUT FLOWERS.

Hardy border flowers were well shown, and in the class for twelve kinds the competition was very strong. Mr. A. H. Searle occupied the premier position with large vases of finely-grown specimens; Messrs. Thomas Pecking and Son, 34, The Drapery, Northampton, staged for the second place smaller bunches, but the quality of the flowers was high; Mr. E. Palmer, Kettering, who occupied the third place, also had a good set of flowers. There was a small but attractive display of roses. Mr. H. Drew, Longworth, Faringdon, Berks, obtained premier honours for twenty-four varieties with a fine set of blooms, Avoca, J. B. Clark, and Dean Hole being particularly noteworthy: Messrs. W. and J. Brown, Peterborough, and Mr. W. T. Mattock, Headington, were second and third respectively. The blooms were uniformly high in quality in the class for twelve, and the awards were made in favour of Mr. H. Drew, Mr. E. Hicks, Wallingford, and Mr. W. T. Mattock. Tea-scented and noisette roses were shown in twelves, and the winning exhibits were from Mr. H. Drew, Mr. W. T. Mattock, and Messrs. W. and J. Brown, the prizes being awarded in the order of their names.

Sweet peas were fairly well represented, both as regards numbers and the quality of the flowers, but they fell somewhat short of expectations. In competition for the prizes for twenty-four vases, distinct, not more than eighteen spikes in each, Mr. S. Cole, gardener to Earl Spencer, Althorp Park, Northampton, was far in advance of the other competitors, and easily obtained premier honours. Especially noteworthy were the blooms of Miss Delia Spencer, Althorp White, Mrs. Hardcastle Sykes, Gladys Cole, Countess Spencer, Earl Spencer, Mabel Cole, J. C. Waud, and Lady Sarah Spencer; Mr. Cole had in his collection several promising seedlings. Mr. F. G. Bull occupied the second place, and Mr. A. H. Searle was third.

Carnations were admirably shown in the class for twelve vases, and the premier award was made to Mr. A. H. Searle, who staged splendidly developed blooms of the finest of the Malmaison and perpetual varieties.

There were numerous entries in the class provided for decorated dinner tables, but the arrangements did not display much originality or great taste. In one of the classes Mr. J. Goodman, Northampton, was first with an arrangement of sweet peas, and in the other Mr. W. T. Mattock obtained the premier position with a table on which buttonhole roses were used.

FRUIT AND VEGETABLES.

Fruit was hardly so plentiful as might have been expected, but the quality was surprisingly high throughout. Mr. A. H. Searle scored in the class for nine varieties with magnificent clusters of Madresfield Court and Muscat of Alexandria grapes, fine Lord Napier nectarines, and Royal George peaches, and good figs, apricots, cherries, and a well-ripened melon; Mr. S. Cole was second with a good collection. For six dishes the last-named exhibitor occupied the first place with produce of high quality, and Mr. A. H. Searle followed for second place. Mr. A. Child, gardener to A. H. Attenborough, Esq., Catesby House, Northampton, and Mr. A. H. Searle were first and second for two bunches of black grapes with well-coloured clusters of Black Hamburgh, and in the cor-

MESSRS. JAMES VEITCH AND SONS' GREAT DISPLAY OF FINELY-GROWN VEGETABLES AT NORTHAMPTON.

responding class for white grapes these exhibitors occupied the same relative positions with Buckland Sweetwater and Muscat of Alexandria. Peaches and nectarines were exceptionally good. Mr. Searle and Mr. Cole were first for six peaches with Royal George, and for nectarines Mr. Searle was first and Mr. Tipler, Hartwell House, Aylesbury, second.

Several classes were provided for collections of vegetables, and in that in which the society provided the prizes Mr. A. H. Searle had a capital collection, comprising potatoes, beet, onions, tomatoes, cauliflowers, carrots, peas, and scarlet runner beans in a high state of development. Mr. F. G. Bull, gardener to James Mansfield, Esq., Weston Favel House, Northampton, was a close second; and Mr. Silas Cole, gardener to Earl Spencer, Althorp Park, Northampton, was third, with produce of high quality. There were two competitors for the prizes offered by Messrs. Yarde and Co., and the first award was made in favour of Mr. A. H. Searle, and the second was made to Mr. S. Cole. Both exhibitors staged excellent produce. Mr. A. H. Searle was first also in Messrs. Sutton and Sons' class for six kinds, and Mr. F. G. Bull followed for second place. There were four collections of fruit and vegetables and flowers, grown by market gardeners and members of working men's clubs and village horticultural societies, and as they were all well staged they formed a noteworthy feature. The Kingsley Park Club obtained premier award with a remarkably fine display; the St. Giles' Street Club were second; and the Twentieth Century Club followed for third place, the last-named having too many flowers to show the vegetables to advantage.

NON-COMPETITIVE COLLECTIONS.

The collections not for competition were numerous and good, and contributed materially to the attractions of the exhibition.

From Messrs. Sutton and Sons, Reading, came a delightful arrangement, in which melons, vegetables, salading, and annual flowers were presented to public notice in their most attractive guise. The taste with which the Reading firm presents the products of the garden to public notice is well known, but on this occasion they surpassed themselves, and their collection constituted one of the most important and attractive features of the exhibition. Sweet peas, annual chrysanthemums, scabious, antirrhinums, lupins, gaillardias, and coreopsis were prominent among the flowers, the melons included finely-ripened fruits of the best of the many excellent varieties introduced by the firm, and the vegetables included a considerable number of the peas, tomatoes, cauliflowers, cucumbers, and runner and other beans that have been introduced by the firm.

Messrs. J. Veitch and Sons, Chelsea, exhibited a magnificent collection of vegetables, comprising upwards of sixty dishes of distinct varieties in the best possible condition. Prominent among the several varieties were Comet, Perfection, and Ham Green tomatoes, Sharpe's Express, Crimson Beauty, Royal Kidney, Windsor Castle, and Eightyfold potatoes, James' Scarlet, Intermediate, Early Nantes, and Matchless Scarlet carrots, Cheltenham Green Top and Improved Black beets, Giant Rocca, and White Italian onions, Early London, Early Giant, and Pearl cauliflowers, Custard, Long Green, and Bush vegetable marrows, Early Green and Purple Kohl Rabi, Prodigy pea, Superb White and Early Rose celery. The collection was not less remarkable for the taste with which it was staged than for the splendid quality of the produce, and it attracted much attention from the general body of visitors, as well as from the many cultivators present.

Messrs. John Perkins and Son, Market Square, Northampton, filled the centre of one of the large tents with cut flowers and plants. The former comprised border carnations, tastefully set up in vases with long stems; sweet peas, and roses. Messrs. Yarde and Co., Northampton, exhibited a large and attractive collection of sweet peas and hardy flowers.

Bishop's Waltham.

JULY 28.

The thirty-fifth annual show was held in Swanmore Park, by the kind permission of W. H. Myers, Esq., and, as on all occasions when the show is held here, the beautiful gardens and grounds were open to the public. The entries were more numerous than last year, but in the cottagers' section there was a distinct falling off, as compared with twenty years ago. The schedule contains thirty-seven classes for cottagers only, and cottagers may compete in the forty open classes also.

The feature of the show was the table decoration classes; £10 is offered in an open class, in three prizes. Eleven competed, making a handsome display, and the first prize was awarded to Mrs. Arthur Bide, Alma Nurseries, Farnham, for a delightful arrangement of Madame Abel Chatenay roses, with rose foliage, in a silver bowl centrepiece and small silver vases. Mr. R. H. Jeffery, Nursling, Southampton, was second with Gloriosa superba, lily of the valley, Francoa ramosa, and suitable greenery; Miss Hattie, Birch Lawn, Sholeing, third, with a charming arrangement of Iceland poppies. A class was provided for a table decorated with wild flowers, and this brought seven contestants. Miss Molyneux, Swanmore Farm, Bishop's Waltham, was distinctly ahead with scarlet poppies, wild camomile, docks, bramble leaves, hornbeam, and grasses; Miss E. G. MacLean, Jervis Lodge, Swanmore, second, also with poppies; Miss M. Luttrell, Curdridge, Botley, third, with scabious. Still another class was provided for lady members of the society, in which there were six competitors, and here Miss M. Luttrell won with pale blue delphiniums most charmingly arranged; Mrs. Humpage, Dell Cottage, Swanmore, second; and Miss Medlicott, Shedfield, third. Several vase classes were provided in the ladies' section, and Mrs. Humpage was first with delphiniums beautifully blended; in the open class Mr. Ellwood won with bougainvillea and Francoa ramosa, an effective combination.

Cut flowers were numerously shown, and for eighteen varieties, grown out of doors, Mr. C. English, gardener to H. A. Franklyn, Esq., New Place, Shedfield, was first with a thoroughly representative display. Mr. H. Childs, gardener to Mrs. Macrae, Meonstoke House, Bishop's Waltham, was second. For the prizes provided by Mr. B. Ladhams, Shirley Nurseries, Southampton, there was a keen competition; they were for twelve varieties, and Mr. Ellwood was distinctly ahead with huge sheaves of phlox, delphiniums, etc. Mr. Barnes, gardener to T. C. Wilson, Esq., The Thickets, Bishop's Waltham, second. For six bunches of annuals Mr. B. Peppler, Vernon Hill, Bishop's Waltham, was first with a fresh exhibit of desirable kinds. For six bunches of carnations, distinct, Mr. Reed, gardener to Miss M. B. Jones, The Grove, Exton, was first with an effective exhibit. Mr. Childs won for six cactus dahlias with really fine blooms.

For six bunches of roses (prizes provided by Messrs. Rogers and Son, Southampton), and for six ramblers, Mr. Ellwood, gardener to W. H. Myers, Esq., Swanmore Park, was first with good exhibits. For twelve bunches of sweet peas, distinct, E. C. Perin, Esq., M.D., Droxford, was first with a capital set of popular varieties; Mr. W. Cooper, gardener to Miss Gladstone, Hampton Hill, Swanmore, a good second. For twelve bunches (Eckford's prizes) Mr. Cooper led with a charming exhibit, and he was also first for Messrs. J. Carter and Co.'s prizes. Mr. Childs and Mr. Peppler followed in the order given. The last-named won the premier award in Mr. C. W. Breadmore's class for six bunches, followed by Mr. J. Keath, gardener to Sir Nowell Salmon, V.C., Curdridge Grange; Mr. B. Peppler third.

Fruit was well shown, and Mr. Ellwood won for six dishes, distinct, with handsome grapes, melon, peaches, nectarines, and cherries. For black grapes Mr. Ellwood was first with Black Hamburgh in prime condition.

For four kinds of fruits, grapes excluded, Mr. Childs won, and for four hardy kinds Mr. Barnes was first with a capital collection in which peaches were a prominent dish.

Vegetables were, as they always are here, good. In Messrs. Toogood's class for eight kinds, and in Messrs. Sutton's and Webb's class for six dishes, Mr. Ellwood was easily first. Mr. Barnes was second in the two former classes, and Mr. Childs second in Messrs. Webb's class. Mr. Cooper won Messrs. J. Carter and Co.'s prize for six dishes. Mr. Sherwood, gardener to T. H. Gillson, Esq., Swanmore Cottage, won for a collection of potatoes, six varieties, and for twelve tomatoes.

Royal Horticultural Society.

SCIENTIFIC COMMITTEE.

At the recent meeting of this body there were present Mr. E. A. Bowles, M.A., F.L.S., F.E.S. (in the chair); Sir J. T. D. Llewelyn, Messrs. W. E. Ledger, J. T. Bennett-Poë, J. Fraser, C. E. Shea, and F. J. Chittenden (hon. secretary).

WATER LILIES DYING.—Mr. G. S. Saunders reported that he had examined the water lily rhizome sent to the last meeting, and had failed to find any organism present which would account for the death of the plants. He considered the water in which they were growing very foul. Some further material was referred to Mr. Saunders.

GALLS ON RHODODENDRON.—Galls similar to those frequently seen on R. ferrugineum, caused by the fungus Exobasidium rhododendri, were exhibited on behalf of Mr. Veitch, on Rhododendron Wilsonianum. The occurrence of these galls in succeeding years may be materially lessened by their removal before they acquire the white bloom which marks the time of spore formation.

LATE-FLOWERING RHODODENDRON.—Sir J. T. D. Llewelyn made some remarks upon a rhododendron now flowering at Wisley, which he considered to be a hybrid of R. Aucklandi or R. Fortunei. The bush always flowers at this season, and bears bunches of white flowers on long viscous peduncles subtended by deciduous bracts.

AGAPANTHUS UMBELLATUS BRANCHED. — Mr. Worthington Smith, F.L.S., sent one of two samples of a branched scape in agapanthus. Originally there were two branches, but the upper branch was accidentally knocked off; the remains of this are, however, quite distinct. In the umbel will be seen two buds on one pedicel. The growth is caused by the fasciation of scapes, one major and two minor. Whether this character will remain permanent or not is uncertain, as this is the first season of branching.

MALFORMATION IN HONEYSUCKLE.—Mr. J. Fraser showed specimens of Lonicera Periclymenum, Linn., as follows: Specimen A showed (1) cloranthy of the corolla; (2) cloranthy of the stamens; (3) anthers shortened, fleshy, basifixed instead of versatile, and do not open, filaments hirsute instead of being glabrous; (4) chloranthy of the pistil. Specimen B showed (1) chloranthy of the corolla; (2) petalody of three stamens, phyllody of the other two stamens, 2—3 lobed and glandular on both surfaces, like the back of the normal corolla; (3) phyllody of the pistil, the style and three carpels being separated nearly to the base. Specimen C showed a double honeysuckle, (1) chloranthy and shortening of the corolla; (2) petalody of the five stamens; (3) petalody of the pistil and duplication of the three carpels, the style of the three carpels being separated nearly to the base and then duplicated, hose-in-hose fashion; thus there are eleven supernumerary petals. In each case the malformation occurred on plants attacked by aphides.

Northumberland, Durham, and Newcastle.

The summer show of this society was held in the Recreation Grounds, Newcastle-on-Tyne, on July 28, 29, and 30, and was considered one of the finest that the society has ever held. The weather was favourable, and there was a large attendance.

In the large group class arranged for effect on a space 25ft. by 12ft., there were seven competitors, and these must have afforded the judges some little difficulty in arriving at their decision. Mr. J. S. Sharp, Valley Nursery, Huddersfield, was placed first; Mr. H. H. Hillier, second; and Messrs. Carnagie and Co., Newcastle-on-Tyne, third. For six plants in bloom the pitmen showed their usual large specimens of stove and greenhouse plants in perfection; Mr. J. Ellison, Cramlington, was first; Mr. R. Arthur, West Wylam, second; and Mr. J. Hunter, Hexham, third. For four specimen plants in bloom Mr. Ellison was again first, and Mr. Arthur second.

For a collection of sweet peas, twenty-four bunches, Mr. E. Keith, gardener to Sir G. O. Trevelyan, Cambo, Morpeth, led with a most praiseworthy exhibit, as not only were the flowers exceptionally fine and well staged, but most of the newer varieties were included; Mr. F. J. Bell, Whitley Bay, second; and Mr. W. S. Heslington, Little Thorp, Ripon, third. For forty-eight roses Messrs. R. Harkness and Co., Hitchin, were first; Mr. Hugh Dickson, Belfast, second; and Messrs. Gibson and Co., Bedale, third. For twenty-four roses Mr. Hugh Dickson was first, Messrs. R. Harkness and Co. second, and Messrs. Gibson and Co. third. For thirty-six roses, three blooms of each, Messrs. R. Harkness and Co., were first, and Mr. Hugh Dickson second. Messrs. Harkness and Co. and Mr. H. Dickson scored in most of the other rose classes.

Eighteen bunches of herbaceous and border flowers were well shown by Messrs. G. Gibson and Co., who were followed by Messrs. R. Harkness and Co., and Mr. G. Findlay. For the best collection of carnations, arranged for effect on a space 15ft. by 5ft., Mr. W. Lawrenson, Gallowgate, Newcastle, led; Mr. A. F. Dutton, Iver, Bucks, second; and Mr. W. Smith, gardener to the Earl of Durham, Lambton Castle, third, with a fine group of Malmaisons. In most of the decorative classes Mr. E. Edmondson was first, but the competition was very poor.

In the fruit classes, for eight dishes of fruit, black and white grapes allowed as separate kinds, Mr. J. C. McPherson, gardener to Lord Londesborough, Market Weighton, was first; Mr. W. Nicholls, gardener to Lady Beaumont, Charlton Towers, Yorks, second. For four dishes of fruit Mr. J. C. McPherson led, with Mr. W. Nicholls second. For four bunches of grapes Mr. J. C. McPherson was followed by Mr. J. R. Gardiner, gardener to Lady Cowell, Clifton Castle, Bedale. For white Muscat grapes Mr. J. C. McPherson scored, with Mr. W. Nicholls second, and Mr. G. Shotton, gardener to Mrs. H. F. Swan, Prudhoe Hall, third. The best two bunches of white grapes came from Mr. J. C. McPherson, and Black Hamburghs were best shown by Mr. G. Shotton. Mr. A. Woods, Beamish Park, scored for peaches, and Mr. W. Nicholls for nectarines.

CURE FOR MILDEW.

One ounce of Cyllin Soft Soap to a gallon of water is the surest remedy for mildew, green fly, and all forms of insect blight in the garden or greenhouse.

CYLLIN SOFT SOAP

Is a reliable all-round non-poisonous insecticide and germicide. It does not injure the tenderest shoots, and it cleanses the surface soil, thus safeguarding against further attack.

Particulars from Manufacturers, JEYES' SANITARY COMPOUNDS CO., 64, Cannon Street, London, E.C.

Vegetables were good, and for a collection of nine kinds Mr. W. Nicholls led, Mr. E. Keith second, and Mr. T. H. Bolton, Powderham Castle, Devon, third. For the best collection of six kinds Mr. T. H. Bolton led, with Mr. E. Keith second. In another class Mr. E. Keith was first.

The following awards were made to trade exhibits: Gold medals to Messrs. Dicksons, Chester, for hardy flowers; Messrs. Sutton and Sons, Reading, for vegetables, fruit, and hardy flowers; Messrs. Forbes, Lim., Hawick, for pentstemons, phloxes, and carnations; and to Messrs. Dobbie and Co., Rothesay, for sweet peas, etc. Silver medals were awarded to Messrs. Clibrans, Mr. W. Lawrenson, Messrs. Stuart and Mein, Messrs. Storrie and Storrie, Glencarse (for fruit trees in pots), Messrs. Ord Brothers, North Shields; and to Mr. J. Douglas, Great Bookham, for new carnations.

Bournemouth Gardeners' Association.

The members of the Bournemouth and the Highcliffe Gardeners' Mutual Improvement Association drove in char-a-bancs on Tuesday, July 20, to Cuffnells Park, the charming new forest residence of R. G. Hargreaves, Esq., J.P., for their annual outing. Cuffnells Park is a very beautiful residence, situated in the midst of lovely forest surroundings. The mansion is built on high ground, and very charming views can be enjoyed from the terrace over undulating country. King George III., when on his way to Weymouth, stayed at Cuffnells House with the then owner, Mr. Rose. While there the conservatory was destroyed by fire, and His Majesty made Mr. Rose a present of the noble structure which now forms a part of the mansion.

Mr. Hargreaves is an enthusiastic plant lover, and is especially devoted to his trees and shrubs, which are, certainly, a very important feature of the pleasure grounds. A very fine tulip tree has attained a height of 102ft.; Pinus insignis and Wellingtonia gigantea, 110ft. A wonderful rhododendron, about one hundred years old, was originally brought from Highcliffe Castle, near Christchurch, Lord Bute's residence at that time. It is now a very large specimen. There are many self-sown seedlings of evergreen and deciduous trees, of which Mr. Hargreaves is taking care. The deciduous cyprus and the liquidambar do remarkably well here. A fine specimen of the Maltese rose fifty years old, grows against the front wall of the mansion. Edwardsia grandiflora, Rosa rubrifolia, the burning bush, Eucalyptus coccifera, and many kinds of rare trees seem to find a congenial home at Cuffnells Park. Near the mansion there is a lovely water lily pond, with an island near the centre, and a rosery backed by a semi-circular hedge of escallonia. Stone slabs form the paths between the rose beds and broad grass verges. After duly inspecting the pleasure grounds the party visited the kitchen and fruit gardens and the glass department. Mr. Hargreaves gave the members a hearty welcome, and was kind enough to personally conduct them round the pleasure grounds, taking much pains to describe the chief features. A very hearty vote of thanks was accorded both Mr. Hargreaves and Mr. Witt, his able and courteous gardener. The last-named was also the recipient of a silver-mounted walking-stick from the visitors in memory of the occasion of their visit. The day was beautifully fine.

ANSWERS TO CORRESPONDENTS.

PEACH TREES UNDER GLASS.—W. W. R., Andover.—It is the greatest possible mistake to allow peach trees to become neglected as soon as they have finished off a crop of fruits. If the soil is in any degree dry give the borders a good soaking, following this with a dose of liquid manure before the soil dries again. Having taken care of the roots proceed to clean the foliage by the use of weak insecticides, or, if these are not necessary, use the syringe or garden engine freely so as to keep the leaves clean and green for as long as possible. Admit abundance of air, and, if the roof is composed of movable lights these should be removed so as to expose the trees to light and air.

HARVESTING SHALLOTS.—A., Colchester: Lift the crop at once, and lay the bulbs on old mats in the sunshine, or, if the stage of a pit or greenhouse is available, lay the bulbs on this, where they will receive all the light and air possible.

MALMAISON CARNATIONS.—F. E. S., Scrooby: The plants you propose to grow on for another season should be potted at once. Take care that the ball of soil and roots is moderately moist at potting time. Use the very best loam, that has been stacked some time, and add sufficient sand to prevent it becoming sticky. A little soot may also be added with advantage, but it is better to apply this between the layers of loam when the latter is stacked. Pot firmly, water very carefully until new roots are formed, and keep the stock in a well-ventilated house. It will be a rather risky proceeding to stand newly-potted stock in the open this season, because of the continuous wet weather.

MUSHROOM SPAWN.—G. R. G., Towcester: A very common practice is that of breaking up a brick of spawn into eight pieces of equal size; it is rare that larger portions are used, but we have seen smaller pieces used successfully.

ROSE GALLS.—E. N., Leatherhead: The curious growths on the briar shoots sent are produced by the larvæ of Rhodites rosæ, a species of gall insects belonging to a very large family. The common name for this interesting and rather pretty production is Bedeguar Gall, and we have this year seen some very large specimens on briar shoots in Surrey, though very few on the growths of garden roses. The galls are rarely, if ever in sufficient quantity to be really dangerous to roses, and if the shoots carrying galls are cut and burned there is not likely to be any great outbreak the following season. If your troubles in rose culture are confined to the presence of a few bedeguar galls you have very little to complain of.

VARIEGATED ROSEMARY.—B. P. C., Buckleigh: Both the silver and the golden variegated rosemary are less hardy than the green-leaved form, and it is therefore advisable to plant them in specially sheltered positions, or give them the protection of a wall. Propagation may be effected by layering a few of the lower branches at once.

GOOSEBERRY MILDEW.—E. T. F., Hemel Hempstead: In the pamphlet issued some time ago by the Board of Agriculture it is laid down that all nurserymen and market gardeners who purchase gooseberry bushes or Ribes aureum (the stock upon which the standard gooseberry bush is worked), whether from abroad or from Ireland, or even from other growers in Great Britain, should observe the following precautions: (1) Only to purchase from those growers or dealers who are prepared to offer a guarantee that the plants they are selling are of their own growing, and that no case of American gooseberry mildew has ever appeared in their gardens or in the immediate neighbourhood, and that the said plants have not been near any gooseberry plants recently brought on to the seller's premises. (2) To plant such gooseberry bushes or stocks as they may buy or acquire from other premises than their own in a special part of their nursery or garden at some distance from other gooseberry bushes. (3) To destroy all plants found to be affected with the mildew, and to spray with Bordeaux mixture all others suspected of being infested, with the object of destroying any external mycelium or adhering spores that may be present. This should be carried out during the period when the disease is dormant. (4) To keep a careful watch on all gooseberry plants for any signs of mildew, and to report any appearance suggestive of the disease to the Secretary of the Board of Agriculture and Fisheries, 4, Whitehall Place, London, S.W., immediately it is detected. (5) To assist the Board in discovering any unreported cases of the disease.

LATE CARROTS.—S. J., Weston: If a sowing of a good short horn variety is made at once on a warm border, broadcast, you will be able to pull young tender carrots all through the winter. During very severe weather a little straw or bracken should be shaken over the bed, but no other protection is needed.

FLY ON CURRANTS.—A. R. P., Bolsover: Spray the bushes with a soapy solution of quassia or nicotine, first cutting away the points of any shoots that are badly infested and have been crippled by the fly. Spray twice, allowing an interval of four or five days, and follow, a few days after the last spraying, with a vigorous hosing or syringing with clear water.

NAMES OF PLANTS.

S. N. C., Cardiff.—1, Colutea arborea; 2, Kalmia latifolia; 3, Rubus deliciosus.

S. E. M., Teignmouth.—1, Edwardsia microphylla; 2, Fremontia californica.

P. B. J., Lewes.—1, Acalypha Macafeeana; 2, A. hispida; 3, Gloriosa superba; 4, Swainsonia galegifolia.

W. K. W., Chesterfield.—1, Odontoglossum blandum; 2, Clerodendron fallax; 3, Astrantia major; 4, Trachelium cœruleum.

W. B., Wycombe.—1, Gladiolus byzantinus; 2, Astrantia major; 3, a garden variety of Geum coccineum; 4, an erigeron, species not recognised.

E. I., Ross.—1, Curculigo recurvata; 2, Dianthus Heddewigi; 3, Plumbago capensis alba; 4, Streptosolon Jamesoni; 5, Saintpaulia ionantha.

S. N., Ryde.—1, Hypericum Moserianum; 2, Spiræa ariæfolia; 3, Viburnum lantana; 4, Linaria vulgaris; 5, Gypsophila paniculata; 6, Gunnera scabra.

? What is
QUASSOP
PATENTED REGD
A solution made from Quassia chips has long been recognised by the leading horticulturists to be
the best Insecticide
The advent of QUASSOP for the first time enables the preparation of the soap solution and the extraction of the bitter principle from the wood to be carried out efficiently without heat and in one operation.
Quassop is not soap and does not contain an "Extract." It only requires the addition of cold water to produce a solution which [illegible] all the fine qualities of Quassia and soft soap in a [illegible] degree.
[illegible] directions, [illegible] 5 [illegible] gallons 10s. One trial [illegible]. Sample packet (to make 3 gallons, 6d., from Seedsmen, [illegible] or post free, from

TO-DAY! AND FOR YEARS AND YEARS PAST the XL ALL Specialities are and have been the best on the market. Where is the Gardener who does not pin his faith to one or the other of these celebrated Insecticides or Fertilisers? XL ALL FERTILISER has pleased all who have used it this season. The Sales of XL ALL FUMIGATOR prove that it is more popular than ever. XL ALL LIQUID NICOTINE INSECTICIDE is always spoken of by gardeners and growers as the most deadly to Mealy Bug, Thrip, etc. XL ALL WEED KILLER used once a year "No weeds can live." RICHARDS' ARSENATE OF LEAD for all leaf-eating insects. CUCASA (fungicide), the finest preparation of copper ever offered to gardeners. Please ask your Nurseryman, Seedsman, or Florist for a copy of my small pink list, giving particulars of these and many other XL ALL Preparations, which can be obtained from the Horticultural Trade throughout the World. G. H. RICHARDS, Manufacturer and Patentee, 234, Borough High Street, London, S.E.

NOTES OF THE WEEK.

Cross-fertilisation.

One of the most curious facts presented to the consideration of the plant student is, that while Nature has contrived innumerable modes of circumventing self-fertilisation, and promoting cross-fertilisation of flowers, a fairly definite line is drawn by her against indiscriminate cross-fertilisation between distinct species, so that, as a rule, this only occurs, or, at any rate, only leads to fruition, within specific limits. The process of fertilisation is, however, such an extremely delicate one, and so dependent upon what we may term fine adjustments of the two elements essential to it, that it is not difficult to grasp how the modifications of form which have resulted in the differentiation of species may easily involve insuperable obstacles in the process. Furthermore there are undoubtedly sympathetic and antipathetic relations between pollen grain and stigma which involve selection and stimulation of the pollen grains proper to the operation, and the rejection of alien ones. There is also no doubt in this connection that the substance of the pollen grain, which consists of a fertilising cell associated with a certain amount of nutrition to aid the formation of the tube destined to convey the contents of this cell to the embryo seed, is very nicely correlated with the distance it has to travel, i.e., the length of the stigma it has to traverse, and that of the tube it has to form. It is a known fact, for instance, that the primulas, which bear long and short-styled flowers on different plants, have smaller pollen grains associated with the long-styled flowers than are found in the short-styled ones, so that a long-style pollen grain can hardly fertilise a long style ovary, since it can only form a short tube adapted to a short-styled flower. The converse argument cannot, of course, apply, but probably the excess of nutriment involves a misfit, so to speak, and, in any case, the dimorphic arrangement is not an insuperable bar to self-fertilisation, to some extent, though it certainly reduces the probabilities. These various methods of aiding cross-fertilisation appear to be part of a scheme, if we may use such a term, for maintaining that vigour of a race which constant inbreeding is known to impair, but it has also had the effect of bringing into action the insect world as general cross-fertilisers, whom a floral system on purely self-fertilisation lines, would have excluded. Hence, as a secondary result, we now enjoy the fruits of the interaction between insect discrimination and floral response, which has undoubtedly led up to a wondrously beautiful and diverse flora, instead of, presumably, a much simpler and less attractive one, such as we see in those flowers which are either self-fertilised or fertilised by wind-blown pollen or other mechanical agencies. Leaving cultivated flowers aside, of the evolution of which we know something, we cannot fail to recognise the fact that there are innumerably perfectly wild types which fully equal the finest blossoms the selective florist can produce, and which are frequently endowed with a simplicity and grace which are often largely lost in the so-called improvements. Our finest lilies, for instance, belong to this category, and yet they have attained their immense size, and often rich coloration, by purely natural selection. Their evolution through the æons of time, which this must have occupied, we have no means of tracing; flowers do not lend themselves to fossilisation; in themselves ephemeral and unsubstantial, when they perish nothing is left of them capable of perpetuation in the strata of their period. All, therefore, that we know is that they must have been derived from simple types, and that their present splendour is the outcome of the greater and greater daintiness, so to speak, of the bees, moths, and butterflies, which have acted as discriminating intermediaries, and, while themselves being evolved on higher and higher lines, have unwittingly conduced to improve their associated flowers in like ratio. Here, as ever throughout organic creation, we see how marvellously that struggle for existence which involves so many hardships and extinctions of the weaker and inferior, proves itself to be a divinely beneficial factor in the evolution of races from lower to higher grades on underlying principles, which, apparently insignificant, are yet of the most vital importance. The seemingly simple fact that a flower's own pollen is less fitted for its fertilisation than that of another is the foundation of the great mass of our floral wealth.

MR. J. CHARLESWORTH,
A Famous Orchid Hybridist.

Mr. J. Charlesworth, whose portrait we present this week, is the head of a firm that has figured largely in orchid raising and cultivation during the last score of years. Born at Bradford, and brought up in the wool trade, Mr. J. Charlesworth made his mark in the business, but never really liked it. Persuaded to take up horticulture as a hobby he decided to attempt orchid culture, and from cultivating a small collection skilfully he passed on to raise hybrids, and soon the hobby developed into a business, and he left the wool trade and devoted his energies to the new venture. The results that have followed are well known to our readers. The establishment at Heaton, Bradford, had to be enlarged, and a fresh one added, and then, quite recently, as our pages have shown, the whole business was transferred from Yorkshire to Haywards Heath, Sussex. It would occupy more space than we can spare to tell of Mr. Charlesworth's successes as importer and cultivator, and even these are surpassed by his successes as a raiser. He is a keen observer, and a clever hybridist, his bigeneric hybrids alone making a notable addition to orchid collections, while his autumn and winter-flowering lælias, lælio-cattleyas, etc., have altered the appearance of our orchid houses during the dull months of the year. Mr. Charlesworth is a prominent member of the Royal Horticultural Society's Orchid Committee, where his very special knowledge of hybrids and their parentage is of great value.

Cattleya Mendeli His Majesty.—Our readers will remember that we illustrated the superb variety of Cattleya Mendeli named after His Majesty the King last year, and they will be interested to learn that the owner of this unique specimen, Mr. Francis Wellesley, J.P., Westfield, Woking, has succeeded in dividing it, and that Her Majesty the Queen has been graciously pleased to accept from him the new portion. This has been sent to Frogmore, and is now under Mr. Mackellar's care.

Foreign Vegetables.—The chief vegetables received into this country from abroad are potatoes, onions, and tomatoes. During July we imported 589,876 bushels of onions, valued at £104,532, as compared with 593,431 bushels that only cost £64,182 in July, 1908. Potatoes amounted to 620 cwts. from Germany, 613,400 cwts. from France, 291,413 cwts. from the Channel Islands, and 76,452 cwts. from other countries, the total being 981,885 cwts., costing £231,338, against 891,173 cwts., costing £205,126 in the corresponding month of last year. Tomatoes show an increase of 22,981 cwts., and £6,523. Unenumerated vegetables were valued at £19,754, a material decrease.

The Horticultural Trades Association of Great Britain and Ireland is holding its annual meeting and excursions during the present week, and Belfast is the headquarters for the time being. An excellent programme has been arranged, and it includes visits to the nurseries of Mr. Hugh Dickson, Belmont and Ballyhanwood; Messrs. Alex. Dickson and Sons, Newtownards; Messrs. S. MacGredy and Sons, Portadown; and Mr. T. Smith, Newry. A visit to the Marquis of Annesley's splendid gardens and arboretum at Castlewellan is also included in the programme. Mr. John Harrison, of Leicester, is the president of the association for 1909.

Horticultural Progress in Canada.—The recent exhibition at Peterhead was opened by Senator W. Gibson, of Canada, a native of Peterhead, now on a visit to his old home. After dealing with the conditions which prevailed horticulturally in Peterhead when he was a boy, Mr. Gibson proceeded to describe the conditions which prevail in Canada for the encouragment of horticulture and agriculture. Everything was done, he said, by the Government to promote these industries. They had experimental farms free to all, where farmers could go at any time and obtain information with regard to the kinds and varieties of plants suitable for their different kinds of soil and climate. They had colleges where young ladies were taught domestic science, and where the young men were taught agriculture on scientific principles, and where, if they were willing to work, the students were allowed a certain sum per day, so that they could make enough to pay for their education, and then go back to farming at the end of their college course. He wished that such practice prevailed in this country. Flower culture was becoming almost a necessity in the large cities of Canada, for the reason that the large cities demanded flowers on all occasions. In Brompton, Canada, for instance, they had one nursery with seven acres of glass for the purpose of growing flowers to be sent to the city of Toronto every day. In Canada the table decorations at social functions were described in the daily papers even before the ladies' dresses.

The "Journal" of the British Gardeners' Association.—Following a recommendation from the treasurer of the B.G.A., the Council have agreed to combine in one person, i.e., Mr. J. Weathers, the offices of secretary and editor of the "Journal." It is anticipated that the combination of these offices will facilitate business, prevent overlapping, and prove more economical than the old method.

Imported Fruits. — During the month of July the imports of fresh fruits cost us £882,523, against £838,024 in the corresponding month of last year. The amount expended on imported fruit during the seven months just past was £5,532,255, or £105,867 more than in the same period of 1908. The chief items for the month, and their values are as follows: Apples, 95,262 cwts., £46,961; apricots and peaches, 37,785 cwts., £54,820; bananas, 716,749 bunches, £198,150; cherries, 33,090 cwts., £37,946; currants, 105,783 cwts., £121,587; gooseberries, 9,420 cwts., £3,982; grapes, 4,613 cwts., £7,666; lemons, 107,317 cwts., £49,080; nuts, 42,990 cwts., £64,149; oranges, 77,160 cwts., £40,595; pears, 32,608 cwts., £38,967; plums, 115,949 cwts., £146,144; strawberries, 415 cwts., £180; unenumerated, 101,818 cwts., £72,294. It is interesting to notice that our imports of apples for the month of July are more than double those of last year, both in quantity and value; peaches and apricots show an advance of about 14,000 cwts., and bananas to the extent of 50,000 bunches. Currants cost us £21,804 more than in July, 1908, but plums, though more extensively imported, cost us rather less this year than last. The greatest declines for the month have been in grapes, about £3,000 less; cherries, about £3,000 less; strawberries, £3,100 less; and gooseberries, £9,357 less than in July, 1908. Our own heavy crops of strawberries, gooseberries, and cherries account for the decline, but it is difficult to understand the great increase in the imports of currants and apples.

Royal Botanic Society.—The annual meeting of this society has been postponed from August 10 to September 21. It will be held in the society's gardens, Regent's Park.

The Edelweiss as a London Flower.—Referring to the deaths of tourists in the Alps caused by foolish attempts to gather edelweiss from some difficult position, Sir Frank Crisp, who has a splendid alpine garden at Friar Park, Henley, writes to point out that the edelweiss is not an Alpine prodigy, but that it will grow on the roof of the Bank of England and in an ordinary London back garden. Whatever may be said of the fertility —financial and otherwise—of the area which the Bank's roof covers, the roof itself is as infertile a place as could well be selected, whilst a London back garden has always been the ideal of abomination as regards the growth of floral rarities. Assuming that anything can be said in favour of the wisdom and foresight of risking one's life to gather a unique and remarkable flower, nothing can surely be said in support of taking such a risk for a flower that will readily grow in the waste places of civilisation.

American Rubber Trees.—The economic value of rubber-producing trees is now so great that any information regarding them is of the utmost importance to planters and others. These who are dealing commercially with rubber trees cannot afford to disregard the botanical aspect of the species used, as a knowledge of the essential characters will enable one to distinguish between the economically valuable and the merely interesting kinds. A work dealing with the botanical side of the question, but including only the American rubber trees, has been now provided by Mr. William Botting Hemsley, F.R.S. This is issued as part of Hooker's Icones Plantarum for 1909, and includes the illustrations from 2,876 to 2,900. Manihot dichotoma and a large number of species of Sapium are figured and minutely described by Mr. Hemsley, and the illustrations are by Miss M. Smith.

Flower Imports. — For foreign flowers we paid £5,320 last month (July), as compared with £3,467 in July, 1908, and £4,509 in July, 1907. The total paid during the seven months just ended is £204,320, as against £181,087 in 1908, and £181,749 in 1907, taking a similar period.

"Journal" of the Chelmsford Laboratories.—Excellent work has been and is being done at the Essex County Laboratories, Chelmsford, and the results are from time to time made known to the public. Horticultural and agricultural education is a great feature of the work, and very many students in these and other branches of industry and science have passed through the establishment. An "Old Students' Club" is in course of formation. Another feature, and an interesting one, is the production of a "Journal," and an advance copy of Parts 1 and 2 has just reached us. It contains the results of various agricultural and horticultural experiments, an article on "Nature Study Training," by Professor F. Caves, and notes on insect pests, seeds, etc. The editor hopes by means of this "Journal" to bring Chelmsford authorities into closer touch with those to whom at present the work done in the laboratories is a sealed book.

The Hampton Court Vine is this year carrying about three hundred excellent bunches of grapes, and these, by the size and colour of their berries, show the influence of the careful treatment bestowed upon this famous Black Hamburgh by Mr. Mackellar.

Road-side Fruit Trees. — Mr. W. R. Boelter, of Great Titchfield Street, W., writes: Anyone who has travelled along the country roads in Germany cannot have failed to observe that they are planted on both sides with fruit trees. To see them in early summer when they are vast avenues of apple, pear, and cherry trees in full bloom, or in the late summer and autumn, when the branches are laden with fruit, is a sight not easily equalled or forgotten. From a report before me, issued by the Minister of Agriculture of Saxony, I notice that, after providing employment for a large number of "tree-wardens" and occasional work for a larger number of persons engaged in picking and marketing the fruit, after providing all who chose to have them with free meals of fruit throughout the autumn, and after beautifying a countryside corresponding in parts to our own Black Country, this department made during 1908 a profit of £12,000. I am prompted to suggest that a similar system of roadside fruit-tree planting be instituted here, and by way of making its realisation practicable in the near future, I would further suggest that we take also a leaf out of the book of the Colonies and establish a People's Arbour Day. An additional holiday seems greatly needed to break the long spell of work from now until Christmas. Such a day would most naturally fall in the first part of October—the most suitable time for fruit-tree planting. If an influential society were formed—I suggest Lord Avebury as its natural president—to lead the agitation, to make the necessary arrangements with the public bodies controlling the roads, and collect funds and trees, there is little doubt that in a few years it would literally "change the face of the country," and provide an enormous amount of productive employment for capable and willing hands. To give details of the organisation as it presents itself to my mind would take up too much of your valuable space, but I venture to submit that since there are the roads, and the un- and under-employed, and thousands of public-spirited people desirous of helping the unemployed as long as their donations are not spent in paying one squad of workless to dig a hole for another squad to fill up again, and similar "solutions of the unemployed-problem," the task of organising this scheme of roadside fruit-tree planting as a rational investment of money and surplus labour does not seem to present extraordinary difficulties.

"**Bees in Relation to Gardening**" is the subject of the lecture to be delivered before the Royal Horticultural Society at 3 p.m., on Tuesday, August 17, and the lecturer is Mr. Walter F. Reid, F.I.S., F.C.S.

FIXITY OF WAVED SWEET PEAS.

In January last Mr. Robert Sydenham expressed the opinion that the Countess Spencer type of sweet peas would not come true, and he challenged any grower to any amount from £10 to £50, to send to Reading for trial twenty seeds each of ten varieties of Spencer sweet peas, and if any variety had three rogues (that would be more than 10 per cent., sender should lose. If there was not a single variety that had more than two rogues Mr. Sydenham would lose, and pay the £10 to a gardening charity or charities, as well as all expenses.

Being large growers, and convinced that there were stocks of Spencer varieties in this country that would come 90 per cent. true, Messrs. E. W. King and Co., of Coggeshall, accepted the challenge, and sent the necessary seeds. Having twelve varieties of Spencers which had never left this country, some of which they had grown for several years (including Mrs. William King, which was sent out two years ago with a guarantee of 90 per cent. fixity), they felt confident of the result.

The judges appointed were Messrs. C. Foster and H. H. Thomas, who inspected the trials last Thursday, and gave the result in favour of Messrs. E. W. King and Co., not one variety having two rogues. Six varieties, viz., Mrs. William King, White Spencer (E. W. King and Co.'s), Paradise Ivory, Princess Victoria, Malcolm's Waved Cream, and [illegible] Spencer (E. W. King and Co.'s) came true; Evelyn Hemus, Countess Spencer, Marjorie Willis, and Mrs. Henry Bell had one rogue each.

This test would seem to prove that Spencer varieties can be fixed if sufficient care is taken with them. Mr. Sydenham is to be congratulated upon his spirited offer, and Messrs. E. W. King and Co. upon their successful fulfilment of the conditions of the challenge.

C. H. C.

SWEET PEA NOTES.

The importance of comparative trials as regards the utility of certain plants for garden decoration is daily forcing itself with greater emphasis upon those engaged in commercial gardening, and in private establishments the results obtained have often to be further reduced to local requirements. This is particularly evident among sweet peas when, through a superabundance of material one encounters enormous difficulties in making a final selection. In this respect King Edward Spencer is superior to the older so-called scarlets, the standard is beautifully waved and crinkled, the wings of great breadth, and it produces stout fifteen-inch stems, always carrying three or four flowers, while the colouring of the keel and wings is similar to King Edward VII.; the standard is almost identical in colour with Queen Alexandra.

Mrs. A. Malcolm is a rich cream flower, having erect stands; it promises to become a better garden flower than James Grieve.

Anna Lumley is a perfect Spencer flower and of the same colour as the well-known Black Knight.

Mrs. Bieberstedt is described as a deep lavender, but the flower has a wonderful sheen of lilac, which easily marks it as distinct from Lady G. Hamilton or Frank Dolby; the colour is most regular over every part of the flower; the standards are perfectly erect, the stems are usually over 15in., and the flowers generally four to a stem.

Flowers with picotee edge are of doubtful character in garden decoration, but Evelyn Hemus is a striking exception, the colour is cream, with the margins feathered pale flesh; the flowers are of true Spencer form, and strong stems usually carry four flowers. All the above varieties, in so far as I have grown them, are thoroughly fixed.

Audrey Crier produces enormous rosy-pink flowers, and is perfectly waved. It throws what appears to be an extra fine form of Helen Lewis. This variety, in conjunction with St. George and Henry Eckford, are the most brilliantly coloured of all sweet peas under artificial light.

Last year I gathered seed pods from Nora Unwin, which on shelling revealed black and white seeds. These were kept separate, and this season the white seeds are all Nora Unwin (true), while the plants from the black seeds are all Gladys Unwin.

Thomas Smith.

"STREAK" IN SWEET PEAS.

Mr. G. Garner's notes on "streak" in sweet peas have been of much interest to me, and, unfortunately, I can fully bear out the statements he makes regarding this disease. My first acquaintance with "streak" was in 1905, when it appeared in the variety Black Knight, and spread through the whole row of some ten varieties in about a fortnight. The other rows in the same garden did not show the disease; the soil there was a light loam, with a subsoil of gravel and sand fifteen inches down. With the exception of a few isolated plants last year, towards the end of August, which I pulled up and burnt immediately, I have had no trouble with the disease since, till this year. This year I limited the number of varieties grown to seventeen of what I considered the best, and the disease has appeared in every one of them. It started some three weeks ago in Evelyn Hemus. I at once pulled up some of the worst, and cut back one or two others to what seemed healthy growth, but it has gone right through this variety, which is entirely spoilt, and several others are almost as bad. The soil here is a fairly stiff loam, on pure yellow clay some eighteen inches down. Mr. G. Massee, reporting on a case of "streak," the answer to which appears in this year's "Sweet Pea Annual," is of the opinion the disease is of a physiological nature, a common feature of the disease being the absence of nodules on the roots. This he considers is due to the nitrogen-fixing bacteria being rendered inert, or doing work detrimental to the pea plant, owing to the excess of nitrogenous manure used. I have noticed the absence of nodules on the roots of the diseased plants myself, but this year I planted two varieties, St. George and Henry Eckford, by themselves, where they are partially shaded by some large oak trees; as far as I can remember neither sweet peas nor the culinary sorts have been grown on this piece of ground for the past sixteen years, and the ground is poor and hungry owing to the roots of the oak trees, and yet the disease has appeared here, as well as in the better-cultivated parts of the garden. With Mr. Garner, I hope the National Sweet Pea Society, which, I know, fully recognises the danger of the disease, will deal with the matter immediately, while the disease is still in its infancy, otherwise I feel sure it will soon become a serious scourge, as it spreads so rapidly. The disease seems to me to be in the soil; would it be possible to have the soil in which some of the worst of the diseased plants are, thoroughly analysed and examined by several of the trained experts in this department, as many, like myself, will be compelled to grow their sweet peas in close proximity to if not on the same ground, as occupied by them this year, and if the disease, whether of a fungoid nature or not, is in the soil, the proper time to deal with it will be before, or when preparing the plots for next season, and as many growers prefer to do this work as early as possible, there is no time to be lost.

H. G. Collyer.

The Gardens, 16, South Eden Park,
Beckenham.

AN AMATEUR'S COMPLAINT.

As an amateur I have read Mr. Curtis's "Sweet Pea Jottings" with interest, and have pondered over them a while. May I ask your indulgence for the few lines which follow? The trade have the fortunes of the flower in their hands, and they may make or mar it—they certainly will not make it by sending out doubtful varieties which appeal to one's artistic sense as seen upon the show bench, but which, when grown in the garden, produce so many "rogues" that the unfortunate amateur is tempted to discard the flower as a part of any colour scheme he may devise, and to banish it to the reserve garden.

One feels inclined to ask the growers not to bother themselves about raising any new varieties, but to be content with the true and old friends we know so well; yet to do so would be absurd, for they are not engaged in horticulture "for fun," and *les affaires sont les affaires*, after all is said. But there is solace in the knowledge that the N.S.P.S. may be trusted to safeguard our interests, and to check the distribution of unreliable varieties which nobody wants and which only bring vexation of spirit to the enthusiastic amateur, to whom our good friends "the trade" look for their bread and butter. *Verbum sat sapienti.*

Amateur.

HOW TO GROW SWEET PEAS.—"Sweet Peas and their Cultivation," by C. H. Curtis (Secretary of the National Sweet Pea Society), is a complete guide to the successful culture of sweet peas for home or exhibition. Price 1s. net, by post 1s. 2d., or bound in cloth 1s. 6d., by post 1s. 8d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.

THE LING.

Closely allied to the heather, the Ling, Calluna vulgaris, is frequently found growing in company with Erica cinerea on hillsides and moorlands throughout the country, brightening up the landscape with brilliant masses of colour. Common, however, as it is in a state of nature, it is not to be despised as a garden plant, and many a bright patch and pleasant feature is added to the garden by the ling or a selection of its varieties. For the wilder parts of the garden it is well suited for planting in extensive masses either on level or undulating ground, and an added interest may be given to such groups by including dot plants of certain rare trees, which well repay by increased growth the little protection thus gained. Although the ling grows vigorously on peaty land, it is not an essential to its success that peat should be given, for if the soil is moderately free from lime it will flourish. Neither is any special preparation required for this plant, for, in the event of a large area of ground having to be planted, it is only necessary to dig the soil over deep enough to bury weeds and grass, so that they will not have an opportunity of growing again. In planting an area the chief weed to guard against is couch grass, for if this is allowed to grow amongst young plants it seriously interferes with their development and spoils the appearance of the mass.

With a subject so widely distributed as the ling, it is not remarkable that a great variation should occur amongst the plants both in habit and colour of flowers. In some districts it grows to a height of 3ft., whilst in other places it rarely exceeds 6in. in height. Some varieties are known which form dense tufts 2in. or 3in. high, whilst a few years ago a tiny form was noted in the Scilly Islands, which had the appearance of moss and rose scarcely half an inch above the ground.

In colour of flowers there is a great variation, for, whilst the type produces reddish-purple blossoms there are varieties with white and many intermediate shades. Foliage exhibits a certain amount of variation, for in one form it has a silvery appearance, whilst in at least two varieties it is of a rich gold hue. In addition to its ornamental properties, the ling is used to a moderate extent for other purposes. In some districts it is cut, dried, and used for thatching summer-houses, fruit rooms, sheds, etc., whilst it is also in demand for broom-making.

Propagation may be effected by means of cuttings or layers in the case of the varieties, or by seeds for the type. The cleanest plants are those grown from cuttings, which should be made and inserted in sandy peat in a close frame or under a bell-glass in August or September. When forming a plantation, masses of single colours may be planted or a mixture of red and white. Very effective masses of mixed colours were noted two or three years ago in the nursery of Messrs. Smith, of Darley Dale, where many thousands of these plants are grown. The sentimental associations attached to the white varieties have created quite a trade in cut bloom, and large quantities are disposed of annually.

Amongst the many varieties the following may be depended on to give a good account of themselves. Red-flowered: Alporti, a tall grower of upright habit with rich-coloured flowers is one of the best. Flore pleno is remarkable for its floriferous character and double flowers. Rosea has paler coloured flowers than the type, and rubra deep red flowers. White-flowered: Alba, alba pilosa, alba Serlei, alba rigida, and alba tenella are all good. Coloured-foliaged: Argentea, with silvery leaves, and aurea and asprea with golden and coppery leaves respectively, are the best. Dwarf moss-like varieties: This group is remarkable more for its dense cushion-like masses of greenery than for its flowers. Foxi, hypnoides, and minima are the most distinct.

W. D.

FLOWERING SHRUBS.

The passing season has been a notable one for the wealth of blossom on flowering shrubs, and such a season brings into prominence the variety of shrubs which the present day planter has to select from. This profusion of blossom may be due to several causes, but from reports which have reached me this season it appears to have been very general. Season, locality, soil, and condition of the wood are all important factors in the production of bloom among hard-wooded flowering plants, and the summer of 1908 has doubtless contributed largely to the present season's floriferousness.

Two shrubs which have been very beautiful are Styrax Obassia and S. japonica, the last-named exceptionally so. Exochordas have been a mass of white. Cornus in variety have been very fine, also the viburnums, especially V. macrocephalum. Veronicas have flowered freely, one of the best being V. salicifolia, and the later flowering V. Autumn Glory promises abundance of its dark blue spikes of flowers. Abelia triflora was very attractive, and Corylopsis pauciflora should find a place in every collection. Myricaria dahurica is another distinct and shrubby plant that flowers somewhat later in the season, as also does Amorpha canescens.

Magnolias have been beautiful; M. stellata should be protected from rough winds and late frosts, and for this reason some sheltered position should be given it. M. Lennei produced some fine blooms, and all the others flowered well, excepting M. Campbelli, and this probably will produce its blooms when the plants obtain greater height and age. The small-flowered Philadelphus microphyllus was a mass of white, and is a moderate-sized shrub suitable for the front of shrubberies.

Stuartia pseudo-camellia flowered freely, but wet and wind soon damages the blooms. Some of the escallonias suffered during the winter, but the majority flowered well, the two best being E. Phillippiana and E. Langleyensis, the last-named being very fine. Daphniphyllum glaucescens is a very distinct evergreen shrub, and though its flowers are not so showy as some of the deciduous section, it makes a distinct shrub as a single specimen on the lawn. The shrubby spiræas are flowering freely, Spiræa Aitchisoni much resembles S. Lindleyana, but has more finely cut leaves. S. callosa and S. callosa superba are masses of flower, and S. Billardieri alba is somewhat taller than the last-named. The other group of the spiræas has flowered well. Xanthoceras sorbifolius is another distinct flowering shrub that has done well. Of olearias, O. Haasti, and O. nummularia have been good. A change of colour is afforded by Buddleia magnifica, B. variabilis, and B. variabilis Veitchi. Among the brooms we have yellow, white, and the mixture of brown and gold in Andreanus. These, with the lilacs, all help to form a floral picture, whether grouped in separate colours, or planted to form a pleasing combination. There is a wealth of colour to suit the most fastidious, if taste and judgment are displayed in the selecting and planting.

T. H. Slade.

BEST BEDDING VIOLAS.

On the invitation of Messrs. Dobbie and Co., a party of some 27 members of the Scottish Pansy and Viola Association visited their nurseries at Rothesay on Saturday, July 31, for the purpose of inspecting a trial of 80 varieties of bedding violas. The trial consisted of practically the same varieties as were tested last year at Messrs. Dobbie and Co.'s seed grounds in Essex, and the object was to ascertain whether the Scottish experts might come to any conclusions different from the Southern enthusiasts.

Instead of being planted in autumn, as were last year's trials, the violas in this instance were not, owing to weather conditions, put into their quarters till the end of April. The border selected for the trial was somewhat heavy in character, and the abnormal rainfall during July was rather against some of the varieties, consequently the trial lines were not so regular as might have been expected under more favourable conditions. Each member on entering the grounds was handed a typewritten sheet with the names of the varieties on trial classified into colours, with the request that XX might be put against the best variety in each shade, and X for the next best.

They were further requested to name what, in their opinion, were the three best whites, yellows, and certain other shades, irrespective of the flowers being rayed or rayless. The results which are given below will show that, on the whole, the decisions in the English trials are pretty well borne out by the Scottish jurors:

White, rayless—1, Cygnet; 2, Mrs. H. Pearce. White, slightly rayed—1, Countess of Hopetoun; 2, White Empress. White, rayed—1, Bethea; 2, Alexandra.

Cream shades—1, Iliffe; 2, Sylvia. Primrose shades—1, Primrose Dame; 2, Maggie Clunas. Yellow, rayless—1, A. J. Rowberry; 2, Wm. Lockwood. Yellow, slightly rayed—1, Redbraes Yellow; 2, Kingcup. Yellow, rayed—1, Canary; 2, Grievei.

Blue, dark—1, Archie Grant; 2, Edina. Blue, light—1, Lady Marjory; 2, Ithuriel. Lilac and lavender—1, Favourite and Kitty Bell; 2, Florizel.

Mauve—1, Mauve Queen; 2, Lady Warwick. Mauve, dark—1, Jubilee; 2, Councillor Waters. Bronze—1, Redbraes Bronze; 2, Bronze Kintore.

Edged varieties—1, Lady Grant; 2, White Duchess. Crimson and rose—1, Wm. Niel; 2, Mrs. J. H. Rowland.

Three best whites in above classes—1, Cygnet; 2, Bethea; 3, Mrs. Pearce. Three best yellows in above classes—1, Canary; 2, Primrose Dame; 3, Grievei. Three best mauves and lilacs in above classes—1, Mauve Queen; 2, Favourite; 3, Kitty Bell. Two best bedders in other fancy types—1, Mrs. Chichester; 2, Agnes Kay.

PRIMULAS AND CINERARIAS IN COLD FRAMES.

From the middle of August until mid-September, primulas and cinerarias growing in frames, may, with beneficial results, be exposed to the night dews in calm weather. Many cultivators do thus expose the plants; others who have not, as yet, tried the plan would certainly be pleased with the beneficial effect that the dew has upon them. For many years I exposed my plants, but not so much as another cultivator whom I am acquainted with, and his plants have excited the admiration of some of the most noted growers in the country. The lights should be taken off only during very warm nights, such as obtain when we have warm weather at this season. As the summer has proved cold and sunless until now, we may have a very warm spell in the early autumn, and it is then that night dews so greatly induce healthy growth of the plants.

G. B.

SHAKESPEARE'S GARDEN.

Among the gardens of Great Britain, both public and private, the one at the rear of Shakespeare's birthplace, at Stratford-on-Avon, stands unique. It is not that its boundary walls encircle broad acres, where some master of garden architecture has achieved the triumph of his skill; we find not here the glorious beds and borders of choice highly-cultivated plants, which are the attraction in the gardens of nobility. The charm and absorbing interest of this place is that within its ivy-clad walls we find the old-world flowers, herbs, and trees which the immortal Bard knew and loved, and which are mentioned in his writings.

Even from the point of view of the gardener who is interested in the plant-lore of a bygone age, this collection of homely flowers and herbs, for the most part native, which "show false art what beauty was of yore," is worth a visit of inspection. The lover of Shakespeare, as he walks around, experiences soul-stirring emotions which cannot be described in words. He is for a season separated from the outer-world, and the spirit of that mighty genius whom all the world reveres seems to pervade the place. Gazing around at the modest flowers, many of which are at home on the hedge-banks of the neighbourhood, he is awakened to a new sense of the beauty that is in the harebell, or the sweetbriar, as the utterance of Arviragus comes to mind:

"With fairest flowers
While summer lasts and I live here, Fidele,
I'll sweeten thy sad grave: thou shalt not lack
The flower that's like thy face, pale, primrose; nor
The azured harebell, like thy veins, no, nor
The leaf of eglantine, whom not to slander,
Out-sweetened not thy breath."

Eglantine is one of the old-world names much used by Shakespeare, and is generally conceded to refer to sweetbriar, the fragrance of which floats over this garden. Here are the roses of red and white, which, "by any other name would smell as sweet," and the old York and Lancaster, flowering freely recalls the lines:

"The roses, fearfully in thorns did stand,
One blushing shame, another white despair;
A third, nor red, nor white, had stol'n of both."

At the time of a recent visit the season had passed, for the

"Daffodils
That come before the swallow dares, and take
The winds of March with beauty; violets dim,
But sweeter than the lids of Juno's eyes,
Or Cytherea's breath: pale primroses,
That die unmarried, ere they can behold
Bright Phœbus in his strength,"

but "lilies of all kinds" were still in bloom. Our readers, accustomed to the modern introductions from Japan, must not take this phrase too literally. The lilies here are such as we find in the gardens about thatched cottages. Remember, too, that the common name of lily was used for many plants which are botanically far removed from the genus lilium, hence the presence of alstroemeria, funkia, hemerocallis, etc.

Passing under the shadow of the oak, one comes upon a corner set apart for herbs, and as thyme, sage, marjoram, and lavender, balm, and hyssop meet the eye, thoughts wander to various references to these in the works of Shakespeare. A cherry tree, bearing a fair crop of fruit recalls the beautiful words of Helena to Hermia:

"So we grew together,
Like to a double cherry, seeming parted,
But yet an union in partition;
Two lovely berries, moulded on one stem;
So, with two seeming bodies, but one heart."

Fruits are well represented in this wonderful garden. There are the

"Apricocks and dewberries,
With purple grapes, green figs, and mulberries,"

mentioned in "A Midsummer Night's Dream," also the medlar, pear, quince, and, in fact, almost all our hardy fruits. Mention of apricocks—the ancient form of spelling—reminds one of the gardener in "King Richard II.," where he bids his assistant

"Go bind thou up yon dangling apricocks,
Which, like unruly children, make their sire
Stoop with oppression of their prodigal weight;
Give some support to the bending twigs."

Shakespeare must have been himself fond of gardening, or of watching the gardener at his work. Note how he makes this same gardener say:

"I will go root away
The noisome weeds, which without profit suck
The soil's fertility from wholesome flowers."

There are, what would elsewhere be called "noisome weeds" in Shakespeare's garden to-day, but they are there by privilege, and, by virtue of being mentioned by the poet, are beloved. One looks upon the

"Rank fumiter and furrow weeds,
With burlocks, hemlock, nettles, cuckoo-flowers,
Darnel, and all the idle weeds that grow
In our sustaining corn,"

and truly, here, they seem as much in order as do the

"Carnations, and streak'd gillyflowers."

Harking back to the gardener, one swells with pride at remembrance of Shakespeare's statement that

"There is no ancient gentlemen but gardeners;
. . . they hold up Adam's profession."

This high testimony of the poet's to the worth and standing of the gardener, should form inducement to all followers of the craft to go and do reverence at his shrine; and when such pilgrimage embraces so much of pleasure and instruction, one feels that exhortation should be unnecessary. Stratford is easy of access. The journey from London by the Great Central route occupies but little over two hours, and the same company caters well for dwellers in provincial towns, both in the matter of direct routes and cheap fares.

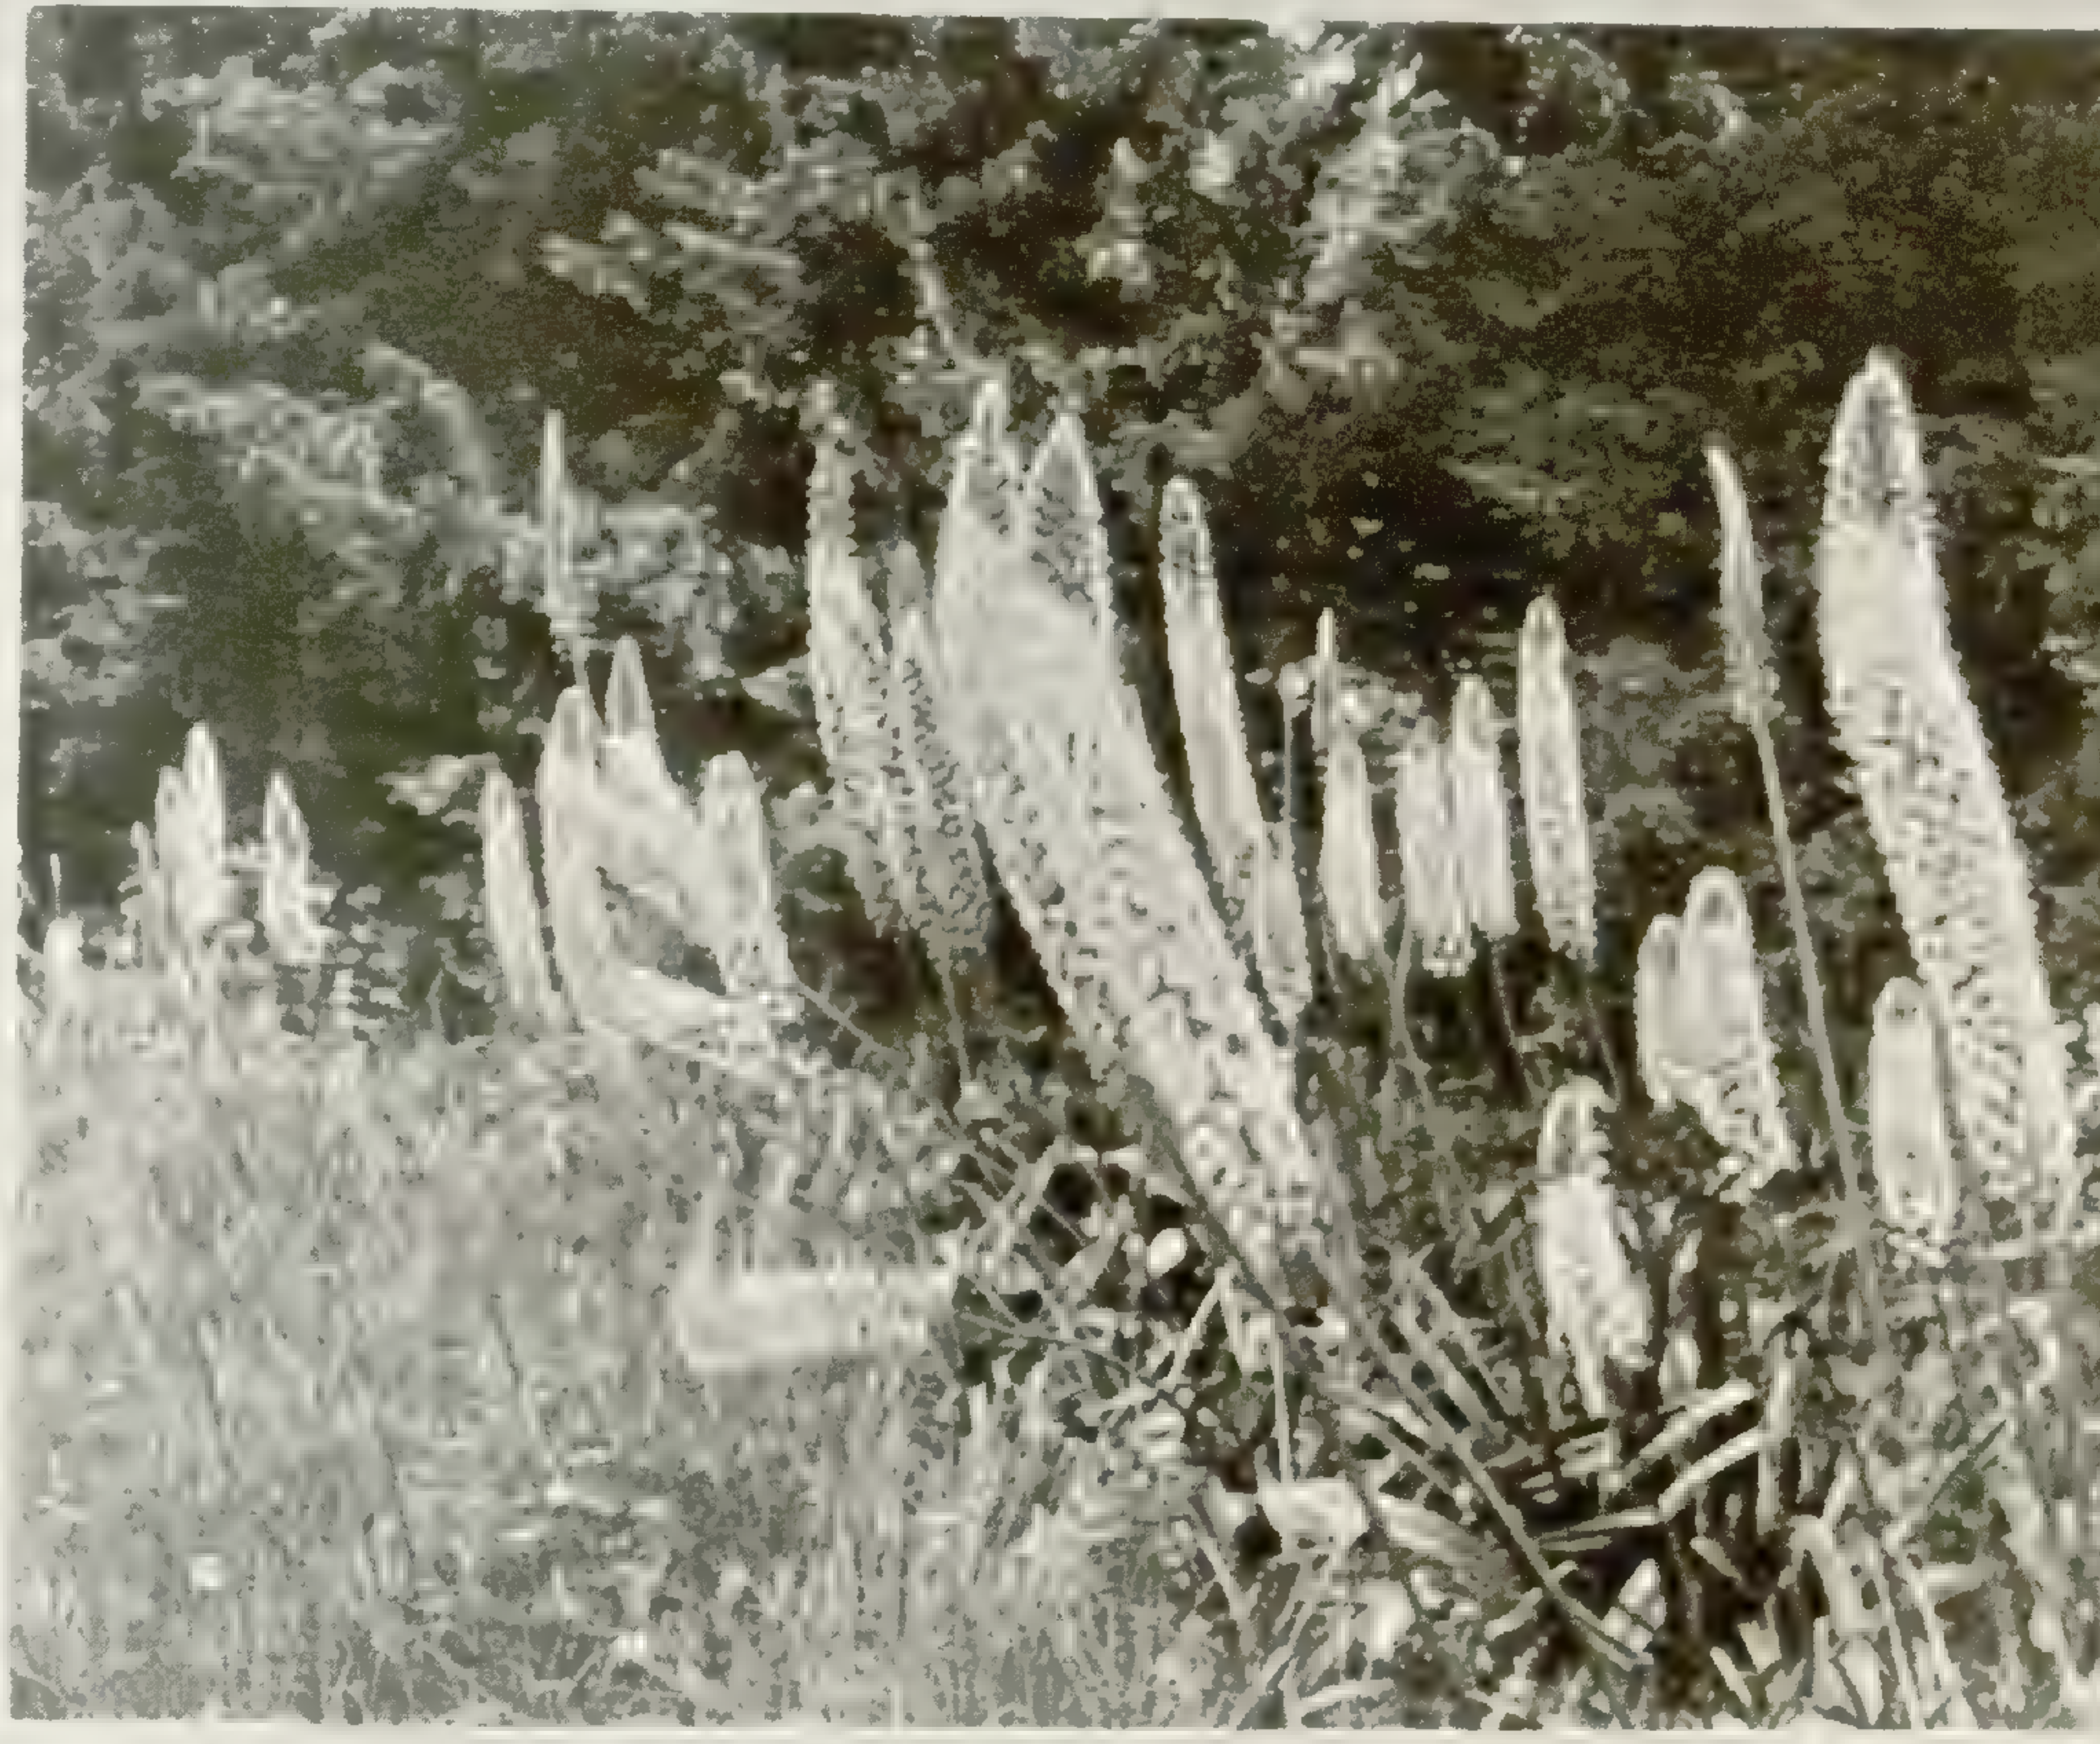
I have but briefly indicated the pleasures to be enjoyed by a visit to a garden which brings one into closer touch with the flora of our land, and into communion with "England's greatest man," as Marie Corelli rightly describes him. Within the compass of a day the pilgrim may also visit the birthplace itself, the school, the grave of Shakespeare, and Anne Hathaway's cottage, and in every corner of the picturesque old town will come face to face with some building or object associated with the poet and his life. A day thus spent is well spent indeed. The memory of it will linger long and pleasantly.

A. J. M.

EREMURI.

Why is it so few cultivate these stately plants? One reason given is that they will not grow; another is that they cost too much. I cannot understand the first reason, because I have grown them for years, in all sorts of soils and positions, and this year, when many other plants have suffered from one cause or another—there have been so many enemies about seeking what they may devour my large number of plants have been a picture. This is a good time to transplant them (moving is good) lifting them with a little care, so as not to snap too many of the brittle roots. When planting, I put some manure below, covering this over, of course, with soil, and adding a little bone-meal. The crown should be three or four inches below the surface.

Of late years I have given no protection of any kind even in the spring, nor in the killing frosts of December, when we had 31 degs., and the sharp frosts later, and the cold spring nights did no harm at all.



EREMURUS ELWESI AT STRATFIELDSAYE RECTORY.

At present I only grow E. robustus, and E. Elwesi, the one in the picture, very much like the former, but shorter and earlier, and E. himalaicus and E. Bungei, all of which are easily raised from seed. But I am looking forward to the possession of one of Wallace's new hybrids. It is curious how some plants will have little families at the roots, especially when the parent plant has been damaged or failed to send up a flowering spike. Shelter from high winds, which blow the spikes and plants, out of shape, is necessary.

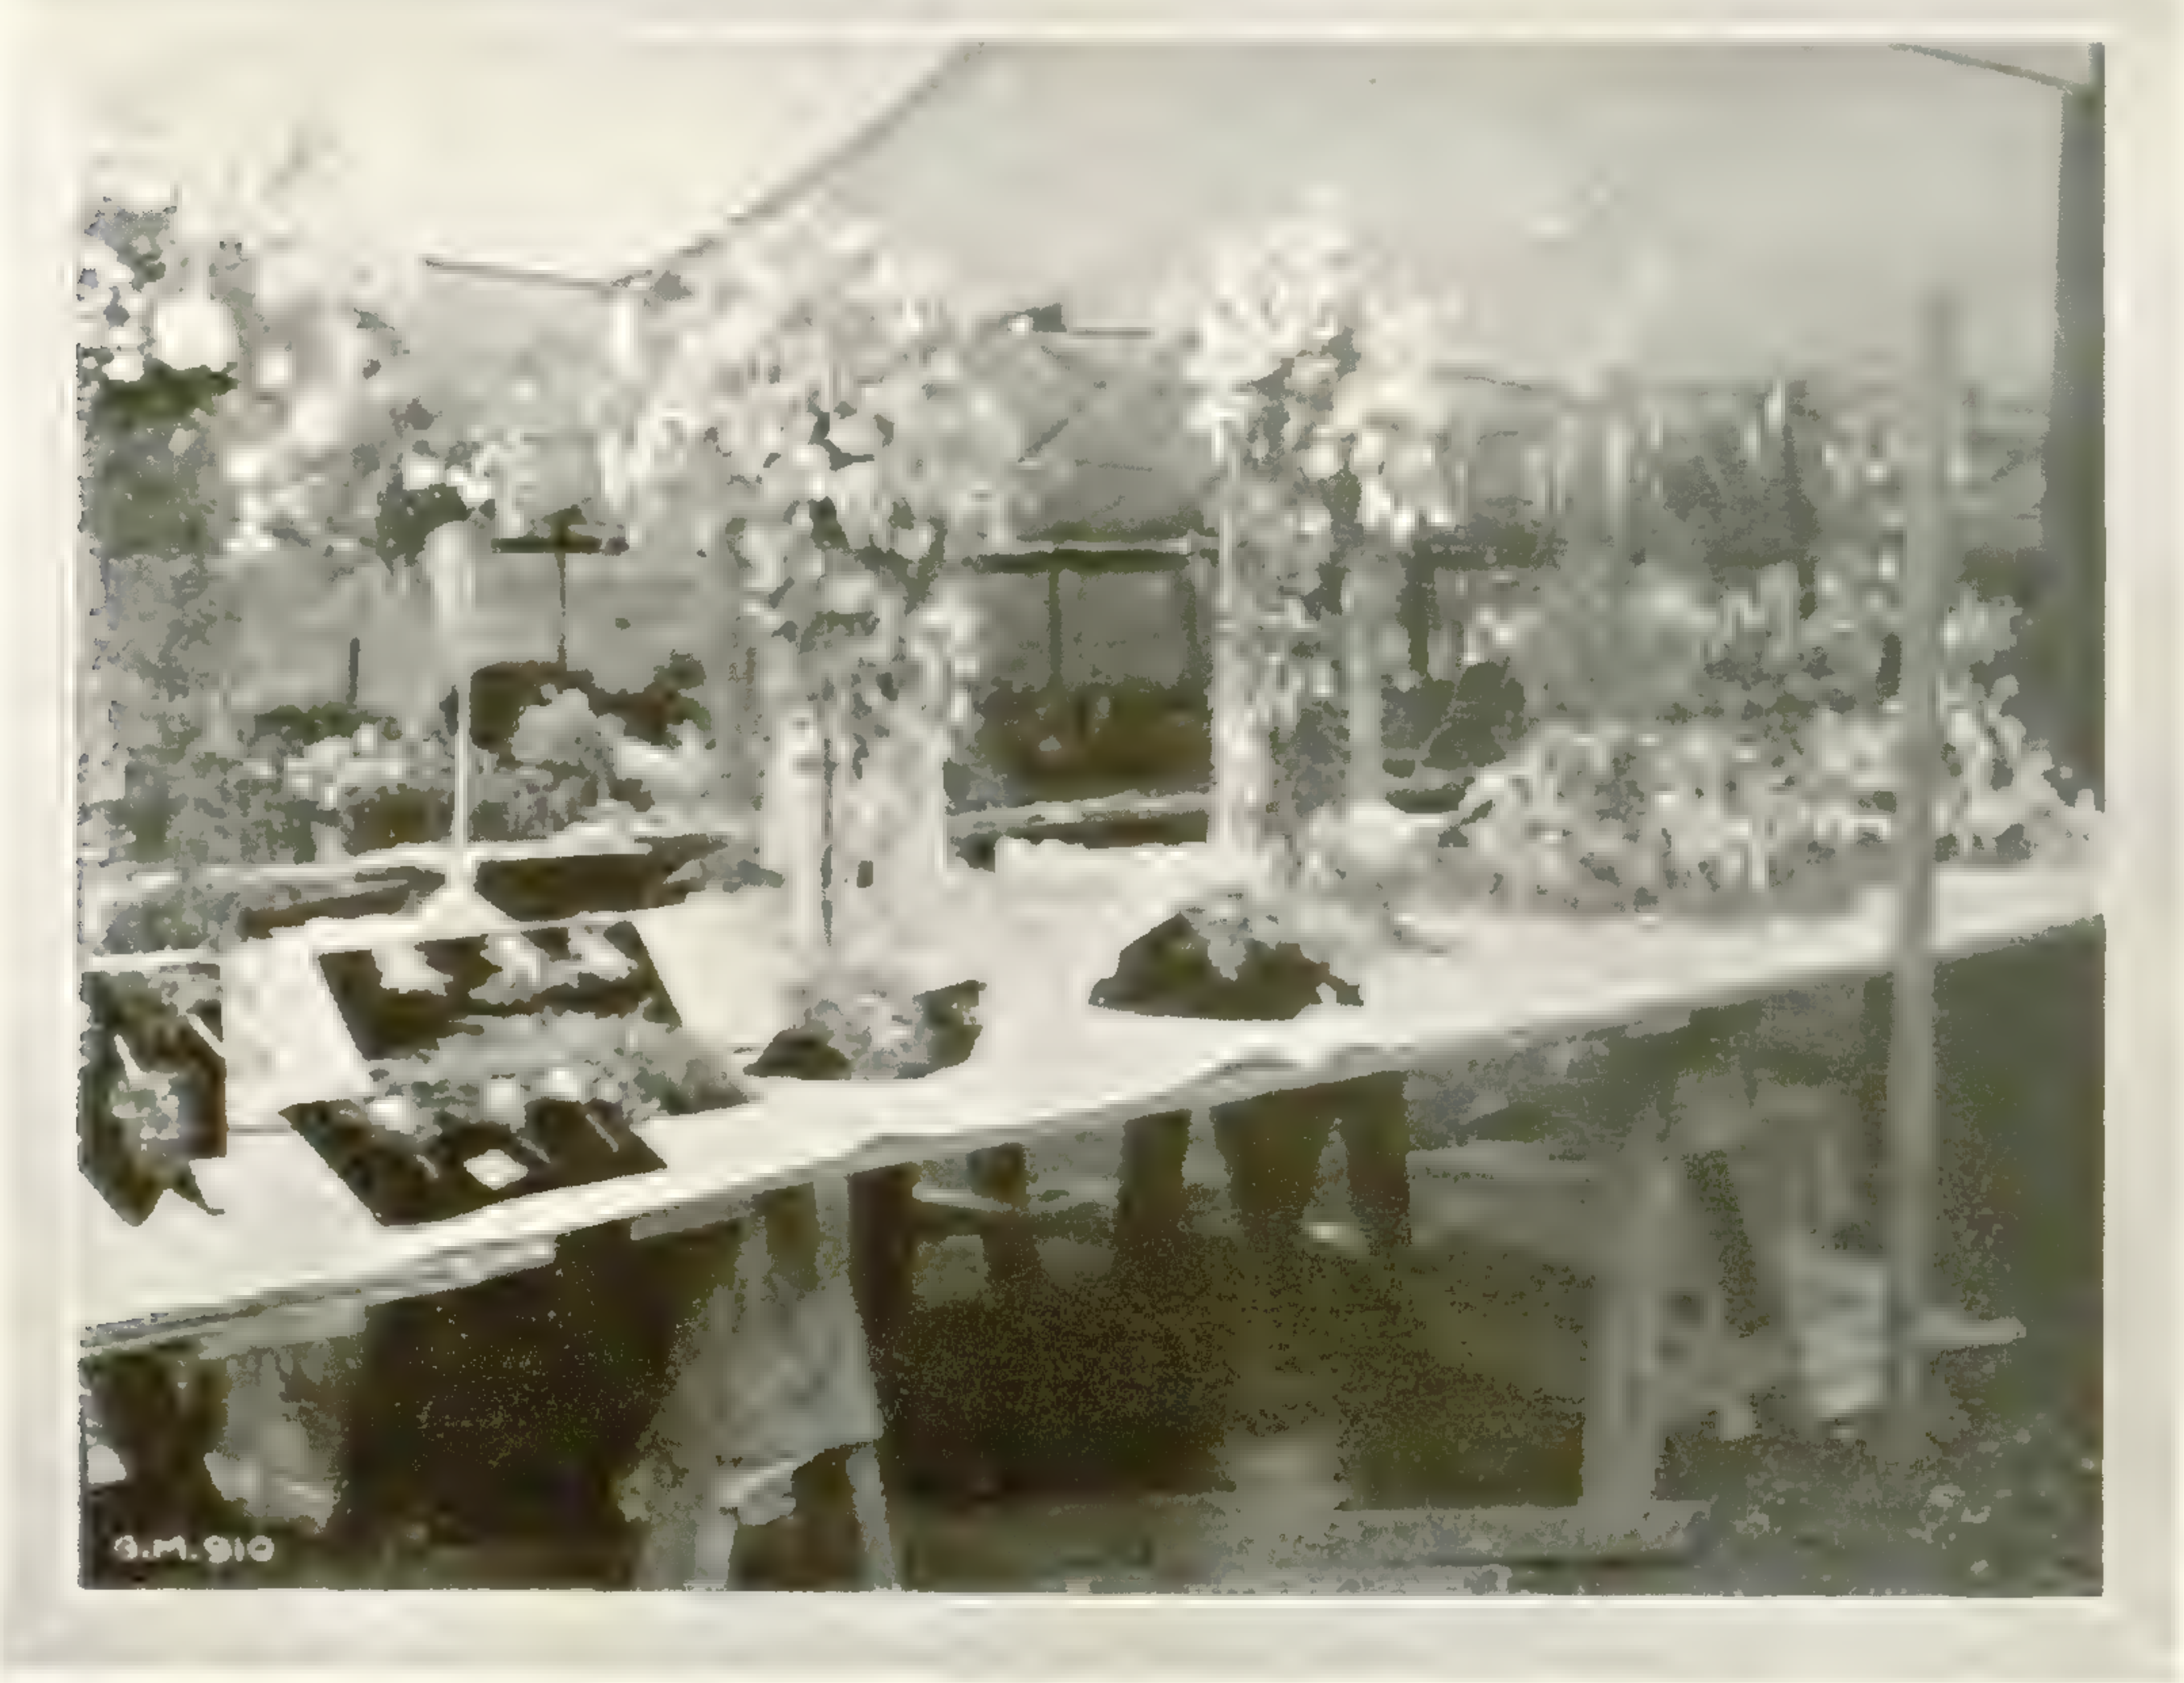
F. Page-Roberts.

Stratfieldsaye Rectory.

Strawberry Laxton's Fillbasket.—Upon strong chalky soil few strawberries yield an adequate return, the best being Royal Sovereign, which scores chiefly on account of flavour. Laxton's Fillbasket is a capital variety to follow as succession; the plant is somewhat leafy, carrying the flower trusses well above the foliage, while, plant for plant, it yields nearly double the weight of fruit borne by Royal Sovereign. The fruits of Laxton's Fillbasket are bright scarlet, flesh white, but a trifle soft, sweet, with only slight traces of acidity; they are of faultless pyramidal shape, and part with great freedom from the calyx.—T. S.

A FAMOUS VILLAGE FLOWER SHOW.

In the New Year's Number of the Gardeners' Magazine, my friend Mr. C. H. Curtis, ably described, under the title of "A Famous Gardening Village," the features that most appealed to him during a brief visit to a Tyneside pit village. I have now been invited by the Editor to furnish a few particulars about the annual flower show held in this same village of Prudhoe. I think if the spirit of enthusiasm that is so much in evidence among the working men who successfully run the Prudhoe and West Wylam Horticultural Society was shown at many of our prominent shows, we might find that the financial difficulties which not a few societies are working under would disappear.



THE MINERS' FLORAL DESIGNS AT PRUDHOE SHOW.

The society holds its 55th annual show this month, and it may not be out of place to mention that in its earlier years it was a very small affair, and I am given to understand that Mr. T. Robson, who was one of its original members has not only shown at every exhibition since its commencement, but has ever been one of the most successful of the exhibitors. This, I think, is a record that would be difficult to beat. The first tent in which the show was held under canvas was hand-made by three of the good housewives in the village, and as an industrial section has ever since been included, it is scarcely necessary to add that the enthusiasm of the men is in every way backed up by their better-halves.

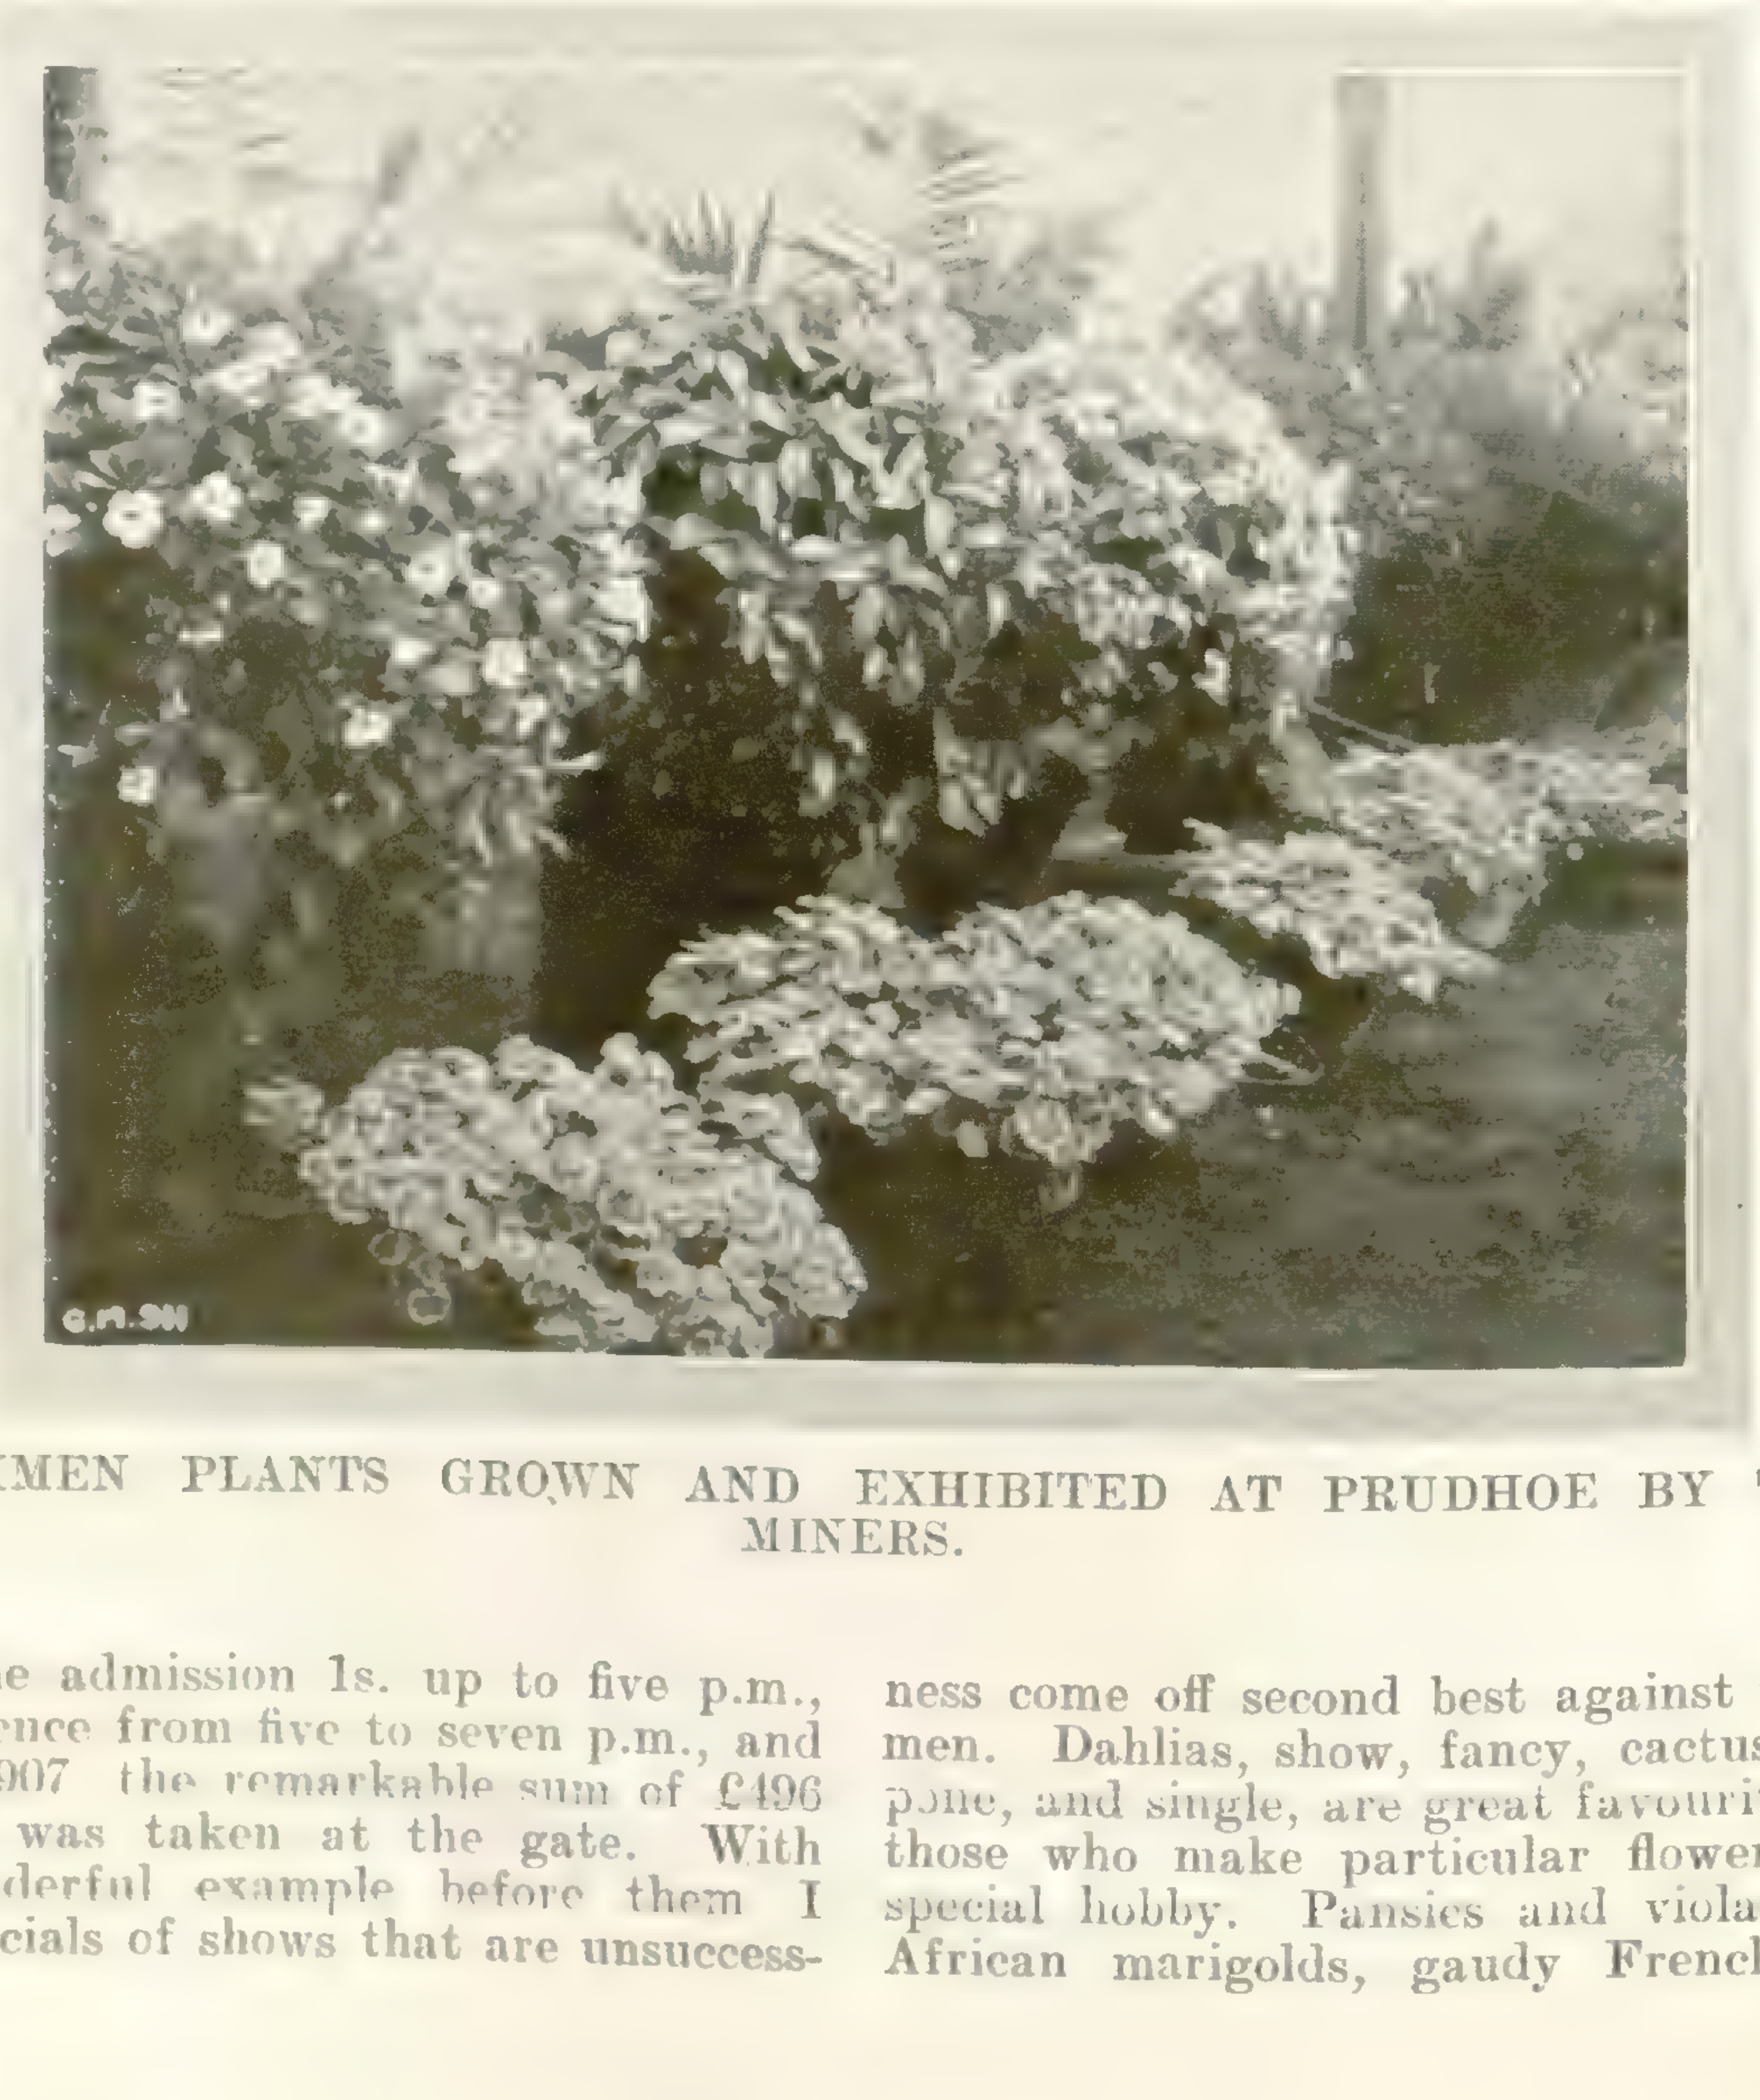
The society is managed by a chairman, vice-chairman, secretary, treasurer, and a committee of forty. There are nearly 700 subscribing members, and the lowest annual subscription is 2s. 6d. Most of the officials are selected from experienced and tried members. The chairman, Mr. W. Telford, has held that honourable position for the past 26 years, and Mr. R. Marshall, the vice-chairman, has an experience of equally long duration, his tact and genial manner being much appreciated in cases of differences between his colleagues; but as in all cases of local undertakings, the brunt of the work falls upon one or two, and in this instance, the secretary, Mr. T. Marshall, and the treasurer, Mr. R. Charlton, personally attend to every show arrangement. While the whole committee are to be congratulated on the success of the society, they will not begrudge my attributing to those named a large share of the credit of the remarkable success of the show.

The annual meeting is held in February, when a sub-committee is always deputed to arrange the schedule. this afterwards being submitted to the full committee, and the show date is then fixed for a Saturday in August. The scheduled prizes and various competitions amount to nearly £700. I should not be surprised if some readers expressed doubts as to the accuracy of my figures, and perhaps they will be even more surprised when I state that the show is only open from one o'clock to seven p.m.; the admission 1s. up to five p.m., and sixpence from five to seven p.m., and yet, in 1907 the remarkable sum of £496 11s. 6d. was taken at the gate. With this wonderful example before them I think officials of shows that are unsuccessful, in this district at least, might do worse than pay a visit to Prudhoe and get to know how success is secured.

To deal with the show itself, the exhibits consist of stove and greenhouse plants, both foliage and flowering. The quality of the exhibits, as the accompanying illustrations will convey, leaves nothing to be desired. Specimen plants of allamandas, rondeletias, stephanotis, statices, clerodendrons, ipomæas, lapagerias, palms, etc., are comparable to those produced by a Cypher. It has often appeared a marvel to me how these sons of toil can possibly have cared for and tastefully trained their plants during the intervals of their pit work. Yet not only is this done, but what is worthy of note also, the vans that take their plants from show to show during the months of July and August, are built, in many cases, by the men during the winter months.

To mention a portion of the various foliage and flowering plants at the show would fill more space than I am allowed. The vegetable classes are the principal features of the show, and if I could only get my friend "A. D." to visit this show, I think it would give him an object-lesson in excellent vegetable culture. The vegetables are usually arranged on trays or tables, as seen in the accompanying illustration; the leeks are exhibited in threes, and the judging of these is done by measurement in cubic inches. The pot leek class is one that is becoming very popular in the district, and the least extension of the limited "blanching" means disqualification.

In the open cut flower classes we find the local pit men in competition with the assistants in the florists' shops, and they often carry off the chief honours. Sweet peas naturally come in for prominent display, and in both the open and amateur or confined classes there are a great many competitors, and consequently keen interest is taken to display the flowers to the best advantage. Roses are generally well represented, and I have seen the Messrs. Harkness come off second best against the pitmen. Dahlias, show, fancy, cactus, pompone, and single, are great favourites with those who make particular flowers their special hobby. Pansies and violas, huge African marigolds, gaudy French mari-



SPECIMEN PLANTS GROWN AND EXHIBITED AT PRUDHOE BY THE MINERS.

golds, and asters are displayed on boards. Carnations and picotees are shown with that keen knowledge of the peculiar points required by experts.

The different illustrations accompanying this note will convey some idea of what is included in this successful show, and I conclude with the hope that the working pitman may long continue to show good produce and manage a successful horticultural exhibition at Prudhoe.

Oakwood Gardens, Wylam.

THE WONDERFUL LEEKS GROWN BY THE MINERS OF PRUDHOE AND WEST WYLAM.

JULY WEATHER.

The month of July just ended will long be remembered as a very wet and cold one. We had only 11 days during which rain did not fall. The total fall for the month was 5.59 inches. Not many crops benefited by the abnormal rainfall, but the two things that it has eminently suited have been mint and parsley. There was a wonderful promise of a very full strawberry crop, but the bulk of the fruits rotted in a half-ripe condition, and, consequently, the promise was not fulfilled.

Peas have filled very slowly. French beans look starved, vegetable marrows are very much retarded, and runner beans are podding very slowly.

Peaches and nectarines inside lack colour as there was very little bright sunshine during the month. General outside work has been retarded, and golden opportunities have occurred for outside men to do all the odd jobs necessary in the sheds and outbuildings. We may now hope for a warm dry August as a recompense, to a certain extent, for the inclement July.

It has been a very unfortunate time for the jobbing gardener, as most days have been too wet for his work. It seems very unfortunate that just in the height of the summer season there should be so many days unsuitable for outside gardening, and it also makes the fact clear that a situation where work of some sort is always found, whatever the state of the weather, is more desirable than being at the mercy of the weather and unable to work for perhaps many days in some weeks.

Cheshire.

W. M.

AMONG THE ROSES.

In spite of the indifferent weather experienced, our roses are still (early August) very showy. Scarcely a full week of rose weather has been enjoyed as yet, and doubtless much of our pleasure in the rose garden is due to the great increase of what I may perhaps call "every-season" varieties. For example, we do not find such as Mdme. Abel Chatenay, Mdme. Ravary, Le Progres, Fisher Holmes, Victor Hugo, and Frau Karl Druschki fail us. These are among the first to bloom, and continue with scarcely a break during the whole season.

I notice mildew and red rust are putting in an appearance, and several of our seedling briar stocks have died off at the spot where orange fungus attacked them early in the season. This disease appears to have killed by eating away the bark all around the stem, and is more intractable than usual this season.

Budding is now in full swing, and the stocks run well, the frequent showers being a great help in this respect. I would like to have this operation finished during the present month, so that the buds can get well set.

Year by year one notices a few roses that come extra well during that particular season, and a few may be mentioned here. Mdme. Melanie Soupert is one that is very conspicuous, and the deep scarlet maroon of Avoca is strikingly showy. This last is a grand doer, and some maiden plants have carried good flowers. The form and size, together with rich colouring, demand attention at once, Molly Sharman Crawford is also very prominent, and some small plants of The Lyon rose have been a feature for some weeks. Mrs. A. Goodwin has been exceptionally bright, while a little-known rose, Theresa Bevan, has been most pleasing; orange, salmon, carmine, and apricot are all in this flower, which, if not large, is a good decorative rose, and grows very freely. Another rose that has been very bright and glowing is George C. Waud. This is quite a distinct colour, orange-vermilion, that retains its brightness until the last. Among the largest of the hybrid teas we must name Mme. Segond Weber, a grand rosy-salmon without a fault in its shape. Mme. Pauline Bertnay is very pretty in its combination of orange-yellow, nasturtium red, and a rosy flush; not large, but full and very free. But there are such a lot of really good new roses that space will not admit of half being mentioned; the few I have named are likely to stand for years.

Some of the darker hybrid perpetuals have been very glowing during this cool summer, and a few old favourites, such as Dr. Andry, Comtesse de Ludre, Annie Wood, and Duc de Montpensier have been prominent. So far we have escaped thrip—a trying pest during late summer, more especially upon some of the lighter-coloured flowers.

Roses under glass need as much open-air treatment as can be afforded now, and most pot plants will be better if outside, due care being given, especially at first, to avoid too rapid drying of their roots. Look out for scale as the plants ripen their wood, and clear this pest off before any more young growth appears.

Uckfield. A. Piper.

COLLECTIONS OF TWELVE KINDS OF VEGETABLES SHOWN BY THE MINERS AT PRUDHOE.

NEW PLANTS, ETC.

DENDROBIUM SANDERÆ.

A very fine new species something after the style of D. Dearei. It has long growths and bears its flowers in short racemes. The flowers are, individually, of large size, and very beautiful. The sepals and petals are white, not pale blush as described in our previous issue, while the large three-lobed lip has purple and rosy-purple markings, with yellowish green in the throat. The species comes from the Phillipines, and promises to be a distinct and useful introduction. (See p. 621.) F.C.C., R.H.S., August 3. Messrs. Sander and Sons, St. Albans.

SPIRÆA VENUSTA MAGNIFICA.
A.M., R.H.S., August 3. Mr. Amos Perry, Enfield. Flowers bright rose pink.

CATTLEYA GIGAS W. WATERS BUTLER.

A handsome and brilliantly coloured variety that is best described as a particularly fine form of C. g. Sanderiana. The sepals and petals are rich mauve, and the lip is bright crimson purple, with yellow blotches on the side lobes. A.M., R.H.S., August 3. Mr. W. Waters Butler, Southfield, Edgbaston, Birmingham.

GLOXINIA VEITCH'S STRAIN.

A splendid strain of these fine and useful flowers, the form of the blooms, their stout, erect stems, and the colouring and markings all combining to make up a particularly high standard of excellence. A.M., R.H.S., August 3. Messrs. James Veitch and Sons, Chelsea.

TUNICA SAXIFRAGA ALBA PLENA.

This double-flowered variety of a useful border plant is sure of a welcome. A.M., R.H.S., August 3. Messrs. Bakers, Wolverhampton.

NYMPHÆA COUNTESS OF WARWICK.

A splendid tropical water lily that possesses a good deal of the character of N. zanzibarensis, but the petals are not so pointed. The blooms are eight or nine inches across, with a pinkish ground-colour heavily overlaid with purple towards the centre. A.M., R.H.S., August 5. Mr. H. Lister, gardener to the Countess of Warwick, Easton Lodge, Dunmow.

MELON BARNET HILL FAVOURITE.

A finely netted yellow-skinned variety with highly flavoured white flesh. It has been tried at Wisley, and as a result of the test was awarded an A.M. on August 3. Mr. A. Mitchelson, Wonersh, Guildford.

GALEGA HARTLANDI.

This hardy perennial is now found in all the best collections of herbaceous plants. It has large flowers and spikes and a sturdy habit, and differs from G. officinalis chiefly in the rich purplish colouring of the flowers. A.M., R.H.S., August 3. From the R.H.S. Gardens, Wisley.

SPIRÆA VENUSTA MAGNIFICA.

This is a distinct advance upon the type, having larger flowers and more ample plumes of a bright rose-pink hue. The plant is of strong growth, and the leaves are deep green. A decided acquisition. A.M., R.H.S., August 3. Mr. Amos Perry, Enfield.

CARNATIONS.

Elizabeth Schiffner.—A very finely formed apricot-yellow self variety; smooth petalled, and of good size. A.M., R.H.S., August 3. Mr. James Douglas, Great Bookham.

King of Spain.—A grand border carnation of very large size; it is a fancy variety, red, with deep maroon margins. A.M., R.H.S., August 3. Mr. James Douglas, Great Bookham.

Jupiter.—A beautiful yellow-ground flower of large size, the yellow being overspread with a lovely pink suffusion. A.M., R.H.S., August 3. Mr. Chas. Blick, Hayes, Kent.

Fiery Furnace.—A brilliant fancy variety, of full size, and coloured with crimson, scarlet, and orange. A.M., R.H.S., August 3. Messrs. Blackmore and Langdon, Twerton-on-Avon.

THE GARDENER'S HOUSE.

It is a sign of the times that the residence of the head gardener on an estate is becoming more commonly known as his "house" rather than as his "cottage." The "cottage" was often a poor shelter, unsanitary, and in no sense a proper dwelling-place for the family of a skilled servant. Fortunately, these wretched places, like the awful bothies, are rapidly passing away, and in many gardens the gardener's house is a thing of beauty as well as a comfortable and admirably designed dwelling. Mr. Harry J. Veitch, V.M.H., who has done so much for British gardeners and gardening, has, as our readers are well aware, a charming garden and home near Slough, named East Burnham Park. Of the beauties of the gardens we have already written, but much might be said of the admirable arrangement of the farm buildings, the stables, the model dairy, the aviaries, and the gardener's house. These are all well built, designed primarily for the comfort and convenience of their occupants, and yet care has been taken to combine beauty with the highest utility. The gardener's house at East Burnham is not far from the employer's; it is not hidden away as though ashamed of itself or as though folks were ashamed to see it, and yet it is so placed that its occupants have their own privacy respected, while the building itself makes a charming feature of the garden scenery. To any of our readers who may be contemplating the erection of a gardener's house, we commend this example.

MANURING FRUIT TREES.

Owing to inclement weather, accompanied by low temperature, fruit trees are very backward in swelling out their crops, so that from this time forward every assistance should be offered to such as are carrying crops, particularly those planted against walls. Liquid manure obtained from the drainings of the cow yard is a most useful stimulant, if alternated with a watering of a phosphatic manure in liquid form, as this latter materially influences the quality and finish of the fruits. Many growers fail to discriminate in manuring fruit trees, often applying nitrogenous manures when least wanted, whereas manures of this nature are only profitably employed for trees carrying full crops or to recuperate their strength consequent upon exhaustion or weakness from neglect. Lime is another ingredient whose action in the soil is not always fully appreciated, although it is generally recognised as essential for all stone fruits, yet its fundamental work is that of neutralising and converting the acidity of chemical substances into forms capable of being taken up by the roots of plants. Consequently it forms the backbone of all intensive cultivation that aims at the production of choice fruit and succulent vegetables. Thomas Smith.

GARDEN REFUSE.

There can be little doubt that, as stable manure becomes more valuable, owing to the falling-off in the supply, we shall be led to make a better use of the refuse of the garden than many of us do at present. From the point of view of economy—and most of us want money spent on the garden to go as far as possible—there is everything to be said in favour of making the best use of all sorts of organic matter without waiting till it becomes a necessity to do so. There are few gardens which can be cultivated with the best possible results for an indefinite number of years without the addition of some bulky manure to replenish the store of humus in the soil—a store which is always wasting away through fermentative processes in the soil, as can be seen by the sinking of soil which is left undisturbed for a number of years and given no top-dressings of organic material.

The fermentable refuse from the garden during the year—leaves, clearings from the beds and borders, the haulm of peas and beans, etc., amounts to a very large heap, which, though not nearly equal to the value of a heap of stable manure of the same size, by reason of its less ammoniacal content, will yet, if applied to the soil, be very valuable as a store of humus for some years. It will not only gradually give up its plant food, but, by its fermentation, will warm the soil, and at the same time keep a heavy one open and retain moisture in one which is light, while the acids formed in the fermenting processes will dissolve the insoluble compounds in the soil, and so render them available for the use of plant life. Garden refuse is naturally divided into two kinds—that which will decay more or less rapidly, and that which will not so decay.

To deal with the latter first, it consists mainly of the prunings of trees, pea and bean sticks, and the stems of the larger perennials, to which may be added the bones from the kitchen. All these may be kept for the garden fire, not forgetting to burn all the stalks and roots of the cabbage tribe, especially if they show any sign of being attacked by club-root or finger-and-toe, as this will persist in the soil for a long time while awaiting a suitable host. If the bones are put on the fire when a good heap of red-hot embers has accumulated they will soon be reduced to ashes, or calcined, that is, deprived of all animal matter. In this state, if used as a top-dressing for fruit trees and left on the surface, they will soon become disintegrated and afford a valuable supply of phosphate and lime. The ashes from the fire are valuable for many things, but there is no better use to which they can be put than for working amongst the roots of fruit trees when planting, for being in such a finely divided state they fill up the interstices between the roots, and so promote the formation of a greater number of new rootlets, which start in this material more quickly than in ordinary soil. The best way to store it for this purpose is to damp it when the fire is well out, and then sift it, after which it can be stored away in boxes in a rain-proof place ready for use.

As a general rule it is wasteful to burn that which can readily be converted into humus, and such material should be treated differently, not because the ashes from its burning are less valuable, but because in the process we lose all the nitrogen, in addition to the beneficial effect of the decaying matter upon the soil. It may be used in various ways, according to the season. In the summer, for instance, the cuttings from the lawn and the weedings are valuable for mulching fruit trees, while the more untidy looking material, such as the haulm of potatoes, peas, etc., may be put between the raspberry canes, and in other places where it will do good in lessening evaporation from the surface, besides ultimately feeding the crop. Later in the summer it may be allowed to accumulate for a week or two till the trenching of some part of the vegetable quarters begins, when all sorts of stuff may be buried two spits deep, and not much of it will be found the next time that piece of ground is trenched, especially if some lime or basic slag is dusted over it before it is covered up. When trenching or bastard trenching ground for the first time, there is no finer use to which garden refuse can be put than to bury it in, or lay it on the top of, the subsoil which is now loosened for the first time, for as the refuse decays it settles down amongst the lumps of ungenial soil, much to the benefit of the latter. Practically all the mass of the softer stuff which is cleared away in the autumn may be used in this way, except such as is wanted to form a heap of leaf or vegetable mould for potting, etc.

A word must be said in conclusion about the possible utilisation of the refuse from the kitchen, as most of this is more or less garden refuse. Where people live in country districts it has to be disposed of in some way or other on the place, and the less offensively it is done the better, especially if it can be turned to some good account at the same time. In towns possibly it is best for the community that it is all carted away, wasteful though this is, but the thrifty gardener will generally manage to make use of a good deal even there. The disposal of it in the garden from late autumn to early spring presents no difficulty, as it can either be put in the open trench where digging is going on, or a hole can be made in a fairly accessible place and the refuse put into it, the latter being occasionally dusted with lime and covered over with earth to prevent any offensive-

THE GARDENER'S HOUSE AT EAST BURNHAM PARK.

ness. The following autumn it can be dug out, when it will have become a valuable compost. In the summer the use of refuse in the garden needs care and discrimination, and the practicability or otherwise of using it in this way depends upon one's having an out-of-the-way place where it can be buried in the same way as in the winter, only it should be attended to more frequently as it becomes offensive so quickly. ALGER PETTS.

MORELLO CHERRIES—EARLY NAILING.

There is a custom in many gardens to follow up the course of summer pruning by the nailing in of the Morello cherry shoots retained for successive fruiting. It is, too, a very common practice to reserve, and nail in, far too many summer growths on these cherries. One is almost made to wonder why so much fertility is found in cherries when crowding is so zealously practised. In most other trees a paucity of crop follows crowding, and unless there is a free admission of sun and air there is not that solidity of growth which is so essential in fruit trees. When it is remembered, too, that the position usually allotted to the Morello cherry is the comparatively sunless north wall, there is still more reason for surprise that these trees are such willing and regular workers.

If the thinning of the shoots is undertaken early, and training done simultaneously, the fruit is more accessible when ripe, and insecticides can be more readily and economically used. There are several reasons that justify early completion of the work. The one course only of pruning and training each year affords at least the justification of economy. Birds are exceedingly partial to cherries, and much effort is made by them to reach the fruits. When nets have to be placed in position a good open space must be allowed between them and the attractive fruit. Thrushes and blackbirds are experts in pilfering even netted cherries, and unless leaning poles, forked struts, or strands of wire are so disposed as to keep the nets a clear foot from the trees, there is sure to be loss.

Observation extending over a series of years does not, however, reveal much in favour of early training when the extent of crop is taken into account. It is so often remarked, even by the most casual of observers, how beautiful are the densely clustered branches in the flowering period, and this, not in occasional seasons, but in regular order, and unless frost damages the expanding buds there is usually a heavy set of fruit. We have often heard it remarked how hard-worked is the Morello cherry, which is quite true, for no other tree in the garden gives such regular and bounteous crops. Desirable, therefore, as is the early thinning of trees, there is not the same comparative value when it is applied to the Morello cherry.

W. STRUGNELL.

Rood Ashton Gardens.

ANEMONE PULSATILLA.

This is one of the prettiest of our native spring flowers, and it is at its best about the season of Easter (from whence its common name, "Pasque flower," is derived). It grows wild on open limestone pastures, and in certain parts of Cambridgeshire, on the higher ground, it is fairly plentiful. The slightly drooping flowers are of a violet-purple colour, with yellow stamens, the whole plant measuring about six or eight inches high, and clothed with silky hairs.

The flower stalks lengthen as the fruits ripen, and they are extremely pretty, the awns being long and feathery like those of a clematis. It is a good garden plant, thriving on the rockery in a sunny position, or on the border in well-drained soil. There are two or three varieties, one being pale purple and another white. I send a photograph of the white variety in flower, and the same plant at a later date showing the fruits. This is growing in a bed devoted to anemones in the Cambridge Botanic Garden, and is always attractive in April and May. E. J. ALLARD.

ANEMONE PULSATILLA ALBA IN FLOWER AT THE CAMBRIDGE BOTANIC GARDENS.

PROFITABLE FRUIT GROWING for Cottagers and Small Holders of Land.—By John Wright, V.M.H. A Gold Medal Essay, written for the Worshipful Company of Fruiterers. Fully illustrated. Price 1s., by post 1s. 3d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

PEAS AND STRAWBERRIES AT BEDFORD.

Peas.

For many years Messrs. Laxton Brothers, of Bedford, have done excellent work in the improvement of strawberries and vegetables, and the late Mr. T. Laxton many years ago made a special study of the pea family, and effected considerable improvements in the varieties. One of the best of the dwarf varieties he raised was William I., which was a small round pea of exceptional quality. Since then the Messrs. Laxton have introduced Gradus, a larger podded, wrinkled marrow only a few days later than the small white peas of uncertain flavour, which have been totally eclipsed by Gradus, Thomas Laxton, and the new Laxtonian. In the last-named there is a marked advance, and it was obtained as the result of cross-fertilisation devised with a view to obtain earliness combined with fine flavour, and, it may be added, dwarfness also. The Laxtonian is only eighteen inches high, and the pods average nine to ten peas in a pod, with true marrow flavour. The growth is strong and vigorous, and the variety is greatly superior to the small older early varieties. Mention should also be made of the fact that this excellent variety was obtained by the intercrossing of Gradus and the dwarfer William Hurst. The last-named, when introduced by the firm, was regarded as a great advance, as it assuredly was, over the then existing varieties. Noteworthy also at Bedford is a new maincrop pea which has been named Laxton's Maincrop. This has been obtained from a cross between the well-known Alderman, one of their excellent introductions, and still one of the best varieties grown, and the remarkably fine pea Sutton's Prizewinner. This new introduction has pods of the size of those of Alderman, and the good quality of Prizewinner. Other late crosses not yet fully grown possess much that is of interest, and they promise well.

In the vegetable department are some other notable specialities, such as The Czar, and Girtford Giant runner beans; a large breadth of Chou de Bedford, a brassica raised from a cross between the Chou de Burghley, one of the late Mr. Gilbert's introductions, and Couve Tronchuda, or Portuguese cabbage. It is a very hardy winter vegetable, and, therefore, most useful. Tomatoes have received much attention here; the Messrs. Laxton have studied hardiness, and for outdoor culture such varieties as Laxton's Open Air, Early Prolific, and Fillbasket are of much value.

Strawberries.

Many may consider these fruits should have had first place, and though more popular than vegetables, the last-named, from a vegetable enthusiast's point of view, are equally important. This year two new strawberries have been introduced, and these are named Utility and Rival, and they are both late kinds. The first-named is a fine fruit as regards shape, colour, and quality. The well-known Waterloo was one of the parents, and it has its good qualities, and will thrive where Waterloo fails. The last-named is not reliable in all soils, but even the small late fruits of the new variety finish well. Rival claims the popular Royal Sovereign as one parent and Givon's Late Prolific as the other, and, as in the case of Royal Sovereign, it is very vigorous, though much later; it is a great cropper, and the fruit is handsome, has firm flesh, and is richly flavoured.

Since the Royal Sovereign was introduced there has been a demand for large fruits, and, believing that this may be overdone, Messrs. Laxton have, in their more recent work in strawberry improvement, given flavour a prominent position. This is important, as mere size is nothing if flavour is deficient, and though we are by no means averse to size, we regard it as essential that the quality should be high. The fruits of this year's introductions, although not large.

are large enough for all purposes, and the flavour is remarkable for its richness.

There are distinct varieties which are exceptional in quality, namely Pine Apple, Epicure, and Connoisseur. Those who saw the splendid fruits of the earlier Laxton introductions, such as The Laxton (a superb sample), Reward, Fillbasket, Leader, Cropper, and Bedford Champion, staged by Mr. Camber at the Holland Park Show, would agree with us that we have no lack of these varieties, and may with advantage give special attention to flavour. The three named above are not large. Pine Apple, as its name implies, is of a distinct pine flavour, and a midseason variety. Epicure is similar as regards size, and is the result of crossing British Queen with Fillbasket, the latter being a great cropper, and excellent. This variety will, we learn, grow vigorously where the British Queen fails. In the strong red Bedford loam at the Goldington Nurseries, an ideal soil for fruits, this variety is a close grower, and sets very heavy crops, and this also applies to Connoisseur. The latter is a very choice fruit, one of the parents being Scarlet Queen, and it is luscious in flavour, and a remarkably free cropper. The fruits have the bright vermilion colour of Scarlet Queen, and should be popular for exhibition.

To the earlier introductions it is not necessary to do more than make the briefest reference. A distinct variety, named Profit, must be mentioned as deserving attention, for it is a good all round variety, with large fruits of the flavour of Countess, and the vigour of Sir J. Paxton. The popularity of the older kinds, such as Reward, Cropper, Progress, Bedford Champion, and Laxton's Latest, is indicated by the large area devoted to them. Many thousands of runners are layered for August planting, the runners of Royal Sovereign alone reaching 60,000 for forcing, and when the enormous space the strawberry occupies here, some thirty acres, is considered, it will be seen that much labour is entailed. There is no crowding, and the open, exposed position and the strong Bedford loam suit the plants admirably.

A new break from the old, or summer strawberry, has of late years found much favour, and this is the Perpetual type. With this the Messrs. Laxton have not been idle, and they have a very distinct new autumn fruiter called Laxton's Perpetual, raised from a cross between The Monarch, a summer fruiting variety remarkable for its large size and freedom of cropping, and the perpetual St. Joseph, a variety that has found much favour for autumn supplies. Laxton's Perpetual bears a large wedge-shaped fruit, and, by special attention to culture, ripe fruits may be had from June to November. Grown in pots in frames it is excellent for late supplies. It is a compact grower, and can be planted much closer than the summer kinds.

POMOLOGIST.

Cæsalpina sepiaria (japonica) is a very beautiful and comparatively unknown shrub in gardens, belonging to the natural order Leguminosæ. The foliage is very striking, and is composed of leaflets arranged in pairs on either side of a stout petiole, forming elegant compound leaves, which resemble some of the better-known acacias. The shoots are light brown, densely covered with short sharp prickles, as also are the petioles of the leaves. The plant is a native of Japan, and was introduced to gardens in 1888, in which year it was figured in the GARDENERS' MAGAZINE. Although none too hardy in the open, it attains a height of six feet, and when it blooms bears drooping terminal bunches of yellow, pea-shaped flowers. Cæsalpina sepiaria succeeds in a good, free, loamy soil, preferably that to which a quantity of leaf-soil has been added, its growth being slow; it is for this reason well adapted for clothing low, sunny walls, where the beauty of its foliage will be fully appreciated. The plant is deciduous, the autumn tints of the leaves being a rich golden-yellow.—THOMAS SMITH.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

CALANTHES.—Many of the calanthes will now be forming their pseudo-bulbs, and it is at this stage that the plants require most attention. Where they are grown in small pots, and the receptacles are filled with roots, care must be observed that the potting compost does not become dry, or at any rate, remain dry for any length of time. It is in this condition, too, that artificial feeding, if desirable, may be best applied. I have not the least doubt but that there are many successful cultivators of calanthes who consider artificial feeding a necessity; but although we grow our plants in small pots, I do not consider it advisable to resort to artificial feedings, because we find little or no advantage therefrom. There are differences to be made in different localities. I have had a fairly wide experience in the cultivation of calanthes, and am quite of opinion that under certain conditions feeding after the pots have become filled with roots produces most desirable results, while in others it is equally detrimental, and it is not until trial has been made and experience gained that we are able to properly determine the best method. It has frequently been said that many of the successes we have obtained are due to a process of feeding, or, in other words, we have some special chemical solutions which we apply. Whatever was done previously, I am not prepared to say; but I have had charge of the plants here for a number of years now, and no manure or feeding of any kind, except for experimental purposes, has been given.

ANEMONE PULSATILLA ALBA IN FRUIT AT THE CAMBRIDGE BOTANIC GARDENS.

RIPENING THE PSEUDO-BULBS.—As the pseudo-bulbs develop more light should be afforded. It is better to begin hardening the pseudo-bulbs before the flower scapes become far advanced, so that they may become properly ripened before the flowers commence to expand. Considerable differences will be found in the same plant. I have frequently observed that the larger pseudo-bulbs which have not become so well ripened before flowering, rarely produce such good colour in the flowers as do smaller and properly matured ones. In a sunless season, such as we have experienced since the plants started into growth, calanthes require every attention and encouragement to enable them to become properly ripened. The later flowering kinds, such as C. Regnieri, C. Williamsi, and C. Stevensi, will require to be kept growing for a few weeks yet, as their growths are usually later in maturing.

PHAIO-CALANTHES, which have a semi-deciduous habit, will now be resting freely, and these should be kept growing throughout the winter and until after the flowering season is over. The resting season should be between the flowering period and the re-commencement of growth.—H. J. CHAPMAN, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

CHRYSANTHEMUMS.—The present is a busy time among chrysanthemums, for, in addition to the weekly tying of the shoots, the plants must be examined nearly every day, and as the buds appear these must be "taken," and the young growths around the bud must not be allowed to get the upper-hand, thereby weakening the flower. Feeding must now be regularly attended to. water with farmyard liquid, or give a little artificial manure every seven or ten days. I prefer to mix the artificial manu with a little soil and sprinkling a handful over the surface of the pot, and water it in through a rose; this will feed the surface roots and prevent them getting burnt by the sun (though there has not been much fear of that this season). As soon as young roots are seen a further dressing may be given. Where the pots stand on ashes they should be lifted once a week to prevent rooting through, for if this is done regularly it will prevent a severe check when the time comes to take the plants indoors. Care must also be taken to keep earwigs down, and frequent syringings, or dustings with tobacco powder, must be given to keep the green and black fly under, as these have been most persistent all the season through.

HYDRANGEAS.—The present is a very suitable time for putting in cuttings for flowering on single stems in the spring and early summer. Good strong half-ripened shoots should be secured and put in singly in small 60's, using light loam and plenty of sand; these, if placed in a hand-light in a frame, or some semi-shady position out of doors, and kept fairly close, should soon make roots. Do not apply much water overhead or the cuttings will rot off; but an occasional damping is quite necessary to keep the foliage firm. Young plants that have been cut down some time, and are breaking strongly, should be potted up into large 32's, or 24's, using a fairly rich compost and potting very firmly; these will get well hold of the soil before autumn, and if given an open position, with plenty of air, the young shoots will ripen well, and will produce an abundance of good flowers. I find they do much better thus than when potting is delayed until the early spring.

CYCLAMENS.—Old corms will now be ready for repotting; shake away as much of the old soil as possible without damaging the roots, and provide pots a size larger than they have previously occupied, using a compost as advised for young plants in a previous calendar. After potting replace in a cold frame and give a good soaking of water, after which they will not require much moisture for a time, beyond light overhead syringings daily to encourage leaf-growth. Give plenty of air, but do not let them have too much direct sunlight.

LATE CELOSIAS AND BROWALLIAS should now be potted into their flowering pots, and these must not be too large; 48-sized pots, with careful feeding, will produce really serviceable plants.

BEGONIA GLOIRE DE LORRAINE.—If large plants of these are wanted, the more forward of them should be picked out and potted into 24's, using a rich light compost with some charcoal added, afterwards replacing them in a house where plenty of heat is maintained, giving shade and little air, when they will soon take hold of the fresh soil.

COLEUS CUTTINGS should now be put in, and they will make nicely coloured plants that will prove very useful during the autumn and early winter months. We have plenty of large-flowering plants during the autumn, but none too many of small size, so that for edging groups, etc., in the conservatory, these small well-coloured coleuses will be just the thing, and they are most easily grown.

THE LATEST BATCH OF LILIUMS should now be placed indoors, where they may have a little shade, as it will be found that they have become a little stunted and short in growth, but this shade will induce them to grow out of it.

FREESIAS, PAPER WHITE NARCISSI, AND ROMAN HYACINTHS.—These, if not already to hand, should be ordered at once, and a batch for early use be potted up. Lachenalias should be turned out of the old soil, sorted over, and the best of the bulbs potted into 48's, or put into baskets or pans. The smaller bulbs may be put in boxes, and, if looked after during the winter and spring, will produce many good flowering bulbs for the following autumn. — T. STEVENSON, Woburn Place Gardens.

THE FLOWER GARDEN.

SEASONABLE WORK. At this season of the year a tremendous amount of work needs to be done in all parts of the flower garden, in addition to the ordinary routine. The summer bedding plants will now need regulating to prevent overcrowding, and spoiling the design. Such subjects as mesembryanthemums, iresine, alternantheras, annual phloxes, verbenas, etc., must be kept regulated and pegged down, and the beds kept fresh and free from weeds. All standard plants, as lantanas, heliotropes, swainsonias, fuchsias, etc., must be kept neatly staked and tied. The rose garden must not be neglected now, and the blooms that are over should be picked off. Hoe and rake the beds and attend to any plants which are mildewed, dusting them with flowers of sulphur. Such growing plants as dahlias, asters, chrysanthemums, etc., will need tying and cleaning, and slight applications of manure in showery weather will assist their growth. Attend to the herbaceous borders, remove old flower spikes, and stake any plants that require it. Sweet peas must not be overlooked, and constant removal of seed pods will do much to induce them to continue flowering.

SUBTROPICAL BEDDING.—Where this is employed, and on light soils in favoured positions, it will now be creating a fine effect. With the advent of more seasonable weather, and the already moist condition of the ground, the plants will grow apace, and great care must be exercised to make them secure to strong stakes. No pains should be spared to make this part of the garden as effective as possible during the short time it is possible to do so.

SPRING BEDDING.—The preparation of the plants for next spring must not be delayed if sturdy plants are wished for at planting time. Wallflowers should be thinned out, or planted in beds, and myosotis should be treated in the same way, and I would here like to mention that excellent variety Sutton's Royal Blue, which deserves inclusion in every garden, great or small. Continue to divide other subjects if larger quantities are required. All beds containing polyanthuses, arabis, and hellebore must be kept weeded and cleaned.

CLIMBERS.—Give attention to climbers on walls, but do not tie these in too severely or much of their beauty will be lost. Tropæolum canariense is a splendid subject for a wall, and T. speciosum, the Flame Flower, which grows to such perfection in Scotland, is a brilliant flowering plant, where it can be persuaded to establish itself. The roots require a cool shady position, while the growth enjoys sun and light; planted amongst evergreens it seems to have an ideal position.—E. BECKETT, Aldenham Gardens.

HARDY FRUITS.

THE EARLIER APPLES AND PEARS must be protected from the ravages of blackbirds and tom-tits, the former having a great liking for brightly-coloured apples, while the latter can be very destructive to the pear crop by pecking a small hole in the fruit near the stem, and from which decay rapidly proceeds. It is practically impossible to protect with fish-netting the trees growing in the open, unless it be the very small ones. Guys are of very little use in frightening away the blackbirds, and nothing seems to be of any use here for keeping them away from the fruit, except a frequent use of the gun both early in the morning and also during the evening. These fruits, when growing against walls, may be easily protected by the use of fish netting, which should be kept clear of the trees by the use of several upright laths. The early apples and pears remain but a short time in a fit condition for use, and to make the most of these a few of the most forward should be picked daily and placed in the fruit room for a day or two, when they will be fit for dessert.

WASPS.—These, in some seasons, are very destructive to the choicer kinds of fruits, such as grapes, peaches, nectarines, apricots, and plums, therefore every opportunity should be taken to keep them in check by destroying every queen wasp that may be seen in the early summer, and every nest which can be found later on. We pay one penny for each queen wasp, and sixpence for every nest taken, and I am pleased to say we are not so much troubled with them now as we were before we adopted this course. To destroy the nests, soak a piece of cotton-wool in some cyanide of potassium, and place it just inside the mouth of the hole; as soon as it is dark, dig out the nest, and place this, with all the stupefied wasps which may be found, in an old newspaper, and burn the lot in the furnace.

STRAWBERRIES.—The young plants for new beds should now be ready, and the sooner they are transferred into their permanent position after they have filled the pots with roots, the better opportunity they will have for developing and ripening up the crowns for next season's fruiting. The strawberry is one of those fruits which must have some protection from the attack of birds, hence the necessity of making the beds in positions where they can be conveniently netted. For early fruiting the strongest plants should be put out on a warm border, and if they are only intended to remain for one season, may be planted out fifteen inches apart each way; but for the main crop we allow two feet between the plants each way. The Leader, which makes less foliage than most of the other varieties, may be planted eighteen inches in the rows, and the latter two feet apart. Plant firmly, and water the plants well in; remove all runners as they show, and keep the surface well open by frequent use of the Dutch hoe.

RASPBERRIES.—As soon as the fruit is gathered choose a dry day for removing the netting, which, if found fit, may be stored away at once. Cut down all the old fruiting canes, and loop up to the supports, as a protection against damage by rough winds, sufficient of the strongest of the young ones to take their place; afterwards cut out all surplus suckers, pull up any weeds that may be seen, and give the quarter a general clean up.

AUTUMN-FRUITING RASPBERRIES.—The young fruiting canes must be made secure to the supports; leave ample room for each cane by removing any that are not required, always selecting for removal the weakest ones. If a mulching of manure has not already been placed over the roots, let this be done at once, as this will not only conserve the moisture in the soil, but will greatly assist in perfecting the canes for the production of fruit.

BLACK CURRANTS.—There is a good opportunity after the fruit is picked to attend to the necessary pruning. This currant produces its finest fruit on the young wood of the preceding season's growth, therefore the old fruiting wood should now be cut away, so that the new growths may receive the full benefit of sun and air to ripen them up.—GEO. WOODGATE, Rolleston Hall Gardens.

Ozothamnus rosmarinifolius is an interesting and beautiful old shrub that succeeds on any moderately warm wall. It is a near relative of the daisy bushes (Olearia), and was introduced from Australia in 1827, so that it is almost a century old in gardens. The young shoots are extremely soft and wand-like, covered with long, narrow, rosemary-like leaves; the flowers are produced on the old wood, in small, dense heads, and in such quantities as to suggest the appearance of snow in summer. The plant grows freely in any soil, wintering best in that which is well drained. It is easily propagated from cuttings of ripened shoots taken in autumn.—THOMAS SMITH.

Everyone interested in a garden should obtain a copy of the ALPHABET OF GARDENING, by T. W. Sanders. Thoroughly practical information is given as to soils, manures, seed sowing, planting, potting, budding, pruning, grafting, forcing, hybridising, etc., with explanatory diagrams. Price 1s. 6d. net, by post 1s. 9d.; cloth, 2s.; by post 2s. 3d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

PRELIMINARY ANNOUNCEMENT.
THE BIRMINGHAM GREAT CHRYSANTHEMUM, FRUIT, and FLORAL EXHIBITION will be held in BINGLEY HALL,
NOVEMBER 9th, 10th, and 11th.
SPECIAL NEW CLASS FOR TREE CARNATIONS.
Schedules and all particulars may be obtained from ALFRED NOAKES, Secretary, 148, Bristol Street, Birmingham.

SANDY (BEDFORDSHIRE) 41st ANNUAL SHOW, AUGUST 26th, 1909.
PLANTS, FLOWERS, FRUIT, VEGETABLES, etc., DOGS, CATS, RABBITS, POULTRY, PIGEONS, etc.
PRIZES VALUE £1,000, including
£8 and £7 for ten Stove and Greenhouse Plants; £10, £9, and £8 for Group of Plants.
Entries for Dead Stock close Aug. 19, 1909.
Schedules and Entry Forms of W. GREEN, Secretary, Sandy.

SHREWSBURY GREAT FLORAL FETE,
AUGUST 18 and 19, 1909.
OVER £1,100 IN CASH PRIZES.
Schedules for this year are now ready, and may be had post free from—
Messrs. ADNITT and NAUNTON, Hon. Secs.,
Shrewsbury.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Midland Carnation and Picotee Show.

AUGUST 5 and 6.

Favoured by bright summer weather, there was a good attendance at Edgbaston on August 5 and 6, and the carnation show, if not quite so large as some of its predecessors, was remarkable for the uniform high quality of the flowers, which were said to outrival those of the southern shows. Sweet peas were also of the highest excellence. There was a slight falling off in the number of honorary contributions, but the usual standard of high merit was maintained by Messrs. T. Gunn and Son, and Messrs. W. H. Simpson and Sons. A word of praise is also due to the hon. secretary, Mr. T. Humphreys, for a much appreciated modification of the staging arrangements. That there is a rapidly growing favour for carnations exhibited without paper collars, but with carnation foliage and buds allowed, was evidenced by the crowd of admirers at this show.

OPEN CLASSES.

In the class for twelve selfs, dissimilar, Mr. A. R. Brown, King's Norton, was to the fore with a beautiful set of Cecilia, W. H. Paxton, Alba, Southwell, Alma, Mrs. Eric Hambro, Helen Gottwaltz, Helen, Cardinal Crystal, Mrs. Howard Green, and Cardinal Newman; Mr. H. Mathias, Medstead, Hants, was a close second; and Mr. C. F. Thurstan, Wolverhampton, was third. For six selfs, Rev. C. A. Gottwaltz, Droitwich, led with fine examples of Helen Gottwaltz, Theodora Galton, Connie Humphreys, Mrs. E. Hambro, Camonia, and Mr. Howard Evans; Mr. Harry Skeels, Walsall, second, with fine flowers, and Mr. G. D. Ford third.

A keenly contested class was that for twelve yellow-ground picotees, and here Mr. H. Mathias scored with Silva, Styx, Mayflower, Exquisite, Togo, Serena, Goblin, Leonora, Coquelin, Astrophel, Mrs. Heriott, and Ariel; Mr. A. R. Brown second; Mr. William Sydenham, Melbourne, third; and Mr. C. F. Thurstan fourth. For six blooms, Mr. H. Skeels led with a dainty set of unnamed flowers; it may here be remarked that Mr. Skeels was not alone in this important oversight, and yet there is a regulation that unnamed flowers—including seedlings—may lead to disqualification; the Rev. C. A. Gottwaltz second; and Mr. E. J. Price, Bournville, third.

A keenly contested class was that for twelve fancy carnations, Mr. A. R. Brown being victorious with a magnificent set of Lord Steyne, Highland Lass, Elaine, Erl King, Pluto, Billy Barlow, Pasquin, Westfield Seedling, Betty Sharpe, Mandarin, Clement, and Margaret Thurston; he had a close antagonist in Mr. A. W. Jones, Stetchford, who was second; Mr. W. Sydenham third; and Mr. H. Mathias fourth; there were nine entrants. For six fancies there were ten entries, Mr. G. D. Ford leading with fine examples of Lord Steyne, Erl King, Pasquin, Liberté, Sam Weller, and King Solomon; the Rev. C. A. Gottwaltz second, and Mr. H. Skeels third.

The white-ground picotees were well represented by the four entrants; Mr. C. F. Thurstan led with Mr. H. Hoskier, Amy Robsart, Excelsior, Ganymede, Fair Maiden, Thos. Williams, Carrie Goodfellow, Molly, Myra, Brunette, Elaine, and Mrs. Holden; Mr. A. R. Brown second, and Messrs. H. Mathias and C. H. Herbert third and fourth respectively. There were ten entries of six blooms, Mr. F. W. Goodfellow, Walsall, leading with beautiful flowers of Mrs. W. H. Twist, Carrie Goodfellow, Pride of Leyton, Mrs. Openshaw, Psyche, and Lavinia; Mr. G. D. Ford second, Mr. W. H. Twist third, and the Rev. C. A. Gottwaltz fourth.

For twelve flake or bizarre carnations, Mr. C. F. Thurston was to the fore with an exquisite lot of Master Fred, Gordon Lewis, Mrs. Rowan, J. D. Hextall, Mrs. Skirving, Sportsman, J. S. Hedderly, John Herbert (a seedling), Arthur, Geo. Rudd, Merton, and Admiral Curzon; Mr. C. H. Herbert second; and Mr. A. R. Brown third. For six blooms, Mr. G. D. Ford was again victor with Master Fred, Sportsman, Gordon Lewis, Admiral Curzon, W. S. Skirving, and Meteor; Mr. Wm. Derry, Edgbaston, was a close second; and Mr. H. Boyes, Walsall, third.

SINGLE BLOOMS.

These were capitally represented, but it would be only a repetition of the names of the exhibitors and their flowers to enumerate them. The amateur classes were meritorious throughout.

PREMIER PRIZES.

Dressed flowers.—Bizarre carnation, Mr. C. F. Thurston, with Master Fred; flake, Mr. Thurston, with Gordon Lewis; heavy-edge white-ground picotee, Mr. F. W. Goodfellow, with Mrs. W. H. Twist; light or wire-edge white-ground picotee, Mr. G. D. Ford, with Mrs. Gorton; heavy-edge yellow-ground picotee, Mr. C. F. Thurston, with Santa Claus; light-edge yellow-ground picotee, Mr. A. W. Jones, with Astrophel; yellow-ground fancy carnation, Mr. A. R. Brown, with Lord Steyne; self carnation, Mr. F. W. Goodfellow, with Sir Galahad.

Undressed flowers.—Self carnation, Mr. F. W. Goodfellow, with Sir Galahad; fancy carnation, Mr. A. R. Brown, with Lord Steyne; yellow-ground picotee, Mr. C. H. Herbert, with Mrs. W. Heriott.

First-class certificates were awarded to Mr. Goodfellow for Mrs. W. H. Twist; to Mr. A. W. Jones for Linkman; to Rev. C. A. Gottwaltz for Mrs. Howard Green; and to Mr. H. Mathias for Iota and Libra.

SWEET PEAS.

These were a pleasing feature and good throughout. In competition for Messrs. Robert Sydenham's prizes there was a keen contest. For twelve varieties Mr. Thos. Jones, of Ruabon, annexed the premier prize with John Ingman, Audry Crier, Queen Alexandra, Clara Curtis, Frank Dolby, Evelyn Hemus, Mrs. Hardcastle Sykes, Henry Eckford, Helen Pierce, Helen Lewis, Etta Dyke, and Black Knight; Mr. J. Haycock, Wrexham, second; and Mr. C. Holder, New Oscott, third. For six distinct varieties, Mr. John Sceaney, Harborne, led with Evelyn Hemus, Helen Lewis, Mrs. H. Sykes, F. Dolby, George Herbert, and Etta Dyke; Mr. W. H. Clement, King's Norton, second. In the class for three distinct varieties, Mr. T. Jones led with Mrs. Routzahn, Paradise, and Syeira Lee; Mr. J. Haycock, Wrexham, second; and Mr. John Sceaney third.

MEDALS.

Silver-gilt.—To Messrs. B. R. Davis, Yeovil, for a splendid display of begonia blooms; to Messrs. W. H. Simpson and Sons, Birmingham, for splendid large arrangement of sweet peas; and to Messrs. Gunn and Sons, Olton, for an elaborate design of roses.

Silver medals.—To Mr. C. H. Herbert, Acock's Green, for a bold arrangement of border flowers; and to Messrs. Young and Co., Hatherley, Cheltenham, for a large and tastefully arranged collection of perpetual carnations.

Solihull.

The fifth annual show of the Solihull and District Horticultural Society was held on August 2 and 3, in the picturesque and richly timbered park at Malvern Hall, under the most favourable auspices both as regards weather and the extent and quality of the exhibits, as well as the attendance of visitors. A word of praise is due to the staging committee for their excellent arrangements.

Messrs. Gunn and Sons' grand and imposing exhibit of rock and water gardening, flanked on either side with fine groups of perpetual carnations in pots, phloxes, and other herbaceous flowers, occupying a space of sixty feet in length, had a host of admirers, and their splendid exhibit of roses was equally attractive; each exhibit gained a gold medal.

Messrs. Hewitt and Co. were assigned a gold medal for a representative display of herbaceous flowers most artistically arranged without undue crowding, and a fine display of perpetual carnations. Messrs. H. Neale and Co. had a silver medal for a highly creditable display of herbaceous flowers, and a similar award went to Miss S. S. Thompson, Handsworth, for one of her unique collections of cacti and other succulents.

First and foremost in the competitive classes was the group of plants arranged for effect by Mr. J. V. Macdonald, gardener to Sir G. Kenrick, Lord Mayor of Birmingham; a close second being Mr. W. Vause with one of his best efforts; whilst Mr. H. S. Foster, gardener to F. E. Muntz, Esq., Umberslade, was a worthy third. Specimen plants were most creditably shown by Mr. Alfred Hughes, Packwood Grange, Mr. W. Vause, and Mr. J. Warner, who won in the order named. Begonias were very well staged by Mr. C. T. Eborall, Mr. Hugh Mitchell, and Mr. W. Wood. In the class for carnations, Mr. A. R. Brown led in a small competition. Exotic ferns were well shown, Mrs. Upton, Mr. Alfred Hughes, and Mr. H. G. Grenville being the respective prize winners. The latter was to the front for three large and finely flowered fuchsias and coleuses, while Mr. Upton led for large specimens of zonal pelargoniums and gloxinias, the latter being particularly fine. In the open local class Mr. T. Warner, gardener to Mr. Upton, Solihull, annexed the first prize for a highly creditable group of miscellaneous plants arranged for effect.

There was not a strong competition in the class for dessert fruit, the first prize being accorded to Mr. A. Hughes for six dishes, comprising fair examples of grapes, peaches, nectarines, a melon, strawberries, and gooseberries; Mrs. Upton second, and Mr. F. E. Muntz third. Outdoor fruits were fairly well staged, and tomatoes were excellently put up, the first prize lot shown by Mr. Alfred Hughes being superb.

The National Sweet Pea Society's silver medal for the best six feet run of flowers was awarded to Mr. A. Hughes. Mr. E. A. Grove secured the first prize for a collection of hardy perennials. Violas were well staged by Messrs. F. W. Hitchman and H. Anderson, Shirley. There was a keen contest for the special prizes offered by Messrs. Robert Sydenham for sweet peas, and for nine distinct varieties, in bunches, Mr. F. W. Hitchman was placed first with very fine flowers. There were several other exhibits of sweet peas, and altogether the display was a fine one.

Another attractive feature was the display of ladies' table decorations. There were seventeen exhibits in the two classes, one for any kind of flower, and the other from which sweet peas were excluded. In the former class Mrs. Ford, Acock's Green, won the coveted first position with an elegant arrangement of pink perpetual carnations; Miss Sarah Page second with a similar composition; and Mrs. H. Martin third with a charming arrangement of Plumbago capensis. In the latter class Mrs. Ford was again the victor with an arrangement of pink carnations etc.; Miss F. M. Felton second and Mrs. Zain third.

Basingstoke.

AUGUST 2.

In Golding's Park the annual show was held on the above date, and the entries were fewer than usually. The secretarial duties were well carried out by Mr. Hailstone. The Mayor of the Borough is the treasurer, and he takes a keen interest in the society.

For a group of miscellaneous plants arranged for effect in a half-circle, 10 feet by 7 feet, there were four competitors; Mr. J. Keen, gardener to H. Welch Thornton, Esq., Beaurepaire Park, Basingstoke, was first with a bright but slightly crowded arrangement of suitable plants, well grown crotons, palms, ixoras, caladiums, and Humea elegans; Mr. W. Green, gardener to S. E. Bates, Esq., Maenydown Park, was a good second. Mr. J. Keen had the best specimen flowering stove or greenhouse plant, a well-blossomed Stephanotis floribunda, and he had an exceedingly fine Cycas revoluta, with which he scored for a specimen foliage plant. Exotic ferns were remarkably well shown by Mr. Keen in the class for six specimens, and here he showed huge plants of Asplenium nidus, Dicksonia antarctica, Nephrolepis elegantissima, and Adiantum cuneatum.

Tuberous begonias were well shown in the class for eight, Mr. W. E. Perriss, gardener to the Rev. A. H. Gay, Worting, being first. Coleus are now seldom seen in good condition, but here they were exceptionally good, and for four pyramidal-trained specimens Mr. Green was the winner with richly coloured examples of popular varieties. Mr. Keen had a capital set of twelve table plants, annexing the premier award.

For two dozen roses, distinct, there were but two entrants, Mr. W. Neville, gardener to F. W. Flight, Esq., Cornstiles, Twyford, Winchester, winning easily the first prize with handsome blooms of Miss A. M. Kirker, J. Cuff, Dean Hole, A. K. Williams, Lady Ursula, G. C. Waud, Mrs. Theodore Roosvelt, G. Laing Paul, and Lyon Rose; Mr. A. Childs, gardener to the Hon. Mrs. F. Baring, Brown Candover, second. For twelve tea roses Mr. Neville again led with neat, fresh examples of E. V. Hermanos, Mrs. E. Mawley, and Maman Cochet; Mr. Childs second. Carnations, undressed, with foliage as grown, three blooms of each of twelve varieties made an interesting class, and here Mr. Neville won with typical blooms of Miss Patterson, Gautuzza, Sam Weller, Trojan, Duchess of Wellington, and Mulebar; Mr. Bowerman, gardener to Lord Curzon, Hackwood Park, Basingstoke, was second.

Cactus dahlias were well shown. For twelve, distinct, Mr. Childs was first with C. Stredwick, Phineas, Oscar, Pink Beauty, and Mrs. E. Mawley; Mr. H. Tomalin, gardener to Dr. Maples, Kingsclere, second. For twelve bunches of cut flowers, distinct, Mr. Keen had the best of four collections and showed anthuriums, stephanotis, Clerodendron fallax, ixoras, and cypripediums; Mr. Childs second.

An interesting class was that for a collection of cut flowers, grown out of doors, to fill a space of six feet run of tabling, quality and decorative effect to be the leading features. Mr. R. W. Dean, gardener to L. de L. Simons, Esq., Audley's Wood, was first with an exhibit of roses, delphiniums, and Cimicifuga simplex, etc.; Mr. C. C. Hammond, Sherbourne, St. John's, second. For twelve bunches of sweet peas, distinct, Mr. Childs won with effectively arranged spikes of popular varieties; Mr. Neville second.

Fruit was good in quality, and for a collection of six dishes, distinct, Mr. Bowerman, with Black Hamburgh and Muscat of Alexandria grapes, Violette Hative peaches, Sutton's Scarlet melon, Humboldt nectarines, and Oullin's Early apricot, scored. For two bunches of Black Hamburgh grapes, Mr. H. Tomalin staged well finished clusters, and secured the premier award; Mr. R. W. Dean second. Mr. Bowerman, in the any other black grape class had Madresfield Court in good order. Mr. W. Green had the best Muscat grapes, two bunches. In the any other white grape class, Mr. W. Green had extra large berried Foster's Seedling, and annexed the premier award. Melons were of excellent quality; Mr. Green staged Sutton's Ringleader, and won in the green-flesh class with an exquisite fruit. Mr. Bowerman, with Sutton's Scarlet, won for that colour. Mr. Bowerman had the best plums, cherries, pears, peaches, and nectarines in the single dish classes.

Vegetables made a fine show. For eight varieties, Mr. Bowerman won with Wright's Giant White celery, Magnum Bonum cauliflower, Ailsa Craig onions, Duke of Albany Peas, and Hackwood Park tomatoes; Mr. H. E. Wallis, gardener to G. D. Fullerton, Esq., Sherfield Hall, second. Mr. Bowerman also won Messrs. Suttons' prize for six dishes, and Messrs. J. Carter and Co.'s prizes for six dishes. The single dish classes were well filled with good exhibits.

The decorative section for ladies made an attractive display. For the best decorated table for six persons, Miss N. Wadmore, Cliddesdon Road, was first with pink and blue sweet peas and pink carnations, and suitable greenery, all nicely blended; Miss M. Cannon, London Street, Basingstoke, second. For the best arranged stand of wild flowers, grasses, and berries, Miss Gosling, St. Aubyn's, Basingstoke, won with a handsome exhibit. The Hon. Mrs. Baring had the best pair of stands for table decoration. Miss K. Wadmore secured the leading prize for a stand of flowers and fruit, and in an open class Mr. A. E. Wadmore won with a handsome design of an open book, fully four feet across, of white asters, edged with yellow chrysanthemums, and with a handsome spray of orchids on one side.

Trade exhibits were not numerous; Messrs. B. Ladhams and Son, Shirley Nurseries, had an attractive collection of hardy flowers in which gaillardias were a fine feature—one special variety, Charles Ladhams—rich crimson with gold edging, standing out prominently among other good varieties. Messrs. E. Hillier and Son, Winchester, had cut roses and shrubs in variety. Messrs. W. H. Rogers and Sons, Southampton, had a noteworthy display of roses.

Prescot.

AUGUST 2.

The twenty-fifth annual show was held in Knowsley Park, by kind permission of the Right Hon. the Earl of Derby. The entries were fully up to the average, and the plant classes were better than usual.

For a group of plants eleven feet in diameter Mr. W. H. Roberts, gardener to F. D. Nutall, Esq., was successful. For two palms or cycads Mr. J. McFall, gardener to Mrs. Harding won with fresh plants. For four stove or greenhouse plants Mr. J. George, gardener to J. Henshaw, Esq., staged a good Clerodendron Balfourianum and Allamanda Hendersoni. For four greenhouse plants in flower Mr. J. McFall led, having a good Plumbago capensis, etc. For one stove or greenhouse plant in flower Mr. F. Leyland won with a well-flowered Stephanotis floribunda, and for one fine foliage plant Mr. F. Leyland scored with Cycas circinalis. Mr. J. McFall had the best specimen fern, a good plant of Dicksonia antarctica. For three caladiums Mr. J. McFall was first, and for three stove or greenhouse ferns Mr. J. McFall also won. Mr. D. McKelvie, gardener to J. Stone, Esq., scored for begonias, and Mr. W. H. Roberts led for three fuchsias, three coleus, six table plants, crotons, and zonal pelargoniums.

Mr. J. George led for eighteen cut roses, distinct varieties, and also for six of one variety. For twelve roses, Mr. J. McFall led, and for six blooms Mr. T. Culshaw, gardener to Captain Young, was the chief prize winner. Mr. J. George had the best twelve kinds of hardy herbaceous flowers, scoring with an excellent lot; he also led for twelve carnations. Mr. T. Kilshaw was an easy first for eight bunches of sweet peas.

For four dishes of fruit, distinct, Mr. J. McFall led with good grapes, Mr. T. Eaton, gardener to Mrs. Parrington, coming a close second. For two bunches of Black Hamburgh grapes Mr. W. Oldham, gardener to Joseph Beecham, Esq., scored with well-berried bunches. Mr. J. McFall led for Muscat of Alexandria; and for any other black grape Mr. D. McKelvie scored; while for any other white Mr. W. Oldham led with Buckland Sweetwater.

Mr. J. George had a fine collection of eight kinds of vegetables, and especially good were Magnum Bonum potatoes, French beans, Ailsa Craig onions, and Sutton's Al tomatoes; Mr. H. McFall second.

Peterhead Horticultural Society.

AUGUST 7 and 9.

Brilliant weather favoured the annual show of this society. In past seasons the display has been held in the music-hall, but this year the council determined on a new venture, and secured the Recreation Park, and by providing several attractions besides the show itself, made the event one of the most successful in the society's history. The exhibits were shown in two marquees, and were more numerous than last year.

The pot plants were exceedingly good, begonias being especially noteworthy. Chrysanthemums, geraniums, ferns, and pelargoniums also came in for favourable comment by the judges. There were also excellent displays of mignonette. Cut flowers were wonderfully good, considering the lateness of the season, but scarcely up to last year's standard. A very fine collection of sweet peas by Messrs. J. and J. West secured a first place, and considerable attention was devoted to a collection of new sweet peas sent by Mr. Walter Findlay, of Peterhead.

The exhibits in the fruit section were rather meagre for a show like Peterhead, and many of the fruits were not yet ripe. Strawberries and black currants made a meritorious display. The backward nature of the season was also observed in the vegetable section. In the classes for professionals, leeks and onions were specially good, and in the amateur sections, leeks, shallots, and cabbages were the best exhibits.

The chief prize winners in the professional classes were: Pot plants—Mr. Alexander Watson, Wellbank; Mr. John Christie, Whitehill; Messrs. J. and J. West, Eden; Mr. Robert Shand, The Grange; and Mr. William Taylor, Eastburn. Cut flowers—Messrs. J. and J. West; Mr. John Christie; Mr. Robert Shand; Mr. R. Duguid, Cruden Bay; Mr. Alexander Watson; Mr. W. M. Findlay, Hatton; Mr. A. Davidson, Cairngall; Mr. B. Gibb; and Mr. D. Edward, Invernettie. Fruit—Messrs. J. and J. West; Mr. James Gibb, Millbank; Mr. John Christie; Mr. Robert Shand; and Mr. Alexander Watson. Vegetables—Messrs. J. and J. West; Mr. J. Christie; Mr. R. Shand; Mr. James Gibb; Mr. R. Duguid; Mr. A. Morgan, Cairntrodlie; and Mr. J. Sim, Brickwork.

Large crowds, many coming from the country districts, visited the show. The arrangements, which were made by the secretary, Mr. A. Clark Martin, and an energetic committee, were complete in every way, and these gentlemen are to be heartily congratulated on the successful outcome of their labours.

Taunton Summer Show.

The forty-second show of the above horticultural society was held on Wednesday and Thursday, August 11 and 12, in the beautiful park of which Taunton is justly proud. Favoured by glorious summer weather, which indeed Taunton Show has always been, the show was an unqualified success in every way. Rumour has had it that Taunton Show is not what it was years ago. This is true, but in a different sense from that in which we understood rumour to imply—it is better; infinitely better, and Taunton Show, 1909, deserves to be reckoned among the important events of the year. We feel that a word of praise is due to the committee, and especially to its secretary, Mr. J. S. Winsor, for the admirable way in which the business of the society is worked. As an exhibitor remarked to-day, few shows have such a secretary as Mr. Winsor. One fault we have to find, and this we mention by way of explanation to our readers, viz., the prize cards bore only the names of the exhibitors, not their addresses; and our efforts to obtain these met with no success.

PLANTS.

The schedule led off with a class for twelve stove and greenhouse plants in flower, and in their usual first-class style Messrs. J. Cypher and Sons, Cheltenham, staged the winning set. Their grand specimens of Rondeletia speciosa major, Chironia ixifera, Statice intermedia, etc., were really splendid. The second position was taken by Mr. W. Vause, Leamington. The same exhibitors preserved the same order in a class for six plants in flower. Messrs. Cyphers' winning half-dozen foliage plants were all grand specimens, and they were well followed by Mr. W. Vause's second prize set.

Prizes were offered for a group of plants arranged on an oval space 13 feet by 10 feet, and the group set up by Messrs. J. Cypher and Sons, Cheltenham, was awarded the first prize. The group was arranged in an artistic and pleasing manner, with a tall palm as a centrepiece, surrounded by liliums, Clerodendron fallax, and a few bright crotons. Nearer the margins were some good orchids and other choice subjects, the whole being finished off with small plants bedded in moss. Mr. W. Vause, Leamington, followed with a closer arrangement of somewhat smaller plants. In the amateurs' group class Mr. W. Cox, gardener to Mrs. E. M. Bernard, Taunton, secured premier award with a very neat little group, in which carnations and francoas were well set off by ornamental foliage plants. Mr. S. Kidley, gardener to Colonel Sanford, C.M.G., was second.

For eight begonias, Mr. W. Hayward, gardener to Miss Neal, secured first place, there being no other competitors. Mr. W. H. Bruford, gardener to the Hon. H. P. Gore Langdon, secured first for four specimen zonal pelargoniums, double, his plants being well trained and well flowered. He was followed by Mr. J. Stuckey, gardener to B. C. Shepherd, Esq. The class for singles brought only one competitor, Mr. W. R. Prince, gardener to the Hon. Francis Bowes-Lyon, who was awarded first prize. Messrs. J. Cypher and Sons practically swept the board in the single plant classes, and also led in the class for four orchids, with Mr. W. H. Bruford as runner up.

CUT FLOWERS.

Roses came up well, and were of good quality early in the day, but the intense heat rapidly told its tale on the more susceptible blooms. The leading class was for thirty-six blooms, and the stand exhibited by Messrs. Perkins and Sons, Coventry, was awarded premier honours. Their stand contained some excellent specimens. Mr. Henry Drew, Longworth, Farringdon, Berks, was second, and Mr. John Mattock, New Headington, Oxford, third. Messrs. Perkins and Sons again led for eighteen blooms, followed by Mr. John Mattock, and Messrs. Jarman and Co., Chard. Mr. Henry Drew led for eighteen teas, followed by Messrs. Perkins and Sons, and the West of England Rose Farm, Lim., in the order named. Mr. J. Stuckey was the only exhibitor of a dozen show dahlias, and was awarded first; while in the class for fancies he was beaten by Mr. W. Cox. For six bunches of cactus dahlias, Mr. John Thorne led, and Mr. W. Cox again came second. Cut zonals shown in a class for twenty-four trusses brought two excellent exhibits, and Mr. W. Hayward, gardener to Miss Neal, worthily received first prize, while Mr. W. R. Prince closely followed. Mr. Fred Eames, Frome, led for twelve spikes of phloxes, his trusses being of remarkable size; Mr. J. Webber was second, and Mr. H. Bellamy third. For a dozen Comet asters, Mr. J. H. Harris led with splendid blooms. Mr. Fred. Eames won for twenty-four gladioli, and was closely followed by Mr. Vincent Slade.

There were five entries for twelve bunches of sweet peas. Mr. H. Ellis, gardener to R. D. Hancock, Esq., led with good flowers, nicely arranged. Mr. E. Argall, gardener to E. C. Curtis, Esq., was a good second, and third and fourth places were secured by Mr. E. Day, gardener to C. E. Pierson, Esq., and Mr. A. E. Richards. In Mr. H. Eckford's class for twelve vases, Mr. A. Shakleton, gardener to Freeman Roper, Esq., led with a lovely lot. He was followed by Mr. H. Board, and the third prize went to Mr. C. E. Haddon. In a similar class provided by Messrs. Robert Sydenham, Lim., Mr. J. Moore, gardener to Rev. E. F. Fellow, won with ease. The arrangement of his flowers was sufficient to make the award a certainty, albeit his blooms had quality also. Mr. H. Cullurch was placed second, but here the arrangement was faulty. Mr. John Thorne was third. In the class for six vases, Mr. M. G. Gardner came first; Mr. S. Kidley second; and Mr. J. Chidgey third. In this class Mr. A. Shakleton staged fine flowers in an excellent manner, and, we thought, stood well ahead of all others, but, for some reason, his exhibit was passed over.

A tent that attracted the majority of lady visitors was the one in which the dinner-table decorations were on view. For a table decorated with fruit and flowers, but without the addition of cutlery, there were five entries, and Mr. J. T. Curtis, gardener to Sir W. Howell Davies, M.P., Bristol, scored with a beautiful table of good fruit and exquisite flowers. F. J. Cole, Esq., was second, with a rather meagre arrangement, Mr. W. Hodge's third prize table was too heavy in the centre.

In a similar class, restricted to lady amateurs, there were also five entries. Here the effort of Mrs. T. H. Woodland met with success. The arrangement of this table was very artistic, and there could scarcely be two opinions as to its supremacy over the other tables in the class. The second place was taken by the Misses Hill, who had capital fruit, but, in our opinion, used too much variety of colour. Mrs. J. M. Balfour came third. Another class that was much appreciated by the visitors was the table of floral decorations. Here Mr. J. T. Curtis led off with a lovely ideal of elegance and grace, carried out in shades of orange and yellow. Mrs. M. E. Richards followed with sweet peas, in shades of cream, pink, and mauve, cleverly blended. Mr. F. J. Cole was third.

Mr. Fred Eames, and Messrs. Rich and Co., Bath, sought honours for eighteen bunches of hardy flowers, and the awards were made in the order named. Both lots were good and attractive.

For six vases of carnations, self-coloured, the Frome Flower and Fruit Company won first place; Mr. A. F. Dutton, Iver, Bucks, second; and Mr. A. R. Brown, King's Norton, third. For fancies, Mr. A. R. Brown led, Mr. J. Webber following.

AMATEURS' SECTION.

A tent of considerable size was requisitioned to accommodate the exhibits of amateurs of the district. Most of the classes were for stipulated numbers of certain plants, and the names of Messrs. H. Bellamy, W. R. Prince, J. T. Curtis, and W. Cox occurred repeatedly as the successful candidates for premier awards. It must be said that the stove plants exhibited here by the last-named and by Mr. S. Kidley were examples of masterly culture, and were of a quality not often met with nowadays. The huge specimen ferns shown in groups of six were also remarkable, and reflected great credit on Mr. W. R. Prince, and Mr. W. Cox, the first and second prize-winners.

Two entire tents were requisitioned for the fruit and vegetable exhibits, and it was gratifying to note the interest taken in this section of the show, although the press of people and the great heat made note-taking no easy task.

The most important fruit class was for a collection of eight distinct varieties. Here Mr. G. Richardson, gardener to H. St. Maur, Esq., secured the coveted award with good black and white grapes, peaches, figs, etc. Mr. George Hall, gardener to the executors of Lady Ashbarton, was second. A big Royal Jubilee melon was particularly noticeable here. Mr. W. H. Bruford was third. In a collection of four dishes the winner was Mr. George Hall, followed by Mr. J. Stuckey. In the various classes for single dishes of various fruits, the aforementioned exhibitors somewhat equally divided honours. Vegetables led off with a collection of twelve distinct kinds, and two entries were forthcoming, Mr. George Lock and Mr. J. Stuckey coming first and second with good produce. In Messrs. J. Carter and Co.'s class for eight kinds, Mr. Thomas Harrison, gardener to J. Dyson, Esq., was first; Mr. J. Stuckey second. Mr. George Lock won Messrs. Suttons' class, followed by Mr. Stuckey and Mr. T. H. Bolton. Mr. Stuckey was leader in Messrs. E. Webb and Sons' class, and Mr. Lock in the class provided by Messrs. R. Veitch and Son. In each class Mr. Stuckey was second. Messrs. Robert Sydenham, Lim., offered prizes for eight kinds, and here Mr. George Lock was once more successful, Mr. Thomas Harrison being second, and Mr. Wm. Gould third.

NON-COMPETITIVE EXHIBITS.

These were accommodated in a very large marquee, which they filled entirely, many well-known trade exhibitors coming forward in their best style. The combined efforts of quite an army of practised hands succeeded in transforming this huge tent into a garden of loveliness, which was undoubtedly the most attractive and important section in the show. Messrs. Jarman and Co., Chard, put up an exceptionally fine display of cut flowers, arranged in a series of groups, each of which consisted of one kind of flowers. First came roses, arranged on tall stands, and smaller vases. Then the delightful Sweet Sultans, which are now so well known as introductions of this firm. Carnations, dahlias, sweet peas, and zonal pelargoniums were all well shown, and the whole front of the stage was finished off with a succession of arches, draped with flowers and foliage. A capital collection of American perpetual, and border carnations was admirably exhibited by Mr. C. F. Waters, Balcombe, Sussex. Among the border varieties were several seedlings of sterling quality, some of which will doubtless win general favour.

An effective arrangement of sweet peas came from Mr. T. W. Darlington, Warton, Carnforth. The flowers were bright and fresh-looking, in spite of their journey from the North. Messrs. Dobbie and Co., Rothesay, showed dahlias; cactus, pæony, and pompone types, being represented by up-to-date varieties. The King's Acre Nurseries, Lim., showed apples, pears, figs, grapes, and other kinds of fruit hanging plentifully on well-trained trees. Mr. W. L. Pattison, Cherry Orchard, Shrewsbury, staged bedding violas in great variety. Messrs. Young and Co., Hatherley, Cheltenham, exhibited perpetual-flowering carnations in most of the leading varieties. The flowers were set up in a bold and effective manner. Alpines were exhibited by Messrs. Heath and Son, Cheltenham. The plants were arranged on a groundwork of virgin cork. A delightful little plant was Verbena tenera Mahoneti, with pretty starry flowers of ruby red, with white markings. Messrs. Barr and Sons, King Street, Covent Garden, London, staged herbaceous flowers in capital variety. Phloxes, kniphofias, heucheras, and gladioli were prominent on the stand. A display of carnations came from Mr. A. F. Dutton, Iver, Bucks. Francis Samuelson, a fine large border variety of rich apricot shade was particularly good. Sweet peas were shown in small bunches by Messrs. Geo. Massey and Sons, Spalding.

Messrs. Sutton and Sons, Reading, put up one of their splendid exhibits of high-class vegetables, staging sixty distinct varieties. Interspersed between the vegetables were tall stands furnished with fine melons, and the whole group was tastefully decorated with vases of choice annuals and a few foliage plants. Messrs. Isaac House and Son, Westbury-on-Trym, put up some glorious delphiniums, phloxes, and pentstemons, also a display of sweet peas of their own raising. Mr. Vincent Slade, Staplegrove Nursery, Taunton, showed zonal pelargoniums. Large bunches of the newest and best varieties occupied the centre of the stand, with groups of sturdy plants in pots at either end, and tall bamboo stands artistically furnished with blooms of ivy-leaved varieties served as a background. Messrs. W. E. and T. Cousins, Taunton, exhibited fine floral designs. The King's Acre Nurseries, Lim., had a gorgeous bank of phloxes and other hardy flowers.

An excellent display of vegetables came from Messrs. Yarde and Co., Northampton. Upwards of sixty dishes were staged, all of high quality. A most effective arrangement of choice perennials was staged by Mr. H. Clarke, Greenway Nursery, Taunton. Huge trusses of phloxes, bold spikes of gladioli, and kniphofias, and a variety of other decorative subjects were used to much advantage. Roses were shown in great quantity from the West of England Rose Farm, Lim., Henlade, Taunton. Another attractive display of roses came from Mr. J. Mattock, New Headington, Oxford; Bardou Job, Leonie Lamesch, White Dorothy Perkins, and the Wichuraiana were well associated with the best of the larger and fuller-flowered varieties. Mr. Arthur Edwards, Arnold, Nottingham, showed his bronzed table decorations, and these were tastefully furnished with sweet peas. A first-rate batch of begonia flowers was set up in glasses by Messrs. B. R. Davis and Sons, Yeovil. A number of named varieties, both double and single, were put up, but a large proportion were unnamed seedlings of high quality. An exhibit of more than ordinary merit and interest was that of choice flowering plants and cut flowers staged by Messrs. R. Veitch and Sons, Exeter. Alpines, border plants, shrubs, and climbers were represented by the choicer and rarer things in each class. A fine cut-leaved rhus, named R. typhina laciniata, was beautiful, and a branch of Eucryphia pinnatifida was laden with its white and fragrant flowers.

Border carnations were staged by Messrs. Tuplin and Sons, Newton Abbot, but unfortunately the flowers were not put up in a really attractive manner. Mr. Lowis, Levesdown, Bridgwater, made a bold display of hardy flowers of the more useful and popular kinds, such as Chrysanthemum maximum varieties, gaillardias, alstroemerias, etc. The huge bank of phloxes which bore the name of Messrs. T. S. Ware, Lim., Feltham, attracted every eye. The attention, however, was ultimately divided between them and the exquisite begonias which occupied the front of the stage. Gorgeous is the only word that can describe the gladioli staged by Messrs. Kelway and Son, Langport. The spikes were, needless to say, very finely developed, and the effect of the brilliant and pleasing colours can scarcely be described. Among a few of the newest varieties we noticed Mrs. Stanley, a cream and delicate blush variety, and Mrs. Coplestone, a purple and mauve flower of good form. Mr. W. B. Smale, Torquay, showed dahlias and zonals. Phloxes were well shown by Mr. F. Eames, Floral Nurseries, Frome. The varieties were of the latest and best, and the flowers were clean and bright.

MEDAL AWARDS.

Large Gold. — To Messrs. R. Veitch and Sons, Exeter; Messrs. Isaac House and Son, Westbury-on-Trym; Messrs. T. S. Ware, Lim., Feltham; Messrs. Kelway and Son, Langport; Mr. J. Mattock, Oxford; Messrs. Sutton and Sons, Reading; Mr. C. F. Waters, Balcombe; Mr. T. W. Darlington, Warton, Carnforth; and Messrs. Jarman and Co., Chard.

Silver-gilt.—Messrs. W. E. and T. Cousins, Taunton; Mr. H. Clarke, Taunton; Messrs. Yarde and Co., Northampton; Messrs. Dobbie and Co., Rothesay.

Silver.—The West of England Rose Farm, Lim.; Mr. Vincent Slade, Taunton; Messrs. Young and Co., Hatherley, Cheltenham; Messrs. Barr and Sons, London; Mr. A. F. Dutton, Iver, Bucks; Mr. F. Adams, Taunton; Mr. W. L. Pattisson, Shrewsbury; Mr. N. Lowis, Levesdown, Bridgwater.

Bronze.—Mr. A. E. Richards, Staplehay; Messrs. W. Tuplin and Sons, Newton Abbott; Messrs. Geo. Massey and Sons, Spalding; Messrs. B. R. Davis and Sons, Yeovil.

Bournemouth Gardeners' Association.

A very successful exhibition of sweet peas by the members of this prosperous association was held on August 3, and a good discussion followed the judging of the exhibits.

For nine vases, distinct varieties, twelve sprays of each, Mr. Tompkins was first, and Messrs. W. H. Reeves, jun., and W. Reeves were second and third respectively. For six vases, distinct varieties, twelve sprays of each, Mr. Ernest Cox was first, and his John Ingman, Countess Spencer, and Etta Dyke were very fine; second honours fell to Mr. W. B. Nausley, and third to Mr. C. Pearce.

In the class for three vases, distinct, twelve sprays of each, Mr. Spong was placed first, Messrs. G. Robins and T. Sprackling being second and third respectively. Competition was very keen in the class for one vase, mixed varieties, thirty sprays, and here Mr. E. Cox was again successful, followed by Mr. W. H. Reeves and Mr. Spong.

Some very fine collections of sweet peas, not for competition, were staged and much admired. Mr. A. E. Usher, gardener to Sir Randolf Baker, Bart., Ranston, Blandford, was awarded a certificate of merit for his beautiful flowers, which showed evidence of high culture; the leaves measured nearly six inches across. Mr. Kinnard also had a lovely lot of flowers which were very highly commended, and Mr. W. Reeves was also highly commended for his collection. Mr. W. Shave, gardener to Lady de Tabley, brought a magnificent plant of Clerodendron fallax, which was greatly admired, and he was awarded a certificate of merit.

The President, Ralph Smythe, Esq., attended the meeting, and was very pleased with the exhibits. Mr. R. Chamberlain presided at the discussion which followed, and which proved very interesting and instructive. Many members gave their experiences in the cultivation of sweet peas, and these were much appreciated. A hearty vote of thanks to the Chairman brought to a close a most enjoyable meeting.

CURE FOR MILDEW.

One ounce of Cyllin Soft Soap to a gallon of water is the surest remedy for mildew, green fly, and all forms of insect blight in the garden or greenhouse.

CYLLIN SOFT SOAP

Is a reliable all-round non-poisonous insecticide and germicide. It does not injure the tenderest shoots, and it cleanses the surface soil, thus safeguarding against further attack.

Particulars from Manufacturers, JEYES' SANITARY COMPOUNDS CO., 64, Cannon Street, London, E.C.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

SEEDLING CARNATIONS. — A. D. S., Wanstead: The seedling carnations, though very useful and beautiful for garden decoration, and for cutting, are by no means of sufficient merit to warrant their perpetuation as named varieties. No. 1 and No. 6 are the best, but they are far behind well-known named varieties. There is yet much to be done among carnations, as there is still need for free-flowering, hardy-constitutioned, clear-coloured, and non-bursting varieties that will prove successful under ordinary border treatment. Do not be disappointed with the results obtained so far, but carefully select varieties for parents, cross-fertilise these, and carefully select the seedlings that approach nearest to the ideal you have in view, and, with these, make further crosses and selections.

EXHIBITING STOCKS. — T. M., Northwich: The mere fact of removing the roots of the plant just prior to judging does not turn a specimen into a "spike," and if in each case the competitors showed whole plants, either with or without roots, no one of them, however he showed, can secure the disqualification of those who did, or did not, include the roots, as the case may be. Botanically, the stock bears its flowers in racemes, but, horticulturally, the whole inflorescence has come to be regarded as a branched spike, consequently it has become the custom to show the whole plant as "a spike," and the roots are generally allowed to remain, as these permit a competitor to stage his exhibit well, and also, when the roots are in a jar or vase of water, enables the flowers to remain fresh much longer than they would if the roots were removed. It may be desirable to slightly amend the schedule specification for another year, and make it read, "six stocks, to be shown in water."

BONES.—E., Heytesbury: Fresh or green bones contain both organic and inorganic matter; the former is very rich in nitrogen, and the latter is composed chiefly of phosphate of lime. In green bones the presence of the organic matter, or fatty portion, greatly retards their action and usefulness as manure. Various methods are employed to separate the organic matter from bones, and though much nitrogen is lost in the process, this is compensated for by the more rapid action of the treated bones, especially when these are ground down to a wonderful degree of fineness. In a small way bones may be treated by boiling them until all the fatty matter has been extracted, then drying and grinding them. Aikman considers that the fat present in raw bones forms, along with lime, an insoluble soap which prevents the mineral matter in the bone being dissolved by the carbonic acid of the soil.

HORTICULTURAL EXAMINATIONS.—J. D. S., Mortimer: So far as we are aware there are no other public examinations in horticulture than those named. You should take up elementary botany and chemistry, and attend lectures given under the auspices of a County Council, so as to make yourself familiar with methods of teaching. Preparing lectures for the local gardeners' association, and writing for the Press will each help you to put your thoughts into words readily, and to properly arrange your ideas and the various points to be emphasised in teaching. Practice all the principal operations in gardening, so that you can demonstrate these easily and correctly—for instance, budding and grafting are, theoretically, extremely easy operations, but, except to the practised hand, they are not so easy of accomplishment as would appear from diagrams and verbal descriptions. Gardening is essentially a practical art, and everyone

** If a receipt is required for amounts under 10s. a stamped envelope should be forwarded.

who sets out to teach it must (to be a success) be in entire sympathy with his subject and his pupils, and be able to "do" as well as "talk." Some experience in teaching is generally required of those who would compete for a post of horticultural instructor. It is excellent training to gather together half a dozen of your juniors and give them a course of half a dozen lectures, with demonstrations, and if you can persuade some sympathetic and up-to-date head gardener to attend and point out to you your deficiencies, a splendid start would be made. Posts under County Councils, or at horticultural colleges, etc., are usually advertised in the horticultural Press, and educational magazines, and must be applied for in proper order. We like your style, and we wish you every success.

NAMES OF PLANTS.

A. G. R., Wheatley.—1, Quercus cerris; 2, probably Colutea media.

J. H., Loughborough.—1, Streptosolen Jamesoni; 2, Oncidium flexuosum.

C. S., Dover.—1, one of the plumose varieties of nephrolepis; 2, Nerium oleander; 3, Celsia arcturus.

B. G., Lynn.—1, Todea superba; 2, Collinsia bicolor; 3, Swainsonia galegifolia; 4, Tecoma radicans.

E. J. H., Oxford.—1, Spiræa venusta; 2, Olearia Haasti; 3, Phlomis fruticosa; 4, Azara microphylla.

C. L. N., Bournemouth.—1, Browallia elata; 2, Francoa ramosa; 3, Polygonum Baldschuanicum; 4, Ansellia africana.

G. H. P., Parkstone.—1, Cedrus atlantica; 2, 3, and 5, appear to be forms of Cupressus obtusa, the last-numbered being very like C. o. pendula, but the specimens are not good ones; 6, Retinispora pisifera plumosa.

OBITUARY.

◆

MR. JOHN THORPE.

On July 15, there died at Chicago a man who for long years has been a leading spirit in horticultural circles in the United States. This was Mr. John Thorpe. Mr. Thorpe was born at Keyham in Leicestershire on April 3, 1838. He was engaged in the nursery business at Bristol and at Stratford-on-Avon from 1868 to 1872, and in the latter year he went, with his wife and family, to America, and commenced business near New York. He was largely responsible for the organisation of the Society of American Florists, and was the first president of that body. He also was prominent in the formation of the American Carnation and Chrysanthemum Societies, and was secretary of the New York Horticultural Society for eight years. He was specially clever in arranging exhibitions, and in laying out and superintending public parks, and in this respect he contributed very largely to the success of the World's Fair at Chicago in 1893, as chief of the floricultural department. At the funeral service, Mr. W. N. Rudd, secretary of the Society of American Florists, well defined the character of the deceased man, when, in an appreciative address, he said: "This man was a genius. It is said that genius is akin to madness. It may be so. He created while others reaped the material benefits. He had little or no genius for money-getting or money-keeping. But he did have a genius for seeing the beautiful in nature. In that wonderful brain he could see, long before anyone else, the grand commercial carnation of to-day which is literally the bread and butter of so many of our profession. This man was a genius. His were the golden dreams coined into golden dollars by those who came after him."

TRADE NOTE.

Mr. H. N. Ellison, of West Bromwich, was awarded a silver-gilt medal at the recent Handsworth Show, but notification of the award was inadvertently omitted from our report.

SUTTON'S APRIL.
Per packet, 1s., post free.

SUTTON'S FLOWER OF SPRING.
Per ounce, 1s., post free.
"I have a bed of 900 of your Flower of Spring Cabbages, which were nearly fit to cut at Christmas. Although all greenstuff suffered from the severe winter, these cabbages survived the ordeal, and I am now cutting nice heads, which are very much appreciated (March 22nd).—Mr. H. Harris, Gardener to E. M. Eversfield, Esq.

SUTTON AND SONS, THE KING'S SEEDSMEN, READING.

KELWAY BORDERS.
A perfect picture in your garden to last for years will be the result if you allow us NOW to plan a scheme, whether of contrasts or of harmonies, to be carried out in September this year. Our "Artistic" Border, 50 yards by 10ft., costs £12 10s. only.
Consider what is "saved" in heat and labour by this system, and what is gained in true beauty.
KELWAY and SON, The Royal Horticulturists, Langport.

TO-DAY AND FOR YEARS AND YEARS PAST the XL ALL Specialities are and have been the best on the market. Where is the Gardener who does not pin his faith to one or the other of these celebrated Insecticides or Fertilisers? XL ALL FERTILISER has pleased all who have used it this season. The Sales of XL ALL FUMIGATOR prove that it is more popular than ever. XL ALL LIQUID NICOTINE INSECTICIDE is always spoken of by gardeners and growers as the most deadly to Mealy Bug, Thrip, etc. XL ALL WEED KILLER used once a year. No weeds can live. RICHARDS' ARSENATE OF LEAD for all leaf-eating insects. CUCASA fungicide, the finest preparation of copper ever offered to gardeners. Please ask your Nurseryman, Seedsman, or Florist for a copy of my small pink list, giving particulars of these and many other XL ALL Preparations, which can be obtained from the Horticultural Trade throughout the World. G. H. RICHARDS, Manufacturer and Patentee, 234, Borough High Street, London, S.E.

Situations Wanted.

A GENTLEMAN wishes to recommend his HEAD-WORKING GARDENER, who is leaving through reduction of staff. Thoroughly experienced in all branches; nine years in present situation. London preferred. Married, no family. Rev. [illegible] WIGAN, Packrup Hall, Tewkesbury.

HER GRACE THE DUCHESS of DEVONSHIRE wishes to recommend J. THOMPSON to any Lady or Gentleman requiring the services of a HEAD GARDENER, where several are kept; 20 years' experience in all branches. Holker Gardens, Cark-in-Cartmel, Lancs.

LADY highly recommends her GARDENER (Head Working); life experience in all branches; 10 years' personal character; married, no [illegible] S., Field House Garden, Witney, Oxon.

MESSRS. LADHAMS, Nurserymen, Shirley, Southampton, can confidently recommend W. [illegible], age 35, as HEAD WORKING GARDENER to any lady or gentleman requiring the services of a good all-round man, who is conversant with the requirements of a well-kept establishment; excellent references. Apply as above.

MR. BOUVERIE CAMPBELL - WYNDHAM wishes to recommend GEORGE MERRETT as HEAD GARDENER, where two or three are employed. G. Merrett is thoroughly up to all garden work, understands hothouses, vines, and growing of carnations; he is married, no children; leaving for no fault, but to better himself; age thirty. Apply to Mr. Cawte, Head gardener, Corhampton House, Bishop's Waltham.

GARDENER (Head), Scotch, where several are kept; life experience all branches in first-class places; good refs.; age 30; married, no family. [illegible], The Gardens, Hadspen House, Castle Cary, Somerset.

GARDENER (Head) seeks SITUATION where three or more are kept; age 30; married, two children; six years Escrick Park, five years Campsall Hall; three years as Head at present situation. SKILBECK, Nunthorpe Hall, York.

GARDENER (Head, where two or three are kept or good Single-handed), thoroughly experienced in all branches, Inside and Out; management of cows and poultry, if required; good references; married, two children. A. GOODFELLOW, 94, Sherrard Road, Forest Gate, Essex.

GARDENER (Head), in first-class establishment; life experience in all branches, both Inside and Out, five years in last situation, and can be well recommended; age 38; married, one child. Apply fully to W. DUNKLEY, Stokelake Gardens, [illegible], South Devon.

GARDENER (Head), or GARDENER and BAILIFF; life experience; thoroughly efficient in all branches, Inside and Out; including Orchids; [illegible] stock, and bees; three years present situation [illegible]; age 3[illegible], married, one child. C. JONES, The [illegible], Woodview, Watford, Herts.

GARDENER (Head Working, or good Single-handed); life experience, Inside and Out; age [illegible]; married, no family. 23, Colwell Road, Lordship Lane, East Dulwich, S.E.

GARDENER (Head Working), thoroughly experienced Under Glass and Outside; also herbaceous plants; excellent character from present and previous employers; married, no children. J. L., 20, Carnarvon Road, Barnet.

GARDENER (Head Working), good, practical life experience in all branches, Inside and Out, early and late forcing; especially good with [illegible], Violets, and Chrysanthemums; nine years with last employer as Head; can have excellent references. H. TURNER, 4, Glenton Street, Peterborough.

GARDENER (Head Working); 24 years' good all-round practical experience all branches, Inside and Out; 14 years Head; excellent references; age 40; married. W. MARJORAM, Westerfield, Ipswich.

GARDENER (Head or Single-handed) seeks RE-ENGAGEMENT; life experience Inside and Out; poultry, etc.; age 30; married when suited. State wages, to GARDENER, 18, Gowland Place, Beckenham, Kent.

GARDENER (Single-handed with help, or second in good establishment where three or more are kept).—R. STEVENS, Esq., highly recommends H. STEDMAN; age 33; married, one child; life experience Inside and Out, Stove and Plant Houses, Flower and Kitchen Garden; good references; life abstainer. STEDMAN, Sandy Cross, Seale, Surrey.

GARDENER (Head or good Second), age 27; life experience in good establishments; highest references; disengaged; abstainer. H. HENRY, care of 224, Essex Road, Islington, London.

GARDENER seeks SITUATION, as Second or Single-handed, 18 months as Foreman; good references; married; age 24. Apply GARDENER, 10, Sanderstead Road, South Croydon, Surrey.

GARDENER seeks SITUATION as Second or Foreman on Pleasure Grounds and Kitchen Garden, where several more kept; age 23 years; good references from last situation. R. KNOWLES, Sutton Courtenay, nr. Abingdon, Berks.

GARDENER seeks SITUATION as Under or Single-handed; odd jobs not objected to; 9 years' experience Inside and Out; 4 years present situation; age 24. Apply, W. GULLIFORD, 19, Mill Place, Chislehurst, Kent.

FOREMAN or SECOND (Inside), age 27; practical experience in all branches, Decorating, etc.; two years Closes Hall, Yorkshire; good references; disengaged. S. NORMAN, Botolph Claydon, Winslow.

FOREMAN (Inside), age 27; thoroughly experienced in Fruit and Plants, House and Table Decorations; excellent references. A. CARRINGTON, 118, Stowe Street, Lichfield, Staffs.

FOREMAN (Inside), age 29, 15 years' experience in Plant and Fruit Houses, Orchids, Decorating; previously Lockinge and Hartham Park. Member B.G.A.; excellent references. JOHNSON, 192, Haverstock Hill, Hampstead, N.W.

GARDENER seeks SITUATION, age 26, single; fully experienced in Kitchen Gardening, Flowers, and Pleasure Grounds; good reference. Apply L. LOWNDS, Mayfield, Ashbourne, Derbyshire.

GARDENERS (Under) seek SITUATIONS, Inside and Out; 3 and 4 years' experience with good references; ages 19 and 21 years. Apply J. B. and E. P., c/o Mrs. Roberts, White Hill, Wrotham, Kent.

GENTLEMAN wishes to recommend YOUNG MAN as UNDER GARDENER; 7 years' experience Inside and Out; age 22; good references. N., Red House Gardens, Heatherside, Camberley, Surrey.

MR. F. GREEN, Enville Gardens, Stourbridge, can thoroughly recommend W. SMALLMEN as JOURNEYMAN; age 24; good refs., large places. SMALLMAN, 109, Lower Thrift Street, Northampton.

MR. F. W. KEMP, Eastcourt House Gardens, Malmesbury, Wilts, can thoroughly recommend F. BUTLER as JOURNEYMAN, Inside and Out; age 23; 3 years here; abstainer; Bothy preferred. Apply as above.

AS IMPROVER in Gentleman's Establishment; life experience Inside and Out; age 21. H. GILBERT, Gardens, Westfield House, Wimborne.

AS IMPROVER, age 20, experience of Fruit Growing, Inside and Out, and Market Gardening; excellent references. J. R. A., 12, Pownall Gardens, Hounslow.

CARPENTER and JOINER, single, seeks SITUATION on Estate, or as House Carpenter; abstainer; excellent references; own tools. FEARN, Moseley Terrace, Rolleston, Burton-on-Trent.

GARDENER - CHAUFFEUR, or to take charge of motor and assist in garden. Fully-certified driver, abstainer; excellent references; age 25; single. INWOOD, Bushey, Herts.

GARDENER or GROOM-GARDENER seeks SITUATION; single; age 25; willing; experienced; good references. Apply BETHEL, Middlewich, Cheshire.

GARDEN LABOURER, married Man, aged 27, requires SITUATION as above; strong, and willing to be useful; able to milk if required, or attend to horses, and general garden work; good references. G. STEPHENS, 11, Dairsee Road, Well Hall, Eltham, Kent.

HARDY PLANTSMAN seeks POST in Nursery or private garden, where exceptional knowledge of Alpine and Herbaceous Plants, etc., etc., would have plenty of scope, and be duly appreciated. E. H., "Gardeners' Magazine," 148 and 149, Aldersgate Street, London, E.C.

LAD (17) seeks SITUATION as IMPROVER (Inside or Out); Bothy preferred; two years and three months' good character. J. HODGSON, 31, Bolney Street, Haywards Heath, Sussex.

MAN (28) seeks SITUATION in Shop or Warehouse; well up in Bulbs, Trees, Shrubs, Plants, etc.; good references. BOHANNON, 3, Green Street, Enfield Highway, Enfield, N.

SITUATION required by HANDYMAN; assist Gardener; understands Bees (certificated expert); handy with carpentering tools, painting, etc. total abstainer; Single. SHORT, Langton Lodge Farm, Blandford, Dorset.

T. MAYHEW, for the past 13 years STOKER and HANDY MAN to H. B. May and Sons, Millfield Nurseries, Upper Edmonton, seeks similar position. 125, Huxley Road, Edmonton.

YOUNG MAN (20) seeks SITUATION as Under, or Inside and Out; four years' experience; good reference; abstainer. W. FIELD, 18, Royal Oak Place, Lee, S.E.

YOUNG MAN seeks SITUATION as Under in Kitchen Garden; good experience; age 25; good references; abstainer; bothy preferred. W. PENFOLD, Beresford Road, Goudhurst, Kent.

YOUNG MAN (24) seeks SITUATION Outside or Inside and Out. A. KNAPP, Cemetery Road, St. Ives, Hunts.

YOUNG MAN (21) seeks SITUATION as GROWER; Cucumbers, Tomatoes, Chrysanthemums, and all general Bedding and Pot Plants. G. G., Hill Cliff Lane Nurseries, Turnditch, Derby.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

The Origin of Life.

Although the origin of life on the earth's surface is, and must remain, a profound mystery, we are drawn to the conclusion that the primary germ must have been vegetable rather than animal, since it is the vegetable alone which can maintain existence by assimilation of non-organic matter. When and how the incipient biological tree branched out to produce the animal kingdom is, of course, part of the insoluble problem, since apart from the presumably microscopic nature of the primary organisms, they must have existed at a period far and away antecedent to such as have been preserved as fossils, and thus provide us with a glimpse into the past, by which we have learnt so much of the evolutionary process. Mere gelatinous cellular growths are not of a nature to be perpetuated in recognisable form, and hence it was not until bony skeletons, or shells, or tough woody frameworks had been developed, that there was a chance of their survival in fossil form for our guidance, and the development of these probably meant æons of time, so far are they removed from the primary forms of organic life. We may conceive some idea of the immensity of the period when we consider that as far back as the Coal age, the ferns of those days were as fully and perfectly developed as those of to-day; and, as there is practically no doubt that land vegetation originated by modification of ocean vegetation, we see that another inconceivably long period is demanded for the transformation of seaweeds into the far different ferns and gigantic mosses which we know existed when our coal formations were created. It is a curious fact to consider that even to this day the boundary line between the vegetable and animal kingdoms is by no means well defined. In the microscopic realm of life, we find organisms which are unicellular vegetables, endowed with powers of rapid locomotion, and even with volition, as is evidenced by the fertilising antherozoids of the fern tribe, which swim actively in water, and will make their way in definite directions in order to fulfil their functions. Many vegetable spores are similarly motile. There are, on the other hand, many animal organisms which are as inert as any plant, and others which can propagate themselves by buds quite on plant lines. Higher up in the scale we have the carnivorous plants, the droseras, dionæas, nepenthes, sarracenias, and their kin, who have adopted the animal characteristics of entrapping and feeding on animal food. Recurring to the assumption that life must have begun in the primæval ocean, we cannot get away from the fact that it has always been the so-called firm land which has been disturbed, by subsidence or elevation or by denudation, and that such disturbance must probably have been on a much greater scale at the time when the cooling ball was forming a crust and the waters were forming the oceans. With all respect for the non-cataclysmic theory of geologists, we must assume that the earth's crust was at first a fragile one, liable to volcanic outbursts on a far larger scale than obtains nowadays, and this would mean that the ocean practically was the only place where the incipient germ of life, having once appeared, it had a fair chance of multiplying and varying and developing those marvellous potencies which must have been within it, and which, step by step, has built up the organic world as we now know it. Later on, doubtless the land became more stable, islands and continents, although disturbed by rude shocks, did not entirely lose their individuality, and thus the ocean vegetation and animal life had a fair chance of adapting itself to land conditions by slow modification, first on amphibian lines, born in the water and passing thence to the land, or as marsh plants which gradually adapted themselves to drier conditions, and so built up the land flora generally. The possibilities of such adaptations are always before us, for innumerable life histories, plant and animal, display the links and gradations which connect most diverse forms. The germ cell of life is, in point of fact, almost infinitely plastic, and, given time and opportunity, will adapt itself to almost any environment.

MR. JOHN HEAL, V.M.H.

Mr. John Heal, V.M.H., whose portrait we give herewith, has for so long a period occupied an important position in the glass department of the nurseries of Messrs. James Veitch and Sons, at Chelsea and Feltham, as to be well known to a wide circle of horticulturists, and has accomplished so much useful work in plant improvement as to have obtained a foremost position among plant hybridists. Mr. Heal is a native of Devonshire, and, like many another Devonian, possesses in a marked degree the energy, clearness of perception, and other characteristics so essential to success in life. With reference to his association with Messrs. J. Veitch and Sons, it is of interest to mention that he has spent nearly 47 years in the services of the firm. Many years ago Mr. Heal turned his attention to the improvement of hippeastrums, and, as the result of his work among them, the Chelsea collection of these flowers became famous both at home and abroad. Mr. Heal also raised large numbers of hybrid rhododendrons requiring a warm greenhouse for their successful cultivation; he created a new race of streptocarpus, and of winter-flowering begonias, and immensely improved the phyllocacti. Notwithstanding his many successes, Mr. Heal has always remained the most modest of men, and has never failed to regard his work more as the accomplishment of the firm than of himself, or to speak of the support he has invariably received in working out the several problems in plant improvement to which he has given his attention. Mr. Heal has not only attained to a high position among hybridists, but has been successful in obtaining the esteem of all with whom he has been associated in the course of his active life. The value of Mr. Heal's work in plant improvement was recognised by the council of the Royal Horticultural Society in 1897, when the Victoria Medal of Honour in Horticulture was founded, by the inclusion of his name among the first sixty on whom the medal was conferred. He has also been awarded the Veitch Memorial Medal, in recognition of his success as a hybridist and cultivator of new plants by the Trustees of the Veitch Memorial Fund.

Greenhouses and Undeveloped Land.—In the House of Commons on Tuesday last Mr. Harold Cox asked the Chancellor of the Exchequer whether land upon which greenhouses had been built for market garden purposes would be exempt from the undeveloped land tax; and, if so, whether that exemption would be confined to the actual area covered by the roofs of the greenhouses, or whether it would include the land occupied in conjunction with the greenhouses and used for carrying on the same business. In reply Mr. Hobhouse stated that there will be no such exemption.

Visit of French Fruit Cultivators.—During the past fortnight a deputation of French fruit growers have been on a visit to this country, for the purpose of making themselves more familiar with British markets, with a view, presumably, to an augmentation of the supplies of French produce. The fruit growers, some fifty in number, were accompanied by representatives of the principal French railways, and during their stay have visited all the principal London markets, and also the markets at Hull, Newcastle, Edinburgh, Glasgow, Liverpool, and other of the more important provincial centres.

Horticultural Exhibits at Brussels.—It is now evident that the Brussels Exhibition will be of special interest to horticulturists, and even to fruit growers and market gardeners. The centenary of a very old Belgian Society, the Royal Agricultural and Botanical Society of Ghent, occurs next year, and in connection with the exhibition it is to be made the occasion of remarkable shows and celebrations. In one form or another, this great society has existed since 1622. Only its present basis was created so late as 100 years ago, when it started an annual public show in the Frascati Gardens. Its members now export from Belgium flowers to the value of £600,000 a year. It is, therefore strong enough to have arranged that there shall be permanent flower shows throughout the exhibition, from May to October, and that the grounds shall be beautified with gardens. The special centenary show will begin on April 24 and extend to May 5, and on the second day it will be visited officially by the King of the Belgians. In the course of this celebration there will be an international flower show from April 30 to May 3, in which it is hoped that British gardeners will participate. A similar show for chrysanthemums and other autumn flowers will be held from October 29 to November 2; while an international show of fruit and vegetables will take place from September 24 to 27. These are the dates desired by the meeting at the Royal Horticultural Hall that Lord Lytton and Sir Albert Rollit attended, when the exceptional facilities for showing which are offered by the Board of Trade were explained, and the scale on which the shows are to be staged may be gathered from the fact that no fewer than 250 foreign experts will serve on the juries. Intending exhibitors may obtain full particulars through the Board of Trade.

Importance of Magnesia.—With reference to the important article by Monsieur George Truffaut on magnesia as a constituent of plant food, that we were able to publish a fortnight since, it is of considerable interest that Mr. Truffaut's views should have been strongly supported by the experiments that were conducted last year at the Woburn Experimental Station. In 1908 experiments were carried out for the purpose of comparing the action of "nitroline," or calcium cyanamide, with sulphate of ammonia, and with nitrate of soda. In consequence of the striking results obtained at the Pot-culture Station in regard to the influence of magnesia, it was resolved to try its effects in the field. In the several plots utilised in carrying out the two sets of experiments, potatoes were grown, and the variety selected was Table Talk. The results obtained from the use of magnesia were very remarkable; 3 cwts. per acre of magnesia increased the crop 13 cwts., although no more nitrogen was used, and 6 cwts. per acre of magnesia gave an increase of 25 cwts., the crop being the second largest one of the whole series. Thus 3 cwts. of magnesia per acre showed itself superior to 1 cwt. of calcium cyanamide, and 6 cwts. per acre acted better than did 1¼ of nitrate of soda. It is intended to further test the influence of magnesia upon crops at Woburn.

A Darwin Exhibition has been opened at the Natural History Museum, South Kensington, and should prove of much interest to those who are acquainted with the late Charles Darwin and his work. The exhibition is being held in commemoration of the centenary of Darwin's birth, and the fiftieth anniversary of the publication of his "Origin of Species." Its chief object is to illustrate the main arguments of the "Origin of Species," and a considerable portion of the material which passed through Darwin's hands, and the various species he had in view when engaged in writing this book, are for the first time brought together for the inspection of the public. Three of Darwin's microscopes are in the exhibition, and it is of interest that his important investigations, in which the aid of the microscope was necessary, were carried out with instruments of an extremely simple character. Two pages from a letter written to Professor Asa Gray, September 5, 1857, and his own notes made nine years previous, are of interest as proofs that Darwin had committed his theories to writing before he was aware that Dr. Alfred Wallace had arrived at similar conclusions with regard to natural selection. A page of Darwin's manuscript is exhibited to show how much he was addicted to self-correction, interlineation, and, indeed, of superimposition of fresh copy. In support of the conclusions in the "Origin of Species," two putative parents of large families are included in the exhibition; one is of a fowl, which is of the Indian jungle, and represents the ancestral type of all the domestic breeds of fowl, and the other is the Chrysanthemum sinensis, which, as so well known, has undergone a really marvellous development, and its descendants have spread over the civilised world. There are also specimens illustrating the dispersion of seeds over limited areas, and of their carriage from one country to another by means of birds, winds, tides, and other agencies; and of mimicry in insects. Altogether there are some three hundred separate exhibits, all of which are of interest.

A Small Holdings Exhibition has formed one of the attractions of the Earl's Court Exhibition during the past week. The exhibition has been held in connection with the Land Culture Competition organised by the proprietors of "Lloyd's Weekly News." The exhibition included a model farm, and an extensive display of produce grown on the successful holdings, the fruit and vegetables being especially good.

The Blackberry Crop is this year a remarkably good one, and, as the result of the moist conditions that have obtained during the greater part of the summer, the bright red fruits that now glisten in the hedgerows may be expected to attain to a quite exceptional size and quality. We have been reading that the English people fail to appreciate the value of the blackberry harvest, and that the greater proportion of the fruit will be allowed to rot on the canes, but there is no occasion to be apprehensive upon this point. Every year enormous quantities of blackberries are sent to the markets, and to the fruit-preserving establishments, and one must even at the height of the season be in a very remote district to find any considerable quantity of ripe fruit.

Finsbury Circus Gardens. The Lord Mayor has received from the Streets Committee a large basket of mulberries grown in Finsbury Circus gardens. These gardens, which have an area of nearly two acres, continue to be largely used by the public, and at times the seating accommodation is taxed to its utmost.

White Root Rot.—A bad attack of this disease, which is caused by the fungus known as Rosellinia necatrix, was reported to the Board of Agriculture in the spring from a nursery in the home counties. This disease is scheduled under the Destructive Insects and Pests Order of 1908, and the trees affected were cherries, and had been in the ground two years, having been budded in the summer of 1908. The stocks were bought from France, but the disease appears to have been present in the nursery for some years, and there is no clue to its source. About eight rods of stocks were planted, and about 30 per cent. of these were attacked, but not in a systematic manner, the trees showing signs of disease being distributed throughout the plot in an apparently haphazard fashion. The affected trees were burnt, and the hoeing in of sulphur between the remaining trees and the burning of weeds were advised.

Distinguished Visitors at Coggeshall.—Early this month some distinguished agriculturists and savants from France and Belgium have visited Coggeshall, and inspected the extensive seed farms of Messrs. John K. King and Sons, at Coggeshall, Chappel, and Colne. The visitors were conducted over the farms and experimental grounds by Mr. Herbert King and Mr. J. H. Millard, and they were greatly interested and impressed with everything they saw, especially the large acreages of agricultural and vegetable seeds, and the improved varieties of pedigree cereals, while the large cultivation of sweet peas was greatly admired. The visitors were entertained during their stay at Orchard House by Mr. and Mrs. Herbert King.

SHREWSBURY FLORAL FÊTE.

AUGUST 18 and 19.

Shrewsbury Fête and the Temple Show are two very distinct features of the horticultural year, the one marking the beginning of summertime and the other suggesting that the end of the summer is near. Once more we have wended our way, with hundreds of others whose duty has taken them year after year to the interesting old town of Shrewsbury to see its famous show. Speaking broadly, there is not a great deal of difference in these shows from year to year. The limit of extent has been reached, and the ingenuity of committee and competitors has been severely taxed to provide new classes or exhibits of a distinct character.

If we state that the show just held was scarcely so good as some of those of recent years, this remark must not be taken to imply any serious falling off in quality or quantity. The great grape class was hardly up to the average of quality, and vegetables in competition were a good way below the average of recent years. Plants and groups were well up to the mark, and hardy flowers and sweet peas were good, while the dessert table class was specially fine. Vacant spaces are rarely to be seen at Shrewsbury, but there were a few of these in the local section and among florists' flowers.

VIEW OF THE CHAMPION GRAPE CLASS AT SHREWSBURY FLORAL FETE.

There is one feature of Shrewsbury Show in which we should like to see an improvement, and it is in the naming of the exhibits. Never before, so far as we can remember—and our experience of Shrewsbury shows is a fairly long one—has there been so much laxity on the part of competitors in this particular; fruits, flowers, and plants were, in not a few instances, entirely unnamed. One of the greatest uses of a show is its opportunity of bringing into public notice the best kinds and varieties of horticultural produce, but if prize exhibits are unnamed then the educational value and interest of the display are gone, and they remain only spectacularly effective. If a fine of 25 per cent. of the prize won were levied in the case of unnamed exhibits it would bring competitors to a sense of their duty to the general public.

GRAPE CHAMPIONSHIP.

There were seven competitors in the great championship class for the best dozen bunches of grapes, and the competition was excellent. The premier award of £20 was won by Mr. J. H. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, Derby, with a fine display; his varieties and points were as follows: Black Hamburgh (10), 9½ and 9; Muscat of Alexandria (11), 8½, 8½, 8½, and 9; Muscat Hamburgh (11), 10, 10½, and 10½; Madresfield Court (11), 10, 10½, and 10½. It will thus be seen that Mr. Goodacre only showed four varieties; his was an even set, and his total points were 114½. Mr. W. Parker, gardener to J. Drakes, Esq., Market Rasen, won the second award, and he had heavy and large-berried bunches that totalled 111 points; he had Cannon Hall in good form and heavy clusters of Gros Maroc; Mr. N. F. Barnes, gardener to the Duke of Westminster, Eaton Hall, Chester, third with 100 points; he had a very even set, and his Appley Towers and Madresfield Court being well coloured; Mr. J. Mullins, gardener to G. Farquaharson, Esq., Eastnor Castle, fourth with 91 points; and Mr. J. Wilkinson, gardener to G. A. Gibbs, Esq., J.P., Tyntesfield, Flaxbourton, Bristol, fifth, with 88½ points; Mr. G. Richardson, gardener to H. St. Maur, Esq., Newton Abbott, sixth with 86½ points. Mr. Dawes was not placed. Mr. N. F. Barnes secured the chief award for the decoration in this class, and he used pink carnations, Chironia ixifera, Francoa ramosa, and Lilium speciosum; Mr. J. H. Goodacre second with roses, odontoglossums, francoa, and liliums; and Mr. Mullins third with montbretias.

COLLECTIONS OF FRUIT.

The chief class for a collection of ripe fruit is one for twelve dishes, distinct, decorated with flowers and plants. There were four entries, and the premier award was made in favour of Mr. T. Cave, gardener to E. Bewley, Esq., Dublin—a new competitor at Shrewsbury—with a grand set that consisted of Williams' Bon Chretien and Souv. de Congres pears, Lord Napier and Pineapple nectarines, Dagmar peaches, Emperor Alexander apples, Greengage plums, Duke of Edinburgh melon, May Duke cherries, and Muscat of Alexandria, Black Hamburgh, and Madresfield Court grapes, the latter good, but the two former varieties of grapes were not specially good. Mr. J. Jones, gardener to Mrs. F. Need, Malvern, gained second place, and had grand dishes of Margaret Marillat pears and Lady Sudeley apples; Mr. G. Hall, gardener to Lady Ashburton, Romney, third; and Mr. G. Richardson, gardener to H. St. Maur, Esq., Newton Abbott, fourth. The prizes for decoration, awarded distinctly from the fruit, fell in order of mention to Mr. J. Jones, Mr. G. Hall, and Mr. T. Cave.

In the class for nine dishes of choice fruits, distinct, the premier award fell to Mr. J. Miles, gardener to Captain Heywood Lonsdale, Shavington, for a nice collection, in which not a single dish was labelled. Mr. C. Roberts, gardener to Mrs. Swann, Halston Hall, second.

GRAPE CLASSES.

Once more grapes were well shown, and, considering the season, they were well coloured. For two bunches each of white and black grapes Mr. T. Lambert, gardener to Lord Harlech, Brogyntyn, scored with Muscat of Alexandria and Madresfield Court; Mr. J. R. Tooley, gardener to H. Andrews, Esq., Winchcombe, came second with Muscat of Alexandria and Alnwick Seedling; Mr. E. F. Hazelton, gardener to the Earl of Derby, Prescott, third.

The best two bunches of Black Hamburgh grapes were very heavy, richly coloured clusters from Mr. W. A. Coates, Glan Conway; Mr. W. H. Wilson, gardener to J. Brinton, Esq., Stourport, second; and Mr. G. Richardson, gardener to H. St. Maur, Esq., Newton Abbott, third. The latter was first for a single bunch of Black Hamburgh grapes, and was followed by Mr. W. H. Wilson, and Mr. T. Bagnall, gardener to C. F. Boston, Esq., Hayton. Mr. A. Hall led for two bunches of any black Muscat grape, with Madresfield Court finely coloured; Mr. J. H. Goodacre second with Muscat Hamburgh, and Mr. W. H. Wilson third. For a pair of bunches of Madresfield Court grapes Mr. A. H. Hall led with large-berried bunches; Mr. J. H. Goodacre second; and Mr. T. Cave, gardener to E. Bewley, Esq., Dublin, third. For a pair of bunches of Alicante Mr. G. Mullins, Eastnor Castle Gardens, scored with very moderate bunches; Mr. A. H. Hall second.

Two splendid bunches of Gros Maroc won for Mr. J. Langley, gardener to the Rev. T. M. Bulkeley Owen, West Felton, the premier award in the "any other black" class; these were extraordinarily fine clusters: Mr. J. H. Goodacre second; and Mr. J. Jones, gardener to Mrs. F. Need, Malvern, third, each with Gros Maroc.

Mr. N. F. Barnes, gardener to the Duke of Westminster, Eaton Hall, led for two

THE DECORATED DESSERT TABLES AT SHREWSBURY FLORAL FETE.
Mr. Barnes' table is in the foreground, and Mr. Goodacre's just behind it.

bunches of white Muscats with neat clusters of Muscat of Alexandria; this class was not such a good one as usual; Mr. J. H. Goodacre was second, and Mr. J. R. Tooley third. For a single bunch Mr. T. Lambert led, and was followed in order by Mr. J. H. Goodacre and Mr. J. R. Tooley. For two bunches of "any other white" Mr. A. H. Hall led with fine examples of the handsome Chasselas Napoleon; Mr. A. Child, gardener to H. A. Attenborough, Esq., Daventry, second, with Buckland Sweetwater; and Mr. Dawes, gardener to Lord Trevor, Bryn Rynalt, third, with the latter variety.

In the county classes (Salop) the leading awards for grapes fell to Mr. J. Langley, Mr. G. Taylor, Mr. H. G. Pritchard, gardener to Major A. H. D. Lloyd, Leaton Knolls; Mr. J. Mills, Mr. T. Lambert, Mr. G. Davies, Mr. J. Taylor, gardener to F. Bibby, Esq., Hardwicke Grange; Mr. C. Roberts, and Mr. Ashwood, gardener to Major R. A. Newill, Admaston.

DECORATED FRUIT TABLES.

There were five competitors in the class for a decorated table of thirty dishes of ripe fruit, and as here the premier award is a twenty-five guinea cup, a gold medal, and £20, the competition was very keen. It has been usual to show a table of points, to indicate the merits of the several exhibits; but this was not done on this occasion, and an educational feature was thus lost. First prize was awarded to Mr. J. H. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, who had some magnificent fruit, showing Gros Maroc, Muscat of Alexandria, Black Hamburgh, Madresfield Court, and Muscat Hamburgh grapes; Bellegarde, Exquisite, Barrington, Sea Eagle, and Princess of Wales peaches; Washington apples, Triomphe de Vienne pears, Pineapple nectarines, Large Early apricots, Golden Gage plum, and Bigarreau Napoleon cherries.

Mr. James Gibson, gardener to the Duke of Portland, Welbeck Abbey, Notts, gained second place with a very even set, in which the peaches, apples, pears, melons, and black grapes were grand; Mr. N. F. Barnes, gardener to the Duke of Westminster, Eaton Hall, Chester (who was the winner last year), came third with excellent peaches, pears, apples, and Appley Towers grapes; Mr. G. Mullins, Eastnor Castle Gardens, fourth; and Mr. W. Parker, gardener to J. Drakes, Esq., Market Rasen, fifth.

FRUITS.

Mr. O. Oakley, gardener to A. E. Humphreys Owen, Esq., Berriew, led for cherries; Mr. Searle, Castle Ashby, for purple plums; Mr. Jas. Gibson, Welbeck Abbey Gardens, for yellow plums (Jefferson); Mr. J. Birch, gardener to Lady Mary Herbert, Styche Hall, for gage plums; Mr. J. McFall, for a white-fleshed melon—Hero of Lockinge; Mr. Hazelton, gardener to the Earl of Derby, Prescott, for a scarlet-fleshed melon—Scarlet Seedling; Mr. S. J. Baker, gardener to Lady Duckworth King, Exeter, for a green-fleshed melon; Mr. A. Langster, Droitwich, for apricots—Large Early, very fine; Mr. G. Hall, gardener to Lady Ashburton, Romney, for nectarines, with a grand dish of Pineapple; Mr. G. Mullins, Eastnor Castle, for peaches (sixteen entries), with beautifully coloured examples of Bellegarde.

In the county class for six dishes of hardy fruits, Mr. J. Mills was first, Mr. Robinson, Ellesmere, second, and Mr. E. Gilbert, gardener to Captain F. A. M. Diker, Loppington, third.

GROUPS.

The chief prize in the leading class for a group of foliage and flowering plants, arranged for effect on a space of 250 sq. ft., was won by Messrs. Jas. Cypher and Sons, Cheltenham, who have occupied the leading position a large number of times at Shrewsbury. Their group was a very elegant one, and the crotons, Humea elegans, Francoa ramosa, Cyperus papyrus, Lilium speciosum, Oncidium flexuosum, and odontoglossums were used in a very light and pleasing manner. Orchids were utilised more freely than usual, and the lælio-cattleyas on the corner mounds were a great attraction, and in the foreground the odontoglossums, Anguloa Clowesi, cypripediums, and Nertera depressa finished off the display. Second prize fell to Mr. J. V. Macdonald, gardener to Sir G. Kenrick, Edgbaston, Birmingham, who made good use of beautiful crotons, Ixora macrothyrsa, odontoglossums, phalænopsis, and Fuchsia triphylla. Mr. W. A. Holmes, Chesterfield, took the third prize, and good crotons were his leading feature.

In the class for a group of foliage plants arranged for effect on an area of 250 sq. ft., there was a close competition, and the premier award was made in favour of Mr. J. V. Macdonald, gardener to Sir G. Kenrick, Edgbaston, who had a brilliant display of crotons, pleasingly associated with caladiums, selaginellas, palms, abutilons, alocasias, and Rex begonias—a fine arrangement. Messrs. Jas. Cypher and Sons second, their tall crotons being rather too dark; and Mr. W. A. Holmes, Chesterfield, third.

In the county class for a group of plants, Mr. C. Roberts, gardener to Mrs. Swann, Halston Hall, won first prize with a group in which dracænas and crotons figured largely, and in which there was a need of more and brighter flowers.

Some superb begonias were staged in the class for a group of these splendid plants; the competition was a close one, and Messrs. Blackmore and Langdon, Twerton-on-Avon, gained the premier award, with Messrs. T. S. Ware, Feltham, Middlesex, a close second.

PLANTS.

For fifteen stove and greenhouse plants Messrs. J. Cypher and Sons, Cheltenham, once more secured the premier award, and their collection contained superb examples of Statice intermedia, S. profusa, Allamanda nobilis, Ixora macrothyrsa, I. Williamsi, Croton Countess, and Rondeletia speciosa major. Mr. William Vause, Leamington, second, with some fine ixoras and statices; Mr. W. R. Manning, Dudley, third. These big plants were a great attraction, and were greatly admired.

Mr. T. Lambert, gardener to Lord Harlech, Brogyntyn, scored for a dozen stove and greenhouse plants with medium-sized and beautifully grown examples of Croton Warreni, C. interruptum aureum, Ixora macrothyrsa, Allamanda Williamsi, Clerodendron Thompsonæ, etc., etc., Mr. W. R. Manning, second. Messrs. Cypher and Sons led for six stove and greenhouse plants, and in this set they had grand specimens of Statice profusa, and Ixora macrothyrsa; Mr. W. Vause, Leamington, second.

A trying class is the one for thirty stove and greenhouse plants, and there are comparatively few who can enter it with any prospect of success. Messrs. J. Cypher and Sons led the way with medium-sized examples, that included Statice intermedia, Acalypha hispida, Ixora coccinea, I. Pilgrimi,

(Continued on page 657.)

SEASONABLE PROBLEMS.

I suppose a problem may be described as something which is difficult to understand, and in the pursuit of horticulture hardly a day passes without a problem of some kind or other cropping up. Here we have one suitable, I think, for discussion. It will be generally agreed that 1909 has been a good strawberry season. Well, there's no problem about that, for climatic conditions last autumn were admirable for the development of crowns and the time of blossom was a favourable one. The clerk of the weather might have been kinder when the fruit was ripe, but, in spite of him the berries were fine and plentiful, if lacking somewhat in flavour. History repeated itself as it does again and again when a fruit crop is heavy. Strawberries were cheap, in fact, prices fell so low that they did not pay for picking, and one big grower did a kindly thing, for, instead of letting tons of fruit that he could not sell to profit go to waste, he placed them at the disposal of poor children, who probably had never picked a ripe strawberry from a plant before in their lives.

Here, however, comes the problem, for it seems hardly possible to believe that in a country with the population of Great Britain more strawberries are produced even in a prolific season than can be consumed by the million, especially when we think of what an industry jam making has become in recent years. Men like Mr. Wood, of Crockenhill, Kent, do not give up strawberry picking so long as there is a sale for fruit at prices which allow a margin of profit, and a reasonable solution is that the supply was in excess of the demand. Then one thinks of the consuming millions, and methods of distribution, and wonders whether there is not something wrong here. And what about the jam makers? One would have thought that they could have taken all the fruit to spare at a price remunerative to themselves and also the growers, but it seems not, and perhaps foreign fruit and foreign pulp, cheap, but of doubtful character, have got something to do with it. At any rate, these gluts which are general whenever Nature gives us heavy crops of any kind of fruit, form one of the problems which are not easy to understand.

A Gooseberry Mildew Problem.

There has been such a prolific crop of gooseberries this season that people have not troubled much about the American mildew, which caused such a sensation when it was first discovered. Still, the American mildew, wherever it came from in the first place, or however long it has been here, is still with us, and I came across a curious case not long ago. Cuttings of gooseberries were taken two or three years ago from a certain private garden, and struck in an isolated nursery devoted entirely to conifers and forest trees, which is far removed from any place where gooseberries are grown. No traces of mildew have ever been seen on the parent bushes in the garden where the cuttings came from, and yet the young plants this season were badly affected by the disease. Now you have the problem. Where did the mildew come from and from what source did the young bushes become infected? I may add that the only plants introduced into the nursery since the gooseberry cuttings were inserted are seedling larches bought in as small specimens from time to time, and planted. Is it possible that the gooseberry mildew was introduced on the seedling larches, and from them attacked the bushes growing in the nursery? It does not seem probable, but what source the mildew came from which took possession of the gooseberries growing amongst the forest trees is a problem that I am at a loss to explain. Perhaps some reader of this journal can offer a suggestion which may be helpful in solving the difficulty.

Carrot Failures.

Here is another problem. In scores of gardens round about here the carrots present a sickly appearance, the leaves being yellow and rusty brown. When the carrots are pulled up the tips of the roots are found to be decayed, which is, of course, responsible for the sickly appearance of the growth. Nothing problematical about this, you will say, the trouble is caused by the grub of the carrot fly. Possibly, but in many cases there is the decayed root tip, but there is no grub to be found, and, assuming, in spite of this, that the carrot fly is the initial cause of the trouble, why is it that the pest is so plentiful and widespread this season. Carrots are affected in gardens where the trouble has never been known before, and in some cases beds are entirely ruined. The season, on the whole, has been favourable for the growth of the roots, then why this plague of grub?

Eelworm Troubles.

Still another problem, which affects farmers rather more than gardeners. Weeks ago the question was, What is the matter with my oats? You heard it everywhere, and the oats, instead of growing away freely became stunted and "tulip-rooted." There was nothing novel about the situation, it was a widespread case of the stem eelworm, Tylenchus devastatrix, but where did the eelworms come from, and why did this pest affect oats in fields and on farms where it had never been seen before? The matter has puzzled farmers, and still puzzles those who are now reaping mere remnants of crops and wondering whether they will have similar trouble again next season. In gardens we have had something of it, and duck-necked onions for which the same stem eelworms are responsible are by no means uncommon in beds where no such trouble has been seen before. Indeed, the eelworm trouble, in its different forms, and how to deal with it, presents one of the problems which agriculturists and horticulturists would like to solve.

G. H. H.

CRINUM LONGIFOLIUM.

Of the crinums which are considered sufficiently hardy to be cultivated out of doors this species, and its varieties and hybrids, have the first claim, although there are several others, such as C. Moorei, C. Poweli, and C. Colensoi, which may be easily managed in a sheltered position, where they will attain a degree of perfection not excelled by their fellows of the greenhouse.

C. longifolium is the earliest of the hardy species to flower, being at its best by the end of May. There are about a dozen glaucous green leaves to each crown. The flowers are produced on strong scapes about three feet high, and they are white, tinted with pink, and flushed with red on the back of the segments. It is a native of the Cape, is also known as C. capense, and is figured in the "Botanical Magazine" as Amaryllis longifolia.

CRINUM LONGIFOLIUM IN THE CAMBRIDGE BOTANIC GARDENS.
Flowers white, tinted with pink, and suffused with red.

In the autumn the foliage dies away, leaving the bare bulbs, which stand a foot out of the ground. These should be protected by filling between and around them with pine needles or other suitable material during severe weather. The photograph here reproduced was taken the last week in May, and shows one of several fine clumps of this crinum growing on the sunny side of a plant house in the Cambridge Botanic Garden.

E. J. Allard.

Small Holdings.—Sir Edward Strachey stated recently in the House of Commons that up to July 24 the area of land covered by schemes for small holdings under the Act of 1908 amounted to 46,895 acres. The total included 5,674 acres acquired under 88 compulsory orders.

SUMMER SOWINGS IN THE ROCK GARDEN.

Adorning rockeries of all sizes by outdoor sowings during summer is so easy and successful a task that it can be warmly recommended to all gardeners. The genial temperature causes seeds to germinate quickly and evenly, and the seedlings have time to become robust before winter sets in, whereas those raised in seed beds or frames have to run the risk of root disturbance when put out in their permanent places in October.

A few simple rules will facilitate matters: Firstly, the soil should be lightly forked up and watered in the rock pockets some hours before seed is scattered; secondly, the covering in should be performed by sifting some good sandy compost lightly over, not by any attempt to rake back displaced earth; thirdly, the sown patches ought to be shaded for several days. The best method for this is by lightly crumpling newspaper in between the stones, which will hold it in position; or, if there are high winds to be feared, a little raising of stones, or the addition of a few others, will weight the paper securely.

Uncommon rock plants are often difficult to raise under glass, yet spring up as lavishly as weeds in the open I find. One of the brightest of flowers is Calandrinia umbellata, a trailing perennial six inches tall; the hue is carmine, and the petals have a satin sheen intensifying the effect. Campanulas include especially suitable forms that are scarcely ever found in herbaceous borders; there is the silver-gray C. Loreyi alba, for instance, the wide blue-blossomed C. carpathica pelviformis, the native Scotch blue-bell, C. rotundifolia, and the extra fine white form of C. turbinata.

Gypsophila saxifraga I have had covering large flat stretches of soil on a rockery slope, in which position its foliage and pink blossom are both of wonderful value. Gypsophila muralis is but an annual, but the former species when once sown, is always present, and proves far more showy than G. repens. A minute plant that can be relied upon for almost any rockery position in sun or shade is Linaria cymbalaria globosa, which grows in tufts, and does not trail like the other kind of Kenilworth ivy.

Colour harmonies are never more valuable than among rocks, for the raised ground shows off such schemes better than a level border can do, making them visible right across a garden; nor should the power of quite small flowers in creating these effects be overlooked, for a stretch of Erinus alpinus carmineus, of the orange Cheiranthus Allioni, the blue Myosotis alpestris, even of lavender Viola cornuta, proves more noticeable a few yards away than would be a group of some taller plant with similar-hued blossom. The explanation of this is simple; larger perennials do not cover their foliage with bloom, so green subdues the colour as seen from a distance.

Sow Viola cornuta alba around the orange Iceland poppies which are among our best rock plants, and a beautiful group is at once formed, but, if space permits, see that there are yards of the white carpet about, with a display of the poppy, and this feature of the garden will be eagerly looked for year after year. Viola cornuta lutea I have had around that true violet blossom Campanula glomerata, the two-foot tall cluster bellflower, and the summer glory was a blessing to be long remembered. If there are pale yellow snapdragons at any part of the rockery, the purple Viola cornuta will be a fair dwarf plant to sow near; while pink Alpine poppies prove delightful nodding at the feet of white or crimson snapdragons.

A shaded bit of rock garden can be sown just as well during summer as a sunny one; violas and pansies are bound to thrive sufficiently, so are coloured primroses and polyanthuses, while some of the gayest effects are obtainable with double daisies of rose and red, or the single gold-centred, vivid scarlet-crimson Bellis sylvestris, which is an indispensable gem for all rockeries .

Where honesty rises to warm the neighbourhood of gray stones, the alpine wallflower, Cheiranthus alpinus, will blossom profusely at the same time. I have found Meconopsis cambrica, the yellow Welsh poppy, quite as willing to do without sunshine, and equally precious for its colour contrast.

Against scarlet Oriental poppies in the hottest parts of the rockery, white arabis and iberis prove best of all carpets, the combinations in my garden being improved by the presence of dozens of compact bushes of Pyrethrum aureum, which is absolutely perennial in the southern counties. Sown during summer this popular Golden Feather is gained in vast quantity, and proves perfection for the following spring beds and borders as well as rockeries.

Dwarf aquilegias are other desirable subjects for sowing; we may choose between A. pyrenaica, violet; Stuarti, blue and white; Flabellata, white; Asperula odorata, the sweet-scented Woodruff, is another favourite plant that can be obtained in profusion by this easy method, while yellow or purple masses will be supplied by Erysimum pulcherrimum and E. purpureum.

M. H.

FIBROUS-ROOTED BEGONIAS.

Generally speaking begonias can be divided into three classes: firstly, the exceedingly popular tuberous-rooted section; next, those of a semi-tuberous nature, such as the beautiful winter-flowering hybrids raised by the Messrs. Veitch; and, thirdly, a very extensive group with fibrous roots.

These latter are, for the most part, evergreen in character, and at no time do they need a period of absolute rest, such as the tuberous kinds require. Many of the fibrous-rooted begonias are very valuable for decorative purposes, one species in particular—B. semperflorens, being most popular for bedding out throughout the summer months; and the high ornamental value for indoor decoration of one of the hybrids of this section, viz., Gloire de Sceaux, is well shown by means of an illustration in the GARDENERS' MAGAZINE as recently as February 13 of this year.

Of the numerous species and hybrids one of the oldest is the above-mentioned B. semperflorens, which was first introduced to the Liverpool Botanic Garden from Brazil in 1828. For the last 50 years it has been regarded as a very pretty flowering begonia for the greenhouse, but was at one time not very generally grown. Now, however, by hybridising and by other means, it has given rise to a number of variable and beautiful forms. That strong-growing variety known as B. semperflorens gigantea was raised by M. Lemoine, of Nancy, and distributed in 1884. It was obtained by the intercrossing of B. semperflorens and B. Lynchiana, this last a Colombian species, introduced in 1877, under the name of B. Roezli. It is of tall growth, with bright red flowers, and its association with B. semperflorens proved to be a happy one, as the members of the gigantea section are much grown, notably at Kew, where a group of flowering examples may often be seen in the greenhouse.

Then, a few years since, several varieties of B. semperflorens with double flowers were put into commerce by M. Lemoine, and though they have not attained a great amount of popularity, they are very distinct and free flowering. A large number of dwarf varieties of B. semperflorens are in cultivation, and it is the members of this section that are so extensively used for bedding purposes. In some of them the foliage becomes of an intense crimson colour under the influence of the summer's sun. Some of the dwarfer kinds, too, are very pretty in the greenhouse, notably Gloire de Chatelaine, pink, and Lumineaux, deep crimson. The continuous flowering qualities of this section well merit the specific name of semperflorens.

At the meeting of the Royal Horticultural Society on March 23, an Award of Merit was given to B. Saturne, whose general appearance would suggest that it is a form of, or hybrid from, B. hydrocotylifolia. It forms a tuft of handsome dark-green lobed leaves, while the red flower stems carry large clusters of pink blossoms. A very general idea is that awards at the Royal Horticultural Society's meetings are made only to new or comparatively new plants, but this is by no means the case, as the variety Saturne is at least about 20 years old. The hybrid B. Gloire de Sceaux above alluded to was put into commerce in 1885 by M.M. Thibaut et Keteleer, and announced as a hybrid between B. socotrana, and B. subpeltata. Whether this parentage is correct has been more than once doubted, but there can be no difference of opinion as to its great beauty and value to the gardener. The deep bronzy tinted leaves are very handsome, and serve admirably as a setting to the clusters of comparatively large rose-coloured blossoms.

Among the other species to which attention may be directed is Begonia Dregei, a compact growing species from South Africa, with pure white blossoms. It is full of interest, as being one of the parents of the popular B. Gloire de Lorraine. Begonia coccinea, a vigorous growing species that pushes up stout bamboo-like shoots to a height of six to ten feet, is not effective grown in a pot, but planted out in a warm house, and so situated that it has ample sunshine, it forms a striking object. The flowers, borne in clusters throughout the greater part of the year, are of a bright coral-red colour. This species is sometimes met with under the name of Begonia corallina.

B. Haageana, when grown freely, forms a large bushy specimen six feet or thereabouts in height. The leaves are as much as a foot long, and are on the upper surface dark green with reddish veins, while on the under side they are deep red. The whole of the plant is hairy. This species has enormous flower clusters, a foot or so across, which are thickly crowded with white or whitish blossoms. Both the leaf and flower stalks, ovaries, and under sides of the petals, are clothed with long red hairs, which form a very notable feature.

B. manicata is an old and well-known species with handsome shining green leaves, and a profusion of small pink blossoms borne on erect spikes from two feet to a yard in height. It blooms as a rule in February and March, and when in this stage is very effective. There is a variety—maculata, in which the leaves are blotched with gold, after the manner of the old hardy Farfugium grande, and another—cristata, with the edges of the leaves curiously crested.

B. metallica forms a good sized bush clothed with oblique pointed leaves of a deep green shaded with a dark metallic tint. From a foliage point of view alone it is very ornamental, and the dark tinted leaves serve to throw into prominence the blush coloured flowers.

Begonia undulata, also known by the name of B. glaucophylla, and B. Comte de Lamminghe, is of a drooping or creeping habit, and is seen to considerable advantage when treated as a basket plant. Under such conditions the shoots hang down for three or four feet, and are clothed with pretty wavy glaucous-green leaves. The flowers are in the bud state red mottled with a lighter tint, and when opened are more of a salmon hue.

Of garden varieties and hybrids there is an immense number, some of the most notable, in addition to those alluded to, being:

B. Carrierii, a hybrid between B. semperflorens and B. Schmidtii. It is a small-growing plant of compact habit, and bears its pure white flowers nearly throughout the year. This is sometimes used for bedding.

B. Corbeille de Feu, is the result of crossing B. semperflorens and B. fuchsioides; it was distributed by M. Lemoine of Nancy eighteen years ago, and forms a bushy growing plant a couple of feet or so in height, with shining green leaves and a profusion of red flowers. It is often used for bedding purposes. There are now several varieties of this section, but as far as my experience of them goes B. Corbeille de Feu is quite the equal of any of them.

The charming B. Kewensis is a garden hybrid, raised at Kew, but its origin I am unable to give. It is of a graceful arching, semi-pendulous manner of growth, and bears its clusters of creamy white flowers in great profusion during the summer months. From its style of growth this is seen at its best when grown in suspended baskets.

B. luzerna is a strong growing kind, with stout stems reaching three to five feet high, and clothed with large dark shining green leaves. The deep coral-red coloured flowers are borne in very large drooping clusters. An older variety, a good deal in the same way is B. President Carnot.

B. Weltoniensis is one of the oldest of hybrid begonias, for it was given a First-class Certificate by the Royal Horticultural Society 41 years ago. It was raised by the late Colonel Clarke, who, among his other successes, obtained that pretty cream coloured variety—B. Moonlight. At one time B. Weltoniensis was popular as a market plant, and was also used for bedding. The late Mr. Herbst, soon after its introduction, grew it in large numbers for Covent Garden market. It is of a sturdy upright style of growth, with red stems and leaf stalks, and neat bright green leaves marked with greyish green. The pretty pink flowers are borne in great profusion. I can find no record of its parentage, but have an impression that the [illegible] told me the parents were B. Dregei and B. Sutherlandi. As the flowers of B. Dregei are white and those of B. Sutherlandi coppery orange, one would be [illegible] prepared to find the progeny with [illegible] flowers, only that the same thing [illegible] happened in the production of the pink flowered Rhododendron Prin[illegible], which resulted from the crossing of a white and a reddish orange kind.

The notice of fibrous-rooted begonias might be almost indefinitely extended, therefore I will but refer to the numerous [illegible] foliage kinds in the production of which B. Rex has played such an important part, and to the ubiquitous B. Gloire de Lorraine, which has been the subject of [illegible]. There are now several forms of this, and to the section must also be added M. Lemoine's new variety, B. [illegible], which was given an Award of Merit by the Royal Horticultural Society early in the year.

W. T.

IMPORTANCE OF MAGNESIA IN THE CULTURE OF ROSES.

In the issue of August 7, page 614, Mons. Georges Truffaut calls attention to the importance of the constituent magnesia in the life of plants, and more especially in the cultivation of the rose.

In October, 1898, Mr. A. Hill Gray, of Bath, suggested to the committee of the National Rose Society that it would be of interest to ascertain if possible what, if any, were the particular chemical ingredients in certain soils which enabled rose plants grown in them to produce such an exceptionally large proportion of choice exhibition blooms. At the same time Mr. Gray generously enclosed a donation of £5 towards the expense of any investigation having this object in view which might be undertaken by the society.

The question was referred to a small sub-committee, with the result that Dr. Bernard Dyer was appointed to carry out chemical analyses of various well-known rose soils. From Wolff's analysis of the ashes of the rose we find the amount of magnesia in the various parts of the plant to be as follows: Roots, 7.15 per cent.; wood, 7.62 per cent.; leaves, 9.23 per cent.; flowers, 5.94 per cent. According to these figures magnesia comes next in importance to potash in the constituents of the rose plant. Potash ranges from 13.42 per cent. in the roots to 47.41 per cent. in the flowers.

Dr. Bernard Dyer found on his examination of the special rose soils, that the Colchester Rose Nurseries gave to their soils 0.360 per cent. of magnesia, against 0.226 per cent. of potash. Messrs. Paul and Son, of Cheshunt, showed in their soil 0.260 per cent. of magnesia, and 0.277 per cent. of potash. The soil from Mr. G. Prince, of Longworth, near Oxford, gave 0.4 per cent. of magnesia, against 0.238 per cent. of potash. From Messrs. Harkness, of Hitchin, the soil gave 0.3 per cent. of magnesia, and 0.238 per cent. of potash; while Mr. E. B. Lindsell's rose garden analysed 0.44 per cent. of magnesia and 0.265 per cent. of potash.

Taking the mean analysis of these five soils, the proportion of magnesia is 0.352 per cent. and 0.249 per cent. of potash, showing that the ingredient magnesia is relatively of more importance than potash in the production of good rose blooms.

From many trials it has been found that a manurial mixture composed of four parts of sulphate of magnesia, three parts of sulphate of potash, and two parts of bone meal or superphosphate makes an excellent manure for the growth of roses, applied at the rate of 4 ozs. per square yard as soon as the young leaf begins to break in the spring; to be lightly forked into the soil.

J. J. Willis.

LASTREA MONTANA

Some little time back, in an article on this fern (Gardeners' Magazine, 19/6/09) I stated that I had failed to find it at Kew; but it is abundantly obvious from the accompanying photograph, kindly supplied by Mr. W. Watson, that this was my fault, and that, so far as the usual form of the species is concerned, I must cry "peccavi." To a small extent, however, I must justify myself, since I did not say that it was not there, but that considering its varietal capacity, it was not properly represented, and when we consider that over sixty varieties are recorded and described in the "Ferns of the Lake District" alone, I think Mr. Watson will agree with me that even a fine grown clump of the normal in a collection of varietal forms, which probably has no competitor in the world as regards numerical richness in distinct forms of most of the British species, can scarcely be considered as representative. Nevertheless, I am delighted to see that the species itself is so well to the fore, which is more than can be said of the great majority of collections, a singular fact, since, in my own suburban garden, with all the handicap of a low rainfall, it holds its own bravely from year to year in its crested and plumose condition, while under glass it forms one of the most satisfactory pot plants I possess. In any case, I apologise to Mr. Watson for my oversight, though I hardly regret it so much as perhaps I ought to do, considering that it has evoked a good photo, and nothing worse than amicable protest.

Chas. T. Druery, V.M.H., F.L.S.

A FINE COLONY OF LASTREA MONTANA AT KEW.

THE ROTTING OF STRAWBERRIES.

The season of 1909 will long live in the memory of all who have had anything to do with strawberries, not only for the dreadful weather experienced, but also for the awful manner in which the berries rotted, in all localities, and under almost all conditions. Of course, to a very great extent this latter fact was the outcome of the first-mentioned, the terrible climatic experiences during the period of growth and ripening; still there was, in very many cases, a powerful agent which, aided by the very cold rains, brought about such lamentable results as were often to be seen.

[Photo: W. J. Mitchison.

A FINE OLD CLEMATIS MONTANA AT DUNSHANE, CO. WICKLOW.

The agent I refer to is the fungus, Botrytis cineria, which, during the last year or two seems to have added strawberries to its already lengthy list of victims, and in so doing, seems to have singled out Royal Sovereign for its most virulent attack. The catholicity of its taste may be judged when it is stated that onions, potatoes, lettuce, tomatoes, chrysanthemums, and even gooseberry bushes, in addition to many weeds, have been observed to be suffering from attacks of this fungus.

During the last day or two I have seen some tomato plants in the house of a very good grower which are suffering from this dread scourge, and I shall hope to refer to this phase of its activities later. Botrytis cineria is the summer form of a disease which produces curious hard, black, oval bodies within the tissues of the plants it attacks, i.e., in the skin of the onion bulb, in the potato haulm, in the stem of the tomato or cucumber. However, it is not with the sclerotia or winter form that we are at present concerned, except to say that it seems probable that the disease lives over the winter in these sclerotia, either in the dead and decaying leaves which are generally to be found in the middle of a strawberry plant, or in the ground where they have fallen on the decay of the fruit or vegetation attacked.

With the approach of spring these sclerotia grow, producing a crop of spores which are very minute, and also very light, easily flying when disturbed by a blow or a rough wind. The position most readily attacked by these spores upon a strawberry plant seems to be the little green leaves of the calyx, and it is here that it most often makes its entrance. In a very short time, especially during damp weather, the spores germinate, and the mycelium rapidly passes from the calyx through the flesh of the berry. Soon a dense white mould appears on the surface, changing in a while to a dark brown colour, by which time probably the entire berry is affected, and the spores are again ripe, so that with a touch clouds of spores fly off in thousands to affect other berries.

It is not only the large colouring berries which are attacked, but just as often half-grown green berries, and even the latest, not as big as a pea, will be found to go brown and die off. Though not to be taken as a rule, it has been observed that this disease is often in company with one or other of the eelworms which attack strawberry roots and crowns, and, like them, flourishes most on land that is sour from want of drainage, and more particularly from a deficiency of lime in the soil. All strawberry beds where this latter is deemed to be the case should receive a good dressing of ground chalk in the autumn or early winter, or a dressing of lime in the early spring.

From what has been stated concerning the lightness of the spores, and the ease with which they are disturbed, it will be seen that much care must be adopted in keeping a good look out for the disease and also in adopting very careful methods for dealing with it.

If the first berries are picked off and burnt before the spores have time to assume the brown colouration, there may be some reasonable hope of checking the disease, but if on the other hand, through ignorance of the attack, or carelessness, many fruits are allowed to become diseased and the spores to ripen, the mere act of moving the leaves to search for the sound fruit is sufficient to disturb clouds of spores, which, lighting on the damp calyx of healthy berries, set up fresh infection.

The best thing is to keep a sharp look out for the disease, and on its first approach send someone with a pail, which has been wiped round inside with a little paraffin, to pick off all infested berries, no matter how little diseased they may appear. The person doing this work should be instructed to use as gentle methods as possible, not to bang the pail down on the ground so as to jar the berries and disturb the spores; in handling the leaves and trusses of the plants, not to shake them about; in fine, to do all possible to pass off affected berries without distributing the disease. On no account should any other receptacle than a pail be employed, or the spores may be sown broadcast more than they could possibly have been naturally.

All strawberry plants which have fruited should now have the runners which they have made since the straw was laid down taken off, as well as just a few of the older leaves. A large knife may be used to do this, or, if the beds are of considerable extent, a No. 1 Bagging Hook, without crank, will be found a useful tool. With this, however, the worker should be careful to keep the hook perfectly upright, as a stroke in a more or less horizontal direction will cut more leaves off the plants than they can afford to lose. It will be well, though, to sacrifice a few leaves, and aid in staying the disease rather than carefully preserve every leaf and harbour the infestation.

Where the attack has been very virulent the plants may be sprayed with copper sulphate, after they have been trimmed up, in the form of a Bordeaux mixture, or Strawsonite, taking care to thoroughly drive the spray among the leaf stalks where the withered leaves and rubbish collects.

It was the practice in France to burn over the strawberry fields after picking, and doubtless by this means much of the rubbish was got rid of from amongst the crowns, lessening to a great extent the risk of infection. But I am afraid in most gardens this is not practicable owing to the close proximity of fruit trees and other produce, but where possible it is well worth trying. If the operation is taken in hand now, no damage will result to the plants at all.

If the present fine spell which we are

enjoying at the time of writing continues, I shall hope to flare over about 12 acres, of course, burning the straw with which they were littered as well, which will have to be lightened up with forks before firing, as it is tightly trodden into the ground.

It may be mentioned in conclusion that Sir Joseph Paxton resisted the disease very much more than Royal Sovereign, though it is difficult to say why; possibly it is because the latter is very much the softer in flesh of the two. F. W. Hammond.

Pilgrim's Hatch.

CLEMATIS MONTANA.

So much has been written and said about Clematis montana that the opportunity of writing anything original about this lovely climber has long since passed. And yet there is always something fresh and new about the plant when it bursts so quickly into bloom and flings its long trails of white blossoms around the window frame, and over the eaves, or twines them around the pillars of the porch, the stem and branches of an old tree, or laces them in and out of the lattice work of a trellis fence. To those who have not previously grown this beautiful and quite common climber, the first flowering of a specimen set out with one's own hands is something to remember, though the floral display of each succeeding year is far greater than the initial one. Fortunately it will grow almost anywhere. It will wreath a fence in a backyard at busy Brentford; it will climb an old Scots fir in Royal Kew; it turns many a Surrey roadside cottage into a beautiful picture, and it is a favourite plant for the decoration of the balconies of seaside houses in the West and South-West of England. Probably no plant grown is so often photographed as Clematis montana, especially if one is to judge from the number of prints that reach an editor of a horticultural journal each year, and though those prints are too often beneath contempt, photographically, they show how popular this clematis is, how readily it takes to all kinds of sites and positions, and how beautiful it is in each instance. It is not everyone who may enjoy such a picture as is illustrated herewith, which represents an old Clematis montana covering part of a house at Dunshane, Co. Wicklow, but most people who have a fence or a wall to cover may have the same kind of beauty on a smaller scale if they plant Clematis montana—and planting time is not far distant. C.

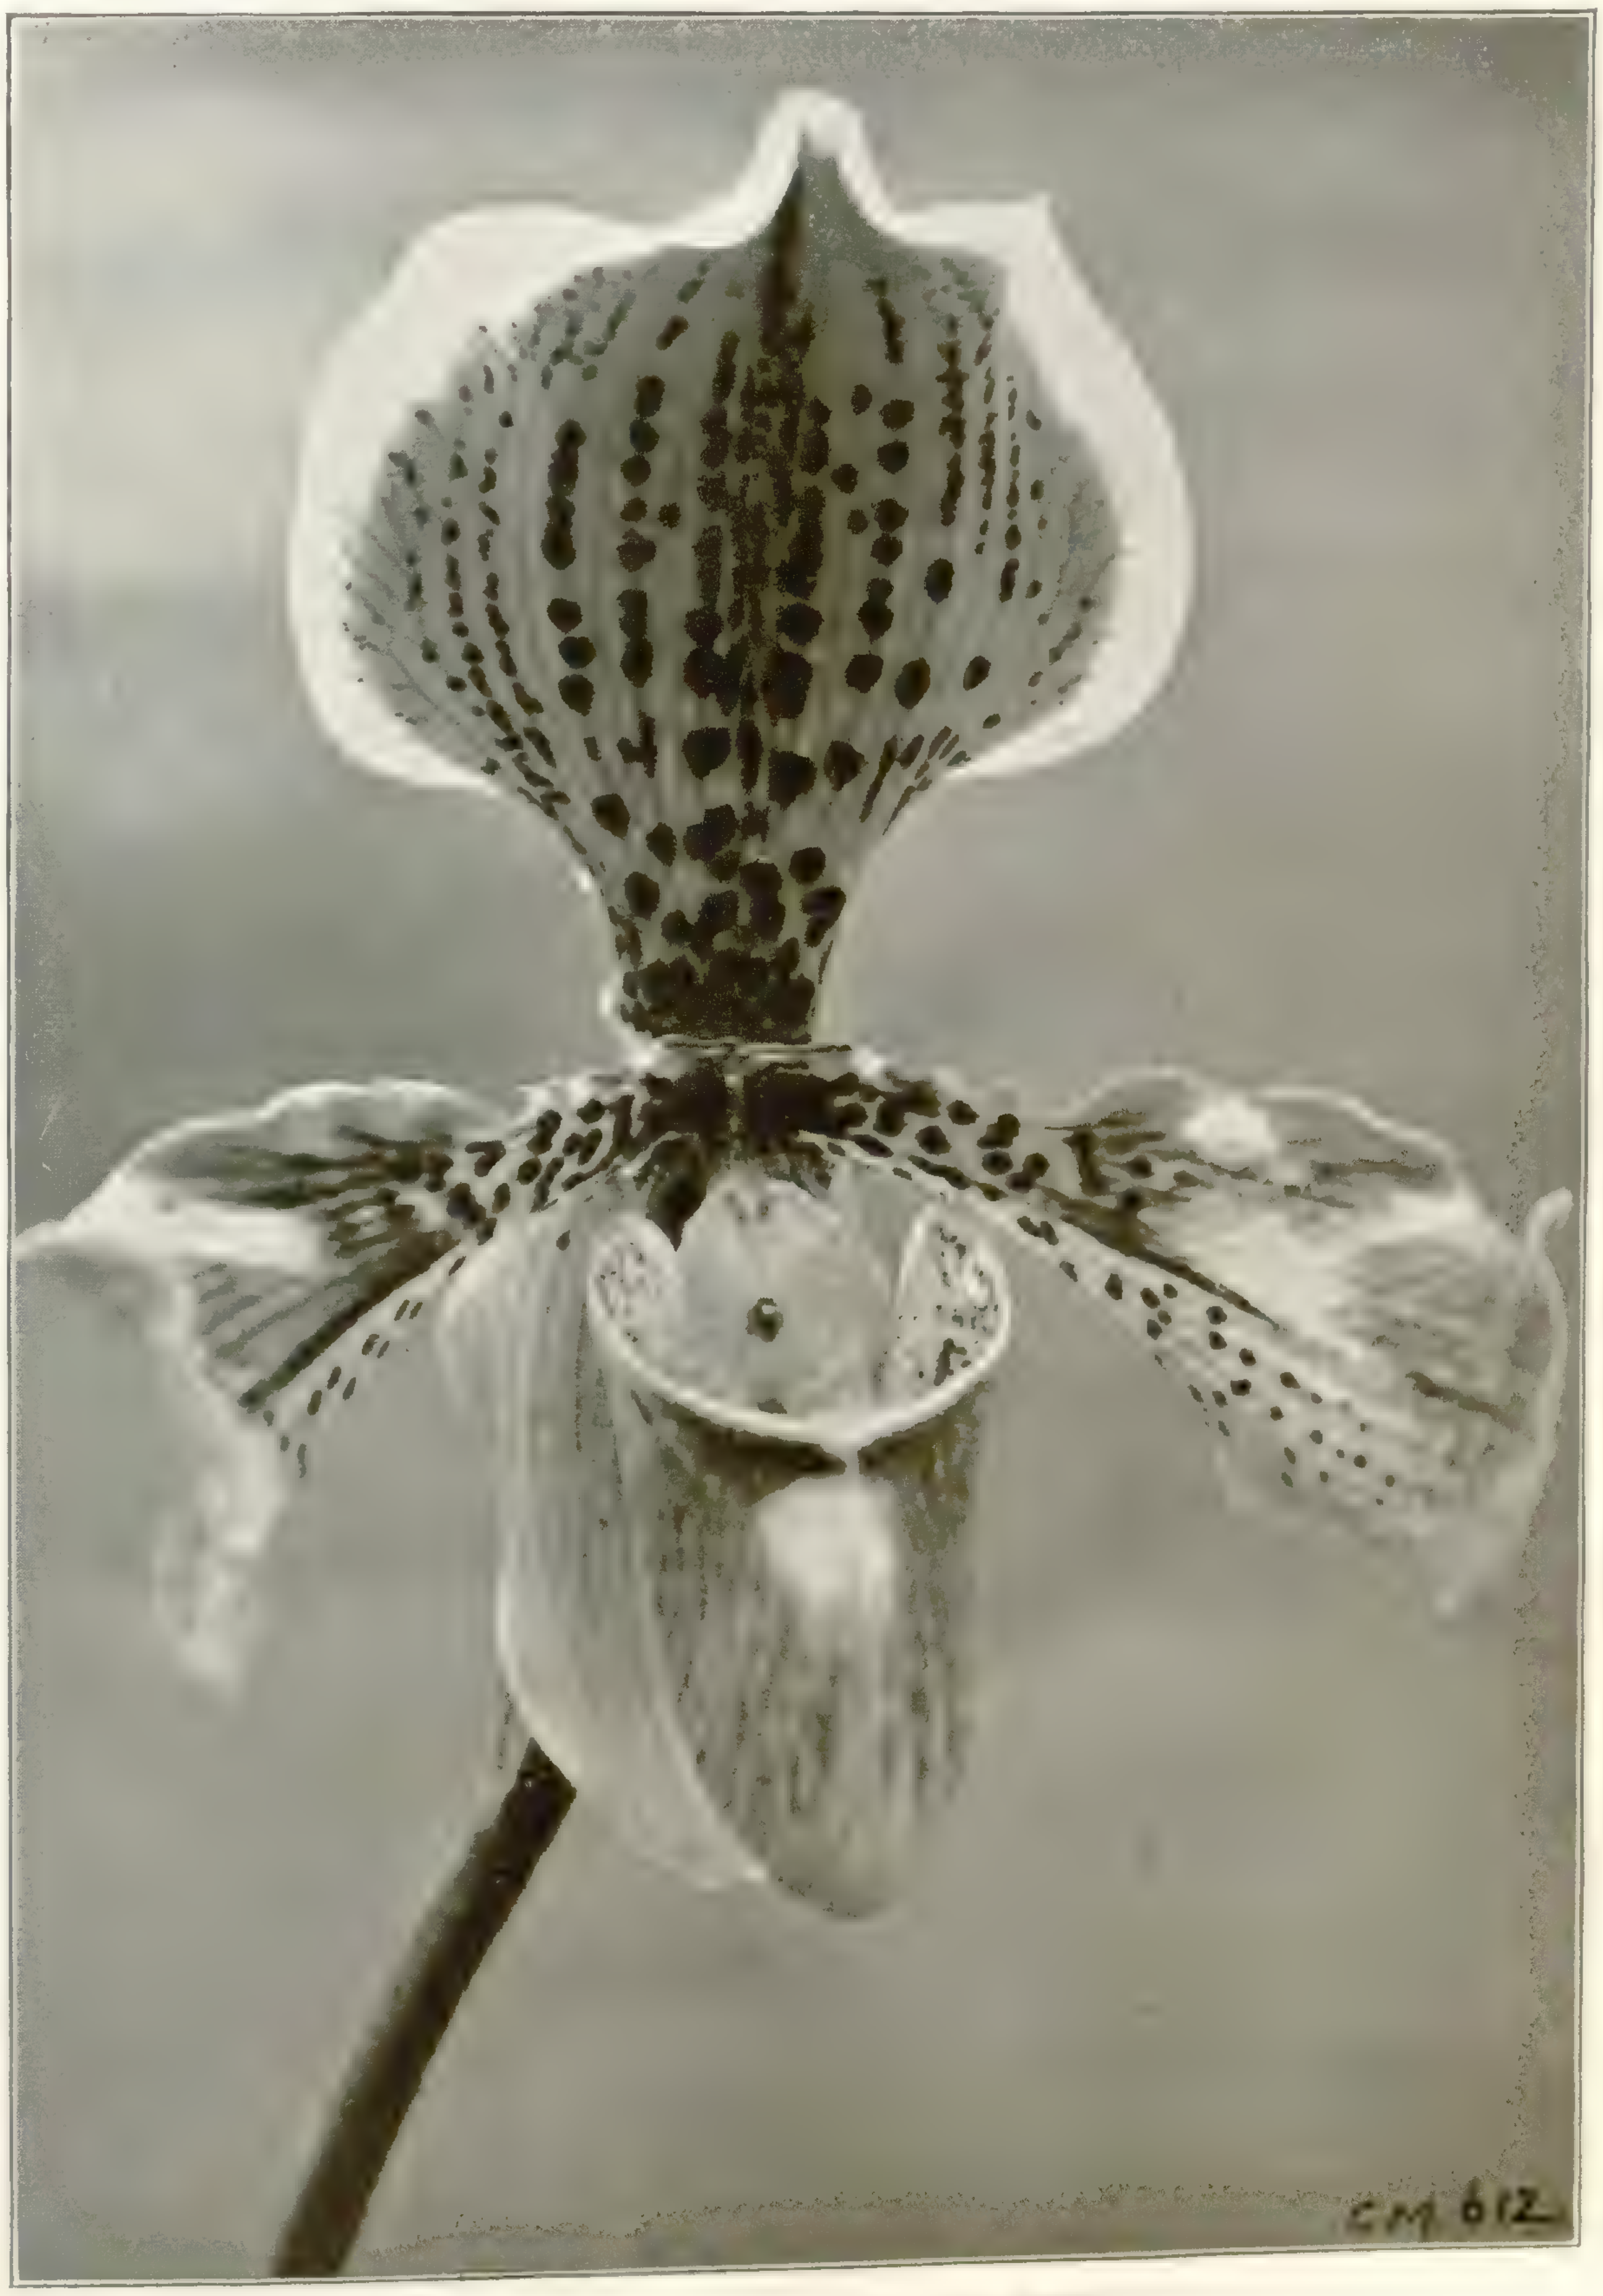
CYPRIPEDIUM THE PREMIER.

Although for some little while Mr. Francis Wellesley, J.P., of Westfield, Woking, gave up the culture of orchids, it was not long before he returned to his first love in horticulture, and now his collection is in some respects finer than the one he originally brought together. One of his many fine cypripediums is C. The Premier, a bold and handsome flower that was raised by crossing C. Mons. de Curte with C. Mrs. Mostyn. The large and shapely flowers are richly coloured, and remind one somewhat of the fine Cypripedium Beek[illegible]. The lip and petals are yellowish, beautifully shaded with bright brown and purple brown; the dorsal sepal is light green, shaded with yellow, with a white margin and apex, and with bright purple and purple-brown markings towards the base. Mr. Wellesley regards this as one of his choicest cypripediums, and he has had so many good things that he is well able to judge.

GOLD MEDAL ROSES.

While walking among our roses a few days ago it occured to me what a grand and fully representative lot of varieties there are that have gained the gold medal of the National Rose Society. Without those of the present year there are upwards of fifty, and they make a grand collection. The diversity of colour, of form, of growth, and of the purpose they are best adapted for, is remarkable. Not a thing is missing. If we want the best and most vigorous climbers then Blush Rambler, Crimson Rambler, Queen Alexandra, and White Dorothy supply the need. Mrs. Paul, J. B. Clark, Avoca, Margaret Dickson, and Purity give good pillar or semi-climbing varieties. We can select half-a-dozen or more eminently suited for pots, in Queen of Spain, Sunrise, Joseph Lowe, Mrs. W. J. Grant, Lady Roberts, and Souvenir de Pierre Notting. Good singles are represented in Irish Elegance, Irish Harmony, and Mrs. O. G. Orpen, while it would be difficult to find a dozen better suited for the exhibition box than Bessie Brown, Mildred Grant, Dean Hole, Florence Pemberton, Duchess of Portland, Her Majesty, Mrs. John Laing, Hugh Dickson, Mrs. Edward Mawley, Mrs. W. J. Grant, Muriel Grahame, and William Shean. In the so-called garden or decorative roses we have Betty, Dorothy Page Roberts, Irish Elegance, Mrs. B. R. Cant, and Mrs. Peter Blair.

If we consider colour the diversity is even more noticeable, as all shades are represented. The golden yellows of Harry Kirk and Souvenir de Pierre Notting; the whites of Marchioness of Londonderry and Margaret Dickson; the creams of Bessie Brown and Mrs. David McKee; the intense scarlets of Ben Cant, George C. Waud, Hugh Dickson, and J. B. Clark; with the purplish crimson of Avoca, and the nearest approach to purple we have in Sir Roland Hill. The lovely pinks of Mrs. John Laing and Mrs. R. G. Sharman-Crawford do not exhaust the variety. If we want some for coat flowers few beat Betty, Lady Roberts, Sunrise, and Mrs. Peter Blair. Why not have a class or classes for our "Gold Medal" roses as well as for new varieties striving for the medal? A. Piper.



CYPRIPEDIUM THE PREMIER.
A handsome Lady's Slipper with large, richly-coloured flowers.

EFFECTS OF THE WINTER ON TREES AND SHRUBS AT KEW.

In view of its importance to those who take an active interest in ornamental trees and shrubs, we herewith reprint, with due acknowledgment, the following report, by Mr. W. J. Bean, the assistant curator, on the effects of the winter of 1908-9 on trees and shrubs in the Royal Botanic Gardens, Kew, which appears in the current issue of the "Kew Bulletin":

The winter of 1908-9 was the severest that has been experienced in the British Isles since 1894-5, and the resulting damage to trees and shrubs grown out of doors has been greater than that of the intervening thirteen winters all put together. Experiments are continually being made at Kew as to the hardiness of new or untried trees and shrubs, and it is not until such a winter as the last occurs that their real powers of resisting cold are ascertained. The results, therefore, of a severe winter, although often chastening, are not without value; and it is thought that a few notes relating to the more interesting losses and survivals may be useful. As a matter of fact the list of survivors tells a more serviceable and reliable story than that of the losses. The fact that a certain plant has survived uninjured a certain degree of cold without artificial protection hall-marks it with a corresponding degree of hardiness in the particular place where it grows. But one cannot assume so positively that another plant which has died under the same conditions is correspondingly tender. So much depends on attendant circumstances. Its death may be due to a series of adverse conditions of which the winter's cold is but the culminating one.

It must be admitted, however, that the damage done to vegetation during the winter of 1908-9 was not due so much to long spells of intense cold as to violent alternations between intense cold and unseasonable warmth. The month of October, 1908, was extremely mild, often even summerlike. The thermometer rarely fell below 42 degrees Fahr., and on five occasions it rose to between 70 degrees and 80 degrees in the shade. The consequence of this was, that many shrubs, more especially young and vigorous ones, kept on growing when they should have been consolidating ("hardening off") the growth already made. From the end of October to December 27, the weather continued very mild, and frosts, ranging from 1 degree to 8 degrees, were registered on six occasions only. But on December 28 the minimum temperature was 24 degrees fahr.; on the 29th it was 23 degrees Fahr., with a heavy fall of snow; and on the 30th the thermometer fell to 10 degrees Fahr. It was, no doubt, to this sudden experience of 22 degrees of frost, following a long period of soft mild days, that much of the damage we have to record was due. On the night of the following day (December 31) it was thawing and raining. The first three weeks of the new year were very mild, but during the last week of January frosts varying from 6 to 12 degrees were registered. February opened mild—on the night of the 3rd the minimum temperature was 51 degrees Fahr.—and continued so until the third week. This had excited some plants, especially Siberian and Manchurian ones, into a premature activity, when the second spell of severe weather occurred. This lasted from the third week of February to the second week of March. On two occasions 13 degrees of frost were registered, and once 18 degrees, these being accompanied by bitter E. and N.E. winds and snowstorms.

From this brief summary it will be seen that the winter has no claim to rank among the severe ones of history. So far as the average mean temperature of the six dark months is concerned, it would probably even be found to rank with the warmer ones. The disasters to vegetation that have occurred are undoubtedly due to that characteristic of English winters (exceptionally pronounced in this instance) which is the bane of all cultivators of extensive collections of hardy exotic plants. This consists, as has already been observed, in violent fluctuations of temperature, which bring about in many plants a state of unrest absolutely opposed to the long winter sleep so many of them enjoy in their native places.

It would serve no useful purpose to go through the full list of killed and injured plants. There are some half-a-dozen great areas whence we obtain the more tender shrubs we attempt to cultivate in the open air, viz., S. Europe, Himalaya, New Zealand and Tasmania, S. America, California, and the S. United States. Among such plants are many which can only be said to exist on sufferance in our gardens, but whose interest or beauty is so great that we are willing to risk their occasional loss; for example, the ceanothuses, tree heaths, cistuses, escallonias, New Zealand veronicas, and (on walls) the myrtle, olive, and pomegranate. These can only be expected to pass through the mildest winters unharmed, and their experiences during the past winter have not differed from those of ordinary winters, except in being somewhat more unfortunate than usual. Some shrubs, too, which are indisputably hardy, such as Cytisus albus, have had their younger branches killed, owing, no doubt, to the soft, unripening weather experienced right up to Christmas. These are not mentioned, for the damage is but temporary. The following notes are only intended to record the behaviour of newer and more interesting plants.

New Chinese Plants.

One of the most interesting elements in the horticulture of the present time is the introduction of new plants from Western and Central China. Most of these, it is hoped, will prove hardy enough to take a permanent place in the outdoor garden, and although the last winter can scarcely be said to have afforded the supreme test of our English climate, the results are full of encouragement.

It is especially satisfactory to find that Davidia involucrata, for which we are indebted to the enterprise of Messrs. Veitch, has not been injured by cold, even to the extent of a single bud. So much could not be said of several British plants. Ailanthus Vilmorini, although young, and only two feet high, is unscathed. In the low damp ground behind the Palm House Rhododendendron rubiginosum was killed by the rupture of the bark near ground level, but on the higher, drier ground near King William's Temple, was unhurt, and has flowered well since. Jasminum primulinum was killed to the ground even against a wall, and appears to be of no value for outdoor cultivation. Magnolia Delavayi, destroyed in the open ground, is unhurt on an east wall. Several young plants of Poliothyrsis sinensis were killed in the nursery, but others are growing well. Poupartia Fordi has survived. The following rare Chinese trees and shrubs, growing in the open ground without any protection, were quite unaffected: Liriodendron chinensis, Euptelea polyandra, E. Francheti, E. Davidiana, Tetracentron sinense, Eucommia ulmoides, Pertia sinensis, Sycopsis sinensis, Eleutherococcus Henryi, Berberis Wilsonæ, B. dictyophylla, B. acuminata, Trachelospermum crocostomum (on a wall), Cotoneaster adpressa, C. applanata, C. moupinensis, C. humifusa (seedlings were injured), C. bullata, C. rugosa var. Henryi, Viburnum Carlesi, V. rhytidophyllum, Rosa Hugonis, Itea ilicifolia, Schizophragma integrifolia, Sinofranchetia sinensis, and Sophora viciifolia.

A great number of plants have recently been raised from seeds presented to Kew by Professor Sargent, which had been collected by Mr. E. H. Wilson during his last journey in China. Nothing definite can be put on record about them because most of them are unnamed and under numbers only. Further, they had only been planted in the open ground a few months. Most of them, however, have survived, although many have been cut back to ground level.

Coniferæ.

This family, as represented in the outdoor garden, is, of course, but little affected by the severest frosts. It is only a few of the uncommon species that need be mentioned. Libocedrus macrolepis, a new Chinese species, is killed. Podocarpus alpina, a species native of Tasmania, and P. chilina from Chile have suffered very little. Fitzroya patagonica and Libocedrus chilensis are untouched. Of the commoner sorts, Pinus insignis was the only one that showed much evidence of damage, and this was confined to its leaves, which remained on the trees but turned a curious rusty brown.

Bamboos.

These afford the worst evidence in Kew of the winter's havoc, and the appearance of the bamboo garden at the time of writing (June) makes one doubt whether a large portion of the species are really worth a place in ornamental gardens. Not a single species probably has been killed, or even permanently injured, but the top growth of many is entirely dead, and only the underground rhizomes are alive. Others, which on Christmas Day last constituted some of the freshest, and certainly most graceful masses of greenery in the gardens, are now leafless stems, with no more beauty than a bundle of pea-sticks. And the worst consequence of a season like the past one is, that, so late are bamboos in renewing their growth, it is not until after midsummer that they become presentable again. The two most satisfactory species are Arundinaria nitida and A. fastuosa, which have not suffered in the least. Many of the phyllostachys have been lost to the collection in recent years owing to their flowering and subsequent death. Of those that remain, P. flexuosa, P. nigra, and P. Quilioi have suffered less than any. A curious fact in regard to P. viridi-glaucescens is, that the only specimen which has escaped damage is growing on a dry slope. The old Arundinaria japonica (commonly known as Bambusa Metaké), which, on account of its hardiness has been planted about the grounds, is very much disfigured. Among the dwarf species, Arundinaria pygmæa, A. Kumasasa (or palmata), A. Veitchi, and Bambusa tessellata are but little affected.

(To be continued.)

YELLOW INGESTRIE APPLE.

This is generally considered to be identical with the Summer Golden Pippin of Kent growers and costermongers' barrows, but is quite a different variety from the Golden Pippin, which is a winter variety. It was raised by that pioneer of English pomologists, Thomas Andrew Knight, who fertilised a flower of the Orange Pippin with pollen from that of the Golden Pippin, and planted two pips from the same cell of the resulting apple, one of which produced the Red Ingestrie and the other the Yellow Ingestrie.

This variety is grown more generally for market than in private gardens, according to my experience. Its growth is slender and somewhat pendulous, forming a small standard, and a compact bush or pyramid on the paradise. It comes into bearing early, and is a great cropper, coming, as usually grown, about twelve or fifteen to the pound; but, on healthy young trees, where the fruit has been thinned, about six or seven to the pound. In a normal season it is at its best for dessert purposes from mid-September to early October, when it is very crisp and tender, with a profusion of highly-flavoured vinous juice, though with a brisk acidity early in its season which never quite disappears. In late October it becomes mealy.

It is a handsome apple, with its clear yellow skin, and is a great favourite with children. ALGER PETTS.

MUSHROOMS IN BEDS OF LEAVES.

Many gardeners in different parts of the country will soon be busy collecting the fallen leaves from trees. In some instances there will be more than can be used, especially where the garden soil is of a very light nature; but where it is clayey, of course, there is plenty of room for sweet leaf-soil. But in any case, where the leaves are plentitul, some may be used for making into beds on which mushrooms may be grown. Many gardeners mix leaves with the stable manure for forming the beds, and some use leaves only.

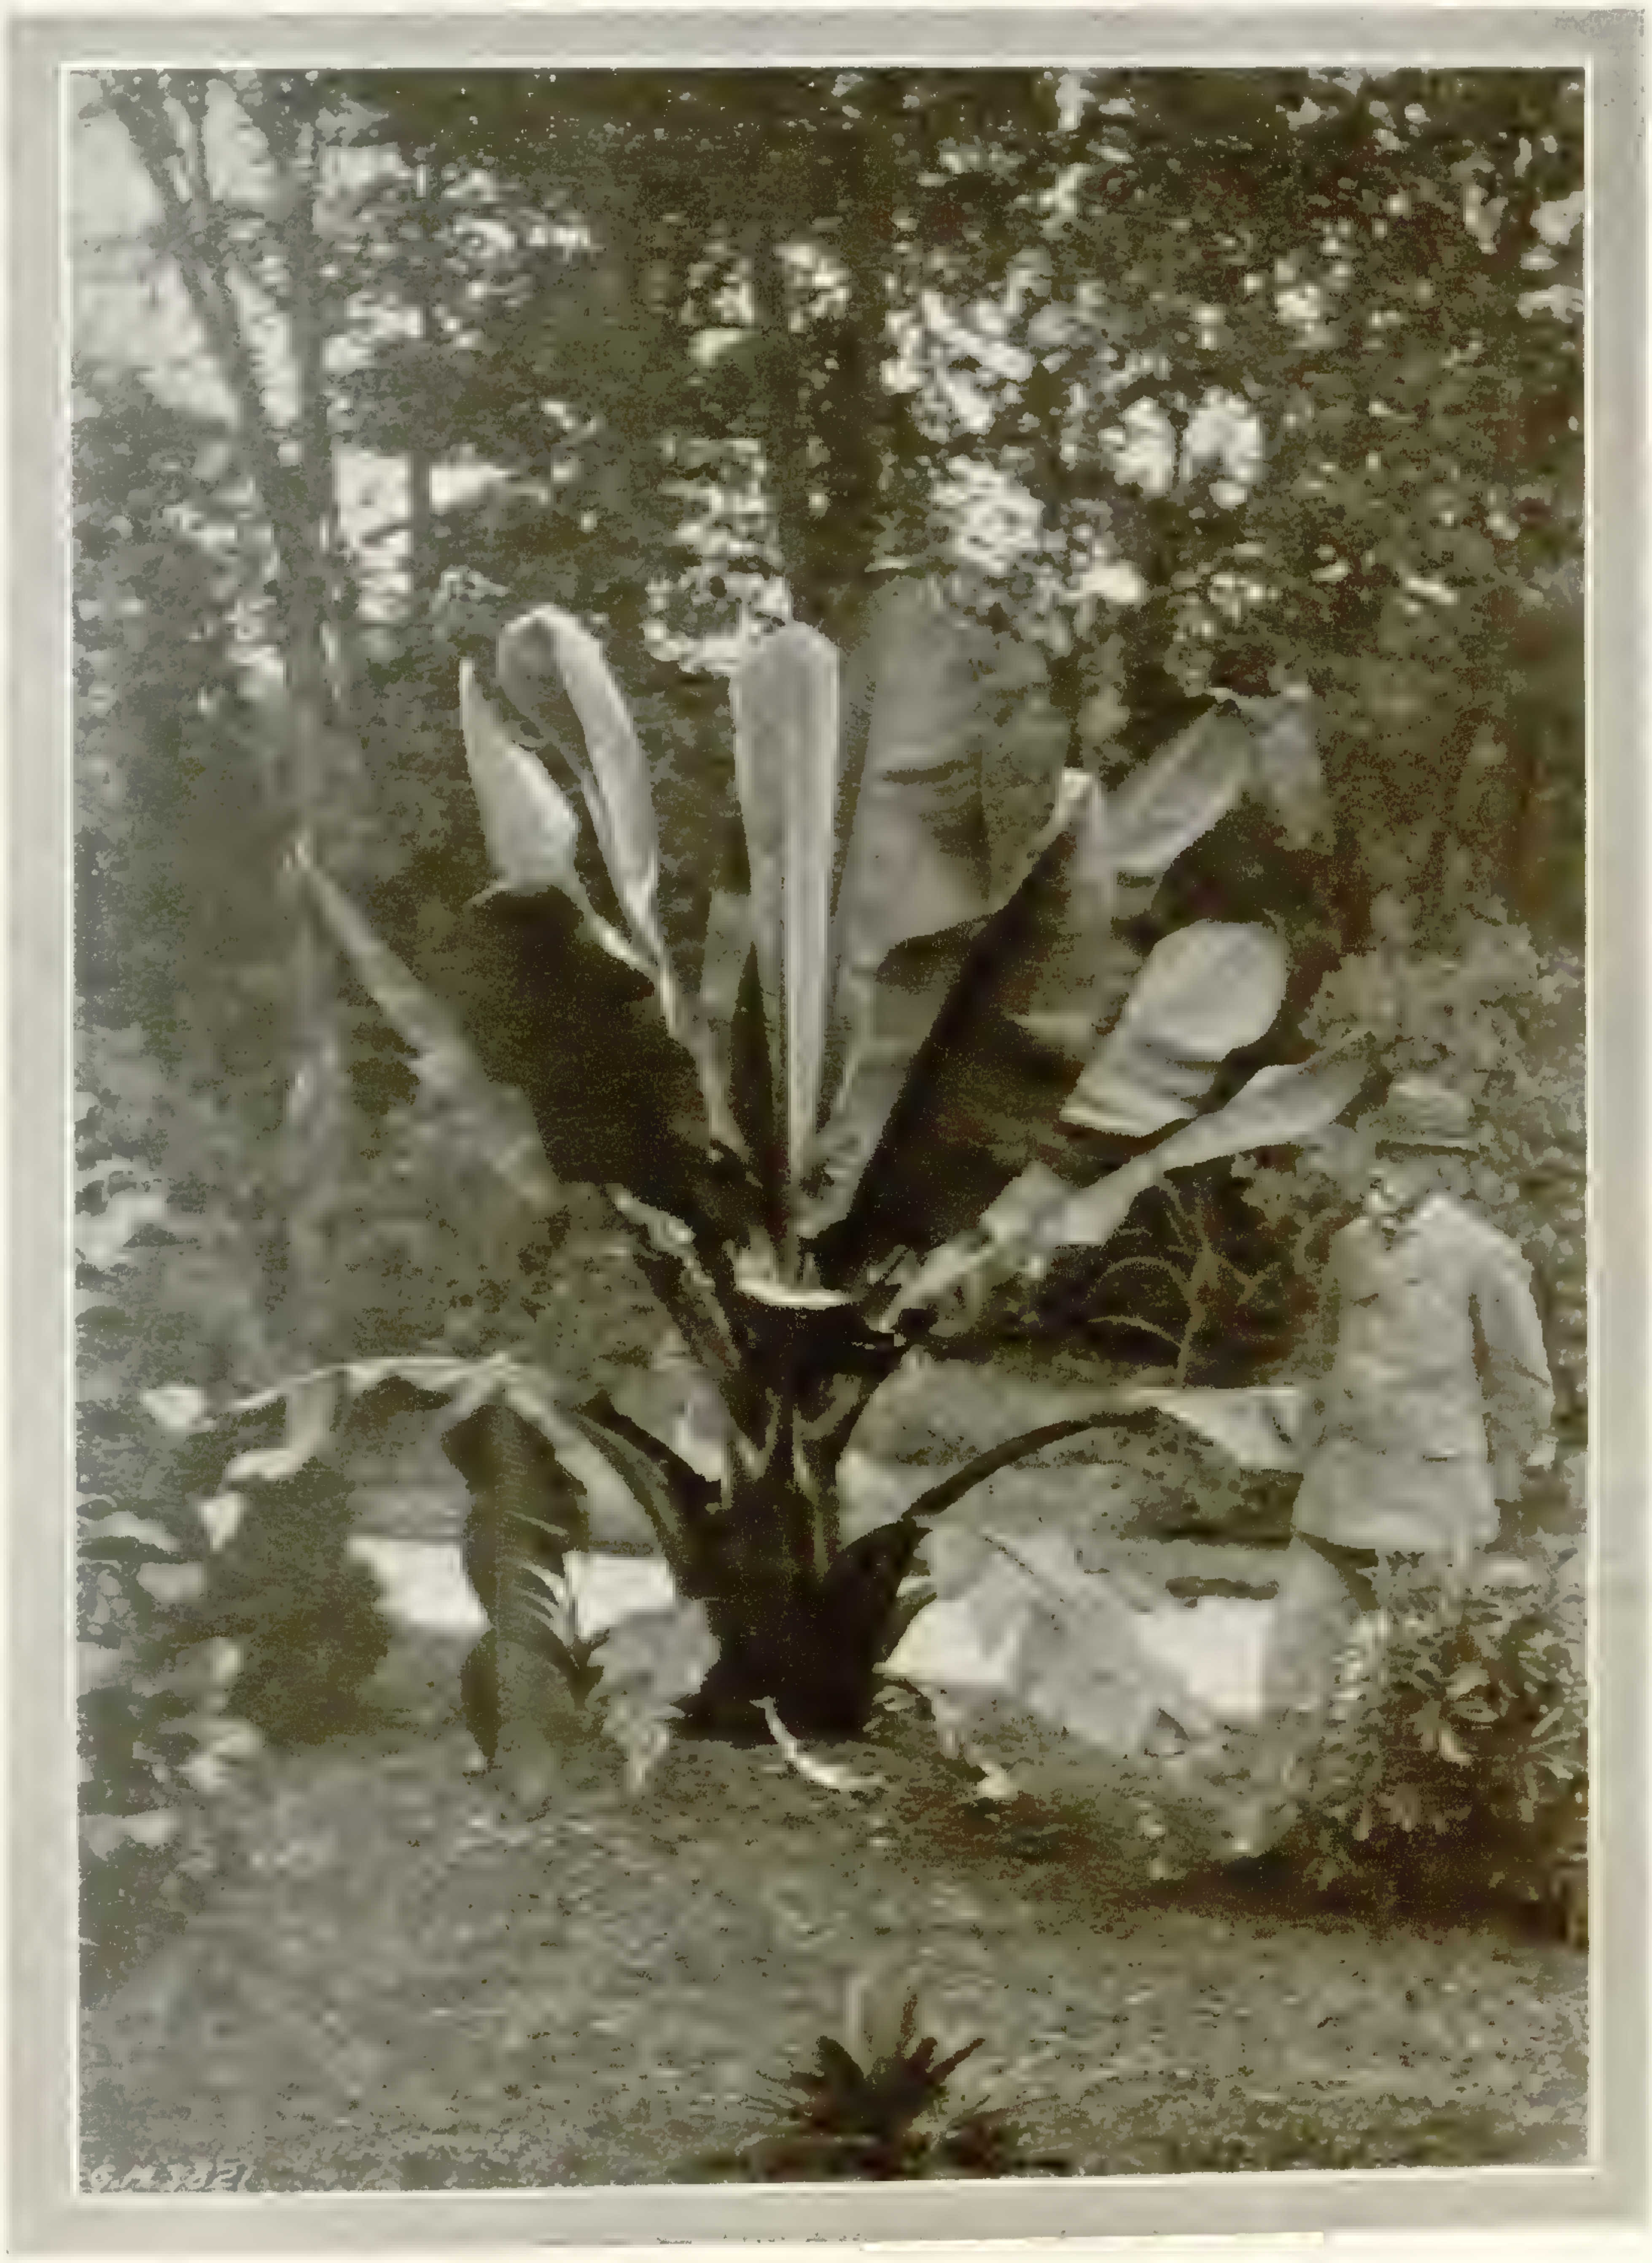
I have been very successful in the cultivation of mushrooms on leaf-beds during the winter months in the open air, and I will briefly explain my method. I never depended entirely upon leaves a year old, no matter how unbroken they were. Directly the fresh leaves commenced to fall they were gathered and spread out in a convenient place, and when sufficient were collected to form a large bed, these new leaves were judiciously mixed with some of the best of the old ones. I rarely found it necessary to damp them, as the new ones contained sufficient moisture for all. The bed was made ridge-shaped 5ft. wide at the base and 5ft. high. This height allowed for sinking. As the layers of leaves were placed in position they were trodden down and kept in place by the addition of a small quantity of good loam which was sprinkled on each layer. The heap was finally covered with a layer of freshly-sifted loam to a depth of about nine inches; the spawn being inserted in the soil in the usual way, and a thatch of straw completed the work.

In addition mats were used in very frosty weather, and other leaves, as gathered, were placed in heaps around the foot of the ridge. In this way a gentle and lasting heat was maintained in the bed for a long period. The mushrooms generally grew in large clusters, few coming singly.

G. B.

MUSA ENSETE IN CORNWALL.

The gardens of Rosehill, Falmouth, the residence of Howard Fox, Esq., have long been remarkable for the large number of comparatively tender plants that are grown to a high degree of perfection within their boundaries without the aid of glass. Here we find acacias, brugmansias, cordylines, palms, tree ferns, and other subjects that in other parts of the United Kingdom have the shelter of glass and assistance of fire heat growing luxuriantly in the open; and of these none contribute more liberally to the interest and attractions of these gardens than do the bananas. Indeed, these are so successfully cultivated that the banana walk constitutes a noteworthy feature, and three years since five specimens of the Japanese banana fruited. The tender Musa ensete often passes through the winter uninjured in the Rosehill gardens, and, as so well shown in the accompanying illustration, established specimens assume noble proportions, and present a stately appearance. This is unquestionably one of the most ornamental of all the bananas, and is of much value in a kind climate such as that of Cornwall for giving a tropical aspect to garden scenery.



MUSA ENSETE AT ROSE HILL.

HARDY FLOWERS are always popular, as they make the garden bright and attractive, and require but little attention. All the information required for their successful culture is given in EASILY GROWN HARDY PERENNIALS, by G. H. Vos. Price 5s. net, by post in box, 5s. 6d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

SODA BORDEAUX.

This fungicide is made from copper sulphate just as the ordinary Bordeaux mixture. It differs, however, in that caustic soda is used to neutralise the acid property of the bluestone instead of lime; and that the final mixture contains sodium sulphate instead of calcium sulphate (gypsum). The resulting form of the copper, copper hydrate, is exactly the same, and exerts the same fungicidal power. The following method of preparing the soda Bordeaux is recommended in Bulletin 171 of the Ontario Department of Agriculture:

The main point in connection with this mixture is that caustic soda is an extremely active alkali, and any amount of it added over and above that required to combine with all the copper will destroy foliage. Therefore, in making soda Bordeaux, it is important to add just the exact quantity of the soda required to change all the bluestone to copper hydrate. This is done by adding the soda solution slowly to the copper solution, mixing thoroughly after each addition, and testing for the neutral point with litmus paper. The moment the litmus paper takes on a faintly blue tinge is the time to stop adding. The copper is then all in the form of a sediment and any more alkali added will be left in the free state.

The following tentative formula can be given:

Caustic Soda	2 pounds.
Copper sulphate	6 pounds.
Lime	5 ounces.
Water	40 gallons.

In making, add three-quarters of the soda solution at once, mix thoroughly and then add the rest gradually, mixing and testing until the proper quantity is present. It may not require the whole amount recommended, and it may require more, depending upon the quality of the soda. When the alkaline value of a sample of soda is once ascertained, then one can proceed with much more rapidity. The small amount of lime is added to make the mixture decidedly alkaline, and, therefore, safe, and to cause the precipitate to remain blue instead of changing to dark brown or black, which it does after standing some time where an excess of soda is used.

Caustic soda can be bought retail or in drums of one hundred pounds, from or through any chemist, while Gillette's lye, which is familiar to everyone, is a convenient form of soda for use in making soda Bordeaux.

Soda Bordeaux has an advantage over the ordinary Bordeaux in that it is just as good a fungicide, and at the same time is made without the labour of slaking and preparing of lime. There are disadvantages, however:

1. Great care is necessary in the addition of the caustic soda. Any added in excess is dangerous to foliage; an excess of lime is not harmful, though not advisable.

2. Unless exactly neutral, the addition of an arsenical to soda Bordeaux to impart to it an insecticidal power, is dangerous. Any free alkali will act upon the arsenic compound and form sodium arsenite, which, being soluble, will scorch foliage.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

MASDEVALLIAS.—The robust-growing section of this genus, comprising such popular kinds as M. Veitchi, M. ignea, M. Davisi, M. coccinea (better known in gardens as M. Harryana), in its varied forms, and the numerous hybrids of the stronger growing species, will now have their growths in such a condition that they will be emitting their new roots, and thus will be ready for potting. Some growers advocate potting in the spring, and this is certainly desirable for many of the miniature kinds, such as M. Wagneri, M. Estradæ, M. simula, and M. tridactylites, where the roots are produced immediately after they have flowered. But the robust growing kinds commence throwing up their flower scapes in the spring, expand their flowers in April and May, start into growth immediately after flowering, and the new roots are formed in due course in the early autumn.

TIME TO POT.—I have always been an advocate of not disturbing cool house orchids when we are about entering upon the hot summer months. It is far better to delay the disturbance until the sun commences to lose some of its power, and at the present season, when little or no artificial heat is necessary at nights, and the days are not so excessively hot, there is the least possibility of the plants suffering any ill effects from potting. Moreover, the plants are at the stage when new roots are active, and in this condition they are enabled to become more readily established in the fresh potting compost. As the plants require a liberal supply of root moisture at all seasons of the year, the matter of ample and clean drainage in the pots should not be overlooked, as there is nothing more likely to cause disastrous results in the winter months than stagnation about the roots. Loss of foliage and spotting of the leaves may generally be traced to this cause.

THE POTTING COMPOST used should also be of a porous and lasting nature. Peat and chopped sphagnum moss, with a little silver sand and finely broken crocks intermixed, is suitable, and all that is really necessary, but a few broken oak or beech leaves we find beneficial, while osmunda fibre or polypodium fibre may be substituted for the peat, but I consider good fibrous peat preferable. When repotting, do not damage the active roots while turning the plants out of their pots and removing the old potting compost. All dead leaf sheaths and decaying material about the base of the plants should be removed. Make the compost moderately firm, and when finishing, gradually mound it to the centre of the pot. A thin layer of sphagnum moss is desirable where leaves are included in the potting-compost. Water thoroughly as soon as potting is completed, and keep the plants shaded until the roots get hold of the new compost.—H. J. Chapman, Oakwood Gardens.

FRUITS UNDER GLASS.

EARLY VINERIES.—Where all the fruit has been cut, give the vines the benefit of a complete rest. Throw open all ventilators and doors, and damp the border and foliage down at least twice daily; by these means a complete rest will be assured. Do not allow the border to become dry, or the small fibrous roots will perish; if the mulching material is spent, apply a little more to check evaporation.

MIDSEASON HOUSES. — Black Hamburghs, when well ripened, may have a little shade over the glass, and should receive the benefit of all air possible. That beautiful grape Madresfield Court should be kept rather dry in order to keep it in good condition. It has coloured well this season in spite of a dull time. Keep a sharp look out for insects, and sponge the leaves upon the least indication of red spider. That fine grape, Mrs. Pearson, is a good midseason variety, being both handsome and richly flavoured, and, moreover, it is a fine keeping variety; it requires heat and time to ripen, but Muscat treatment will grow it to perfection. The fire heat may be now turned off these houses in fine and dry weather.

MUSCAT OF ALEXANDRIA.—Where the fruits in the main houses are approaching ripeness they should be given plenty of air. If the borders are sweet and well-drained no shanking will be present; but if shanking occurs there is something wrong with the border, or the management of the house. If the borders are thoroughly drained, one cannot well give too much water; but if the drainage is imperfect, very little water might be too much, and the border become sour. With houses near the south coast and facing due south, a little shading may be quite necessary, or the skins may be burned or browned by too strong sunshine; a light shading may be put on with a sprayer. Good colour is essential to bring out the finest qualities of this popular grape, and in houses facing any other aspect than south it will be necessary perhaps to draw the foliage slightly aside to allow more sunlight to reach the bunches. It is a good plan with very old Muscats to cut down a vine occasionally and train up a young rod, as this system imparts fresh vigour and secures larger bunches.

LATE GRAPES.—Lady Downes, Alicante, Mrs. Pince, and all late varieties must be kept growing strongly in order to have them ripe by the beginning of October. They will now require copious supplies of moisture and good doses of liquid manure. Lady Downes is the most reliable late black grape. Too many varieties should not be attempted, as it is often a fatal mistake. A little air should be left on the vineries all night, and when this is done very little, if any, burning ever takes place, and grapes colour better under these conditions. The laterals should be kept pinched regularly, so that the strength of the rod is allowed to concentrate on the fruit. This is one of the best grapes to keep clean, as it is rarely that any pest attacks the foliage.

LATE MELONS.—Secure a set as soon as possible so that the fruits will be ripe by the end of September or beginning of October, as being hot weather fruits melons are not much in demand after that date.

FRAME MELONS. — Where these are ripening leave a little air on after the usual closing time, or the fruits may crack with excess of moisture. These melons are doing remarkably well this season, and are within the reach of all who possess a frame, and most varieties will do well and produce heavy crops of fruit in frames.

CUCUMBERS.—It is now time to sow a batch of these for autumn fruiting, and no better variety exists than Everyday. It is, as its name implies, an everyday variety, of convenient size, and, moreover, a good cropper and of good flavour. Seeds should be sown in small pots, and as soon as possible shift the plants into 48's, when the house should be thoroughly cleaned and made wholesome for their reception.

TOMATOES for autumn and Christmas should now be put into larger sized pots, and grown on sturdily out in the open, and should be in their fruiting pots by the middle of September. The supply of fruits from old plants and from outdoors may be kept up for a long time; but these fruits are not so rich in flavour for special purposes as those produced from young plants.—W. A. Cook, Leonardslee Gardens.

THE KITCHEN GARDEN.

CELERY.—The agreeable change in the weather, with more sunshine, will necessitate extra attention to watering and feeding this crop with liquid manure. A dressing of soot spread along the rows and watered in has a very beneficial effect, and acts very quickly. The earliest plants will require earthing up at short intervals. Choose a time when the soil is dry, taking care that the heart of each plant is kept clean from dirt. The latest crops are much better left to grow for a time yet before any attempt is made to blanch them.

LIFTING POTATOES.—Crops that are yet occupying warm situations will be sufficiently matured to be lifted and stored for use. There is no advantage in allowing them to remain in the soil after the tubers are fully grown, but a risk is run of the crop being attacked with disease if a period of warm wet weather sets in. Second earlies, such as Snowdrop, will in most cases be ready for lifting, and will keep much better out of than in the soil.

PARSLEY.—This is the most important herb of the garden, as a continuous call is made for it the year round. If a sowing was made, as advised, good plants will be ready for making plantations in favourable positions to provide the winter supply. Give ample space between each plant so that the leaves make firm growth. Drawn foliage will damp off and be useless as soon as wet and frosty weather sets in. It is also advisable to have plantations established in cold frames during the autumn. A sowing made now often proves useful in giving plants that stand the winter without injury.

MUSHROOM HOUSE.—The time has arrived when this should be put in order for use. A wet day is mostly selected for this as it gives occupation to the staff. Cleanliness is of the first importance in the cultivation of mushrooms, and every particle of rubbish, etc., should be removed, and the walls of the house thoroughly washed with lime. Collect manure and prepare it by frequent turnings, with a view to making up the first inside bed. An outside bed or two is most valuable, even at a private establishment, in yielding a useful addition to the crops inside. The mushrooms are much larger, and sought after by the cook for various flavouring purposes.

CAULIFLOWERS. — The usual practice now is to raise the earliest plants under glass in January, and grow them on in frames till safe to plant out in March or April, but I do not advise giving up the older practice of sowing during the next week or two a quantity of the variety Snowball in a protected position. Last year a sowing of this kind proved most valuable with us. Being a cold wet time, the plants grew away more satisfactorily than those reared under glass.

HERBS. — Many herbs will be now sufficiently matured to harvest. Select a dry day for cutting them, and expcse them to the sun on mats, or hang them in bunches in a dry, airy shed or in a peach house in which the trees are resting.

GENERAL REMARKS.—Thin out the winter crops, such as spinach, turnips, etc., as soon as the plants are nicely up, and run the hoe between the rows when the surface is dry. Late-planted greens will require the surface soil frequently stirred; fill up all vacancies that may happen in the quarters. The kitchen garden should now look at its best, and every effort should be made to secure neatness and a pleasing appearance. — Charles Flack, Cholmondeley Castle Gardens.

Rose Madame Abel Chatenay.—This splendid garden rose has succeeded remarkably well in an almost sandy rooting medium during the past few years. Every summer, about the middle of July, a strong basal shoot has grown up quickly from the last year's shoot, and about the middle of August the new stem branches out freely near the top, and bears a number of small buds which develop in September. I have noticed that the buds on the new shoot and below the youngest flower-bearing branches plump up well while the flowers are opening. The following year these plump buds grow and form strong branches which bear extra fine blossoms. The tree seems to gain more strength each year. So far no pruning has been done. All flower buds that are gathered of this beautiful variety fully develop after being placed in vases of water. It is a long-lived rose in water, and, as far as my experience goes, the variety La France is a short-lived one in a cut state.—G. B.

SHREWSBURY FLORAL FETE.

(Concluded from page 648.)

bougainvilleas, crotons, and palms. Mr. B. Cromwell, gardener to T. Sutton Timmis, Esq., Allerton, Liverpool, a good second with fine alocasias, crotons, ixoras, etc.

Mr. B. Cromwell had the finest half-dozen caladiums, and, as usual, he showed these well. In the county class for six stove and greenhouse plants Mr. T. Lambert annexed the first prize, and he had Clerodendron Thompsonæ, Ixora macrothyrsa, and Eucharis amazonica in fine condition; Mr. J. Farrant, Shrewsbury, a good second. The latter scored for gloxinias. Mr. Lambert had the finest half-dozen dracænas, and Mr. T. Hammonds, Castle Fields, had the best four begonias, but these were not up to the best form. Mr. Taylor, Abbey Forgate, was first in two classes for zonal pelargoniums. Mr. Farrant led for fuchsias. In the open class for begonias Messrs. Blackmore and Langdon were an easy first, with large and beautiful plants finely flowered; Mr. G. Burr, Shrewsbury, second; and Mr. A. Vaughton, Handsworth, third.

In the open class for pelargoniums Mr. Cliff, gardener to Mrs. R. Taylor, Abbey Forgate, Shrewsbury, secured first place for six plants with well-trained and freely-flowered flat specimens; the same competitor also scored for six double varieties, but here, as in the other class, the varieties were unnamed—a very great failing on the part of so good a grower. Mr. B. Cromwell led for four exotic ferns with wonderful plants of Goniophlebium subauriculatum, Nephrolepis todeaoides, Nephrolepis exaltata, and N. davallioides furcans; Mr. C. Kelland, gardener to E. Vaughton, Esq., Handsworth, second; and Mr. J. G. Burr, Oaklands, third.

SWEET PEAS.

These flowers filled the whole of one tent. Mr. G. Aitken, gardener to P. York, Esq., Errdit Park, had the best dozen varieties of sweet peas, and won with beautifully clean blooms of Clara Curtis, Helen Lewis, John Ingman, Mid Blue, Constance Oliver, etc., but the varieties were unnamed; Mr. W. Davies, gardener to Dr. Phillips, Malpas, a good second; and Mr. T. Jones, Bryn Penylan, third; twelve entries. In the class for eighteen bunches of sweet peas the chief of Mr. Eckford's prizes fell to Mr. G. Aitken, whose set contained Henry Eckford, St. George, The King, J. Ingman, Evelyn Hemus, Bobbie K., and Helen Lewis in fine form; Mr. E. Jones, gardener to G. H. F. Robertson, Esq., Gresford, Wrexham, second; Mr. J. Haycocks, Gyfelia, Wrexham, third; Mr. S. Golding, gardener to Mrs. R. Davies, Bangor, fourth; Mr. Proctor, Altrincham, fifth; and Mr. H. E. Ward, Vicars Cross, sixth. Fourteen entrants. In this class Mr. T. Jones was, owing to an unfortunate mistake, placed out of the running, but he had easily the best collection.

For a bunch each of Mrs. T. G. Baker, Baker's Scarlet, and Earl of Plymouth, the awards were made in order of merit to Mr. F. Edge, Callcott; Mr. T. Jones, Ruabon; and Mr. W. H. Banks, Kington, Hereford. First prize for six bunches of sweet peas (prizes provided by Mr. R. Bolton), Mr. T. Jones, Bryn Penylan, scored with Zephyr, Elsie Herbert, Clara Curtis, John Ingman, Asta Ohn, and Birch Knight; Dr. Phillips second, and Mr. J. Haycocks third; seventeen competitors.

Mr. Thos. Jones, Ruabon, was first in Messrs. Webbs' class for six varieties, and here he won with Helen Lewis, Frank Dolby, Mrs. H. Bell, Prince of Asturias, and Henry Eckford; Dr. Phillips second, Mr. E. Jones third, and Mr. H. J. Lowe, Shrewsbury, fourth; eleven entries.

FLORAL DESIGNS.

Many of the floral designs were charming, but the competition was hardly so keen as usual. For a bride's bouquet and two bridesmaids' bouquets, the prizes fell in order to the King's Acre Nursery Company, Hereford, for white orchids and pink carnations; Messrs. Wood and Eastham, Preston, for white orchids and blush carnations; and Mr. R. F. Felton, Hanover Square, London, for white orchids and Mdme. Abel Chatenay roses. Mr. W. J. Garner showed the best bride's bouquet, a lovely design in odontoglossums, white cattleyas, and phalænopsis. The best hand bouquet was a brilliant design in oncidiums, epidendrums, cattleyas, and odontoglossums, from Messrs. Perkins and Sons, Coventry. In the class for a hand bouquet, orchids excluded, Messrs. Wood and Eastham were first, and Messrs. Bottomley and Burton, Elland, second, each with pink carnations.

Mr. J. Nixon, gardener to O. Robinson, Esq., Alderley Edge, led for a shower bouquet of cactus dahlias, and was followed by Mr. W. J. Garner. Mr. Nixon was also first for a featherweight bouquet. Messrs. Gunn and Sons, Olton, had the best floral harp, and Miss A. Townsend the best basket of other flowers than orchids. The open class for a basket of flowers was a very good one, and here first place was filled by Mr. J. Nixon, who had a very beautiful design, made up with odontoglossums, Epidendrum vitellinum majus, cattleyas, and anthuriums; Mr. W. J. Garner, Altrincham, second, with a fine arrangement of orchids; and Messrs. Bottomley and Burton, Elland, third.

CUT FLOWERS.

There were some excellent displays of roses, but the space allowed, 6ft. by 4ft., was hardly sufficient for the best displays; Mr. G. Prince, Longworth, secured the premier award with a lovely lot of tea and hybrid tea roses, artistically displayed; and Mr. T. M. Bradley, Peterborough, was second. Roses were good throughout, and Mr. Hugh Dickson, Belfast, scored for two dozen blooms, his examples of the Lyon Rose and Mildred Grant attracting a great deal of attention; Messrs. Alex. Dickson and Sons, Newtownards, second; and Messrs. Harkness and Son, Hitchin, third. For eighteen roses Messrs. A. Dickson and Sons, Mr. Hugh Dickson, and Mr. G. Prince, Longworth, were placed in the order of mention.

Collections of cactus and decorative dahlias were well set up by Messrs. Keynes, Williams, and Co., Salisbury; Mr. W. Treseder, Cardiff; and Messrs. Campbell and Son, High Blantyre, who obtained prizes in the order named with fine decorative arrangements. Mr. J. Smellie, Busby, led both for show and cactus dahlias, on boards, and showed well in each case. In the amateur classes for both show and cactus dahlias, Mr. W. H. Peerman, Nantwich, was first. Messrs. Harkness and Son, Bedale, had the best gladioli, a fine set.

Collections of hardy perennials were fine, and attracted a great deal of attention. For a display on a space with a 10½ft. frontage Messrs. Gunn and Sons, Olton, were first with a grand lot of bunches of phloxes, gaillardias, montbretias, gladioli, liliums, etc.; Messrs. W. Artindale and Son, Sheffield, second, and Messrs. Gibson and Co., Leeming Bar, third. The best eighteen bunches of hardy flowers came from that now famous amateur grower, Mr. F. Bouskill, Market Bosworth, who had grand phloxes, etc. He was also first for a dozen bunches, staging equally well in this; Mr. T. Kent, Llandaff, second, and Mr. Banks, Kington, third.

Collections of carnations and picotees, set up boldly on a space 6ft. by 4ft., made a brave display, and the fight for prizes was a very keen one; chief honours fell to Mr. C. H. Herbert, Acocks Green, who set up his fine blooms in a most attractive manner; Messrs. M. Campbell and Son, second, and Messrs. Artindale and Son, third. In the trade excluded class for a display of carnations the awards were made in favour of Mr. C. Alcock, Mr. Robinson, and Mr. J. Wallace, Bromborough, who were placed as named. Mr. C. F. Waters, Balcombe, Sussex, led for a collection of tree carnations with a display of excellent flowers of popular varieties. For a dozen vases of fancy and self carnations and picotees Mr. C. Alcock, Blundell Sands, was a good first, and he showed grand blooms of Agnes Sorrel, Daffodil, Liberté, etc.

Mr. B. Cromwell scored for a collection of stove and greenhouse flowers, and he showed splendid bunches of lapagerias, agapanthus, ixoras, stephanotis, liliums, etc. Mr. A. Myers, Shrewsbury, led in the classes for double and single pelargoniums. Mr. F. Bouskill led for gaillardias in a very close fight, while for early chrysanthemums the prizewinners were Mr. J. Smellie, Mr. Bowness, and Mr. A. Hoggan, all of Busby, respectively.

VEGETABLES.

The vegetable section opened with a class for nine dishes, and the premier award was secured by Mr. J. Hudson, Leicester, who had Giant White celery, Early Mammoth cauliflower, Champion Prize leek, Prizewinner carrot, Ailsa Craig onion, Staurbridge Marrow pea, Emperor tomato, Exhibition runner bean, and Duke of York potato. All were excellent dishes, well staged, and of even quality. Mr. J. Gibson, gardener to the Duke of Portland, Welbeck, came a very close second, and Mr. B. Ashton, gardener to the Earl of Lathom, Ormskirk, third. In a similar class, but confined to residents in the County of Salop, Mr. W. Dawes, gardener to Lord Trevor, Brynkynalt, was awarded first for a very nice lot, in which the leeks, celery, and carrots were capital dishes; Captain Heywood Lonsdale, Shavington, was second; Mr. S. D. Brooke, Red Barn, third, and Mr. J. Chapman, Betton Strange, fourth.

Another class for nine dishes was provided for exhibitors not entering the leading class, and here Mr. W. Gaiger, gardener to H. F. Tatham, Esq., Elstree, led off with a beautiful set, the varieties being Autumn Mammoth cauliflower, Pink Perfection celery, Prizetaker leek, Ailsa Craig onion, Intermediate carrot, Prizewinner bean, Perfection tomato, Duke of Albany pea, and Windsor Castle potato. In the class for nine dishes, for which Mr. Edwin Murrell provided prizes, Mr. W. Gaiger again secured the coveted award, his dishes being finely finished, and well arranged. Mr. T. Sanderson, Whittington, was second; and Mr. R. C. Townsend, gardener to J. B. Akroyd, Esq., Gerrards, Bucks, third. In the same firm's class for six dishes, Mr. T. Sanderson came to the fore, Mr. W. Astley, Hadnall, following, and Mr. J. Howells, gardener to G. Mitchell, Esq., Bellevue, third.

There were a number of classes for separate dishes, for which the prizes were provided by Messrs. Webb and Sons, Wordsley, Stourbridge, and among the principal prizewinners in these classes were Mr. A. R. Searle, gardener to the Marquis of Northampton, Castle Ashby, who won for tomatoes, carrots, and celery, Mr. J. Weston, Shawbury, who led for peas; Mr. J. Hudson, Leicester, who was first for onions, cauliflowers, and cucumbers; and Mr. B. Ashton, who scored for leeks with perfect models of Webbs' Champion Prize. Messrs. Dickson and Robinson also provided several classes, and here Mr. B. Ashton secured first for leeks and Intermediate carrots; Mr. Searle first for Scarlet Model carrot; Mr. J. Mills, gardener to Captain Heywood Lonsdale, first for onions; Mr. W. Gaiger for Hercules pea; and Mr. S. Golding, gardener to Mrs. R. Davies, Bangor, for two bunches of Moneymaker tomato.

Other winners in single dish classes were Mr. A. J. King, Stroud; Mr. J. Taylor, Hardwick Grange; Mr. E. Jones, gardener to the Misses Howell, Berriew; Mr. J. Chapman, Belton, Strange; Mr. O. Oakley, Berriew; and Mr. McFall, Huyton. Mr. J. Wilson, Hereford, offered prizes for five Cranston's Excelsior onions, and seventeen sets were staged. Mr. S. T. Baker, Exeter, was chief prizewinner with bulbs that averaged about 18 inches in circumference, and weighed a total of nearly fourteen pounds.

NON-COMPETITIVE EXHIBITS.

The non-competitive exhibits are always a fine feature at Shrewsbury Fête, and this year they were quite as good as usual. In former years medals of various grades have been awarded according to the merit of the display, but this year awards were arranged so as to make the non-competitive exhibits competitive in a sense. It was thus: Four silver cups, six gold medals, and six silver medals were allotted, and the cups were for herbaceous flowers, sweet peas, cut flowers (excluding herbaceous and sweet peas), and the most attractive exhibit. These sixteen awards meant that about thirty-four exhibitors could obtain nothing more than a certificate of merit, and consequently there was a very great deal of dissatisfaction among those who missed the advertising value of a medal award. To make non-competitive displays compete with each other is paradoxical, and bad policy, more especially as it is practically impossible to judge between exhibits of such varied character and extent as those at Shrewsbury.

The Temple of Flora now familiar to show goers as Messrs. Webb and Sons' special design, was on this occasion set up in a conspicuous position, where the artistic arrangement of sweet peas and a few other flowers showed to full advantage. Melons and vegetables also played their part in a bold and pleasing scheme. Messrs. Dobbie and Co., Rothesay, had a beautiful display of cactus and pompon dahlias, with a selection of pæony-flowered varieties. The cactus varieties included the leading sorts: Helium, Dreadnought, and Evening Star occupying prominent positions. A few new and excellent sweet peas occupied one end of the stand. Messrs. Hobbies Lim., Dereham, occupied their usual bay in the large tent, which they filled with roses. Weeping standards of the ramblers stood above hybrid teas arranged in large bunches, the tent pole in the centre of the bay being effectively covered with the clear pink Minnehaha. Messrs. Sutton and Sons' exhibit of melons, vegetables, and flowers was, as usual, arranged in a most artistic manner. A series of flower-decked arches formed a splendid background, and mounded groups of begonias and gloxinias added a feature to the exhibit.

A table of choice ferns was exhibited by Mr. H. N. Ellison, West Bromwich. Among many useful and beautiful kinds Adiantum trapeziforme, Lastræa patens, and Platycerium alcicorne were prominent. Mr. Forbes' phloxes, pentstemons, and carnations, from Hawick, were, as ever, bold, bright, and of high quality. Pentstemons Gregor Mendel, Sir Dighton Probyn, and Peach were three good ones. An orchard under canvas is what Messrs. J. Veitch and Sons, Lim., Chelsea, had to show visitors. Figs, peaches, and nectarines were represented by fine heavily-laden pot trees, with pears, gooseberries, and plums to add variety. Messrs. Pritchard and Sons, Shrewsbury, put up a large miscellaneous collection of greenhouse plants, Verbena Miss Wilmott being fine. A bold group of hardy flowers came from Messrs. Hewitt and Co., Solihull. Liliums and gladioli stood out prominently, with phloxes and other seasonable flowers. Messrs. Gunn and Sons, Olton, Warwickshire, brought a fine display of their far-famed phloxes, among which were interspersed fine liliums, montbretias, and other border perennials. A water and bog garden was well arranged in one bay of the large group tent by Messrs. Bakers, Wolverhampton. Spiræas, sarracenias, bamboos, etc., were well grouped around pools, upon which water lilies floated. At either end of the space were banks of phloxes.

Zonal pelargoniums were well shown by Mr. Albert Myers, Shrewsbury. Ferns and gypsophila were used as a setting for the flowers, with good coleus as a background. Messrs. Dicksons, Lim., Chester, showed hardy flowers of splendid quality. Lilium auratum rubrum vittatum was the most conspicuous subject among many good things. Early-flowering chrysanthemums came from Messrs. Seagrave and Co., Gleadless, near Sheffield. Good varieties were artistically arranged. A good display of dahlias and violas came from the same firm. Phloxes, delphiniums, and other herbaceous flowers were staged by Messrs. Isaac House and son, Westbury-on-Trym. Messrs. William Conway and Sons, Lim., Halifax, also showed herbaceous plants in excellent fashion. The collection of pot fruits staged by the King's Acre Nurseries, Lim., Hereford, was both extensive and excellent. A fine horizontally trained Sea Eagle peach carried over a hundred fruits. Grapes, apples, and other fruit were well represented. A bank of phloxes from the same firm consisted of the best varieties.

Perpetual and Malmaison carnations were shown in fine style by Messrs. W. Cutbush and Son, Highgate Nurseries, London. Mr. Edwin Murrell, Shrewsbury, staged roses in variety, and a small group of clematis. An exhibit which attracted an immense amount of attention was the remarkable display of sweet peas put up by Messrs. Jones and Sons, Lim., Shrewsbury. Large broad-spanned arches were stretched over a wide area, with pillars and pyramids, all festooned and decorated with fresh-looking blossoms of the leading sorts. The table underneath was also filled with sweet peas in bunches, backed by well-grown sweet peas in pots. Messrs. Alex. Dickson and Sons, Lim., Newtownards, made a brave display of their famous "Hawlmark" roses. Exhibition varieties in boxes were backed up by fine bunches of the popular "garden" roses. Mr. W. L. Pattisson, Shrewsbury, staged bedding violas in great variety. Mr. John Smellie, Busby, N.B., put up chrysanthemums and dahlias. Mr. W. Angus, Penicuick, showed a fine batch of Disa grandiflora. Messrs. W. and J. Brown, Stamford, occupied a large space with roses and hardy flowers. Messrs. Harkness and Sons, Bedale, put up a fine bank of named gaillardias which were of bright and pleasing colours.

Mr. William Deal, Brooklands, Kelvedon, showed a small lot of new sweet peas. Messrs. Robert Sydenham, Lim., displayed sweet peas in their own particular table decoration devices; the flowers were good, and showed to advantage in these light and elegant stands. Messrs. Jarman and Co., Chard, had an imposing exhibit arranged on similar lines to that described in our report of Taunton Show last week. vegetables being well shown in addition to the flowers. Messrs. John Peed and Son, West Norwood, London, showed well-grown caladiums.

Sweet peas were quite a feature, and the specialists were out with their best. Mr. Henry Eckford, Wem, Salop, as might be expected, put up a remarkable exhibit. The cream of the up-to-date varieties were here, and the blooms were fine and well arranged. Mr. T. W. Darlington, Warton, Carnforth, had an elaborate display, using arches and baskets as a means of displaying the flowers. Mr. Robert Bolton, Warton, Carnforth, had flowers of remarkably fine quality for the time of year, and put them up in liberal quantities and artistic manner. The new Charles Foster, of a lovely shade, which almost defies description, was well shown and much admired. A blending of rose, salmon, and apricot is our attempt at definition. Messrs. Isaac House and Son had several sweet peas of their own raising on view.

The double hollyhocks of Messrs. Webb and Brand, Saffron Walden, had quite an "old world" halo around them, albeit the varieties were of modern introduction.

Messrs. Kelway and Son, Langport, delighted everyone with their gladioli. They were shown in immense quantity and wonderful variety of colour. Among so many perfect examples it were folly to particularise.

Messrs. Tom B. Dobbs and Co., Wolverhampton, arranged in the open a variety of designs in rustic garden furniture; seats, arches, rose pillars, tree tubs, etc., were furnished with suitable plants, and a few beds of flowers added to the artistic effect.

Miss S. S. Thompson, Charlton Villa, Handsworth, showed cacti and succulents. A few fine pieces of cristated and fruited phyllocacti and mamillarias were very pretty and interesting.

Messrs. Dickson and Robinson, Manchester, arranged an extensive display of vegetables, their onions being of high quality. Hardy flowers were also staged by this firm. Mr. E. Beckett, gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree, staged another of the wonderful collections of vegetables which have made his name famous. Those who frequent shows know something of the quality and interest of Mr. Beckett's exhibits, and, unfortunately, words cannot convey an adequate idea for the benefit of those who have not been privileged to see for themselves. We can only say there were somewhere near a hundred dishes, all of really beautiful samples of choice vegetables, all of magnificent quality. Messrs. Clibrans, Altrincham, deserve high praise for the manner in which they put before public notice examples of vegetables which are but little known or used in this country; aubergines, seakale beet, Chilian beet, and several gourds were especially attractive in their fine display of vegetables.

AWARDS FOR NON-COMPETITIVE EXHIBITS.

Silver Cups.—To Messrs. Jones and Son, Lim., Shrewsbury, for sweet peas; to Messrs. Hobbies Lim., Dereham, for roses; to Messrs. Isaac House and Son, Westbury-on-Trym, for hardy perennials; and to The King's Acre Nurseries, Lim., Hereford, for pot fruit trees.

Large Gold Medal.—To Messrs. J. Veitch and Sons, Lim., Chelsea, for fruit trees in pots; to Mr. R. Bolton, Carnforth, for sweet peas; to Mr. E. Beckett, V.M.H., gardener to the Hon. Vicary Gibbs, Elstree, for vegetables; to Messrs. Sutton and Sons, Reading, for fruits, flowers, and vegetables; to Messrs. Dobbie and Co., Rothesay, for dahlias; and to Messrs. Wm. Cutbush and Son, Highgate, for carnations.

Silver Medal.—To Messrs. John Peed and Son, West Norwood, S.E., for caladiums; to Messrs. Kelway and Son, Langport, for gladioli; to Messrs. Bakers, Wolverhampton, for aquatics; to Messrs. Clibrans, Altrincham, for vegetables; to Mr. Edwin Murrell, Shrewsbury, for roses; and to Messrs. E. Webb and Sons, Wordsley, for flowers, etc.

EXHIBITIONS AND MEETINGS.

◆

Royal Horticultural Society.

AUGUST 17.

A decided improvement on the last meeting, the chief features were the hardy flowers and crotons; the competitive classes failed to arouse even a fair competition.

FLORAL COMMITTEE.

Mr. F. Brazier, Hardy Plant Nursery, Caterham, arranged a group of plants on the floor of the hall, consisting chiefly of a new carnation Mrs. F. Brazier, with some well-grown scabious, gladioli, heliums, and excellent examples of Verbena Miss Willmott. The whole exhibit was tastefully arranged with light grasses. Hardy flowers from Mr. Amos Perry, Hardy Plant Farm, Enfield, proved a source of attraction. The phloxes were bright and arranged in large masses, the most attractive being Siebold, and Graf von Lassberg; while other attractions were Astilbe Davidi, Monarda violacea superba, the everlasting pea Lathyrus [illegible]icata, Delphinium sulphureum, erigerons in variety, and aconitums, the whole being nicely displayed with taste and skill.

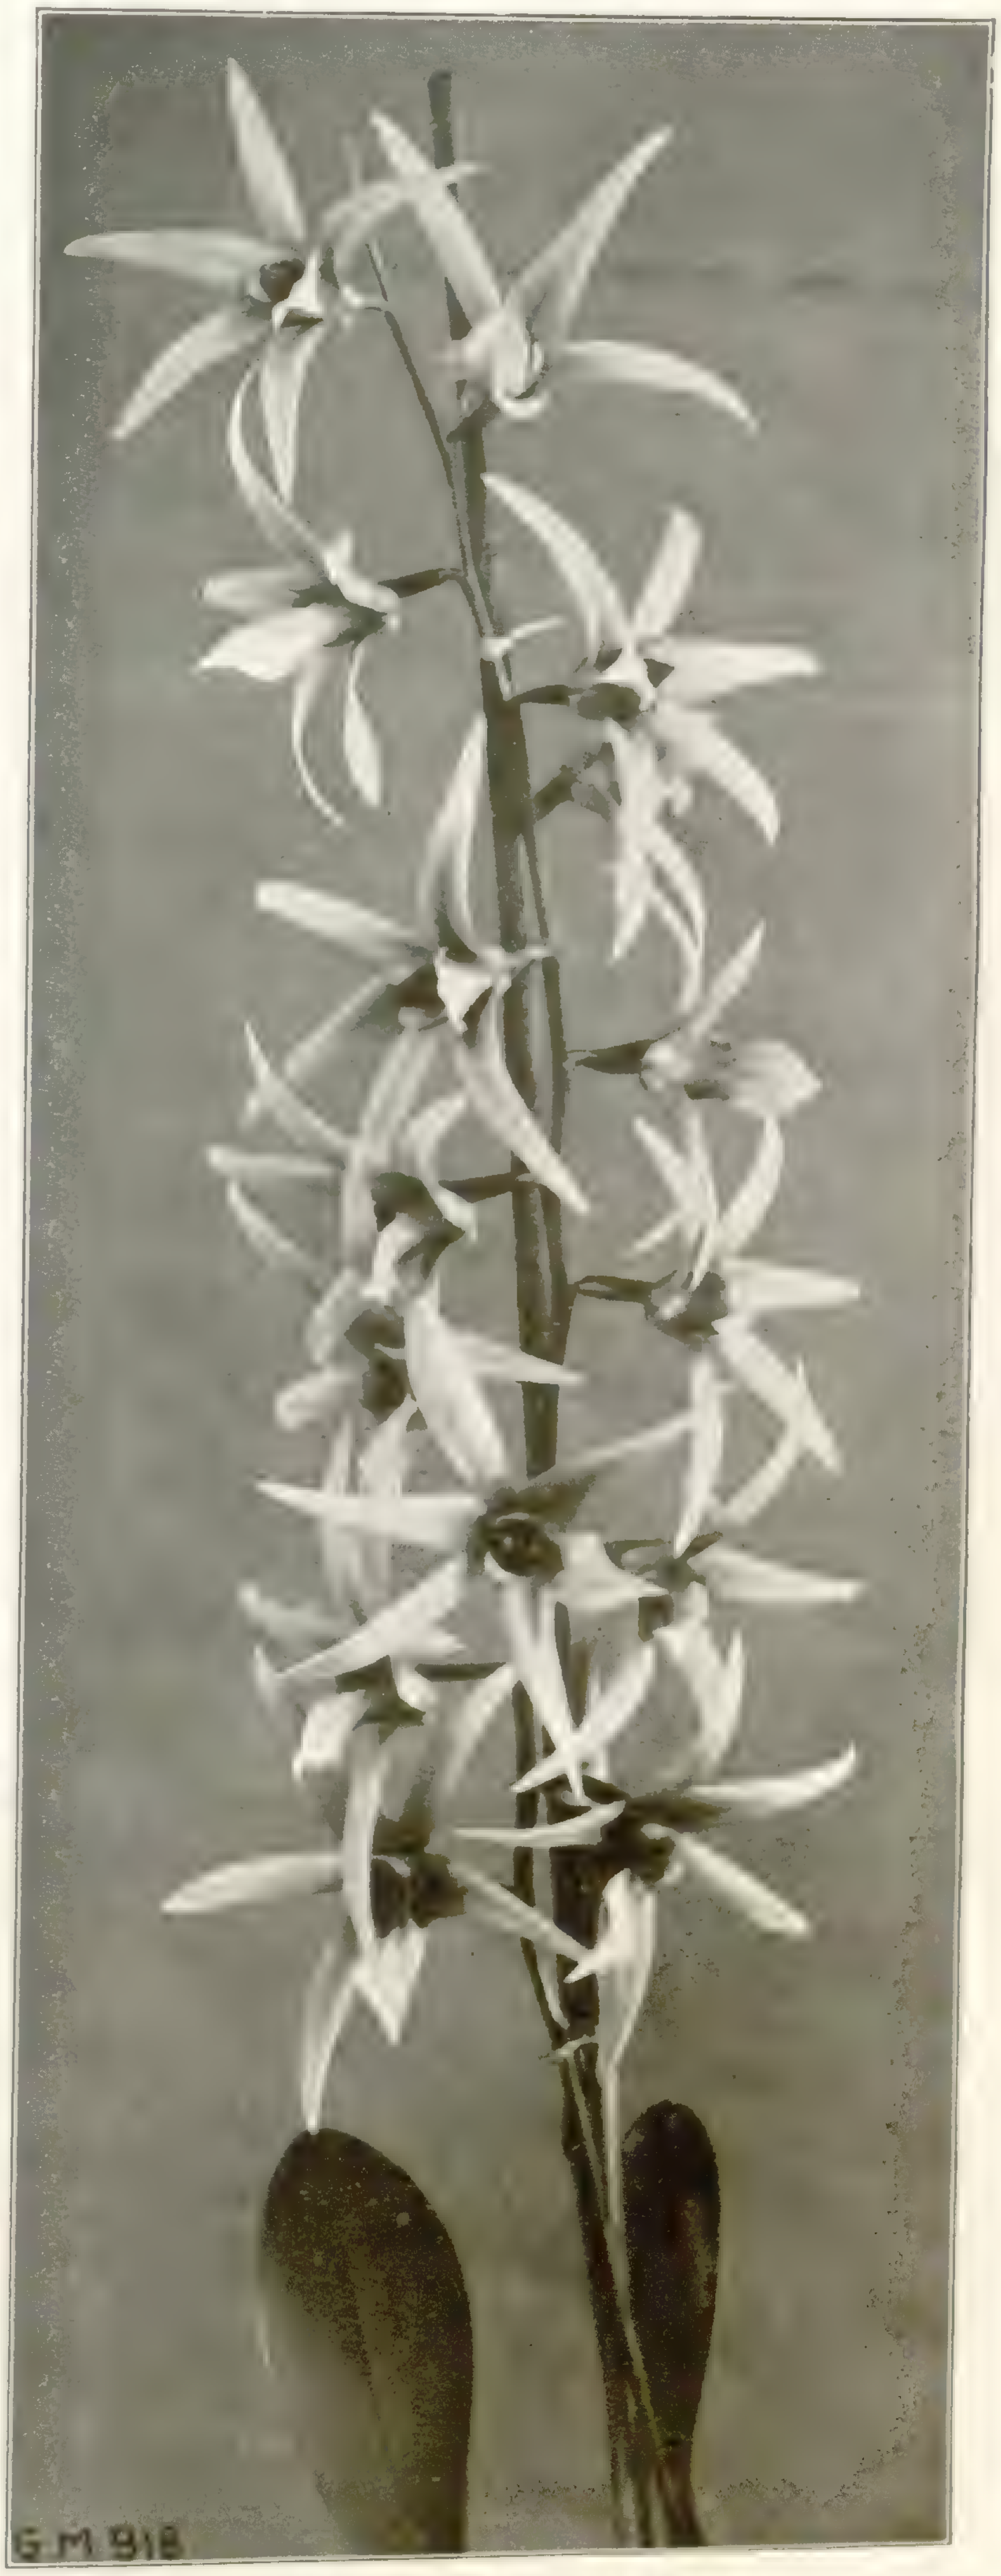
From Messrs. H. B. May and Sons, Upper Edmonton, came a large collection of crotons, chiefly of a decorative size, mostly arranged in blocks of each variety. The plants were pictures of cultural skill, a few of the best were Magnificent, Thomsoni, Hawkeri, [illegible], Emperor Alexander III., Reidi, resplendent, and Sunshine. The plants looked particularly bright in their setting of palms and ferns.

Messrs. J. Peed and Son, West Norwood, exhibited a fine table of gloxinias both in pots and cut flowers, which were all seedlings raised from seed sown in January last. The plants were very good, and they were displayed with suitable greenery.

Gladioli from Messrs. Kelway and Sons, Langport, were a feature of the show. The spikes were large and the colours being staged separately gave them a very pleasing effect. The exhibit occupied an entire table. Some of the best were Vigilant, Mrs. Wood, Mrs. Arundale Palmer, Mrs. Badcock, Peace [illegible], Mrs. J. N. Skittery, Lady White, [illegible] Edward, May Etheridge, Miss A. Reeve, Lord Alverstone, and Prince Henry of York.

Mr. M. Prichard, Christchurch, Hants, was responsible for a very fine display of hardy flowers, which were nicely displayed. A group of kniphofias included Leda, Chrysantha, Clotho, Glow, and Leichtlini amongst others; while groups of Crinum Powelli and its white form were also attractive; as were also liliums in variety, Dracocephalum speciosum, heliums in variety, with some wonderfully new colours in gladioli, such as Czarina, Livonia, Madame F. de Cayeux, Senator Volland, Madrilene, and Baron J. Hulot.

Hardy flowers from Messrs. T. S. Ware, Lim., Feltham, also proved a source of attraction, the background being formed with large masses of phlox, which included such fine varieties as Flambeau, Louis Blanc, Selection, Gros Claude, and Meteor; Chrysanthemum maximum King Edward VII.



DENDROBIUM ACCUMINATUM.
A distinct and handsome species of dwarf growth and bearing long racemes of flowers. The flowers are about two-thirds natural size and the whole of the segments are rich pink, with deep crimson base. Exhibited by Messrs. Moore, Lim., Rawdon, Leeds, at R.H.S Meeting on Tuesday last, when it had a First Class Certificate conferred upon it.

GREENHOUSE MANAGEMENT.—THE AMATEUR'S [illegible], the popular book by the Editor of "[illegible] Gardening," not only treats of the selection and cultivation of greenhouse plants and flowers, but gives full instructions how to build a greenhouse and how to heat it, as well as every detail as to the [illegible] of the plants and flowers grown in it. [illegible] of this book of [illegible] pages is 5s. net, or [illegible] from THE GARDENERS' MAGAZINE [illegible] Aldersgate Street, London.

was conspicuous in this section, as were also montbretias in variety, statices, and Agapanthus umbellatus alba.

The only display of rock and alpine plants came from Mr. Clarence Elliott, Six Hills Nursery, Stevenage, who had several interesting plants arranged in an attractive and natural style.

From Mr. G. Reuthe, Hardy Plant Nursery, Keston, came a large exhibit of hardy flowers, which included good examples of phlox, Crinum Powelli, Berberidopsis corallina, Eucryphia pinnatifida, and Desfontainea spinosa, and large numbers of rock and alpine plants in pots.

Mr. E. Potten, Nurseries, Cranbrook, Kent, made a good display of phloxes, with a large mass of Trollius europæus, Chrysanthemum maximum Mikado, and Rudbeckia purpurea, with other hardy flowers, also the new bedding zonal Double Paul Crampel, which bids fair to become as popular as the single form.

A handsome display of phloxes came from Messrs. Paul and Son, Cheshunt. Each variety was staged in quantity, demonstrating their value either in a bed or border, the most striking varieties were Mrs. W. Smith, Fiancée, Dante, Figaro, Daniel Lesseur, Etna, Longchamps, Iris, L'Aiglow, and Mary Wilkins.

Messrs. James Veitch and Sons, Lim., Chelsea, occupied two large tables with their exhibit, one with a display of greenhouse flowering plants, which included some very fine gloxinias staged in blocks of colour, while two masses of well-grown cannas were also a feature. The double Begonia Washington was in fine form, as were also plants of Amphicone Emodi and Primula obconica rubra and alba; also a nice collection of hybrid Java rhododendrons. A table of cut specimens of hardy shrubs and trees shown by this firm attracted much attention. A few of the most notable were Rubus odoratus, Genista tinctoria, Tamarix Odessana, Eucryphia pinnatifida, Astilbe Davidi, Solanum crispum, hydrangeas, spiræas, and Buddleia variabilis Veitchi.

Messrs. G. Bunyard and Co., Lim., Maidstone, arranged an extensive exhibit of hardy flowers, in which the phloxes weere conspicuous. The best were Countess of Shrewsbury, Fiancee, Iris, Jeanne d'Arc, Etna, and Sprite. Other attractive features of this fine collection were the gaillardias, statices, and agrostemmas.

ORCHID COMMITTEE.

Messrs. Stuart Low and Co., Bush Hill Park, had a choice display of orchids, in which were Cattleya Gaskelliana aurantiaca, a splendid Oncidium superbiens with Sophro-lælia Gratrixiæ, very bright in colour, some fine examples of Odontoglossum Rolphæ, and a few choice cypripediums. A charming group of well flowered examples of Disa grandiflora came from Mr. A. Taylor, gardener to Mrs. Bischoffsheim, Warren House, Stanmore; the plants were beautifully developed, many carrying six flowers on a spike, while the arrangement was light and tasteful. Messrs. Sander and Sons, St. Albans, had a most attractive exhibit, in which were fine plants of Cattleya gigas, examples of Lælio-cattleya Invincible, grand in colour, a cross between L.-c. Dominiana and L.-c. Bletchleyensis, a large specimen of Vanda cærulea var. Dreadnought, a handsome marbled blue form, Odontoglossum crispum Harryanum var. roseum, and Cypripedium Lord Derby, Stand Hall variety.

Messrs. Charlesworth and Co., Haywards Heath, sent an attractive exhibit, which included excellent examples of Cirrhopetalum pulchrum Cliftoni, Cattleya Hardyana, C. Venus, Dendrobium acuminatum, a beautiful species with rose-pink flowers, and Cattleya Germania magnifica.

From Mr. Edward V. Low, Orchid Nursery, Vale Bridge, Haywards Heath, came a few choice plants in which were prominent Lælio-cattleya Clive, a very rich form, with L.-c. Broomfieldensis, Cattleya Gaskelliana var. Phyllis, a charming variety, pale mauve with a lip delicately shaded yellow, and several cypripediums. Mr. H. G. Alexander, orchid grower to Lieut.-Col. Holford, Westonbirt, Tetbury, contributed a nice example of Lælio-cattleya Jason, a fine hybrid between L.-c. Massangeana and Cattleya Aurea. The sepals and petals are lemon-yellow, while the lip is broad and fringed, the colour deep rosy purple, and Cattleya Tacitus, a hybrid between C. bicolor and C. Germania. Mr. G. E. Day, gardener to H. S. Goodson, Esq., staged several choice orchids in excellent condition. A pan of Cattleya Gaskelliana alba, var. Goodsonæ, carrying eleven flowers, deservedly secured a cultural commendation. Lælio-cattleya Black Prince was also noteworthy. A nice example of Odontoglossum Goodsoni was also very attractive, as were also the cypripediums.

FRUIT AND VEGETABLE COMMITTEE.

This committee had little to do except confirming the awards of the sub-committee on the French bean trials at Wisley. These, however, must have been excellent, if we may judge from the splendid examples staged. Each variety was represented by two plants in full bearing and a dish of pods. The following varieties were represented: Chôlet, Evergreen, Excelsior, Golden Wax, Holborn Wonder, The Belfast, and Superlative.

Mr. W. H. Young, Mercury Nursery, Romford, sent a box of tomatoes named Young's Mercury, a cross between Hillside Comet and Carter's Sunrise. It is a heavy cropper, and the fruits of good form and colour. The competitive classes did not fill well, for there were but three entries for six dishes of potatoes. Mr. A. G. Gentle, Little Gaddesden, Berkhamsted was placed first for fine examples of Duke of York, Sir J. Llewelyn, Ringleader, The Cannon, May Queen, and Advancer. The second prize was awarded Mr. R. Stanard, gardener to the Countess Cowper, Panshanger, Hertford, who had a good display of dishes.

In the smaller class for three dishes Mr. A. Tidy, gardener to Charles Coombe, Esq., Cobham Park, Cobham, Surrey, won well with Sharpe's Victor, Webb's Express, and a good kidney seedling, while the Rev. L. C. Chalmers Hunt, Willian Rectory, Hitchin, was placed second.

Mr. R. Stanard was the successful exhibitor for three dishes of French beans, staging good examples of Negro, Victoria, and Canadian Wonder; the Rev. L. C. Chalmers Hunt following second. The latter exhibitor was the only competitor for three dishes of climbing beans, and was deservedly awarded first prize for capital examples of Best of All, Scarlet Champion, and Prizewinner.

AWARDS.

Silver Gilt Flora Medal.—To Messrs. Sander and Sons for orchids; to Messrs. H. B. May and Sons for crotons; to Messrs. James Veitch and Sons, Lim., for flowering plants and hardy cut shrubs.

Silver Flora Medal.—To Messrs. Charlesworth and Co. for orchids; to Messrs. Stuart Low and Co. for orchids; Messrs. G. Bunyard and Co., Lim., for hardy flowers; to Messrs. Kelway and Sons for gladioli; and to Messrs. Paul and Sons, Cheshunt, for phloxes.

Silver Banksian.—To Mr. H. S. Goodson for orchids, and Mr. A. Perry, Enfield, for hardy flowers.

Cultural Commendation.—To Mr H. S. Goodson for Cattleya Gaskelliana alba, var. Goodsonæ.

First-Class Certificate.—To Mr. H. S. Goodson for Odontoglossum Goodsoni; Messrs. Moore, Lim., for Dendrobium acuminatum; and to Messrs. Charlesworth and Co. for Cirrhopetalum pulchrum Cliftoni.

Award of Merit.—To Messrs. Sander and Sons for Lælio-cattleya Invincible and Vanda Cærulea var. Dreadnought; to Lieut.-Colonel Holford for Lælio-cattleya Jason; to Mr. H. S. Goodson for L.-c. Black Prince; to Mr. A. Perry, Enfield, for Astilbe rivularis gigantea; to Messrs. Kelway and Sons, Langport, for Lord Alverstone and Miss A. Reeve gladioli; to Mr. C. B. Green, Acton, for Polystichum aculeatum pulcherrimum plumosum; to Monsieur Vilmorin, Paris,for dwarf French bean Chôlet; to Messrs. J. Veitch and Sons for dwarf French bean Everyday; to Messrs. Barr and Sons for dwarf French bean Excelsior; and to Messrs. Dickson and Son, Belfast, for dwarf French bean The Belfast; and to Canna King Humbert, from Sir Trevor Lawrence, Bart., and Messrs. J. Veitch and Sons.

West Derby.

This exhibition was held on August 2 in the Rectory grounds, by kind permission of the Rev. Percy Stewart.

For a group arranged for effect, Mr. G. Osborne, gardener to Dr. Cook, held the leading place with a pleasing selection of foliage and flowering plants; the remaining awards went to Messrs. Jones and H. Ogden. For four plants, stove or greenhouse, Mr. G. Osborne was again to the fore, and also had the leading pair of palms, the two best geraniums, and two liliums. For one plant in flower, Mr. H. Spencer, gardener to A. H. Jones, Esq., won with Allamanda Hendersoni, and for the single foliage plant with Cycas revoluta. Mr. R. Cleaton had the best six table plants.

For twelve bunches of hardy and half-hardy flowers Mr. G. Osborne led, and he scored for a dozen vases of hardy herbaceous flowers, and for tea roses. For six hybrid perpetual roses Mr. J. T. Edgar won; while for twelve cactus dahlias Mr. H. Ogden won, and also scored again for twelve carnations. Mr. T. J. Edgar, gardener to the Rev. Percy Stewart, secured the silver rose bowl presented by Mr. C. A. Young (chairman) for sweet peas, with a pleasing lot; this exhibitor also secured the leading award for twelve vases, not less than nine varieties.

For nine kinds of vegetables Mr. G. Osborne had the premier set, including good tomatoes, peas, French beans, etc. For six distinct kinds Mr. R. Cleaton, gardener to W. McCubbin, Esq., won, and he scored for two dishes of peas. Mr. Ogden had the best cucumbers, and Mr. G. Osborne the best tomatoes.

The best six dishes of hardy fruits came from Mr. G. Osborne, who had good strawberries, loganberries, etc. Mr. T. J. Edgar won with Black Hamburgh grapes, and Mr. R. Cleaton for Foster's Seedling.

Harborne Gooseberry Show.

The ninety-fourth annual exhibition of the Harborne Gooseberry Society was held at the Green Man Inn, which has been the venue of the show ever since its institution in 1815, and it is the oldest gooseberry society in the Kingdom. Coincidently with this was established what are termed the Waterloo allotment gardens at Harborne, or properly the Edgbaston Estate, bordering the confines of Harborne, which were allocated by the late Lord Calthorpe in commemoration of the Battle of Waterloo. The gardens occupy an area of several acres, and each garden is provided with a substantial thorn hedge, and the entrance doors are each provided with a lock and key. The heaviest berry on record in the annals of the society was a red-coloured variety named Bobby, grown by a noted member of the society, Mr. Barton, in 1875, the berry "bumping" the scale at 34dwts. 20grains. But this was beaten by a berry of London, shown at the Stone (Staffordshire) Society, weighing 37dwt. 7grs., and which, it is presumed, was the heaviest on record in England.

The exhibits at the recent Harborne Show were remarkable for the uniformity in weight and quality of the berries, which, moreover, has not been excelled, at least during the past forty years. Growers attribute this fact to the favourable moist climatic conditions of the past season. Subjoined are a few of the principal names and weights gleaned at the recent exhibition:—

Premier berry, Mr. Emmanuel Withers with Collis Lane, 28dwt. 1gr. Single red berries: 1, Mr. E. Withers with Bobby, 27dwt. 12grs.; 2, Mr. R. Sheppy with Blucher, 25dwt. 8grs.; 3, Mr. R. Smallwood with Dr. Woolley, 24dwt. 12grs.; 4, Mr. J. Davis with Dan's Mistake, 23dwt. 4grs. Yellow berries; 1, Mr. E. Withers with Leveller, 26dwt. 12grs.; 2, Mr. R. Smallwood with Thatcher, 24dwt. 17grs.; 3, Mr. W. James with High Sheriff, 24dwt. 13grs.; 4, Mr. J. Hobday with Ringer, 22dwt. 19grs. Green berries: 1, Mr. E. Withers with Surprise, 24dwt. 7grs.; 2, Mr. M. Nicholls with Cheerful, 22dwt. 11grs.; 3, Mr. J. Davis, with Stockwell, 20dwt. 13grs.; 4, Mr. H. Giles with Shiner, 20dwt. 18grs. White berries: 1, Mr. E. Withers with Transparent, 27dwt. 3grs.; 2, Mr. M. Nicholls with Fascination, 23dwt. 22grs.; 3, Mr. W. James with Antagonist, 21dwt. 15grs.; 4, Mr. R. Sheppy with Careless, 20dwt. 20grs.

Six berries, red, any variety or varieties: 1, Mr. E. Withers with 149dwt. 12grs.; 2, Mr. R. Smallwood with 141dwt. 10grs.; 3, Mr. M. Nicholls with 134dwt. 16grs.; 4, Mr. R. Sheppy with 132dwt. 16grs.

Six berries, yellow, one variety: 1, Mr. E. Withers with Leveller, 150dwt.; 2, Mr. R. Bix with Leveller, 136dwt.; 3, Mr. R. Sheppy with Leveller, 135dwt. 12grs.; 4, Mr. R. Smallwood with Ringer, 134dwt. 10grs.

Six green berries: 1, Mr. E. Withers with Surprise, 124dwt.; 2, Mr. W. Timmins with Surprise, 125dwt. 8grs.

Junior berries: 1, Mr. E. Withers with Ringer, 40dwt. 4grs.; 2, Mr. W. Timmins with Fascinator, 39dwt. 4grs.; 3, Mr. R. Smallwood with Lord Derby, 37dwt. 20grs.; 4, Mr. J. Davis with Lord Derby, 36dwt. 19grs.

National Sweet Pea Society.

The following is the Official List of Awards made by the Floral Committee of the N.S.P.S., after two visits to our trials of 350 stocks and varieties at Reading University College Gardens:—

First Class Certificate.—To Clara Curtis (Row No. 186), from Mr. W. J. Unwin, Histon, Cambs.

Award of Merit. — To Charles Foster (Row No. 7), from Mr. Robert Bolton, Carnforth; to Edrom Beauty (Row No. 350), from Mr. A. Malcolm, Duns, Berwick; to Mrs. W. J. Unwin (Row No. 289) from Mr. W. J. Unwin, Histon; to Dazzler (Row No. 334), from Mr C. W. Breadmore, Winchester; and to Sunproof Crimson (Row No. 338), from Messrs. Dobbie and Co., Rothesay.

Highly Commended.—Mrs. Watson (Row No. 86), from Mr. Robert Bolton, Carnforth.

Commendation as a Market Variety.—To Mercia (Row No. 136), from Messrs. G. Stark and Son, Great Ryburgh; and to Colleen (Row No. 305), from Mr. Wm. Deal, Brooklands, Kelvedon.

Chas. H. Curtis, Hon. Sec.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

POLLEN IN PÆONIES.—E., Heytesbury: In the double pæonies pollen is very sparingly produced, but anthers in various stages of development are often found on the central petals, these later being petaloid stamens. If a double pæony is starved it comes more or less single, and the more single it becomes the more likely is it to bear pollen.

MILDEW ON ONIONS.—G. W. S., Gloucester: The best method of dealing with onion mildew is to spray the crop occasionally as a preventive with sulphide of potassium at the rate of ½oz. to a gallon of water, dusting occasionally, when damp, with powdered quicklime (two parts) and sulphur (one part), using a bellows to distribute the mixture. Where onion mildew has been very bad, do not grow a crop of onions on the ground for two years.

MOSS AND WEEDS ON LAWNS.—With reference to an answer given in our January issue respecting weeds on lawns, Mr. G. Trevethick, of Lower Hall, Wellington, New Zealand, writes—"I would like to give you my experience re moss on lawns, and it has been considerable. I have dealt with many, both croquet lawns and bowling greens, and have never failed in either moss or other weeds, except dandelion or cape weed. The method is simple, effectual, and inexpensive. In a dry day in autumn, when the weeds will readily absorb moisture, apply a liquid composed of one part sulphate of iron to four parts water, giving enough to saturate the weeds you want to kill; it will kill the weeds and will not poison the ground, but will act as a fertiliser to the grass. In a week or ten days the weeds will be dead, and the grass that is among them will be coming green and fresh. In the case of bare patches, break the face of the earth, and sprinkle a little grass seed on and cover. We do this here in autumn; perhaps it would do better with you in the spring. Never cut off a dandelion, or you will have them sprout more than ever, and as they spread close to the ground they not only kill the grass, but look very unsightly. I find the best plan is to get a claw (an old flat file split at one end and turned up a little, answers the purpose all right), and when the ground is wet you can lift them out with it, and then fill the hole with a little earth and a pinch of seed, and the job is done.

REPLANTING VINERY.—S. K. M.: In the replanting of vineries it is necessary to proceed cautiously, and bring about the change considered necessary in a gradual manner, as any material reduction in the supply of grapes is likely to give rise to considerable dissatisfaction on the part of the owner. We suggest that you extend the replanting operations over several years, and that you do not replant more than one vinery in any one of them. In each case you should plant a set of vines along the back of the house for the purpose of yielding supplies until the permanent vines fill their allotted space, and are in full bearing, when they can be cut out. The temporary vines can be planted about thirty inches apart, and cropped more heavily than would be advisable in the case of the permanent ones.

BUTTONHOLE BOUQUETS.—T. H., Atherton: We are sorry that we are unable to do exactly as you wish, for there is so much diversity in taste in the use of flowers in buttonholes that it is not possible to illustrate and describe "the latest" buttonhole bouquet. Each wearer has a preference for certain flowers in the several seasons, but there is a general agreement as to the desirability of taking advantage of the choicest flowers available. Thus the owner of a collection of orchids will turn to his orchid houses for the greater proportion of the flowers he requires for wearing in his buttonhole; the lover of roses will resort to the rose garden, or the glass structure in which the roses are grown, according to the season, and select the choicest buds of tea, hybrid tea, or noisette; and those who have a predilection for carnations will give evidence of this by frequently wearing well-developed blooms in their coats. The comparatively large bouquets of mixed flowers that were popular some years since obtain but little favour at the present time. Preference is usually given to buttonholes containing one well developed, but not over large, bloom, with it may be a bud and a fern frond or leaf of the plant from which the flowers have been gathered. Buttonhole bouquets should be formed with the choicest flowers available, the flowers should be of moderate size, consist wholly of the same kind, retain their freshness for a considerable period under adverse conditions, and have a rather small backing of elegant greenery, the fronds of Adiantum cuneatum and portions of the leaves of one of the greenhouse asparagus being perhaps the most useful.

HARDY PERENNIALS.—R. B.: As the plants that were raised from seed sown early have become somewhat crowded in the nursery beds, your best plan will be to lift them and replant in other beds, allowing them more space. If this be done at once, and care taken to lift them with as little injury to the roots as possible, and to well water them in, they will soon become established, and acquire considerable additional strength by the time they can be transferred to their permanent quarters. If you cannot well spare the time for replanting, and have a larger stock than you will require, it will be a good plan to thin the rows by removing every alternate plant. It is important to remember that one strong plant will be preferable to two or three that have been drawn up weakly as the result of overcrowding.

DAFFODILS.—H. H. W., Sussex: Daffodils may be successfully planted from early in August until the end of October, but when the bulbs are required—as in your case—for the production of blooms for exhibition, it is advisable to plant as early as practicable after the commencement of the first of the two months mentioned. There is no advantage in keeping the bulbs out of the soil after they are thoroughly matured, but when used for garden decoration they cannot, as a rule, be planted until after the beds have been cleared of their summer occupants at the end of September or early in October. In the cultivation of daffodils for exhibition the preferable course will be to select in the kitchen garden or reserve ground a position where the plants will enjoy full exposure and some amount of shelter from easterly winds. It will be an advantage if the soil was deeply trenched and liberally manured early in the winter and has since carried a crop, preferably one that has not been too exhausting. If you have at your command soil of this description give a light dressing of bone superphosphate previous to preparing it for planting, but if the soil is comparatively poor give a liberal dressing of this fertiliser. If you will tell us whether you require cheap, medium-priced, or the finest varieties we shall be pleased to make a selection for you.

CURE FOR MILDEW.

One ounce of Cyllin Soft Soap to a gallon of water is the surest remedy for mildew, green fly, and all forms of insect blight in the garden or greenhouse.

CYLLIN SOFT SOAP

Is a reliable all-round non-poisonous insecticide and germicide. It does not injure the tenderest shoots, and it cleanses the surface soil, thus safeguarding against further attack.

Particulars from Manufacturers, JEYES' SANITARY COMPOUNDS CO., 64, Cannon Street, London, E.C.

TRADE NOTES.

A beautiful selection of spiræas comes to hand from Mr. Amos Perry, of Enfield, including spikes of the lovely S. venusta magnifica figured in our previous issue, and we think this the best of the set. S. venusta delicata has large blush coloured flowers; S. v. Peggy is smaller flowered, pink, with rosy purple anthers, and very effective; S. v. Fairy, a lovely silvery pink. S. gigantea carnea is a new flesh-coloured form of this fine species; S. g. Her Majesty has plumes of pale silvery pink; and S. g. elegans is blush coloured. An exquisite set of fine subjects.

From Messrs. J. Kelway and Son, Langport, we have received some splendid spikes of very fine gladioli. In colour, form, and size of bloom and spike these are of the highest quality. The varieties are Queen Alexandra, deep salmon, flaked with pink, and with crimson markings in the white throat; Saltpetre, pink, with a buff throat and crimson blotches; Lady Inchiquin, brilliant salmon-pink; Mrs. J. Laing, scarlet, flaked with white and with a crimson blotch in the throat; Eugene Sandow, clear rich scarlet, with white throat and red blotches.

We have had our attention called to Cyllin soft soap, which is manufactured by Jeyes' Sanitary Compounds Company, 64, Cannon Street, London, E.C., as a remedy for mildew, greenfly, and other pests with which cultivators have to contend. Some of our rosarian friends have found this preparation effectual in combating mildew and aphis on roses, and speak highly of its merits. We commend it to the notice of our readers as fully deserving of a trial.

TO-DAY! AND FOR YEARS AND YEARS PAST the XL ALL Specialities are and have been the best on the market. Where is the Gardener who does not pin his faith to one or the other of these celebrated Insecticides or Fertilisers? XL ALL FERTILISER has pleased all who have used it this season. The Sales of XL ALL FUMIGATOR prove that it is more popular than ever. XL ALL LIQUID NICOTINE INSECTICIDE is always spoken of by gardeners and growers as the most deadly to Mealy Bug, Thrip, etc. XL ALL WEED KILLER used once a year. "No weeds can live." RICHARDS' ARSENATE OF LEAD for all leaf-eating insects. CUCASA (fungicide), the finest preparation of copper ever offered to gardeners. Please ask your Nurseryman, Seedsman, or Florist for a copy of my small pink list, giving particulars of these and many other XL ALL Preparations, which can be obtained from the Horticultural Trade throughout the World. G. H. RICHARDS, Manufacturer and Patentee, 234, Borough High Street, London, S.E.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Herbaceous Borders.

To those whose knowledge of hardy perennials is limited, and who have failed to appreciate the importance of taste in the grouping of plants, the formation and keeping of herbaceous borders are the most simple matters to which those interested in gardening could well give their attention. We have been told times out of number by writers whose ability to use the pen is greater than their cultural skill, that the use of tender plants in the embellishment of the flower garden is contrary to the canons of good taste, and that with the aid of hardy plants alone the garden can be made beautiful and interesting during the greater part of the year at a very small cost, either of time, money, or skill. It has, indeed, been suggested that not only will a certain number of plants, flowering at different periods, give a continuous display of flowers from the opening days of spring until the autumn frosts impose a severe check upon vegetation, but will thrive with but little attention. There is a vein of truth running through the suggestions and assertions that have been made with regard to hardy perennials, for the mechanical part of planting is a very simple operation, and flowers may, with a suitable selection of species and varieties, be had in succession over a considerable period. In readily admitting this, it must be pointed out that in planting the herbaceous border one should consider something more than the mere transference of the plants from pots to the soil. A border, to fully justify its formation, should be so planted and arranged that for a period of two or three months it will form a glorious floral picture, and make a strong appeal to the artistic perception of those under whose notice it may come. To form a border of this description is no light task, for not until the planter has become more or less conversant with the habit of the finest of the hardy perennials, and the form and colour of their flowers, can he hope to achieve success. Moreover, kinds must be selected that will supply, not merely a succession of flowers, but will yield so freely of their floral beauty as to produce a really effective display over the longest period possible. To those who are specially interested in certain classes of plants the question of an effective display of colour will be of little consequence; they will derive abundant pleasure from a study of the individual charms of the several kinds. But in planning and furnishing herbaceous borders it is necessary to consider, not so much the specialist as the general body of flower lovers, who regard hardy plants as a means by which the garden can be beautified. During the present summer we have had opportunities for visiting large numbers of gardens, both in England and Scotland, in which herbaceous borders constitute one of the most attractive features, and we have been much impressed by the great advance in the method of procedure that is being made on all sides. We have had the pleasure of seeing many borders that are veritable triumphs in the utilisation of hardy plants, and in the art of garden adornment. Some, on the other hand, but these are comparatively few, show that the belief still exists that the proper course is to plant the border, and the whole of the borders where there is more than one, with a view to the continuous production of flowers throughout the spring and summer months. Necessarily, changes of this kind proceed slowly, and it is therefore necessary to state that where the course of procedure was based on this belief, the borders were more or less wanting in beauty. It is impossible it should be otherwise, for at no time can the display of flowers be large, and, speaking generally, the beauty of some proportion of them is marred by the contiguity of flowers that have lost their freshness, or, it may be, showing signs of decay. Especially are such borders wanting in attractiveness for a time when the several kinds are arranged in large masses, as, when a few of these have passed their period of flowering, the blanks produce a far from pleasing effect. It was surprising to learn that in some instances bold grouping had been adopted for the purpose of acting upon the suggestions made by Miss Jekyll in her book on "Colour in the Flower Garden," for the production of several distinct displays in the herbaceous border during the season of spring, summer, and autumn. We can find no such suggestion in the work, but plenty of evidence that the authoress advised something quite different. In the second paragraph of the introduction she writes with reference to the production of a good scheme for colour: "I believe that the only way in which it can be made successful is to devote certain borders to certain times of the year; each border or garden region to be bright for from one to three months." We may not be wholly in accord with Miss Jekyll's views on garden embellishment, but we are in full agreement with her upon this point, being persuaded that only by such arrangement can hardy flowers be fully utilised in the production of artistic effects. This fact is now being recognised by the more successful of the cultivators of hardy plants, and

MR. PETER C. M. VEITCH, J.P.

some of the finest effects that have come under our notice were those in gardens in which practical expression had been given to this recognition. We would direct special attention to this aspect of the herbaceous border, for it is rapidly obtaining increased prominence, and the provision of distinct displays at different periods bristles with difficulties. In the case of gardens of great seats, where the family is in residence for a portion of the summer only, those responsible for their management will plant the border, or borders, with such subjects as are at their best at the desired period. A splendid example of what may be accomplished in the production of a display that shall be at its best between the latter part of July and the beginning of September may, at the present time, be seen at Welbeck Abbey. In these famous gardens hardy garden plants are grown on a large scale, and the glorious displays that Mr. Gibson has succeeded in producing are a revelation in the grouping of hardy plants. At Hopetoun House, West Lothian, where these subjects are grown largely, and with exceptional success, by Mr. T. Hay, there are two sets of borders; the earlier set was over when we had the pleasure of visiting these gardens, but the later one was at its best, and anything more beautiful it would be impossible to conceive. In both these great gardens the practice is adopted of arranging the several subjects in small groups, so that at no time are there large blanks to mar the beauty of the borders. In gardens that are being constantly enjoyed by the owners it would not be specially difficult to provide two or three borders, and to so plant them that they will attain their maximum attractiveness at different times. The greatest difficulty will be experienced in gardens that are of such dimensions as to afford space for one border, and that of moderate size. Here the best course will be to exclude from the selection the early and late kinds, and to plant those which will produce the best effect during June and the two following months, and thus ensure a distinct and beautiful display at a season when the garden can be fully enjoyed.

Mr. P. C. M. Veitch, J.P., whose portrait we have the pleasure of giving herewith, has for a considerable number of years occupied a prominent position in commercial horticulture, and by his wide circle of friends is not less highly esteemed for his personal qualities than for his business abilities. Previous to his assuming the responsibilities inseparable from the position of the head of a great firm like that of Messrs. R. Veitch and Son, of Exeter, Mr. Veitch had the opportunity of studying commercial horticulture under widely varying conditions, and, judging from the position now occupied by his firm, it is evident that he was careful to take full advantage of his opportunities. In the course of his training Mr. Veitch spent several years in the wholesale and retail seed houses in London, and with two of the leading German seed firms. He was some ten years in the establishment of Messrs. J. Veitch and Sons, and during this period he not only passed through the several departments thereof, but he made several important journeys for the firm. For instance he travelled through Australia and New Zealand, and took advantage of the opportunity he had for visiting Fiji and the South Sea Islands. In 1877 he went to Borneo, and, accompanied by the late Mr. F. W. Burbidge, he ascended to the top of Kini-balu, with the object of collecting Nepenthes Rajah and other plants for Messrs. J. Veitch and Sons, and as now well known, achieved much success. In the year 1880 Mr. Veitch went to Exeter to assume the position he now holds, and there he took up as a speciality the choicer trees and shrubs, particularly those that are doing well in so many of the gardens in the West of England. For many years Mr. Veitch has done much excellent work for the City of Exeter, and has especially distinguished himself in connection with educational matters and the hospitals. Some years ago he was made a J.P., and his presence on the Bench in his native city is not less welcome than it is at the meetings of the Royal Horticultural Society's Fruit and Vegetable Committee, of which he has been a member for many years.

The Bulb Season.—In view of the fact that the season for planting spring flowering and other bulbs is again with us, we shall devote the issue of the GARDENERS' MAGAZINE for September 18 chiefly to the selection and cultivation of bulbous plants in the open and under glass. The contents will include articles by the leading cultivators of bulbs, and among these will be an important contribution on the propagation of hyacinths. This and a considerable proportion of the other contributions will be freely illustrated, and the issue should be equally remarkable for its attractiveness, interest, and usefulness.

Mr. E. H. Wilson's Chinese Photographs. — On Tuesday next (August 31) at the fortnightly meeting of the Royal Horticultural Society, Vincent Square, Westminster, S.W., there will be exhibited, on behalf of Professor Sargent, and the President and Fellows of Harvard University, Cambridge, Mass., U.S.A., a selection of photographs illustrating the flora, fauna, and scenery of Central and Western China. These photographs are from the large collection taken by Mr. E. H. Wilson during his last (third) journey to China. It is thought that this exhibit will be of interest and value to those keen on the recent new plant introductions from China; it is also hoped that from its varied character the selection made will appeal to a wider circle. The photographs are whole-plate size (8½ by 6½ inches), with liberal mounts for Herbarium purposes, and all are duly labelled. The work of developing and printing has been done by Mr. E. J. Wallis, Kew.

Gardeners' Royal Benevolent Institution.—By kind permission of Waldorf Astor, Esq., the beautiful gardens at Cliveden will be open to the public on Thursday, September 16, on behalf of the funds of this charity.

Successful Melon Culture.—We are at all times pleased to receive from our readers evidence of their successes in plant, fruit, or vegetable culture, and we have therefore been much gratified by the photograph we have received from Mr. W. Green, gardener to S. E. Bates, Esq., Manydown Park, Basingstoke, of the splendid crop of melons he has produced this season. The photograph shows that the crop has been remarkably heavy, and the fruits well developed. It proves also that Mr. Green is careful to keep the leaves of his melon plants in a healthy state until the last, a point of considerable importance in melon culture, because, unless they are in a condition to perform their functions until the fruits are fully matured, the latter will be indifferently flavoured. We are gratified to know that the importance of the leaves retaining a healthy green state until the crop has ripened is being more fully recognised, and that the practice of keeping the plants so dry during the ripening process that the leaves become a prey to red spider, and are rendered of little value in the economy of the plant, is dying out. Mr. Green informs us that in the house there are fourteen plants, all of which are grown as cordons. The varieties are Sutton's Ringleader, Emerald Gem, and Superlative. Ringleader has carried about 36lb. of fruit to a plant, and Mr. Green considers the variety difficult to surpass both as regards the weight of crop and the quality of the fruits. The quality of the several varieties is said to have been very high, and as a proof of this Mr. Green mentions that he obtained the premier award in the class for melons at the Basingstoke flower show, which was held on the second of this month.

Grapes at Wisley.—One of the attractions of the exhibition of the Royal Horticultural Society, on Tuesday next, will be a collection of grapes from Wisley. The crop of grapes in the society's gardens is again of exceptional excellence, and the collection that Mr. S. T. Wright will send up will certainly be not less interesting and attractive than was that shown from Wisley last year.

Bees in Relation to Fruit Culture.—In his lecture before the Royal Horticultural Society on this interesting subject, Mr. Walter F. Reid said the importance of the part played by bees in the cultivation of flowers and fruit was in a great measure overlooked. Their usefulness in the growing of fruit, indeed, was immeasurable. In proof of this, he mentioned an apple orchard which for one or two years produced most disappointing crops. With the advent of bees, however, there was a material change, a crop of no fewer than 150 bushels of fruit being yielded! Mr. Reid also said that it was a common idea that fruit generally, and pears in particular, could not be grown in London; that the smoky atmosphere of large towns was an unconquerable obstacle to the culture of orchard produce. But this was not so: the cause was negative rather than positive. By actual experience he had proved that, despite the atmosphere of smoke, if bees were introduced to the trees while the latter were in bloom a crop of fruit would be realised. In the gardens of Gunnersbury House, where the orchard house culture of fruit is carried out on an extensive scale, and with much success, Mr. J. Hudson ensures the fertilisation of the flowers by placing a hive of bees in the house during the time the trees are in bloom. The hive is moved from one house to another as becomes necessary, and by the time the bees have completed their work in the latest of the houses, the season is sufficiently advanced for the hive to be placed outside without injury to its occupants.

Harry Veitch Portrait Fund.—The list of subscribers to this fund is now closed. Additional contributions have been received from the undermentioned: Mr. George Baker, Mr. Peter Barr, Mr. J. T. Bennett Poë, V.M.H., Mr. J. Bruckhaus, Messrs. W. Bull and Sons, Mr. A. Chapman, Mr. W. H. Clarke, Messrs. Corry and Co., Mr. C. Curtis, Mr. John Davidson, Mr. W. J. Grant, Mr. G. K. Gude, Mr. R. Millagan Hogg, Mr. T. Humphreys, Mr. G. F. Johnson, Mr. R. Wilson Ker, Mr. W. A. Nanscawen, Mr. Amos Perry, Sir J. Ramsden, Bart., Mr. J. Robson, Mr. Finlay Sanderson, Mr. A. Turner, Mr. Geo. Ward, Mr. W. Hedley Warren, Mr. Anthony Waterer, and Rev. W. Wilks.

TAKING CUTTINGS.

Cuttings may be made of leaves, shoots, branches, or roots, but for the purposes of these notes we shall only deal with the cuttings of soft-wooded plants, and those which are to some extent hardy, the whole subject being large enough for a small book. The time and manner of taking cuttings, the kind of parents they are taken from, the material in which they are placed, the treatment to be given them afterwards, and many other details are so varied that we can do no more here than mention a few general principles upon which success in rearing cuttings rests. First, as to the best kinds of

Material for Cuttings.

When a piece of zonal pelargonium, for instance, is separated from the parent plant, if the cutting, as it now becomes, is put into a suitable medium, a thickening, or callus, is formed along the cut edge, and from this roots are subsequently emitted. If the shoot had remained on the plant the leaves would have continued elaborating plant food for use in the formation of new tissue in all parts of the plant, including the roots. As tissue-forming material cannot get down to the roots of a new cutting it gets as far as it can—the cut end—and there accumulates. The cutting selected, then, must have enough inherent energy not only to maintain itself while it is without roots, but also to form roots; in other words, the substance of the cutting must contain a sufficient proportion of solid matter with leaves in the full vigour of plant life. It is obvious that if a shoot is not in a condition to make fair growth while on the plant that it will not be able to grow and form roots in addition when made into a cutting, and this bars the taking of any shoot with a flower or flower bud at the tip, as the growth of such a shoot has already nearly reached its natural limit. On the other hand, plants that have been growing very rankly will not be able to maintain themselves when suddenly cut off from the liberal supply of nourishment to which they have been accustomed. Plants grown in the shade, with, perhaps, in addition an excess of moisture, will produce watery shoots with little of the solid substance necessary to the formation of roots. The ideal material, then, for making into cuttings must not be too watery or too rank in growth, but should possess the maximum of solid substance in itself consistent with the possession of leaves with their vital functions unimpaired by age. Then as to

The Preparation of the Cuttings.

From what has been said above it will be seen that if the cutting is too long, or the leaves too large, failure will result from excessive transpiration, while if the cutting is too small the formation of roots will be very slow. What is a long cutting for plants with slender laterals, like the antirrhinum, is short for thick growth like that of the zonal pelargonium. The shoots should always be cut straight across just below a joint, and this should be done with a very sharp knife, as a smooth cut heals over much more quickly than a ragged edge. Many plants lend themselves to the taking of laterals as cuttings with a heel attached, and such cuttings need little preparation beyond the removal of the lower leaves close to the stem, and possibly a trimming of the heel. In the fuchsia it is usual to remove two large leaves and perhaps two small, but in the pentstemon sometimes as many as six or eight. An interesting point was raised by the Rev. Professor George Henslow, in a paper read before the Royal Horticultural Society in June, 1908, "On the absorption of rain and dew by the green parts of plants." He referred to a German scientist, who, in accord with his theory that the frequent fading of cuttings before they have struck root is to be accounted for by the fact that the transpiration from the exposed leaves is greater than the amount of water which the cut end can supply, recommends that the cutting should be longer than usual, and that some of the leaves should be buried to assist in the absorption of water. It is claimed that cuttings of roses, pinks, and others usually not easy to strike, will make good roots in this way if the soil is porous enough to permit of the free access of air to encourage the formation of roots before the leaves have time to decay. This is a case where each may experiment for himself, but it is certainly suggestive.

The Time for Taking Cuttings

is too various to admit even of generalisation, there being no time of the year which is not the best time for some plants, as we take chrysanthemum cuttings from November to March, most things in the spring, carnations and pelargoniums in the summer, calceolarias and pentstemons in the autumn. Many plants will strike at any time of the year, though there is a best time for most, and experience is the best teacher. As a rule, however, most soft-wooded plants strike well in the spring.

Suitable Compost.

The compost in which cuttings are put is in many cases important, though some will strike freely enough in the ordinary soil of the border. Silver sand is one of the best mediums for most plants, not only for mixing with the soil, but for putting round each cutting, as, being free from animal matter, it delays putrefaction, and, by reason of its fineness, assists in the rise of water to the base of the cutting, besides filling up every interstice so that there is no likelihood of the cut end being suspended clear of contact—a fatal error. Pots should be filled half-full of clean potsherds, and rough material put over these. If the soil is dry it should be well soaked and left for some time before the cuttings are put in it. Many cuttings do best when inserted round the sides of a pot, though others do equally well in any part.

There is one point about the after treatment which is of general application, and that is that the cuttings should

Not be Allowed to Flag

more than can be helped. To compensate for the diminished power of absorbing moisture on the part of the cuttings, we usually keep them in a moist atmosphere, often, indeed, within a propagating frame inside a greenhouse. There is an immense difference in the amount of moisture which cuttings of different kinds of plants will stand, and a degree which is necessary to some will cause others to damp off rapidly, but the liability to do this is lessened in all cases by a proper airing at least once a day. This applies also when bell glasses are used, as these, when pressed tightly down on the soil, are almost air-proof. The air in these is consequently maintained in a very close state, and cuttings of many plants can be successfully raised under them. Some need bottom heat so that not only the air, but the soil in which the cuttings are put, is kept warm, thus accelerating the formation of roots. Most need shading from the direct rays of the sun, but an almost full amount of diffused sunshine is beneficial as a rule. If the weather is cool, water should be applied very sparingly, and then only enough to wet the leaves, which is usually sufficient so long as the soil is moist about the base of the cuttings.

Alger Petts.

SUMMER PRUNING OF ROSES

This is a very necessary operation during the present month, and has much to do with the prospects of next season. By care in pruning most of the extra vigorous growers now we secure better matured and more suitable growth for next year. In addition to this, the plants benefit during their autumn display. Generally it is the climbing or pillar sections that need most care in pruning, but it is well to thin out wood of others that have flowered, and so aid the later trusses for autumnal display. I find it helps the dwarf polyanthas and Chinas to remove the matured trusses and thin the wood from the centre a little. Unless this is done directly the truss is over one cannot cut them out so well, as there are almost certain to be new growths and trusses forming in quick succession. Thinning the wood in summer avoids the cutting away of so much growth next spring, and also aids in maturing what is left.

As an example we may take Crimson Rambler and Dorothy Perkins, that have now just finished blooming upon the long maiden growths of last autumn. In the ordinary course of things these shoots will continue to make small laterals that are next to useless for the following season. All through the summer and autumn these growths are exhausting the plant to no purpose, and are much better cut away now, when the longer maiden rods will have better opportunity to fill out and ripen; these being the mainstay of such varieties season after season. If the old flowered growths are allowed to remain the main rods of these gradually deteriorate, turn brown or rusty, and soon die in a lingering fashion that cannot but harm the plant.

On walls, too, a good quantity of flowered or old wood can be cut out now, thus encouraging younger growth, and allowing this to occupy the most suitable positions. It frequently happens that much wood which was apparently too sound to cut out during spring pruning developed the results of frost and age about midsummer. I would cut away all such at once after the few flowers had been realised. It is not the quantity of wood obtained so much as securing the right kind, that gives us the best results, and summer pruning or thinning has much to do with this.

A. Piper.

OLEARIA HAASTI.

From the end of July until the middle of September, in the southern counties, this shrub is a mass of white blossom. Lovers of compact-growing shrubs who do not possess the one here referred to, should make a point of either going to see specimens while in bloom, or have a few sprays sent to them by advertisers in the Gardeners' Magazine. There is then a better chance of appreciating its merits. But as the flowers soon drop when gathered, the best plan is to see them on the growing plants. For very dry soils, and those of a rather poor quality, Olearia Haasti is very suitable. Few kinds of shrubs possess as many fibrous roots, and although the olearias will grow in poor soils, they respond quickly to good treatment. For forming a dense growth near a boundary fence, as isolated plants in a mixed shrubbery, or as a low division hedge in a flower garden, Olearia Haasti is equally serviceable.

Geo. Garner.

EFFECTS OF THE WINTER ON TREES AND SHRUBS AT KEW.

(Concluded from page 654.)

◆

Rhododendrons.

Perhaps the most interesting result among Himalayan rhododendrons is the indifference to the recent winter's cold shown by R. barbatum. Some plants, now six feet and upwards high, presented to Kew by Sir J. T. D. Llewelyn a few years ago, and planted in the Rhododendron Dell, have come through quite unaffected, and have flowered this spring. The following N. Indian species also may now be regarded as hardy at Kew: Anthopogon, arboreum (var. Campbelliæ), campanulatum, campylocarpum, ciliatum, cinnabarinum, fulgens, glaucum, lepidotum, niveum, and Thomsoni. R. triflorum has almost perished.

Among the Japanese and Chinese species the only total loss is the recently introduced R. sublanceolatum. In a low-lying situation R. rubiginosum has succumbed, and R. yunnanense has lost its foliage. Several forms of the Indian azalea (R. indicum) have flowered exceedingly well in spite of the winter, and there seems to be a promising future in gardens for several small-leaved, hardier sorts. R. indicum var. amœnum has been grown unprotected at Kew for more than twenty years, and in 1893, Professor Sargent introduced from North Japan the variety Kæmpferi, which blossoms well every year. Since then several other unnamed forms have proved equally hardy. A set of new Chinese species was received from Messrs. Veitch last year, but, protection having been afforded them, nothing definite can be said of their cold-resisting powers. Judging, however, from the plants in the open air in the Coombe Wood Nursery, it is late spring frosts rather than winter cold that have to be dreaded. R. serpyllifolium, a small Japanese species, has suffered badly, but R. dilatatum and R. rhombicum have flowered splendidly this spring. R. Fordi is much disfigured.

South American Plants.

It is interesting to find that the two species of beech introduced from Chile by Mr. H. J. Elwes in 1902, viz., Fagus antarctica and F. obliqua, have been absolutely unaffected. Both are deciduous; but their naturally evergreen ally, F. betuloides, has lost all its foliage, and, although not killed, is apparently unadapted for the open air at Kew. Lomatia obliqua, an evergreen shrub, also introduced by Mr. Elwes in 1902, has withstood the cold very well in a recess of the wall of the Himalayan House. Rhaphithamnus cyanocarpus on a south wall is apparently killed, and Schinus Bonplandianus from Brazil is cut back to ground level. Azara microphylla is one of those shrubs whose young branches are all killed, but it is breaking freely from the older wood. Of fuchsias and escallonias there is nothing unusual to record; all the former, and several of the latter, have been cut back to the ground, even on walls, but, as in former years, will spring up again. Buddleia globosa is killed down to the old stems, but is rapidly recovering.

Californian Shrubs.

Of the tall-growing ceanothuses, C. thyrsiflorus has proved the hardiest, although the large specimens, 15 feet or so high, which have made a remarkable feature for so long near the Broad Walk, are badly hit. They will, no doubt, quite recover. None of the species on the walls, such as Veitchianus, rigidus, integerrimus, etc., have been killed, but some have suffered. Dendromecon rigidum has perished even against a south wall. Fremontia californica, in one of the recesses of the outer wall of the Temperate House, is perfectly healthy, and now in flower. Umbellularia californica, quite in the open, is untouched.

New Zealand Shrubs.

Plagianthus Lyalli, of which there was a fine bush ten feet high in the collection of shrubby Malvaceæ, was destroyed right to ground level, but against a wall it is untouched. The tenderness of this beautiful species is unfortunate; for several years past it has flowered profusely and late in the season, when few other shrubs are in blossom. P. pulchellus succumbed even against a wall. Griselinia littoralis, whilst it withstood the December frost apparently unaffected, was badly cut up by the biting winds of early March. It cannot be regarded as a dependable evergreen at Kew, in spite of all that has been said in its favour. Sophora tetraptera perished in the open, but not under the protection of a wall. The effects of the inclement winter on veronicas—which constitute the most important group of New Zealand shrubs we can grow out of doors—have not been particularly marked, nothing like so disastrous as in 1895. About ten species were killed or injured very severely, but as their susceptibility to cold is well known a set of cuttings is rooted each year, and kept under protection, in order that, if necessary, they may be renewed. An old plant of Muehlenbeckia adpressa was killed back to ground level.

Heaths.

These shrubs succeed well, as a rule, in Kew, and are much valued for producing broad masses of colour in spring and autumn. Apart from the British species, the hardiest of all have proved to be Erica stricta and E. arborea var. alpina, both of which remained fresh and green even to the smallest and youngest twigs. E. mediterranea is untouched except for the young succulent growths made late last autumn. E. australis is mostly killed to the ground; E. lusitanica and E. arborea were rendered very shabby; and E. Veitchi (a hybrid between the two latter) suffered more than either, probably because of its fast-growing habit. All the other species, native and exotic, that are mentioned in the Kew "Hand-list of Trees and Shrubs" were uninjured.

Cistuses, Etc.

We have long regarded Cistus laurifolius as the hardiest species of this genus, and last winter confirms this view. The following have also survived: C. corbariensis, florentinus, lusitanicus, recognitus, and salvifolius. C. cyprius is badly hit, but is now breaking freely from the base. These species are evidently the most desirable members of this beautiful genus to grow where no protection can be afforded. Of helianthemums, H. alyssoides, formosum, ocymoides, and vineale have survived, but H. halimifolium is nearly swept away, and H. umbellatum has almost disappeared.

An interesting—and to me unexpected—result is the passing through the winter of Magnolia Campbelli quite uninjured. Plants were killed in 1895. Two Madeiran shrubs, Genista virgata and Vaccinium padifolium (V. maderense), are grown in the open air here. The former is so hardy as to be naturalising itself about the grounds, and a plant of the latter has grown just inside the main entrance for at least 65 years. Sir Joseph Hooker believes it to be the original plant introduced by Francis Masson on his return from South Africa in 1777.

The exceedingly rare Elliottia racemosa, of which there are two plants at Kew, has not been affected in the least, although a native of Georgia. Diospyros Kaki, uninjured on a wall, succumbed in the open.

In a general way old and well-established shrubs with stout woody stems withstand a severe winter better than younger and more succulent ones. But there are curious exceptions. For instance, all our old specimens of Veronica Traversi have been crippled beyond recovery, but young two or three-year-old plants are scarcely touched. And the only plants of common rosemary remaining after the winter are plants two years old; all the older ones having perished. A similar result was noted at Kew in 1895 in regard to Daböecia polifolia, young plants surviving when old ones were destroyed.

Raphiolepis ovata, usually confined in greenhouses, is in perfect vigour in spite of the trying winter. Choisya ternata, remarkable in being a Mexican shrub, hardy near London (perhaps the only one), was rendered rather shabby in foliage, but flowered excellently in May.

Evergreens.

A curious feature of the winter has been the number of habitually evergreen trees and shrubs which lost all, or nearly all, their leaves, but were not otherwise injured. The most striking instance at Kew is furnished by the Holm Oak (Quercus Ilex). Many trees—but far from all—were quite defoliated. Osmanthus aquifolium dropped all its leaves, whilst its reputed variety ilicifolium retained them. Of the newer Chinese shrubs, Cotoneaster angustifolia and Rhododendron yunnanense, both evergreen in ordinary seasons, were this year deciduous. An old and well-known denizen of gardens, Berberis Wallichiana, became quite bare after the December frost, together with its several varieties except two. One of these, a native of China, sent to Kew by M. Maurice de Vilmorin, is a charming shrub of low, dense, rigid growth, with leaves vividly white beneath; it is quite unharmed. The other, also Chinese, but introduced by Wilson, is similar to the ordinary Himalayan type in habit; it also retained its leaves. Many deodars were almost devoid of foliage by the middle of March, and the Phillyreas (except P. decora) were scarcely recognisable in their almost leafless condition.

One rather striking accompaniment to the denudation of these evergreen trees and shrubs was the uplifting of the branches after they had been relieved of their normal weight of foliage. Many of them, which ordinarily rest on the ground, rose one or two feet from it, and the ends became incurved like the eaves of a Chinese temple, giving the trees a curiously unfamiliar pose.

ARCTOSTAPHYLOS: MANZANITA.

Two species of arctostaphylos are included in the British flora, these being A. alpina and A. Uva-ursi, both dwarf plants, found in mountainous districts, chiefly in the North of Scotland. The plant under notice, however, is a very different looking shrub, for it assumes the proportions of a moderate-sized bush, with a habit resembling that of a low-growing arbutus. A. Manzanita is a Californian species, and doubts have been expressed as to its hardiness; it has, however, passed unscathed through the trying winter of 1908-9 about London, so it is evidently hardy enough for many parts of the British Isles. The branches are similar in appearance to those of an arbutus, and they are clothed with curious rounded silvery leaves, which are suggestive of some species of eucalyptus. The flowers are urn-shaped, pink in colour, and borne in rather dense semi-pendant, terminal panicles, during early spring.

The inflorescences are formed in autumn, and in mild winters they have been known to open during January and February. It is an extremely rare plant, and very few good specimens exist. A nice plant, about 3½ feet in height, may be seen near the arbutus collection at Kew. This particular specimen was raised from imported seeds a few years ago, and is growing in sandy peat. It has flowered annually for the last five or six years, and good seeds have been produced. Several other Californian species are known, but this has proved to be the most ornamental so far.

W. Dallimore.

A BOLDLY ARRANGED FLOWER GARDEN.

The flower garden that contributes so much to the attractions of the south front of Hillingdon Court, the residence of Lord Hillingdon, at Uxbridge, is of interest as a successful example of grouping plants that are quiet in colouring. In other parts of the fine gardens of Hillingdon Court Mr. A. R. Allan utilises as freely as may be desired plants that claim attention by reason of their brightness of colour, but in no case is strong colouring used beyond what is necessary to produce a tasteful effect. But in the example illustrated more dependence would appear to have been placed upon form than on colour to produce a scheme that would appeal to the artistic perceptions of the noble owners, and the result has been eminently satisfactory. As will be seen from a glance at the accompanying illustration, boldness of arrangement has been aimed at, and so successfully accomplished that the breadth of turf with its statues and handsome vases has been relieved of any sense of flatness. It is satisfactory to find in visiting gardens during the summer months that pyramidal and pillar specimens of such plants as Calceolaria amplexicaulis, ivy-leaved pelargoniums, fuchsias and heliotropiums are being used in increasing numbers in flower gardens, and a much bolder and a decidedly more tasteful appearance imparted to both geometric schemes and isolated beds on the lawn. There is, of course, a possibility of this form of arrangement being overdone, but at present it is remote, and there is certainly no cause for being apprehensive upon this point at the present time, especially when we remember how great is the endeavour on all sides to make the arrangements as tasteful as possible and to avoid monotony.

FLOWER GARDEN ON SOUTH FRONT OF HILLINGDON COURT.

RASPBERRIES—RENEWED PLANTATIONS.

The interchange of visits to gardens brings under review aspects of a different character; they may be educative, pleasant, or disappointing, as they severally appeal to the individual. In the matter of raspberry culture, one often observes healthy, full-stocked, and fertile beds in gardens, the greater trouble in such cases being the rigid reduction of the excess of sucker growth. The choice of a dwarf-growing stock removes even the necessity of stakes or wire fences for their support, thus the highest degree of economy is followed by the equally abundant fruit yield.

In contrast to this order of things come paucity of crop and poor stocks of undeveloped canes which are influenced considerably by the state of the weather. Raspberries usually thrive best on heavy land, and give but little occasion for renewals of beds when applications of manure are regularly made, and they are free from perennial weeds. On light land drought seriously hinders the cane growth of raspberries, because it is well known how shallow working are the roots of these plants. Good manure mulches sometimes provide the requisite sustenance when the rainfall is deficient and the sun tropical, but probably the hose and hydrant would afford the greater support to a thirsty crop. This, however, is an equipage denied to a great majority of gardens, and so the best has to be made of other cultural aids.

There is, so far as our experience teaches us, nothing that ensures better results on light land than the periodic renewals on new sites. We have for some years adopted a course of planting a portion of our bed each year, clearing a corresponding portion of the old. A routine course of cropping is necessary if the whole of the raspberry plantation is to be kept on one site, permitting of its extension on its outside extremity. Shortened to a foot from the ground during the winter season these newly-planted rows will give a light but useful yield, usually of fine berries. It is a fatal policy to attempt the cropping of the whole length of cane. The tax on the root reserve if this course is practised is so severe that the canes exhaust themselves in the effort to produce an over-abundant crop, consequently no suckers come for future bearing. By cutting back a fairly vigorous cane to the limit of twelve inches the partial crop and successive cane progress concurrently. In soil unsuited to raspberry culture one cannot expect full-grown canes the first season following their planting, but, given seasonable weather, the two-year-old bed attains to a degree of productiveness more or less satisfying. What the reasons may be for this disparity in regard to raspberry cultivation is not quite clear, but there must obviously be some chemical deficiency in soils of light nature which make them unprofitable, compared to land of heavier texture. There are some gardens even where change of site is not sufficient, for they languish rather than thrive. Such cases call for change of kind, and, what is more important, a new introduction of plants from some distant nursery, if possible off land differing in its character. We have often had proof of the useful service given by such importations in raspberries, as well as other fruit trees. The uninitiated will procure new purchases to replenish blank spaces caused by the collapse of old stocks which is simply inviting further disappointment and loss.

The need has been often urged in orchard planting for appointing new sites, condemning those which have given accommodation for generations past to trees, for the simple reason that the soil is drained of its chemical nutriment, and is, consequently, left exhausted. The same principle applies exactly to raspberries, and we would emphasise the fact that often indifferent raspberry crops are the outcome of a need for fresh sites and new stocks. It is not a laborious undertaking to renew one's raspberry ground, if it is done on progressive lines, extending it forward a portion each year. Much will depend on the nature of the soil, governing the need for deep cultivation. It has been found absolutely needful to trench more or less deeply for this crop in some gardens, while in another the most simple methods suffice. Raspberries, like apple orchards, remain profitable almost for generations in the hands of the favoured few; conflict with circumstances decree otherwise with many, and these latter instances are those which cause those responsible to rise to the occasion, devising fresh means, and changed routine, in order to gain the same desirable ends.

W. STRUGNELL.

Rood Ashton Gardens.

FERNS FOR HANGING BASKETS.

We possess a number of ferns that are eminently adapted for hanging baskets, being of a pendulous or semi-pendulous habit of growth, and it would be well were they more freely utilised for this purpose. In some instances the fronds are of great length, and, as a matter of course, are seen to the best advantage when employed in this way, while, on the other hand, much of their beauty is lost when placed on stages in association with others of compact growth. As seen suspended above the walks of either fernery or conservatory they present a very graceful and elegant appearance, and do much to enhance the beauty of the structure.

Both stove and greenhouse species are available, and while the first-named must be allowed to make their growth in spring and early in summer in the warm and moist house, they can be utilised for conservatory decoration from July to October. Fairly deep baskets should be employed for ferns, the sides being lined with turves or moss, and an important point is to press the soil firmly around the roots. I would advise that loam of a fibrous nature enter into the compost at the rate of one-half, the remainder being made up of good sound peat, leaf-soil, sand, and powdered charcoal. It is interesting and instructive to note that loam is now a recognised ingredient in fern composts, and many growers use but little else, and find that the majority of the species luxuriate therein.

Failures that are recorded may invariably be traced to long-continued drought, and it must be remembered that ferns are very impatient of dryness in the soil. Moreover, from their position, evaporation proceeds at a rapid rate; therefore, when the plants are thoroughly established, and have formed a large quantity of roots, the baskets should be immersed every day for ten minutes during the summer months. To facilitate matters a pulley arrangement should be, when practicable, fixed to the baskets, a small and neat chain being used, and with this they can be lowered and raised with ease. It is necessary to point out that the immersion of ferns and plants generally before the soil is filled with roots must be avoided. The soil becomes saturated, and eventually turns sour, in which no plant can thrive.

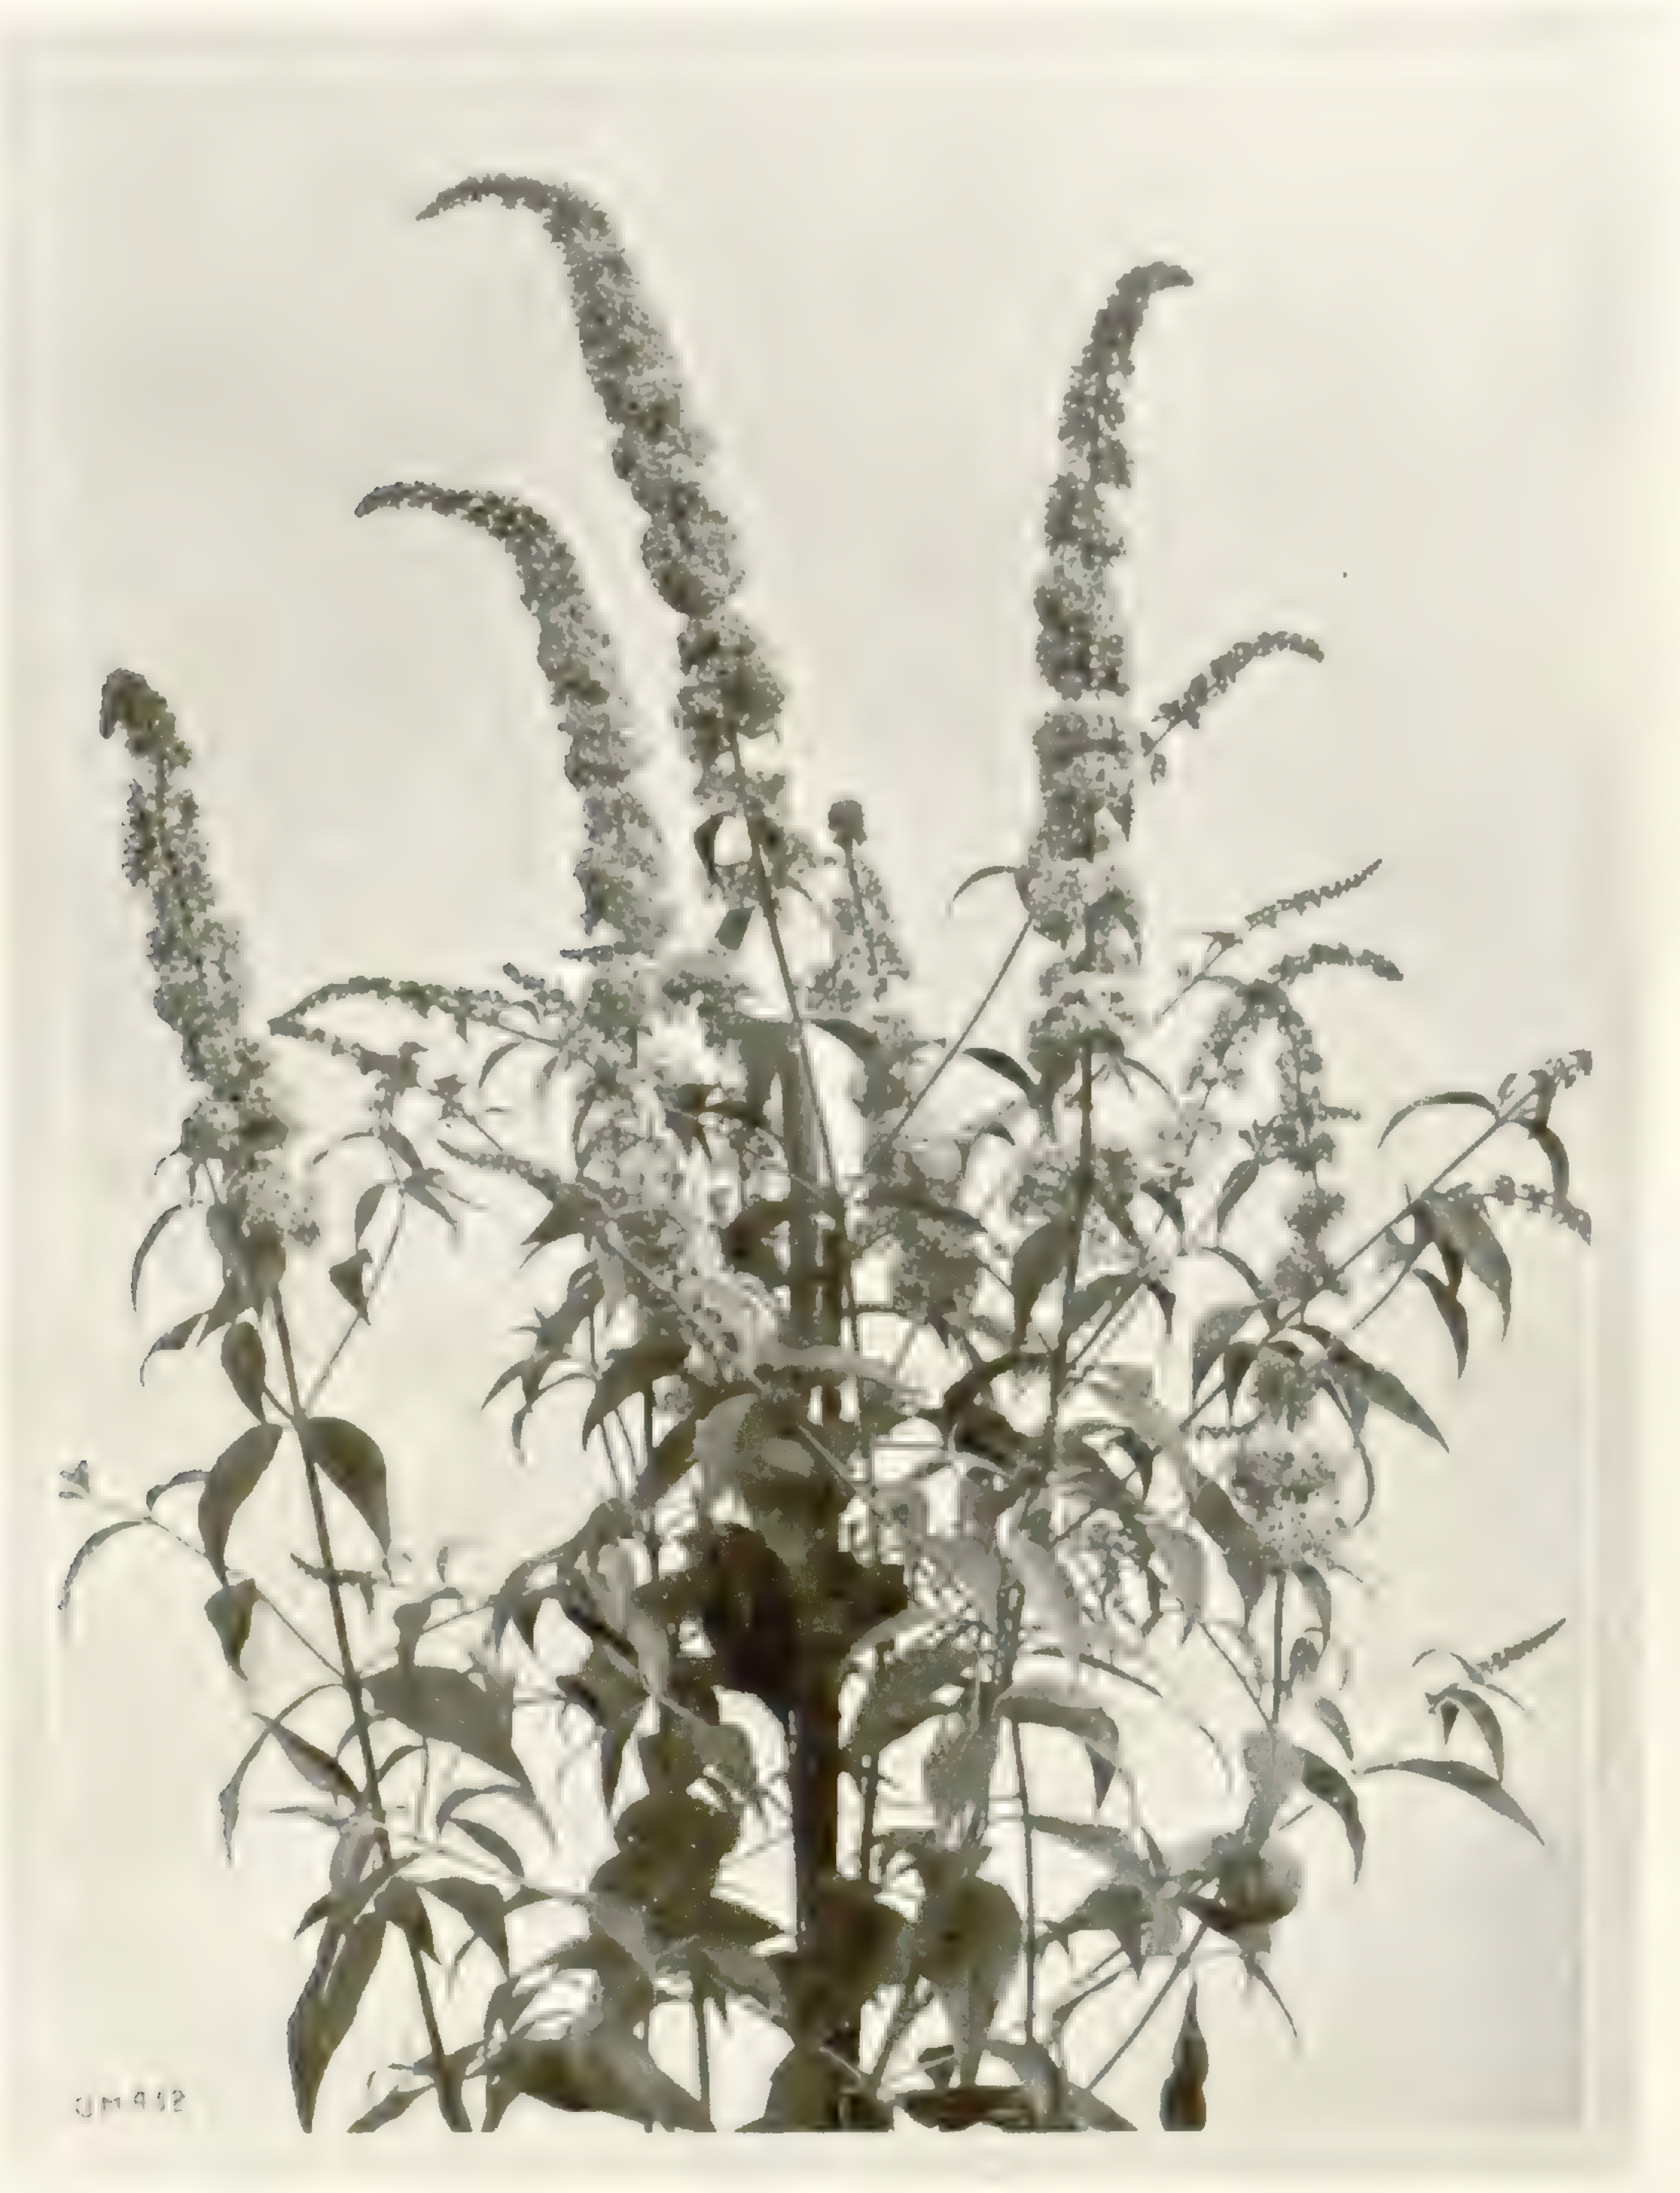
The following comprise a few first-rate warm house kinds, namely, Nephrolepis elegantissima, N. exaltata, a very fine and robust variety, N. tripinnatifida, N. davallioides furcans, Gymnogramma schizophylla gloriosa, Adiantum concinnum and A. caudatum, Davallia dissecta and D. fijiensis, Goniophlebium appendiculatum, G. subauriculatum. The undermentioned greenhouse kinds are of great merit: Pteris serrulata major cristata, P. longifolia and P. moluccana, Davallia bullata, D. Veitchianus and D. tenuifolia, Platycerium alcicorne, Adiantum cuneatum var. grandiceps, Asplenium flaccidum, A. flabellifolium, and A. macrophyllum. The woodwardias are represented by W. radicans cristata and W. orientalis, and in conclusion let good healthy plants, preferably in six-inch pots, be employed for filling baskets, so that a fine effect may be produced within a short period, in fact, beautiful specimens by the end of the season.

WALTER H. AGGETT.

BUDDLEIA VARIABILIS VAR. MAGNIFICA.

The old Buddleia variabilis of gardens was at one time considered to be a decorative plant of exceptional merit, but since Messrs. Veitch, of Chelsea, through the agency of their collector, Mr. E. H. Wilson, succeeded in introducing several improved forms, it is looked on as little better than a weed. The variety Veitchianus is a remarkable plant, producing inflorescences a couple of feet long of rosy-lilac flowers, but magnifica is even better than that, for the flowers are richer in colour, and, if anything, the inflorescences are larger. It also has the advantage of flowering a fortnight later. In August, four years ago, the Floral Committee of the R.H.S. thought so highly of it that it was unanimously awarded a first-class certificate. To obtain the most satisfactory results from this and other forms of B. variabilis, rich loamy soil should be provided, and the plants be cut hard back each spring, so that young, strong shoots are obtained each year. An annual top dressing of rich manure is also helpful. It is a mistake to keep the same plants for many years, as the best results are obtained from moderately young specimens. The illustration given herewith of the upper portion of a young plant indicates the splendid development of the inflorescence when the growth is vigorous.

D.



BUDDLEIA VARIABILIS VAR. MAGNIFICA

Grown as a pot specimen, in which form it is of much value for conservatory decoration during August. The colour of the flowers is rich rose-lilac.

PINE APPLE CULTURE.

Those who have lived a sufficient number of years will know that the pine apple is now cultivated in few British gardens, compared with our younger days. Even in the Royal Gardens at Frogmore, where pine apples were for many years especially well represented, the culture has, I believe, been discontinued. If, however, notwithstanding this, one can judge from the increasing number of enquiries for suckers, and also for advice on the management of the fruits, there appears to be some symptoms of a revival of their culture in our gardens. Imported fruits cannot by any means favourably compare in quality with the good British grown Queen, and I therefore make no apology for presenting a few brief remarks upon the chief points that should be considered in pineapple culture.

So far as houses or pits are concerned, there is no reason why these should cost more than those commonly employed for melons, cucumbers, or tomatoes, and those at The Hendre are of this description. The chief points of importance to consider are shelter from cold winds, plenty of sunlight, means of ventilation, and provision for an adequate degree of warmth in the atmosphere and beds, without having to unduly heat the hot-water pipes. The most commonly come-at-able plunging material is leaf-soil, and this will last for many years, provided a little fresh material is periodically added to it in order to keep the beds up to their desired level. The pots can be more firmly embedded, and consequently kept upright, and in a more equable degree of temperature in this material, than they can be when plunged in either fresh leaves or tan.

With reference to compost, we were lately informed that a widely known skilful gardener grew the best pineapples he ever had in refuse from beneath the potting bench. I would, however, advise those who think of adopting this method, to be certain they have the right kind of material beneath the bench. The soil we use is a light, poor, turfy loam, skimmed from the surface of stony land in the Forest of Dean. This is stacked for a few months before being used, and is then roughly torn in pieces, has its fine particles removed, and a little bone-meal or some similar fertiliser added to it; while particular care is taken that it is in a tolerably dry state.

The foundation of successful pineapple culture is laid by securing good suckers, and it is quite as important to pay careful attention to these while they are attached to the parent plants, as it is to do so at any other stage of their development. They should have firm, sturdy growth, and not be severed from their parents until they commence to push roots. Before being potted, which, in the case of Queens, should be done early in September, they should be prepared for the operation by having a few of their short bottom leaves removed, and their rough base cleanly cut away. Clean, properly drained seven-inch pots should be used for strong suckers, and the compost should be firmly rammed around them. Plunge the pots in a bed where the temperature is about 85 degrees. With careful attention to routine work the suckers will develop into sturdy, well-rooted plants by the middle of November, and from then until the end of February they should be rested by keeping them with soil tolerably dry, in a moderately dry atmospheric temperature of from 55 to 60 degrees.

Suckers treated as advised will be fit for their fruiting pots—12 inches in diameter—about the end of February, and in shifting them see that the balls of soil and roots are first well moistened. Entirely remove a few of the bottom leaves before turning them out of their pots. Use clean, properly drained pots, and ram the compost firmly. The plants should be so placed in the pots that at the completion of potting the old surface soil is covered with about two inches of fresh compost. Plunge the plants two feet apart in a bottom heat of about 85 degrees.

During the spring and summer close attention must be paid to ordinary details, such as ventilation, light, shading from powerful sunshine, atmospheric moisture, and the removal of suckers as they appear; while, above all, the watering of the plants must not be neglected. Be careful that the soil does not remain in a very wet condition, and especially is this necessary when the plants are newly potted, and before their roots have taken possession of the new soil, but as soon as this has taken place a little (enough to well stain it) Peruvian guano should be mixed in the water each time the plants are watered, and sufficient to wet the soil through will be needed about once a week or ten days. Under this treatment the plants will make satisfactory progress, and attain an ample fruiting size by the middle of October. During winter the treatment recommended for suckers for that period should be followed.

It is not advisable to commence forcing until the beginning of January. The night temperature should be increased to about 70 degrees, with a corresponding rise by day, and similar treatment to that recommended for young plants should be followed until the fruits commence to colour, when in order to improve the flavour and colour of the fruit, watering must be discontinued, the atmospheric moisture considerably reduced, and the ventilation of the house increased, the ventilators being left slightly opened during the night.

I have referred to British-grown fruit being of better flavour than are imported ones. The lack, however, of full flavour in the latter is doubtless owing to the fruits being gathered before they are perfectly ripe. A once valued assistant of ours—Mr. J. Norman Ross, son of the distinguished raiser of new apples, and now manager of an Indian tea plantation—tells me he grows in the open without any difficulty grand fruits of Smooth Cayenne, and these of excellent flavour. T. Coomber.

The Hendre Gardens.

COLLECTION OF SPLENDIDLY-GROWN PINE APPLES.
For which Mr. T. Coomber was awarded a Gold Medal at the Holland Park Show.

Tomato Champion Heavyweight.—When judging fruit and vegetables at the Cambridge Horticultural Society's Show I was much impressed by an exhibit of a dish of ripe and a huge cluster of green fruits of the above-named tomato, which were sent by Mr. John Fuller, of St. Martin's, Guernsey, formerly of Cambridge, and a keen exhibitor at our shows. The variety was raised by the exhibitor, and, judging from the fruits shown, well deserves its name, and should make a valuable variety for market. The fruits were of a nice size and very solid and of good colour.—J. H. Ridgewell, The Gardens, Histon, Cambs.

DWARF GARDEN ROSES.

In this short article I am not writing for the rose expert, but I am hoping to assist those who are not fully conversant with all the desirable varieties of roses now available for garden decoration. There are many varieties that belong to this class which are little known to the owner of a small garden, and even to those of larger pretensions, mainly owing to the fact that many of them are not seen upon the exhibition table owing to their being in some respect unsuited. Many such varieties are distinctly valuable in the garden, as they produce an immense number of desirable blossoms for cutting, and have a highly decorative effect in beds and borders.

CANNA KING HUMBERT.

An effective variety, with red-scarlet flowers and bronzy leaves, which received an Award of Merit from the Royal Horticultural Society, August 17. (See New Plants.)

Countess of Gosford was raised in 1905, and is one of the earliest hybrid teas to flower in the open, the pointed, shapely buds are supported on stiff stems, rendering them all the more valuable for cutting. The large shell-like petals are a salmon-pink rose, with a deeper shade running through each. The base of petals is suffused with saffron-yellow. Dainty has small, neatly-shaped buds, primrose-yellow, each edged and tipped carmine. Dr. Grill is quite one of the best of free-flowering roses for decoration, the blooms coppery-yellow, shaded with fawn-rose. A good buttonhole variety. G. Nabonnand, pale flesh, shaded yellow, with large shell-like petals.

General Gallieni is quite an uncommon variety, not known to some nurserymen. The small pointed buds are a bright cerise with a coppery base, and the reflex of petals bright red. Corallina flowers freely at all times, but especially so in the autumn, when roses are scarce; the flowers are deep rosy-crimson flushed coral. Peace has shell-like petals, pale lemon-yellow, changing to almost white with age. Mrs. Peter Blair, lemon-chrome, with golden-yellow centre; the long pointed buds are freely produced on stiff stalks. Marjorie, white, suffused with salmon-pink, is dwarf, and very free of flowering. Mrs. David M'Kee, creamy-yellow, is decidedly effective. Avoca is a crimson-scarlet with long pointed buds, an introduction of 1907. Betty is so worthy that one almost wishes it could be found in every garden, large or small; the blooms are coppery-rose overspread with golden-yellow, paler as it develops. The foliage, too, is quite bronzed in a young state. Dean Hole, silvery-carmine, shaded salmon, long pointed buds, is a beautiful rose. Dr. J. Campbell Hall, coral-rose suffused white. Dorothy Page Roberts, coppery-pink, suffused with apricot-yellow. Duchess of Portland, white, flushed with sulphur-yellow.

Ecarlate, as indicated by its name, has brilliant scarlet flowers, and it is very free. Frau Peter Lambert, rose, marbled pink. General MacArthur is so attractive that it should be in every garden, bright crimson, sweetly perfumed. Goldelse has a deep yellow centre, and as the blooms expand the colour is paler. This is a very sweetly perfumed rose.

Lady Ashtown is one of the most popular varieties we have, either for the garden or exhibition; its silvery-pink shapely flowers are much appreciated, its freedom of flowering, too, is quite exceptional. Le Progrès has a cup-shaped flower of a rich nankeen-yellow; very free and attractive. Lyon Rose is a remarkable variety in freedom of flowering, and the stiff, erect manner in which the blooms are borne contributes to its effectiveness; coral-red with chrome shading, very distinct and beautiful. Madame Ravary is good both as a standard, or as a dwarf bush, flowering freely; its colour, orange-yellow, is much appreciated. Mrs. Aaron Ward has blooms of a rich yellow hue, and these are borne on long stiff stems. Mrs. Harold Brocklebank is a very free-flowering variety of a soft golden-yellow, with a creamy-white centre. Pharisaer, rosy-white, shaded salmon, free, is very pleasing. Prince de Bulgarie is a soft pink, shading deeper in the centre, and fading to white later. Rev. David R. Williamson has dark velvety crimson flowers, with a deeper shade of maroon, and are of globular form. Richmond is one of the most useful garden roses we have, producing well into the autumn its shapely pure scarlet blooms on long stems.

Sarah Bernhardt is a remarkable variety in point of colour, the blooms being brilliant scarlet-crimson, with blotches of velvety crimson on each large shell-like petal; keeps fresh a long time. William Shean has pure pink flowers, with strong habit, and free.

The following varieties belong to the tea section: Betty Berkeley has long buds, bright red, with a crimson shading. Henry Kirk, deep sulphur-yellow, lighter at the edges, free, excellent for cutting. Lady Roberts is an attractive variety, rich apricot, with a coppery base, free and distinct. Meta, is of crushed strawberry colour, with a suffusion of saffron, fine for buttonholes. Lena is one of the most attractive of newer roses, a glowing apricot, the edges of the petals assuming a primrose-yellow as the flowers expand. Madame Constant Soupert is deep yellow, with an edging of peach, the long pointed buds are thus very attractive. Sunrise has attractive flowers, reddish-crimson shading to fawn and pale salmon. Queen Olga of Greece is a soft rosy-pink, most shapely in the bud. Marquis de Zayas has rose-pink flowers, and those of Madame Maurice de Luze are rich carmine.

E. Molyneux.

HERBACEOUS SENECIOS.

Senecios form a group of strong-growing, vigorous perennials belonging to the natural order Compositæ; they flower, for the most part, during late summer and autumn, and all of them are striking objects in the garden. The majority of them grow and flower freely in the ordinary border, provided the soil is rich and the position not too dry; few subjects excel them for the wild garden, and when arranged in proximity to water, where their roots can obtain abundance of moisture, their growth attains highest development. The cultivation of senecios is of the easiest possible nature. Previous to planting the ground should be dug over and well enriched with manure, while in wild gardens the soil should be loosened some distance beyond the planting line, so that the roots may more readily become established.

These vigorous perennials appear nowhere to greater advantage than when massed in considerable quantity, the value of this system having been demonstrated for some years at Kew, both in waterside planting and under conditions less favourable to their development. A great number of species and varieties of senecios are at present in cultivation; they exhibit great diversity in the forms which the leaves assume, but the range of colour in the flowers is somewhat restricted, being usually some shade of yellow or orange.

Propagation of these giant groundsels is readily effected by seed or by division of the crowns, the former, sown in nursery beds in spring, and subsequently transplanted, will bloom in their second or third year. Division is best carried out in autumn, as the roots of these plants are only dormant for a short time, and at that season they soon become established.

The following short selection embraces the best of the older species, and the most promising recent introductions:

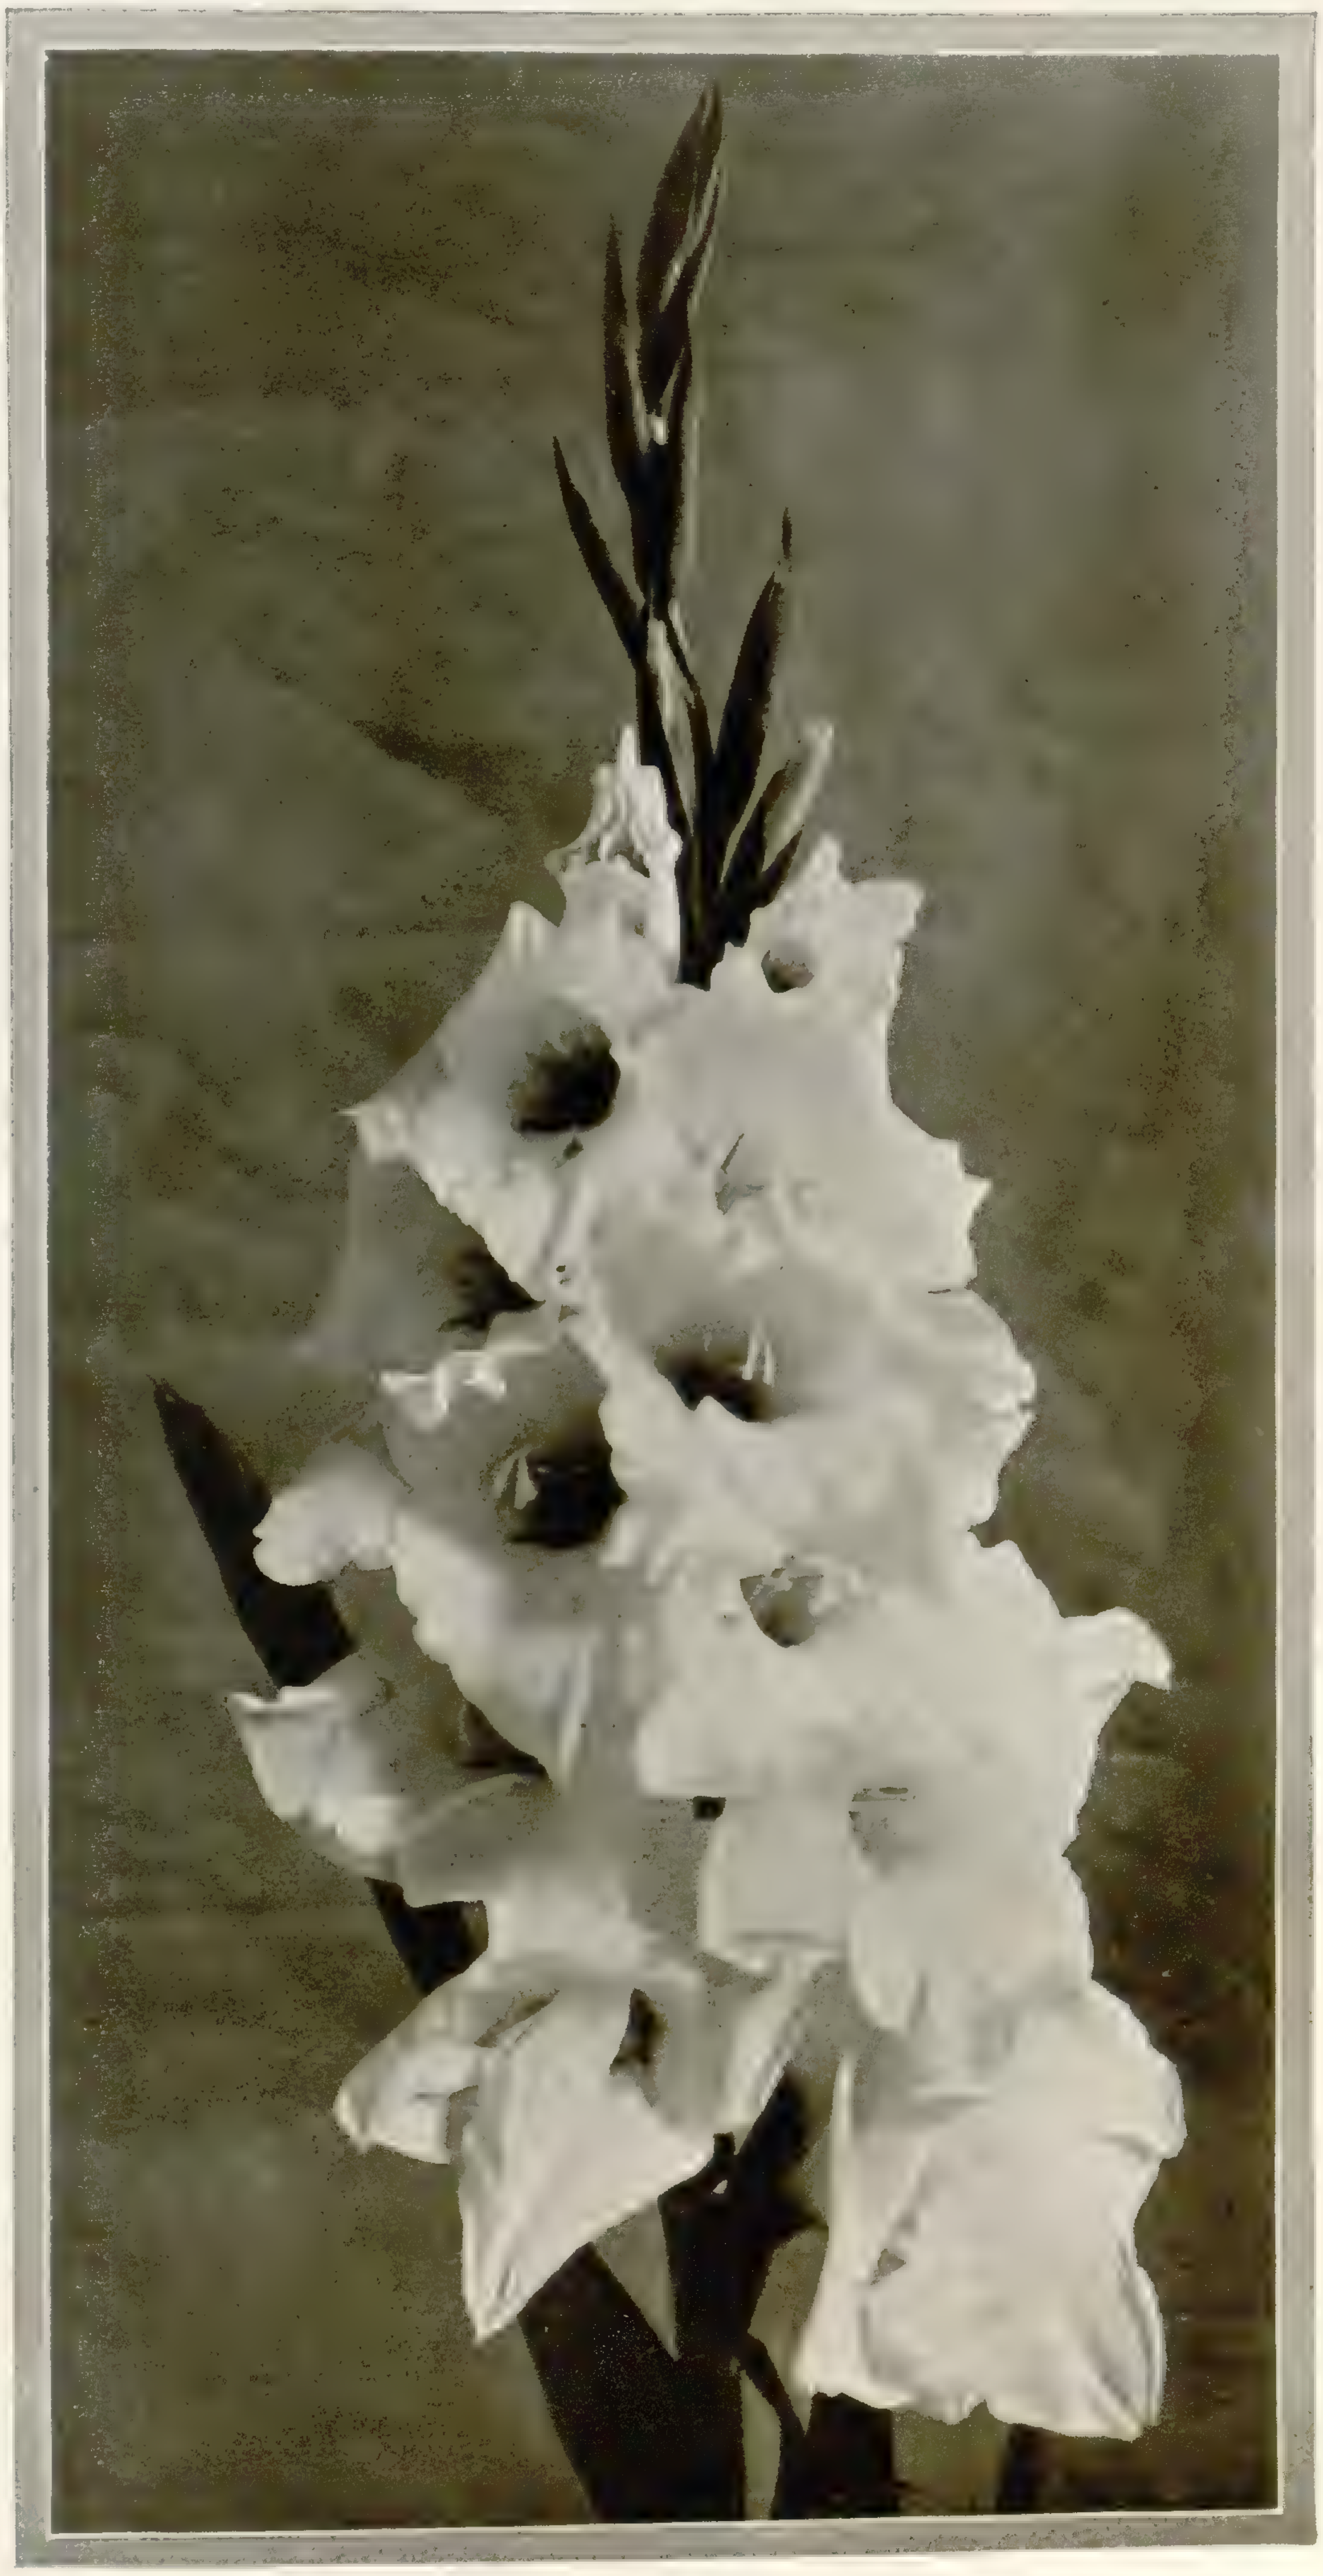
Senecio pulcher is an old species, yet quite indispensable in the autumn border. The ray florets are purple-crimson, and form a striking contrast to the yellow disc. The leaves are broadly lanceolate in form, deeply toothed, and freely covered with a downy tomentum. It grows to about three feet, and flowers from July to September.

S. japonica (Erythrochæta palmatifida) produces yellow flowers in flattish corymbs during July and August. The pinnatifid leaves are carried upon long stalks, giving the plant a handsome appearance; it grows to five feet high.

S. Ledebouri (Ligularia macrophylla) is one of the best and most distinct. The leaves are paddle shaped and glaucous coloured. The flowers are yellow, carried on loose branching panicles some five feet high. It is generally at its best during the latter part of July.

S. doronicum is an old garden plant, flowering in June, and producing golden-yellow flowers upon two-feet stems.

S. tanghutica has erect, leafy stems, bearing dense panicles of golden-yellow flowers. Under favourable conditions it attains a height of five to seven feet, flowering during August and September.



GLADIOLUS MISS ADA REEVE.

An exquisitely beautiful pure white variety, with rose marking on the lower segment, which received the R.H.S. Award of Merit, August 17. (See New Plants.)

S. clivorum is a recent introduction from China. It produces large peltate leaves upon long stalks. The flowers are individually large, and of a bright orange-yellow, borne in loose branching corymbs. It grows to a height of four feet, flowering in August and September.

S. Wilsonian is also a Chinese form. The leaves are cordate, carried upon long stalks. The flowers are close set upon erect, unbranched spikes, some four feet in height: they are strong lemon-yellow in colour, making it altogether most desirable.

S. Veitchianus produces bright yellow flowers on two-feet stems. The leaves are cordate, carried on long stalks. This species, in conjunction with the two last-named, are introductions of Messrs. J. Veitch and Sons, through their collector, Mr. Wilson, and add greatly to the value of the group.

Thomas Smith.

Walmsgate Gardens.

NEW PLANTS, ETC.

◆

DENDROBIUM ACUMINATUM.

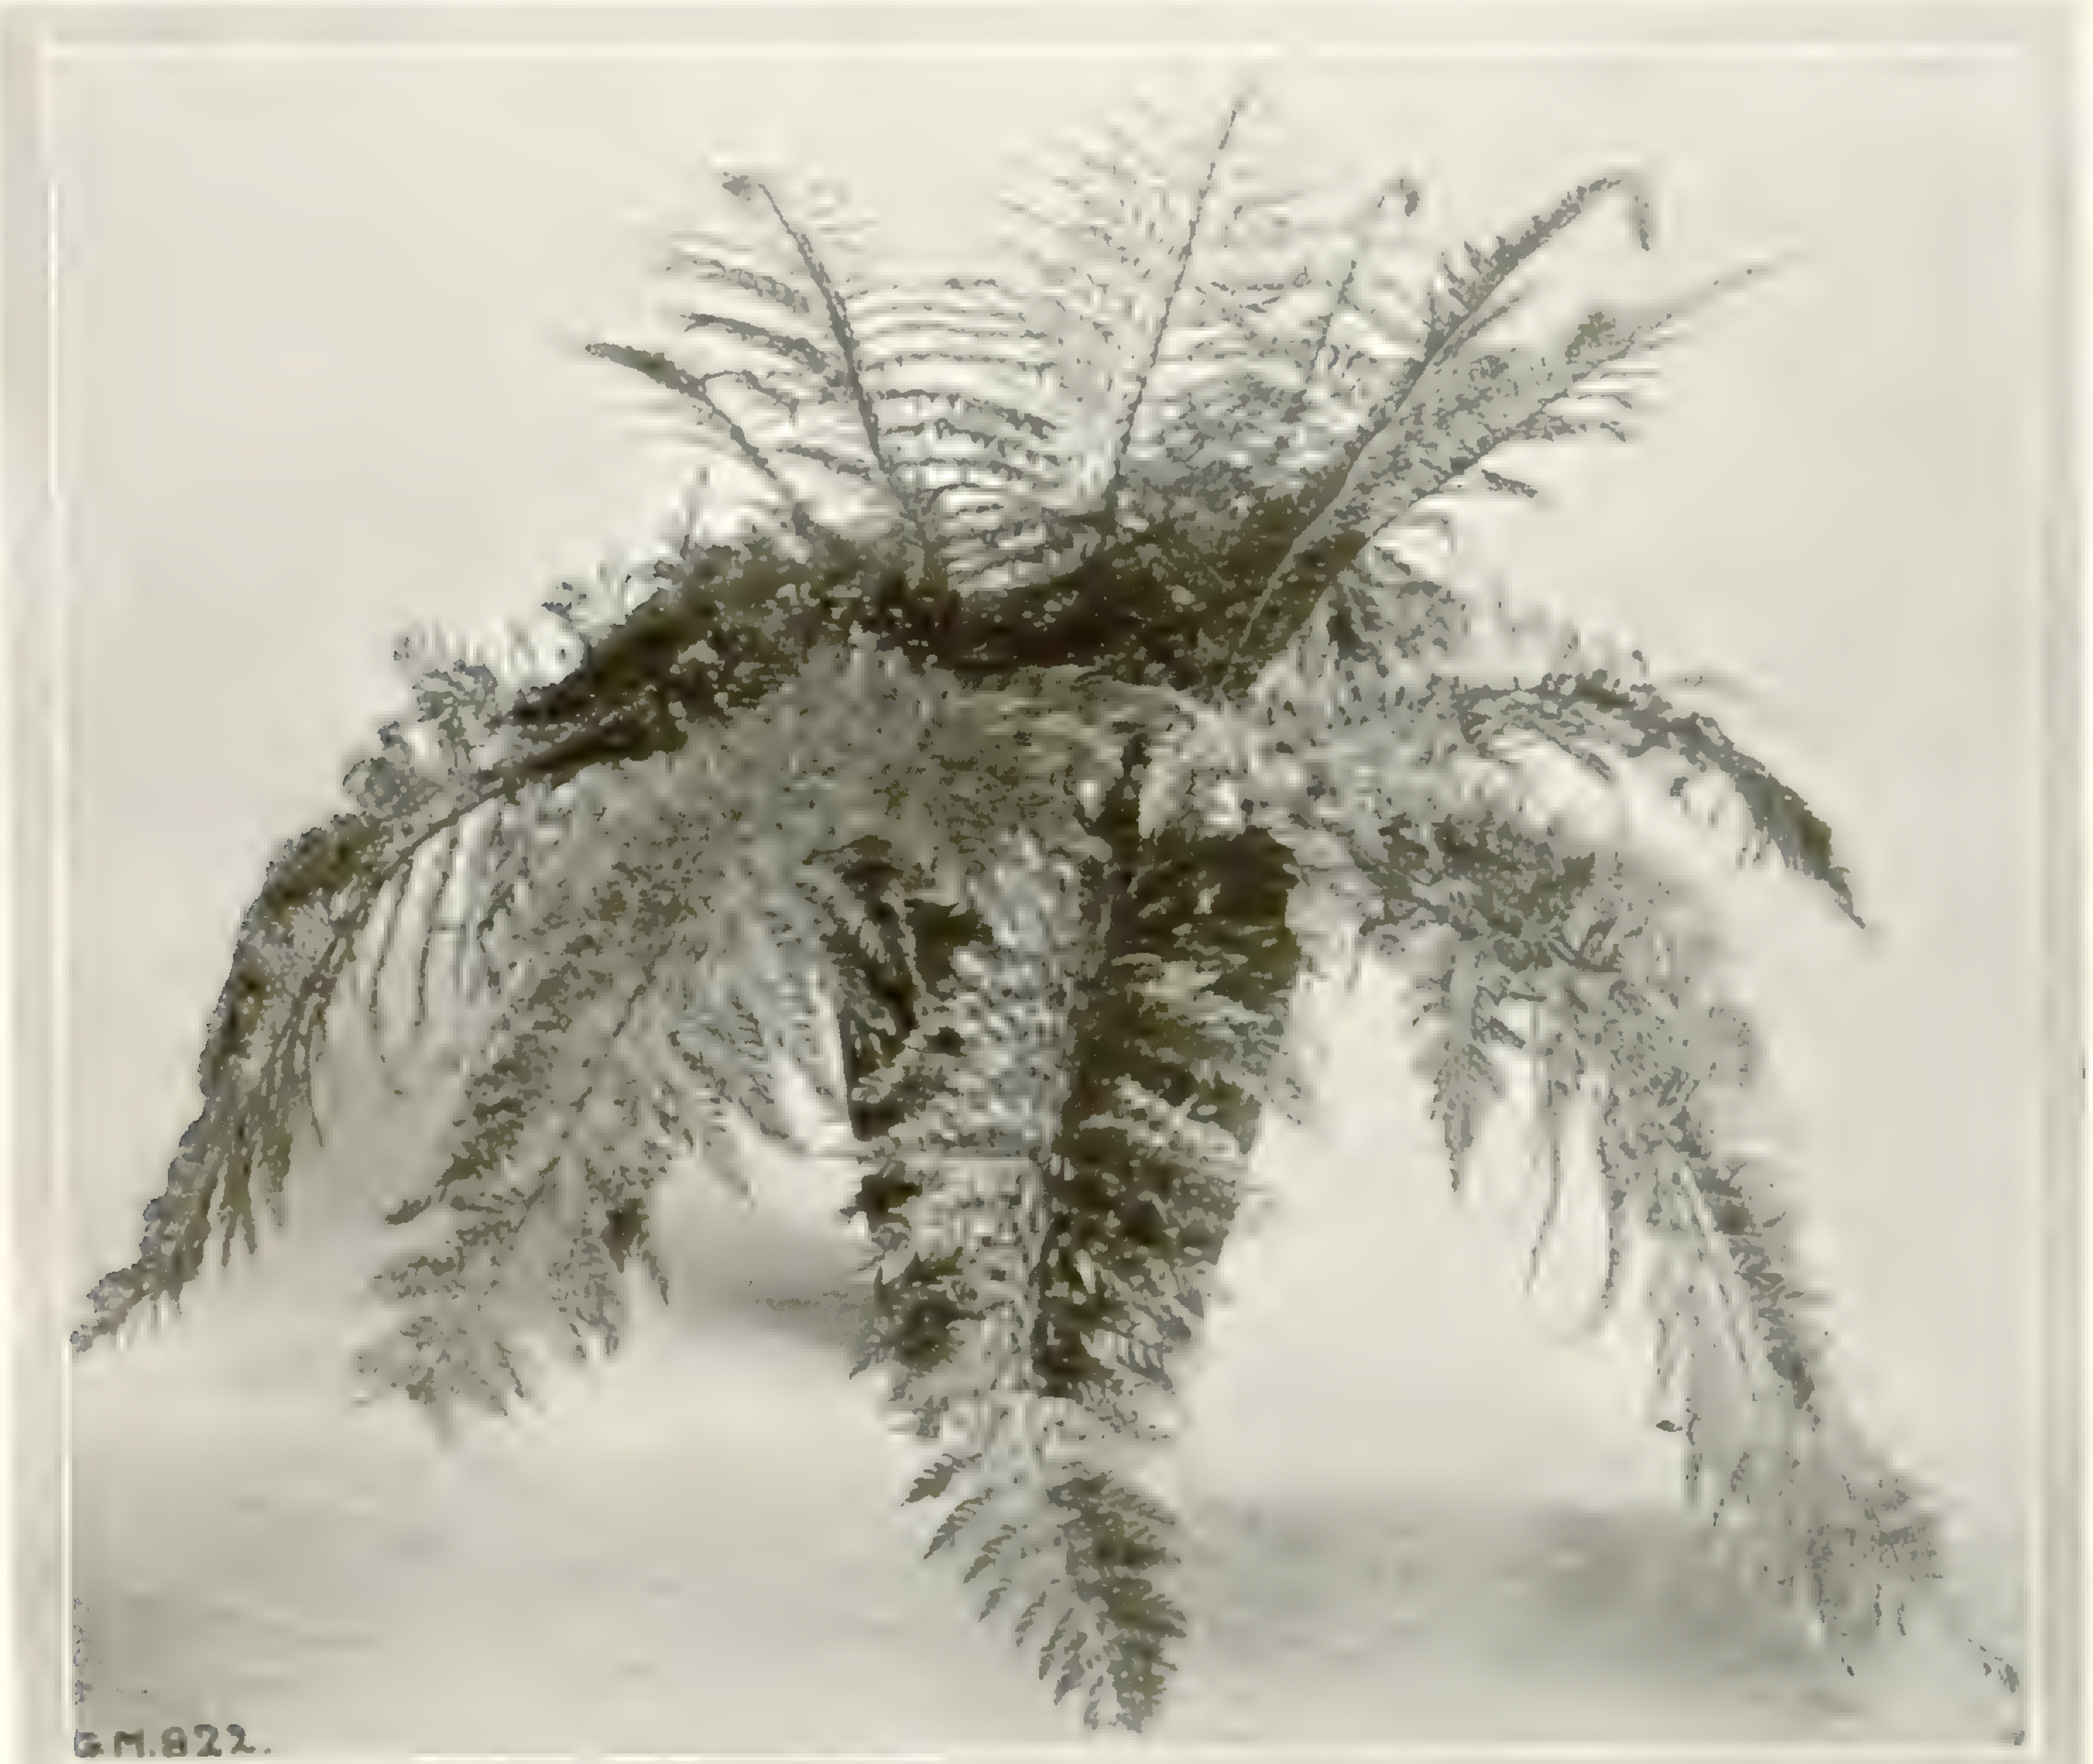
A distinct and handsome species introduced from the Philippine Islands, dwarf in growth and bearing long racemes of handsome star-shaped flowers about two inches in diameter; the petals and sepals and lip are rich pink with crimson base. F.C.C., R.H.S., August 17. Messrs. Moore, Lim., Rawdon, Leeds. An illustration of this beautiful species was given in our issue of the 21st inst.

CIRRHOPETALUM PULCHRUM CLIFTONI.

A beautiful variety of this handsome species; the flowers are borne in large umbels and freely spotted with brilliant rose on a cream-coloured ground. F.C.C., R.H.S., August 17. Messrs. Charlesworth and Co., Haywards Heath.

ODONTOGLOSSUM GOODSONI.

An exquisitely beautiful hybrid obtained from a cross between O. Uro Skinner and Charlesworth's variety of O. Pescatorei. The petals and sepals are roundish and freely spotted and blotched with purple on a white ground. F.C.C., R.H.S., August 17. Mr. H. S. Goodson, Fairlawn, Putney (gardener, Mr. G. E. Day).



POLYSTICHUM ACULEATUM PULCHERRIMUM PLUMOSUM.
An elegant fern exhibited at R.H.S. meeting, August 17, when it received an Award of Merit. (See New Plants.)

LÆLIO-CATTLEYA BLACK PRINCE.

An attractively coloured hybrid between L.-c.Bletchleyensis and C. Hardyana. The flowers are of medium size, the sepals and petals deep rose, and the lip rich vinous red. A.M., R.H.S., August 17. Mr. H. S. Goodson.

LÆLIO-CATTLEYA INVINCIBLE.

A remarkably handsome hybrid with L.-c. Dominiana and L.-c. Bletchleyensis as its parents; the flowers are large, the sepals and petals deep rose, the lip rich claret colour. A.M., R.H.S., August 17. Messrs. Sander and Sons, St. Albans.

LÆLIO-CATTLEYA JASON.

A distinct hybrid derived from L.-c. Massangeana and C. Dowiana aurea, more remarkable for its rich colour than for its form. The flowers are large, the petals and sepals rich yellow, and the lip brilliant crimson-purple. A.M., R.H.S., August 17. Lieut.-Col. G. L. Holford, C.I.E., C.V.O., Westonbirt, Tetbury (grower, Mr. H. G. Alexander).

VANDA CÆRULEA DREADNOUGHT.

A magnificent variety of this beautiful orchid, the flowers are very large, and the sepals and petals are pale blue, very distinctly netted deep blue, the lip deep blue. A.M., R.H.S., August 17. Messrs. Sander and Sons.

ASTILBE RIVULARIS GIGANTEA.

A robust form of this handsome moisture-loving plant attaining a height of about five feet, and producing a profusion of the cream-coloured flowers. A.M., R.H.S., August 17. Mr. Amos Perry, Enfield.

POLYSTICHUM ACULEATUM PULCHERRIMUM PLUMOSUM.

An exquisitely beautiful variety raised from the same set of spores as the two forms for which Mr. C. T. Druery received first-class certificates early in the year. It has the general habit of these, but the fronds are more plumose, and it is perfectly distinct from these, as from all other forms of the species. A. M., R.H.S., August 17. Mr. C. B. Green, Acton.

CANNA KING HUMBERT.

A dwarf-growing variety of much merit, both for pot culture and flower garden decoration. The leaves are rich bronze-colour, and the large, finely-formed flowers are brilliant red-scarlet, and borne in fine trusses. A.M., R.H.S., August 17. Sir Trevor Lawrence, Bart., Burford Lodge, and Messrs. J. Veitch and Sons, Chelsea.

ANEMONOPSIS MACROPHYLLA.

An interesting Japanese plant, with compound leaves and producing anemone-like purple and white flowers. B.C., R.H.S., August 17. Mr. Amos Perry.

GLADIOLI.

Miss Ada Reeve. — A beautiful variety, the flowers large, pure white, with small purple marking on the lower segment. A.M., R.H.S., August 17. Messrs. Kelway and Son, Langport.

Lord Alverstone. — An effective variety with finely formed flowers of a rich crimson hue. A.M., R.H.S., August 17. Messrs. Kelway and Son.

DWARF FRENCH BEANS.

The Belfast. — A fine variety, neat in growth and highly productive; the pods large and fleshy. A.M., R.H.S., August 17. Messrs. Dickson and Sons, Belfast.

Cholet. — A compact growing variety producing a profusion of large fleshy pods. A.M., R.H.S., August 17. Messrs. Vilmorin and Co., Paris.

Excelsior. — A distinct variety remarkable for its productiveness and the large size and handsome appearance of the pods. A.M., R.H.S., August 17. Messrs. Barr and Sons, King Street, Covent Garden.

Evergreen. — A distinct, handsome, and heavy-cropping variety; the growth is compact, and the long straight pods are thick and fleshy. A.M., R.H.S., August 17. Messrs. Sutton and Sons, Reading.

IMPATIENS HAWKERI.

A handsome species with brilliant scarlet flowers, introduced about 23 years ago from New Guinea, and now well known. This and the closely allied I. Herzogi are the most easterly members of the Balsam family in Asia, from which continent and its island about 500 species are preserved in the principal European herbaria. The partiality of the begonia mite for this balsam has so greatly hindered its cultivation that it is not often met with in gardens. Bot. Mag., t. 8247.

MICROLOLOMA TENUIFOLIUM.

A distinct species introduced from Port Elizabeth, South Africa, a few years since; it is of dwarf, slender habit and bears crimson flowers. It requires greenhouse treatment, but it has little horticultural value. Bot. Mag., t. 8248.

ARBUTUS MENZIESI.

A distinct and handsome tree which has long been in cultivation under the name of Arbutus procera; one of the finest known specimens being that in the gardens of Mr. J. R. Anderson, Basset Wood, near Southampton, which is 50ft. high. There is a well-developed tree about 20ft. high on the north side of the broad walk at Kew, where it is quite hardy. It bears large clusters of white flowers, which are followed by red fruits, and is conspicuous by reason of its cinnamon-coloured bark.

STROPHANTHUS PREUSSI.

An interesting tropical climber from the Gold Coast. The flowers are borne in clusters, the corolla yellowish white, and the points of the corolla lobes, which contract into slender tails twelve inches or more in length, are bright red. While attractive when in bloom the species is less valuable horticulturally than either S. grandiflorus or S. gratus. Bot. Mag., t. 8250.

DENDROBIUM BRONCKARTI.

A handsome species, closely allied to D. thyrsiflorum and bearing large pendulous racemes of rose-pink flowers, marked on the lip with golden-yellow. As in the case of the other species belonging to the same group, it is of comparatively easy culture, and blooms freely. It is a native of the mountains of Annam in Indo-China. Bot. Mag., t. 8252.

DEUTZIA SETCHUENENSIS.

A beautiful species, vigorous in growth and profuse in flowering, that would be a most valuable addition to hardy shrubs remarkable for the beauty of their flowers, were it not for the susceptibility of the young growth to injury from spring frosts. The flowers are white and produced in rather large racemes. Bot. Mag., t. 8255.

LARIX OCCIDENTALIS.

A distinct larch, originally collected in the Blue Mountains by Nuttall, where it attains to a height of about 250 feet. The American larch is receiving considerable attention from British foresters at the present time, as it is hoped that it may prove useful as a substitute for the European larch, whose value over a wide area in this country is greatly reduced by its susceptibility to the attacks of Peziza Willkommi. Although less rapid in growth than the European larch its progress is not slow, as indicated by the fact that there is at Kew a tree 36ft. high, with a trunk 26in. in girth near the ground, which was planted in the seedling stage in the autumn of 1881. Bot. Mag., t. 8253.

PYRUS PASHIA VAR KUMAONI.

A glabrous variety of moderate stature, and producing a profusion of flowers which are pale pink when opening and pass to pure white in process of development. The flowers are borne in compact clusters, and the tree is very attractive when in bloom. This form is a native of Kumaon, and is found between 5,000 and 8,000 feet above the sea level. Bot. Mag., t. 8256.

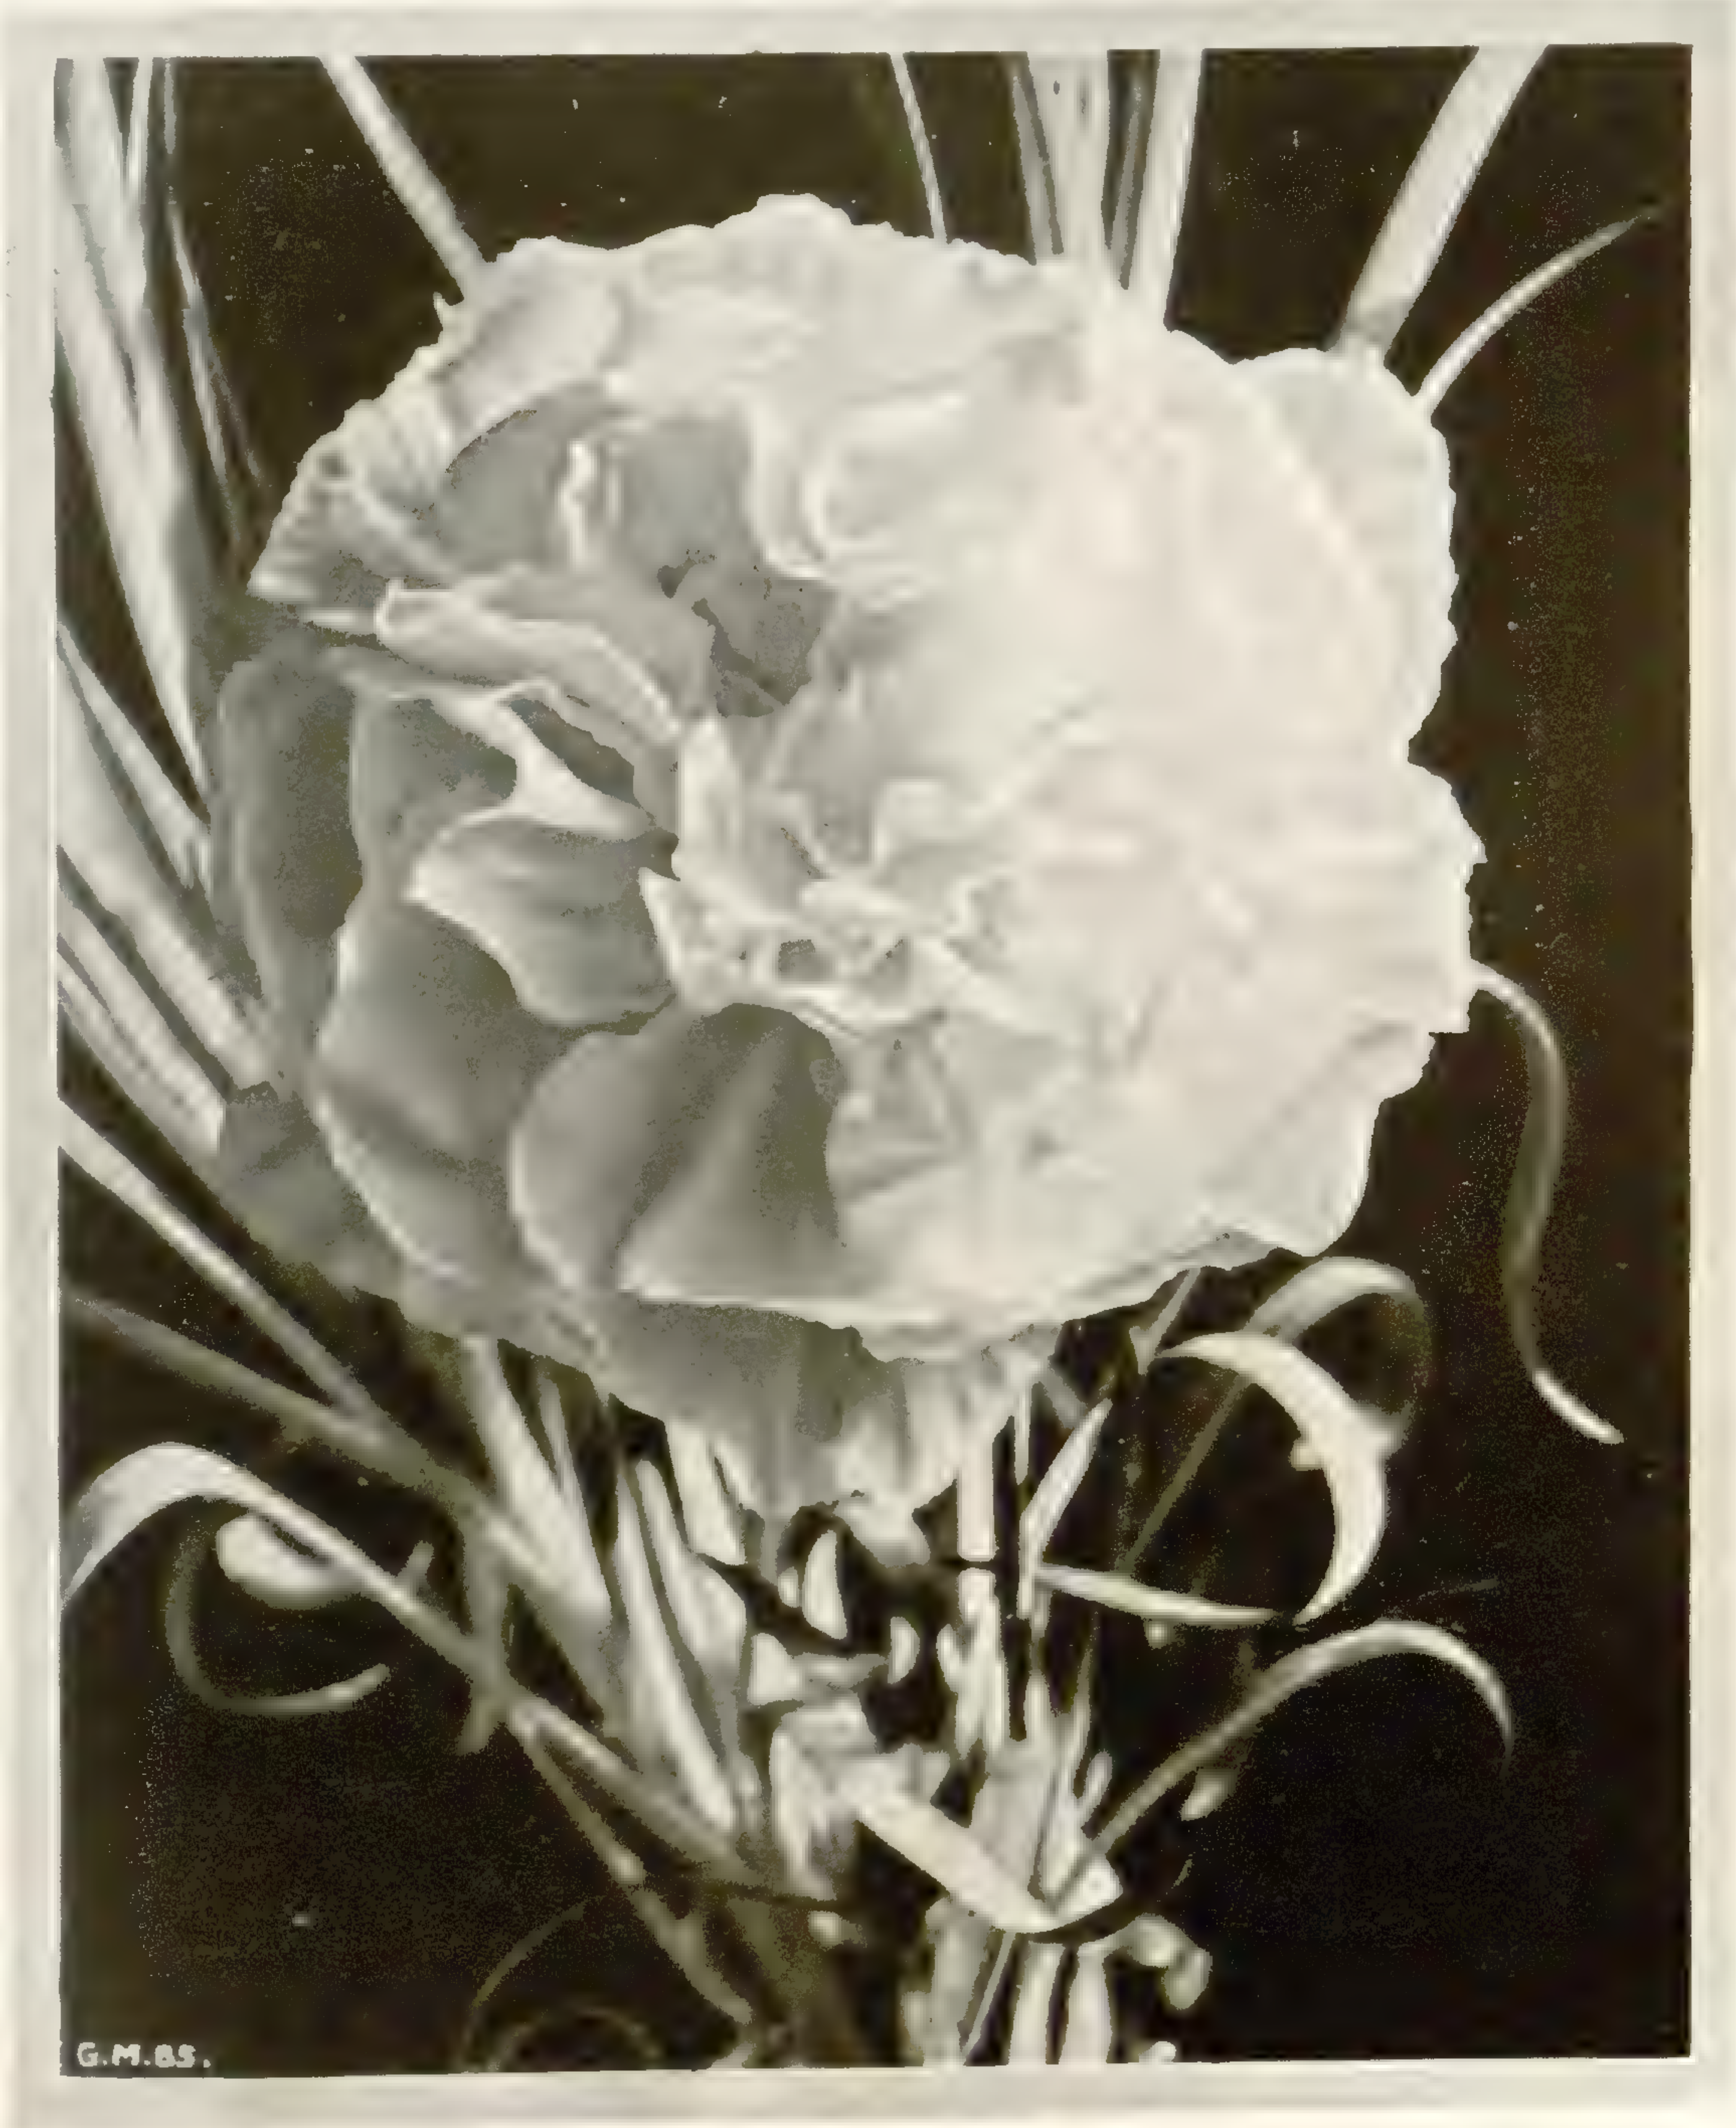
CARNATION QUEEN OF SPAIN.

We have on several occasions during the present summer had an opportunity of seeing the fine new tree carnation that has been introduced by Messrs. J. Backhouse and Son, of York, and have been so impressed by its merits, that in the interest of our readers we have considered it advisable to give an illustration of a typical bloom. The plant is vigorous in growth and remarkably free in flowering, and the blooms are of large size and fine form, the petals of great substance, and the colour is a rich shade of canary yellow. The variety has the additional recommendation of a non-splitting calyx, and this, it need hardly be said, adds immensely to its value whether grown for conservatory decoration or the supply of cut flowers. Not only do flowers with a non-bursting calyx retain their form throughout, but they last much longer, and are more useful for decorative purposes generally. Queen of Spain is so thoroughly good in all respects that it should be found in all gardens in which the tree carnations have a place.

RHODODENDRON FALCONERI.

Though by no means a large-flowered rhododendron, R. Falconeri is one of the most interesting and attractive of the Himalayan species, and everyone who delights in the rarer flowering trees and shrubs endeavours to cultivate it. Unfortunately it is only hardy in the more favoured parts of the United Kingdom, such as Cornwall, South Devon, South Wales, and Southern Ireland, hence in other districts it needs the protection of a cool house. In its native Sikkim R. Falconeri often reaches a height of 30ft., and it is stated to often have a trunk 2ft. in diameter. The large thick leaves are very attractive, especially on the under surface, which is densely clothed with bright red-brown down. The white flowers are closely set in comparatively small round heads, but a plant that is doing well flowers very freely.

R. Falconeri was introduced from Sikkim in 1850. In many parts of Cornwall fine specimens may be seen in the interesting gardens of that county. At Tremough, near Falmouth, where rhododendrons do so well under the care of Mr. Gill, there are several fine examples, which are highly attractive in their season of flowering.



NEW TREE CARNATION QUEEN OF SPAIN.
A beautiful variety, with finely-formed flowers of a rich canary-yellow colour.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

ODONTOGLOSSUMS.—The majority of the plants of O. crispum are now in an active state of growth, and many of the plants will, during the next few weeks, reach the stage of growth when the new pseudo-bulbs commence to form. It is at this period that many of the plants commence root action, and are in such a state that repotting requirements may be best attended to. In dealing with the more rare and valuable odontoglossums, the experience of those in charge of them will have led them to observe that the plants do not all root at the same stage of growth. Some root freely at the same stage as that mentioned above, while others do not commence root action until the pseudo-bulb has reached maturity. It is, therefore, essential in dealing with rare or valuable forms to know something of their peculiarities in this respect. There can be no doubt that the best time to attend to repotting requirements is at the time when root action is commencing, by so doing the plants are enabled to become more rapidly established, and thus avoid the possibility of injury from shrivelling. A general rule may be observed where there are large numbers of plants to be dealt with, but no hard and fast lines can be laid down that may be applied to the whole. With regard to general repotting, we find the majority of plants at the rooting stage during August and September, and as the days are shortening, and the sun's power becoming less, the conditions outside may be regarded as favourable, but it must always be borne in mind that O. crispum makes its growth and flowers at different seasons of the year, and we have to give the treatment according to the circumstances of the cases. While holding the belief that very little danger will ensue by repotting at any season of the year, providing the plants are in the proper condition for repotting, seasons like the spring and summer we have recently passed naturally affect the condition of growth, with us they are three weeks later in their growths than is the case in average years, so that potting in many cases will have to be delayed accordingly until the plants are ready. In repotting odontoglossums one of the principal considerations should be the selections of proper potting composts. I do not consider it advisable to repot annually after they require more space than the smaller size of pots, so the material selected for potting should be of a lasting nature. There is nothing better or safer to use than good fibrous peat and chopped sphagnum moss, two parts of the former to one of the latter, intermixed with a liberal amount of silver sand and finely broken crocks. The pots should be filled to about one-half their depth with chopped bracken roots. Water thoroughly as soon as repotting is completed, and carefully shade from strong glaring light. Keep the atmosphere heavily charged with moisture by damping the floors, staging, etc., two or three times a day.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

CONSERVATORY.—Where bougainvilleas are planted in the conservatory border they should be now making a good display, and plenty of liquid manure should, where practicable, be given them to keep the young pushing growths going. All dead flowers should be removed, and the straggling growths be tied in as becomes necessary. This advice also applies to all kinds of conservatory climbers; many of them will now be going out of flower, so that all dead flower trusses should be removed, and, when possible, a slight thinning of the growths will benefit the plants growing underneath them. This particularly applies to such free-growing plants as habrothamnus, tacsonias, abutilons, and cobæas.

GREENHOUSE PAINTING.—As many of the summer-blooming plants are on the wane, and the weather warm enough to put them outside or in frames, a favourable opportunity is afforded of having interiors of some of the houses painted. The woodwork will now be dry, and in a good condition for painting. If the work is done at once the houses will be clean and ready for housing the bulk of the winter stock by the end of September. As regards colour, there is nothing that looks so well as white, with the ironwork picked out in dark blue. Some prefer darker shades, but if the white shows the dirt quicker, it always looks well when a little soap and warm water has been expended on it.

MIGNONETTE AND SCHIZANTHUSES.—Where early batches of these beautiful spring-flowering plants are required a sowing of seed of each should be made at once, to be followed a fortnight or three weeks later by another sowing. I prefer to sow mignonette seed in the pots in which the plants are to bloom, and the most suitable size pots being 48's or 32's. Use a compost consisting of good turfy loam and sand, with a very little leaf-soil added. Enough sand must be used to keep the whole quite porous, and to obtain really good mignonette the soil must be made very firm before sowing. During the early stages growth will be somewhat slow, but this is of no consequence, as the plants will make up for it when they become well established. Sow thinly, and thin out the seedlings as soon as they are large enough, leaving five or six plants in each pot. As regards varieties, Machet is undoubtedly the best for pot culture, although if one requires to produce large specimens by pinching and potting on, then Miles' Hybrid Spiral will be preferable. The seed of schizanthuses should be sown in large 60's or 48's. Winter them in these pots, and thin as advised for the mignonette. In each case after sowing the seed the pots should be stood in a cold frame, preferably in a semi-shady position, until the advent of cold weather, when they should be removed to a shelf in a cool greenhouse. There are many types and varieties of schizanthus available, but for general decoration the two I like best are S. pinnatus roseus and S. pinnatus roseus compactus. The flowers of these are of various shades of rose-pink, and, given fairly generous treatment they make good plants, and not too dense when in bloom.

CANNAS AND BEGONIAS. — Where named collections of these are grown, before the flowering season is quite over they should be examined to see if all are correctly labelled, as no matter how careful one may be in this respect there are often a few that become mixed. In the case of cannas, or any other plants that are increased by division, this one or two may the following season be one or two dozen, hence the necessity of keeping a close watch on them.

GLOXINIAS.—Early batches of these will be now quite dried down, and should be turned over on their side in some sunny position. Others not so forward should be given plenty of liquid manure until the leaves begin to change colour, thus ensuring good strong corms for next season.—THOMAS STEVENSON, Woburn Place Gardens, Addlestone.

THE FLOWER GARDEN.

SUMMER BEDDERS.—Within the next three weeks the propagation of the majority of subjects suitable for next summer's bedding should be propagated by cuttings, as the earlier this can be accomplished without disfiguring the beds the more successfully will these root and become established. The various varieties of bedding pelargoniums should, as far as possible, be inserted singly in small pots, using a sandy compost. Endeavour to procure the cuttings with hardened and well-ripened growths, insert very firmly, well water them in, and place in an open sunny position, or, better still, in unheated frames. The frames have the advantage that the lights can be placed over the cuttings in case of continuous heavy rains. The propagation of other subjects, such as verbenas, alternantheras, iresines,heliotropes, and mesembryanthemums,should also be proceeded with, and the cuttings of these are best inserted in five-inch pots, dibbling eight or ten in each. The soil should be fine, and contain a liberal proportion of silver sand. These should be well watered to settle the soil about them, and be placed in an unheated frame, as near to the glass as is possible, and kept close and shaded. Spray them with the syringe when the weather is favourable, and do the best to encourage them to remain in a fresh condition, and to speedily root. Fuchsias should also be treated in this way, placing five or six cuttings in each pot. Excellent hybrid varieties for bedding are Thalia, Mary, And. H. Henkel, Coralle, and Gottingen. These are splendid plants for either bush or standards. Take also cuttings of Calceolaria Burbidgei and C. amplexicaulis. These are excellent yellow-flowering subjects for bedding, and far superior to the old shrubby kinds. Cuttings of the latter, however, should be taken later on, and struck in frames in fine soil, treating in the same way as pentstemons and violas.

PENTSTEMONS.—This has been an ideal season for these charming summer and autumn flowering plants, and to ensure their continuing in bloom satisfactorily until frost intervenes, the soil must be kept thoroughly moistened, and liberal supplies of liquid manure, properly diluted, will assist them very materially to continue in bloom, and the quality of the flowers will be much improved. The plants should be kept free from weeds, the surface soil constantly stirred with the Dutch hoe, and all the principal growths should be kept looped up to the central stake. Seedlings from a good strain will give an immense amount of pleasure, as each day up to this date one watches with interest the unfolding of the flowers, and frequently some quite new and improved varieties are the result. These should be carefully marked and propagated, and if it is the intention to save seed, all inferior varieties should be rooted out immediately these are noted, and the most promising kinds carefully fertilised immediately the flowers are sufficiently advanced.

DAHLIAS.—These are now making a brave show, and will continue to do so during open weather. The growths should be kept securely fastened, or gales and winds will be certain to do irreparable damage. The roots must be kept well supplied with moisture, both clear water and liquid manure being necessary. Trap earwigs by placing short lengths of bean-stalks about the plants.—E. BECKETT, Aldenham House Gardens.

HARDY FRUITS.

PLUMS.—This has been a most exceptional season as regards the attack of aphis upon these fruits. Notwithstanding the frequent sprayings which the trees have been subjected to it has been impossible to quite clear the trees of the pest. As the fruit approaches the ripening stage spraying with an insecticide must be suspended until after the fruit is gathered, this gives the aphis another opportunity to again become established; therefore as soon as the trees are cleared of their fruit the young wood should have special attention; tie in any shoots that have been reserved on wall trees, and pinch back all sublaterals to one leaf. Afterwards give the trees a good forcible syringing with an insecticide, repeating this after three days; this will in most cases clear the foliage from aphis, but daily washing of the trees with the hose pipe, or garden engine, during the afternoon will assist in keeping the foliage free from insect pests, and will also cleanse the trees from honeydew and the filth left by the aphis.

BLACK CURRANTS, and in a lesser degree the red and white varieties also, have suffered very much from the same cause as the plum. In a few instances I have noticed trees which have been completely denuded of their leaves, with the consequent loss of fruit. These should have similar treatment to that advised for plums, the object being to cleanse them from aphis, and to endeavour to maintain the foliage in a healthy condition as long as possible, that the buds may be well developed by the autumn.

WALL TREES.—By reason of the multiplicity of work that calls for attention at this season one is apt to overlook the watering of these, but no neglect in this matter must be allowed now. The different kinds of trees are depending on there being plenty of moisture in the borders to assist them in swelling up and perfecting the buds for the next season, and dryness at the roots at this period is often the chief cause of a thin crop the following year. Superficial damping of the surface is of no use, but the borders should be thoroughly soaked throughout the whole medium of the root run. If a light mulching still remains on the borders so much the better, as this will assist materially in conserving the moisture in the soil.

FRUIT ROOM.—This should be thoroughly cleaned out by limewashing the walls and well scrubbing down the woodwork. Keep the room closed during the day, but admit a little of the cool air in during the night.

GRAFTS.—These are growing away well now, and will need some support; remove the clay, and tie some small stakes to the stock in the position to which the young scions are growing, fasten the latter to these to prevent their being broken off by the wind. Remove all growths which emanate from the stock.—GEO. WOODGATE, Rolleston Hall Gardens.

BLIGHTED BEANS.

There has been much outcry in respect to the broad bean of the garden this season, and there has been like complaint from the field also. So many reports come of thin crops and blighted tops that it is presumed the markets have not been overdone with this desirable vegetable this year. Much useful service can be done when they have advanced to the flowering period by removing their tops. This is especially so in a season when aphis troubles abound, for by the removal of the tops a twofold object is accomplished—the pods fill the more quickly, and are less likely to be damaged by high winds. The clearance of the tops with their living freight to the fire-heap gives an assurance of results at once economical and permanent. Instances have come to hand where field crops have been so badly infested as to require early clearance of the ground, for no semblance of a crop appeared. It is not often that the garden affords such instances as these, because, unlike the field bean, they can be attended more easily in the matter of spraying, or, as we have already remarked, their tops carefully removed in baskets and further infestation averted. In bad cases the flowers become attacked, but usually the growing tips are the first to surrender.

W. S.

"CARNATIONS, PICOTEES, AND PINKS," will tell you plainly how to propagate and grow these favourite flowers to perfection. The work is freely illustrated with plates of leading varieties, and explanatory diagrams as to layering, taking cuttings, fertilising blooms, etc. Price 2s. 6d. net, by post, in box, 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

THE CROWFOOT FAMILY.

The crowfoot, or ranunculus family doubtless derives its name from the claw-like aspect of the corms, or rootstocks, of the common ranunculus, as we see them exposed for sale in the autumn, but the family is a very large one, and embraces so many sub-orders and species that this resemblance is by no means general, and the botanist distinguishes it, not by the rootstock at all, but by the number and general arrangement of the floral components. Our most familiar examples are the buttercups of our field, but probably few of our readers would know that these pretty weeds are relatives of all our beautiful clematis, with their splendid blossoms decking their rambling concourse of deftly-clinging foliage, the equally charming anemones of many kinds, from the sweet and lowly flower of the wood anemone, to the gorgeous scarlets and crimsons of the fulgens and St. Brigid strains, the magnificent blooms of the pæonies, and the less attractive, but still charming ones of the hellebores which break the monotony of winter with their hardy inflorescence, defiant of frost and snow.

Nevertheless, despite this diversity and range of form, tint, and habit, they all constitute one great family or order, and present similarities of structure in their flowers which absolutely determine their alliance in the eyes of the botanist. The delphiniums and the Monkshood also belong to the family, which embraces, in fact, something like a thousand species in all, embodied in about forty genera, so that those we have singled out as typical are but a few in a crowd. Plants belonging to this order appear to be mainly, if not entirely, confined to cool regions, occupying in warm countries only elevated habitats, where the temperature is comparatively low. It is a singular fact that despite the great diversity of its members they generally possess either acrid properties or actually poisonous ones.

Thus it is a recognised fact that our familiar buttercup, though it figures so largely in our pastures, and is popularly supposed to contribute to the colour of our butter, is carefully avoided by the cow owing to its bitter and toxic nature, while in the monkshood of our gardens, the deadly poison known as aconite is present, and the leaves of the common wild clematis, the Traveller's Joy, have been used as a blistering medium. All the hellebores are powerful purgatives, and the powder obtained from them is frequently used as an insecticide. This last fact in all probability indicates the real reason why, in the process of evolution of the order, and consequent wide divergence of specific types, these poisonous, or, at any rate, acrid properties have been retained, viz., as a defence against the insect world, and possibly, in a less degree, against the animal world generally. At any rate, in the case of our cows, it is clear, when we watch how the animal sweeps its prehensile tongue around a clump of buttercups, collecting only the adjacent grasses, that its flavour is its salvation.

That it does not, however, render it immune from insect raids is clear, from the fact that we have seen buttercup leaves perforated with leaf miners, and their stalks by the foamy accumulations of the Spittle Fly, a proof that whatever safeguards Nature may contrive for the protection of some of her creations, she does not fail to endow others with sufficient immunity to enable them to continue that struggle for existence which constantly leads to further and, as a rule, higher developments.

Chas. T. Druery, V.M.H., F.L.S.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

Royal Horticultural Society of Aberdeen.

AUGUST 19, 20, and 21.

The members of this society held their annual show on these dates in the beautiful Duthie Public Park, Aberdeen, than which no more ideal spot could be wished for such a display. The entries numbered nearly 1,600, a very slight decrease compared with last year, but this was more than compensated for in the quality of the exhibits. The courteous secretary, Mr. J. B. Rennett, advocate, Aberdeen, made his usual complete arrangements, and the whole of the exhibits were staged in a most attractive fashion. Despite the backwardness of the season, the display was one of the finest ever seen in the eighty-five years' existence of the society, the warm weather and beautiful sunshine experienced during this month greatly assisting cultivators.

POT PLANTS.

In the marquee assigned to pot plants the display was exceedingly rich and varied. The leading honours for the best table of stove or greenhouse plants and cut flowers, arranged for effect, were taken by Mr. A. Douglas, gardener to Mr. Thomas Ogilvie, Kepplestone House, Aberdeen. The centre plant was a large fuchsia, flanked with liliums, and colour was lent by coleus and coxcombs, while roses and sweet peas in vases were introduced to add to the effect. The border was composed of gloxinias and lobelias, interspersed with maidenhair ferns. Mr. John Yule, Fae-me-well, Aberdeenshire, carried off the silver medal and second honours for best specimen plant in flower with a magnificent begonia and a finely-blossomed hydrangea of fine symmetry. Specimen foliage plants were well shown, and here Mr. John Elder, gardener, Norwood, gained the society's silver medal with a finely-grown yucca. Ferns were exceedingly good. For the best four, dissimilar, Mr. Alexander Brebner, Dalhebity, won with four fine adiantums. Mr. Alexander Duncan, Rubislaw Den House, Aberdeen, also won finely in the class for six ferns, three distinct species. Zonal geraniums were a grand feature, and Mr. J. W. Brechin, Ardoe, Aberdeenshire, carried chief honours. Mr. Brechin had also leading place for liliums, with fine Lilium auratum. Mention also must be made in this division of Mr. John Petrie, Crathes Castle; Mr. Gillespie, Aberdeen; and Mr. J. Anderson, Aberdeen.

CUT FLOWERS.

The division devoted to these was undoubtedly the outstanding feature of the show. Numbering some 600 entries, the display given here has probably never been excelled in Aberdeen. Sweet peas were shown in rich profusion, and the variety and charm of their colours added not a little to the beauty of the scene. Mr. John Grigor, gardener to Mrs. Dunbar-Dunbar, of Seapark, Forres, won handsomely for a superb collection of these flowers. The same must be said of Mr. Petrie, Crathes Castle, for his fine entry of sixteen bunches, distinct varieties, which had to include the following new Spencer varieties, namely, Mrs. Routzahn, King Edward, Queen Victoria, Apple Blossom, Mrs. Sankey, Beatrice, Tennant, and Asta Ohn. Shown in their natural foliage, beautifully built, yet not too heavy, the entry made a capital show. Mr. Crozier, Durris House, Aberdeenshire, was a good second, but his blooms were not so large, nor was his arrangement so good as Mr. Crozier's. Roses made an exceedingly fine display, and Messrs. James Cocker and Sons, Aberdeen, gained the silver challenge cup for thirty-six rose blooms, H.P. and H.T., with a fine collection. Messrs. Adam and Craigmile, Aberdeen, were second, and they also secured first place for twenty-four tea roses with a capital entry. Mr. James Jamieson, Tillery, Aberdeenshire, carried off the silver medal for the best twelve blooms, and Mr. W. Coutts, Ellon, Aberdeenshire, had a similar award for best twelve tea roses. Dahlias were well shown, the silver medal for the best group of pompon varieties going to Mr. W. Brechin, Ardoe, with a splendid arrangement. Mr. Jamieson, Tillery, carried off the trophy for cactus varieties. The season has not been favourable for show or fancy pansies, nevertheless the display was very good, chief honours going to Mr. William Scorgie, Springhill, Aberdeen, and Mackenzie, Buxburn. Mr. Jamieson, Tillery, had a fine entry of gladioli, and he richly deserved his prize. Asters and marigolds were a good average, Mr. Brechin, Ardoe, and Mr. John Grieve, Woodside, taking leading places. Zonal geraniums were good, while carnations and picotees were finely shown by Mr. Alex. Rennie, Easter Skene.

For sprays, bouquets (hand and bride's), buttonhole bouquets, and baskets of flowers the entries were not numerous, but they were very good. Mr. A. Cumming, Granitehill, Aberdeen, had a fine win for lady's sprays. He also led for buttonholes. Mr. Grigor, Seapark, had matters pretty much his own way for hand bouquets (roses) and brides' bouquets. Mr. Strachan, Botanic Gardens, Aberdeen, was first for baskets of flowers. For the best collection of twenty varieties of cut flowers, and fine foliage bedding plants, including annuals, Mr. Douglas, Kepplestone House, was first, Mr. Scorgie, Springhill, making a near second.

The competitions for nurserymen and florists, although somewhat few in number, attracted considerable interest in the cut flower division. Mr. Alexander Burns, and Mr. A. J. Burns, Newmarket, Aberdeen (father and son), did some very fine work here, with their independent entries. For hand bouquets (coloured) they took all the honours, with fine entries, composed of cattleyas and odontoglossums, with asparagus. For best floral designs they were also first, second, and third with their several entries, which were chiefly composed of Lilium Harrisi, pancratiums, lapagerias, stephanotis, and white roses, with asparagus as foliage. These were greatly admired, and reflected not a little credit on the exhibitors. The same gentlemen also showed excellent taste in sprays for lady's dress. Messrs. D. and W. Croll, Dundee, had a capital first for shower bouquets, closely followed by Mr. Burns, sen. Messrs. Adam and Craigmile, Fernielea, gained chief place for tea or noisette roses. They were also first for wreaths, with a superb entry, second and third places being taken by Mr. Alex. Burns. Messrs. James Cocker and Sons led finely in roses with excellent blooms.

FRUIT.

This division formed a very attractive feature of the show. Mr. Grigor, Seapark, Forres, scored with his collection of hardy fruits, comprising cherries (Governor Wood), apricots (Moor Park), gooseberries (Whinham's Industry), gages (Denniston's Superb), pears (Clipper's Favourite), and apples (Nonsuch). The apricots in this entry were exceptionally fine. There were some good entries of strawberries, including dishes of that fine and exquisitely flavoured berry, Aberdeen Favourite. In this class Mr. George McLennan, Fetteresso Castle, Kincardineshire, had a fine win. For cherries, Mr. Petrie, Crathes Castle, took first place with a fine dish of the Morello. Raspberries were a good lot, and here Mr. Brechin, Ardo, took first and second honours. It was the gooseberries, however, that formed the outstanding feature in this division, these being splendidly grown. Mr. Harper, Tullibelton, Perthshire, proved a grand leader with dishes of Leveller, Langley Beauty, Telegraph, and Lord Derby. Mr. Grigor, Seapark, was first with early yellows, and for reds Mr. Petrie, Crathes Castle, led the way. Black currants and red currants were splendidly shown, the leaders being Mr. J. Ferguson, Cluny, and Mr. Harper, Tulliebelton. Grapes were not a large entry, but those forwarded by Mr. McKinnon, gardener to the Countess of Aberdeen, Haddo House, Aberdeenshire, were easily first. He led for best two bunches, distinct, one each, white and black, with fine specimens of Muscat Hamburgh and Muscat of Alexandria. Mr. McKinnon was also first for single bunches, white, with Muscat of Alexandria. Mr. Petrie, Crathes Castle, took first and third prizes for best bunch, black, and he also gained first and second honours for melons with very fair specimens. Apples were not a particularly great display, the season not being favourable.

VEGETABLES.

These made a large and fine display. Mr. Douglas, Kepplestone House, was a capital first for a collection, Mr. Scorgie, Springhill, making a good second. Potatoes were the outstanding feature in this division, the tubers being clean, well grown, and thoroughly ripe. The leading prizewinners, all of whom were first in one or more classes, were Mr. William Coutts, Ellon; Mr. Alex. Brebner, Dalhebity; Mr. J. Ferguson, Linton House, Cluny; Mr. Grigor, Seapark; and Mr. William Lawson, Oakbank, Aberdeen. The last-named gentleman's entries were much admired.

The amateurs and working-class sections were capitally represented, special note having to be made of Mr. George Maitland, Great Northern Road, Woodside, who won handsomely the beautiful silver challenge cup for best table of greenhouse plants with a really meritorious entry.

MISCELLANEOUS EXHIBITS.

Than the display forwarded for exhibition only by Messrs. James Cocker and Sons, Aberdeen, nothing finer has been seen at an Aberdeen show. Messrs. W. Smith and Son, of Burnside and Silverhillock Nurseries, Aberdeen, had an unusually large and excellent display, occupying one of the largest allotted spaces in the show. There was also a fine show of named American tree carnations, from the gardens of Mrs. Smithson, Frendraught, Huntly, where these carnations are grown to great perfection; also a superb collection of begonia blooms grown at the Orphanage, Aberlour. Mr. M. H. Sinclair, seed merchant, Aberdeen, had a very large and attractive exhibit in the cut flower marquee. A very interesting collection of plants and flowers was shown by Messrs. Ben Reid and Co., Aberdeen. Mr. James Robertson, Hadden Street, Aberdeen, had a very finely decorated stand, embracing a large collection of herbaceous plants and hardy annuals.

Unfortunately, the weather, after keeping beautifully fine on the first two days, broke down completely on the Saturday, thereby marring, financially, what was otherwise one of the finest shows held under the auspices of the society.

Royal Horticultural Society.

SCIENTIFIC COMMITTEE, AUGUST 3.

Present: Mr. E. A. Bowles, M.A., F.L.S. (in the chair); Messrs. A. W. Sutton, J. T. Bennett-Poë, J. Douglas, W. Hales, G. S. Saunders, and F. J. Chittenden (hon. secretary).

DISEASED WATER LILIES.—Mr. G. S. Saunders reported that he had been unable to discover any insect or fungus pest upon the water lilies sent to the last meeting, and he considered it probable that the condition of the water, which smelt very unpleasant, was the cause of the death of the plants.

SPARROWS AND WATER LILIES.—Mr. W. Hales showed leaves of water lilies with large numbers of scratches upon them, caused by sparrows' feet. The sparrows stand upon the leaves in order to reach the water and scratch the leaves in their endeavour to retain their balance.

POINCIANA REGIA.—From Mr. S. P. Lancaster, of Alipur, Calcutta, came drawings illustrating the variation in the gorgeous flowers of this beautiful plant.

GREEN SWEET PEA.—Rev. W. Wilks exhibited flowers of a sweet pea of a yellowish-green colour. The plants had come true from seed.

MALFORMED PEA.—Mr. E. E. Turner, F.R.H.S., of Coggeshall, sent a flower of the culinary pea showing axial proliferation and various malformations, particularly in producing free stamens and regular petals in some of the small flowers. Mr. Saunders took it for further examination.

CONES OF PINUS SABINIANA.—Mrs. Hadley, of Parkside, Reigate, sent two huge cones of this pine from a tree grown in her garden which had carried five cones.

MALFORMED FLOWER IN LILIUM AURATUM.—Mr. C. E. Shea showed a flower of this species which for the third year in succession produced very narrow perianth pieces, which were green. The plant was very strong, but all the flowers were of this type.

CEROPEGIA SP.?—Mr. W. Ledger showed specimens of ceropegias from his garden. Ceropegia Rendalli, N. E. Brown (Kew Bull., 1894, p. 100, and revised in "Flora Capensis," Vol. IV., 1908, p. 814) belongs to the section having an umbrella-like canopy surmounting the corolla, as in C. Sandersoni, C. Monteiroæ, and the not yet introduced C. fimbriata. The tuber of the plant exhibited was sent without specific name by Mr. Thorncroft, of Barberton, to Mr. W. E. Gumbleton, who presented it to Mr. Ledger. A small twining species with a remarkable flower, originally sent to Kew by Dr. P. Rendall, of Barberton, after whom it was named, in 1894, and since lost. C. barbertonensis, N. E. Brown, n.sp. ("Flora Capensis," Vol. IV., 1909, Addenda and Corrigenda, p. 1,132). The flowers resemble in shape those of C. Woodi and of C. debilis. Plants were raised by Mr. W. E. Gumbleton, from seed received from Mr. Thorncroft. A certain number of the seedling plants produced leaves variegated with pale green along the veins. Both forms were exhibited. C. hybrida, N. E. Brown ("Gard. Chron.," December 8, 1906, p. 383, with figs.). A distinct and large-flowered hybrid (C. Sandersoni ♀ x C. similis ♂) raised in the Botanic Garden at Leiden from accidental insect fertilisation, and the first and only recorded hybrid. The pollen parent was sent to Leiden by Mr. Ledger, who received it from Kew, where it had long been grown as C. Thwaitesi, a Ceylon species, not at present in cultivation. The habit of this hybrid is that of a very attenuated C. stapeliæformis.

AUGUST 17.

Present: Mr. E. A. Bowles, M.A., F.L.S. (in the chair); Messrs. J. T. Bennett-Poë, J. Douglas, L. Crawshay, J. Frazer, G. Gordon, A. Rolfe, G. Saunders, and F. J. Chittenden (hon. secretary).

VARIATION IN SEEDLING CARNATIONS.—Mr. J. Douglas, V.M.H., showed numerous flowers of seedling tree carnations raised from seed saved from self-coloured varieties. He pointed out that among them were several singles in the proportion of about 12 per cent. of the whole, but the greatest peculiarity lay in the large number of striped flowers which were produced. The parents were white, pink, or red, but among the progeny was one with yellow flowers striped with purple.

PROLIFERATION IN GARDEN PEA.—Mr. A. W. Sutton, V.M.H., sent flowers of garden pea from Berkshire precisely like those shown from Mr. Turner at the last meeting.

PROLIFERATION IN CAMPANULA.—Mr. Bowles showed specimens of C. persicifolia with axial proliferation, a number of green foliage leaves growing from the centre of the flower. Some of the shoots, which were from the garden of Mrs. Trotter, Hill House, Wormley, also showed fasciation.

GERBERA NOT FLOWERING.—Heads of gerbera were received, the sender thinking they were from a plant of Gerbera Jamesoni which had failed to produce flowers before seeding, but the heads were from G. Kunzeana, a plant from the Himalayan region, which does not open its flower heads to any extent.

POTATO WITH AERIAL TUBERS.—From Mr. Bevan, of East Finchley, came potato stems bearing tubers in the axils of the foliage leaves, a condition of things frequently following injury to the soft bast tissues, preventing the downward flow of food from the leaves.

DOUBLE SWEET PEAS.—Mrs. A. P. Rigby, of Pentre Mawr, Trefnant, N. Wales, sent several flowers of sweet peas having two or three standards instead of but one. The variation had occurred last year, and seed had been produced from the flowers, which had this year given rise to a proportion of plants bearing double flowers. Other varieties than the first-named had also produced double flowers this year.

WHEAT-EAR CARNATION.—From Mr. B. Nash, of The Gardens, Oakleigh, Cheam, came specimens of the wheat-ear carnation, which, instead of flowers, bears a long series of bracts repeated again and again.

EAST AFRICAN SANDAL WOOD.—Mr. F. H. Seed, F.R.H.S., of the Agricultural Department, Mombasa, British East Africa, sent seed of the East African Sandal Wood tree (Brachylæna sp.), called by the natives "Muhugu." "The seed," writes Mr. Seed, "is as light as thistle down. The natives reported that this tree did not produce seed, but it was found that the thistle down lightness of the seed caused it to be caught on the tops of the long native grass and undergrowth. The Forestry Department has now arrested this loss by clearing the ground around the trees, so that the seed will reach 'mother earth,' and regeneration rapidly takes place. The tree is considerably larger than the Indian sandal."

"One square piece and two small plants were sent to be valued in Bombay Market during the year 1908, and an order was received from a merchant there offering half a guinea a cubic foot."

BRITISH ALPINE PLANTS.—Mr. J. Fraser, F.L.S., showed flowering plants of Saxifraga cernua. The plants bore six flowers and some buds. It was 7in. high, and had ten stems arising from the base. It had been collected at the top of Ben Lawers, and is very rarely seen in cultivation. Numerous bulbils were borne in the axils of the stem leaves, and it is by these the plant is propagated. He also showed Draba rupestris flowering for the second time this year, and flowering specimens of Salix arbuscula herbacea (flowering for the second time this year), and Alchemilla alpina, the latter having flowered continuously since May.

Le Touquet Paris-Plage.

Under the patronage of the National Horticultural Society of France, the local Horticultural Society of Abbeville, and the Société Generale du Touquet, a most interesting flower show was opened at Paris-Plage, near Boulogne-sur-Mer, on August 21. The jury was an international one, and consisted of the Comte d'Applaincourt, President of the show, Messrs. Truffaut, Moser, Leveque, Lozet, Stoneham, Gravereaux, Croux, Harman Payne, Ph. de Vilmorin, Debrie, and Madame d'Applaincourt.

The whole of the arrangements were carried out by M. Henri Martinet, of Paris. The show was held in a walled-in enclosure, which is surrounded by a part of the forest, and was an admirable site. Immediately on entering one could see the artistic way in which the ground was laid out, and the effective planting, which will afford the visitors at Boulogne and other adjacent seaside places to appreciate some of the salient features of French horticulture.

Ornamental shrubs and foliage plants were shown in large numbers, and occupied two sides of the ground. The chief exhibitors were Messrs. Croux, Moser, and Boucher. In great variety were taxus, cupressus, ligustrum, pinus, abies, cedrus, picea, thuja, euonymus, retinospora, hedera, and the like.

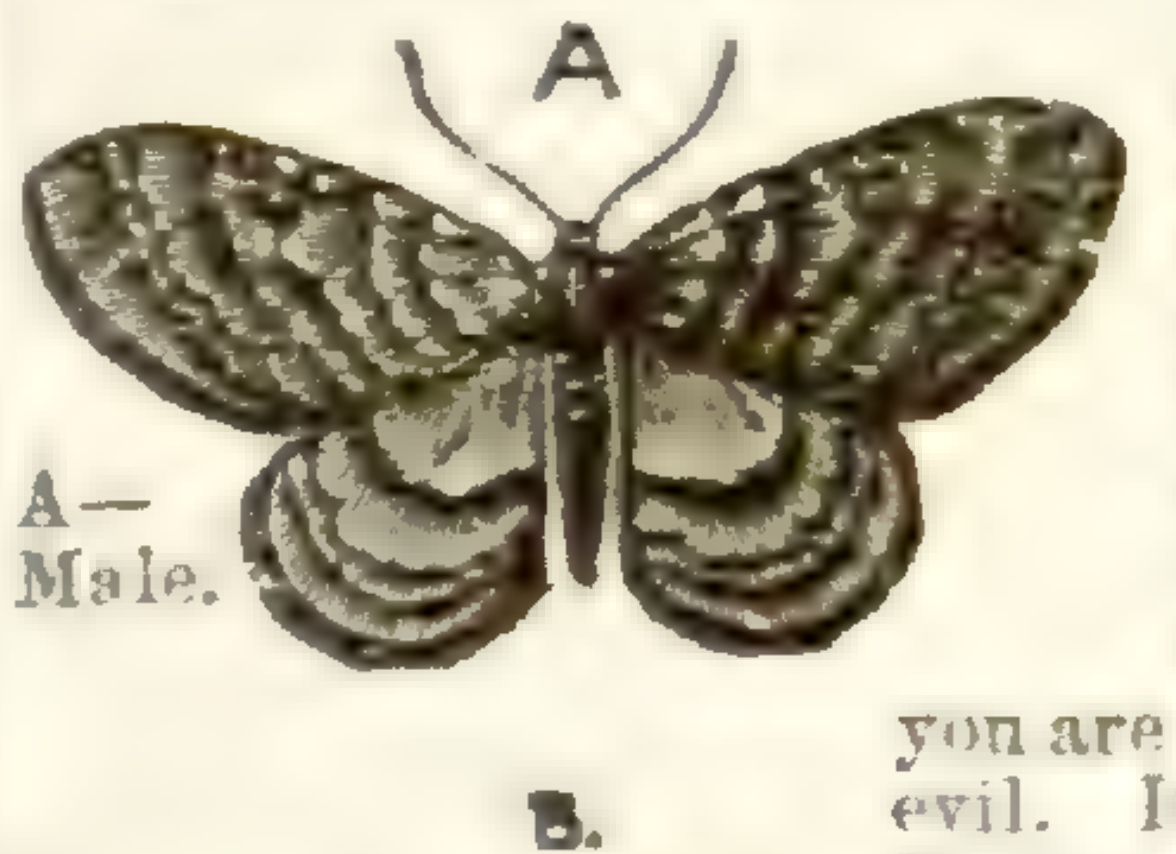
HORNE'S

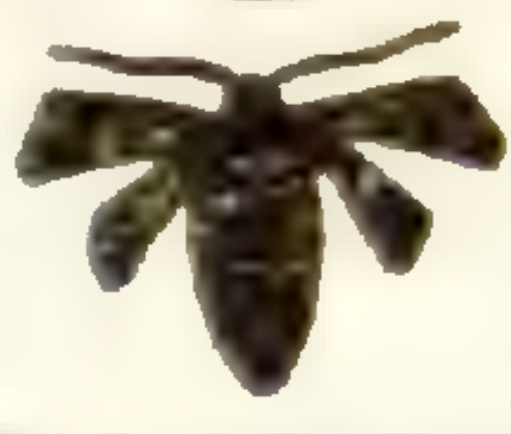
FRUIT TREE DRESSING

Has Stood the Test of 20 Years.

WINTER MOTH.



A—Male.



B—Female.

Thousands of pounds' worth of fruit have been saved by its use that otherwise would have been lost if left to the ravages of the Caterpillar Pest. Invaluable. It is obvious that by catching the female moth in its ascent to deposit the eggs you are striking at the root of the evil. It will capture the Winter Moth, Mottled Umber Moth, March Moth, Apple Blossom Weevil, and Codlin Moth.

W. HORNE and SON,
CLIFFE, near ROCHESTER, KENT.

A large portion of the ground, consisting of two immense grass lawns, was occupied by Messrs. Vilmorin Andrieux and Co., to whom the grand prix d'honneur was unanimously awarded. Charmingly arranged beds of all shapes and sizes were cut out and planted by that firm with Begonia gracilis Rose, edged with Cineraria maritima, petunias, Begonia semperflorens Rouge Feu, Begonia gracilis Gloire de Louveciennes, Begonia gracilis Lumineux. Beds of zinnias, tropæolums, Amaranth tricolor, also came from the same firm. They also staged in vases an immense collection of gladioli.

Roses were staged by a local firm, Messrs. Morel, who had many well-known varieties in only fairly good condition. Cut dahlias also showed rather a lack of good culture.

At the other end of the building, where the cut flowers were staged, was a fine artistic piece of dinner table decoration by M. Debrie, of Paris, and just outside asparagus from M. Compoint.

The town of Abbeville sent three nice lots. Standard fuchsias in great variety, and bicolor zonal pelargoniums; begonias were used as a filling in one bed, and an edging of Cineraria maritima, with Acyranthes Triomphe.

M. Gravereaux filled several beds with gladioli. M. Ferard also had several nice lots of Begonia gracilis Rose, dahlias, Begonia Berlini, Datura arborea fl. alba, Plumbago capensis. Tuberous begonias, double and single, were also shown by M. Billard and M. Cantrelle.

MM. Cayeux and Le Clerc, in the open ground planted some beds containing a large number of dahlias, principally of English origin. We noted Reine Amelie, Daisy Kleber, Maurice Fuld, Dreadnought, Pink Perfection, Raymond Parks, etc. At intervals Begonia semperflorens, with Cannas Benoit, Comte, Bronze Poitevin, Louis Montel, Frau Lina Daucher, Elizabeth Hoss, Jupiter, Direktor Walmark, and many more.

MM. Dubuisson-Foubert had a large display in several beds forming a square. Salvia splendens Züchter Zwerg, Anthemis Perfection, A. floribunda, Lantanas Javotte, Imperatrice Eugenie, and Eole. Zonal and ivy-leaved pelargoniums as a border in infinite variety, the best known of which was Paul Crampel. A fine Chrysanthemum maximum, Etoile d'Anvers, one of the best and largest we have seen, was employed largely, together with Dahlias Keynes' White, Amos Perry, Juliet, Kingfisher, Good Hope, etc.

MM. Billard and Cantrelle were large exhibitors of tuberous begonias, which did much to enliven the ground.

The Société du Touquet Paris-Plage, had a most attractive bed designed in a running vandyke form, filled in with begonias, the framework being of Pyrethrum lacinatum and Acyranthes brilliantissima. Sweet peas in clumps, trained to wire supports, were planted at intervals, an unsual sight at a French flower show. Gladys Unwin, Queen Alexandra, Nora Unwin, Miss Willmott, Emily Eckford, John Ingman, Venus, America, Navy Blue, Celestial, and a host of others completed this excellent display.

M. Aug. Nonin, of Paris, had a large square lawn, with dahlias, begonias, salvias, and other plants in circular beds.

The British Pteriodological Society.

At the annual meeting of this society at Kendal on August 2, it was resolved that a quarterly publication entitled the "British Fern Gazette," should be issued under the editorship of Mr. Chas. T. Druery, V.M.H., F.L.S., and as a result of this resolution a considerable number of ladies and gentlemen who had promised their support to such a publication were elected, not merely as subscribers, but also as members of the society, this being involved in the very moderate annual subscription of 5s. The first number, which will contain a series of interesting articles on the varietal forms of our native ferns, will be ready for issue in September in conjunction with the annual report of the society, the financial position of which is highly satisfactory, while the membership, in view of the new arrangement, promises to increase very rapidly.

A notification of the projected issue was made some time back in these columns, and evoked such a hearty response as to fully justify the outlay involved and the expectation of a great extension of the society's popularity and utility, the more especially as the beautiful "sports" obtained by the fern hunter and selective raiser have now become very popular as decorative foliage plants. Mr. Druery, whose address is Stanvixbank, Shaa Road, Acton, W., will be happy to receive the names of those who would like to join and receive the publication in question.

As an additional inducement to joining this society, it may be pointed out that by so doing, independently of the literature supplied, the British fern lover is brought into immediate touch with a considerable number of specialists and enthusiasts in that line. At the meeting, a number of good varietal forms were submitted by the members for the society's opinion, and a fine variety of hardy fern, A. F. F. setigerum congestum (Cowan) and a new form of Lastrea montana, L m. filifera corymbifera (Wiper), evoked special admiration.

Mr. Alexander Cowan, Valleyfield, Penicuik, was elected president.

Reading Gardeners' Association.

Good fortune again attended the members of this association when, on the evening of Friday, August 6, by kind invitation of the Vice-President, Mr. Leonard Sutton, a visit was paid to his charming gardens at Hillside, Reading. A party numbering within a few of 200, many of whom came from Maidenhead, Henley, Wokingham, Sandhurst, Pangbourne, etc., assembled at 5.45, at which hour tea, thoughtfully provided by Mr. Sutton, was taken al fresco beneath the trees in the orchard, amid perfect surroundings and in ideal weather.

A tour of the gardens under the personal leadership of Mr. Sutton was afterwards made, Mr. Townsend, the head gardener, and his staff, taking charge of those who were unable to occupy the front rank.

The Vice-President is a great lover of annuals, and these beautiful subjects, together with perennials grown as annuals, formed delightful colour effects in the beds on the lawns, lovely pentstemons, antirrhinums, salpiglossis, etc., being much admired. In the houses were to be seen splendidly grown gloxinias, gesneras, coleus, schizanthus, Celsia arcturus, etc. Altogether the party found much to interest them during the hour and a-half spent in the gardens, and as a finale they were conducted to the private recreation ground at Cintra provided by Messrs. Sutton and Sons for their employees, and watched the games of bowls, tennis, etc., until twilight brought a most pleasant evening to a close. Before separating, the President, Mr. Alderman Parfitt, expressed to Mr. Sutton the thanks of all present for providing such a very enjoyable evening.

Jersey Potato Crop.—From the annual return of shipments of potatoes from Jersey, issued for the season recently ended by Mr. Philip Barbier, of St. Heliers, it is evident the crop was a very good one, but that, prices, after starting well, fell at an early period to a low level. The total shipments amounted to 62,690 tons, and the total value to £332,403. The starting average price per ton for the four weeks ended on May 8 was £29 18s. per ton, while the finish was at only £2 12s. While the yield has seldom been greater, the money return was below the average of the previous twenty-three years. The potatoes were remarkably free from disease.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

SHRUBS FOR PEATY SOILS.—J. L.: Your question shall receive attention in our next issue.

PANSIES AND VIOLAS.—T. B., Surrey: The propagation of these should be proceeded with in the course of September, and cuttings that spring up from the centres of the tufted varieties are the best for the purpose. Cuttings about three inches in length are the best, slipping the stems off at the bottom. Frames or hand-lights placed in a cool position should be used. Put in them four or five inches of sandy soil, and in this the cuttings must be dibbled about two inches apart, and well watered to settle the soil about them.

ASPARAGUS INFESTATION. — S. J., Yorkshire: Your beds of asparagus are infested with the larvæ of the Asparagus Beetle (Crioceris asparagi), and considerable damage will be done unless you can adopt repressive measures. The larvæ, as you are aware, are dull green, and attain their full size in about fifteen days after they are hatched out, when they bury themselves in the bed, spin cocoons, and in from fifteen to twenty days the beetles, which are a quarter of an inch long and dull green, emerge and commence to lay their eggs, these being deposited along the stems to which they are attached at one end. The larvæ, or grubs, injure the plants by stripping them of their leaves and eating the tender parts of the young growths. Several broods are produced in the season, and they consequently increase rapidly, therefore repressive measures should be adopted as soon as they are detected. One of the most efficient of these is to syringe the plants with warm water, and then give the surface of the bed a rather liberal dressing of dry soot. Dusting the plants with powdered lime when moist with dew or fine rain is also useful, as is syringing with a mixture prepared by adding flowers of sulphur, soot, and soft soap to water. The latter should be quite warm, and half a pound each of the soot and sulphur and one pound of soft soap be added to eight gallons of water. We would also advise you to burn the shoots much infested with eggs and larvæ.

PHLOXES.—R. H. B.: The poor attenuated spikes that you send us are the best possible evidence we could have of the necessity for considerable improvement in your method of growing these flowers. The plants

CURE FOR MILDEW.

One ounce of Cyllin Soft Soap to a gallon of water is the surest remedy for mildew, green fly, and all forms of insect blight in the garden or greenhouse.

CYLLIN SOFT SOAP

Is a reliable all-round non-poisonous insecticide and germicide. It does not injure the tenderest shoots, and it cleanses the surface soil, thus safeguarding against further attack.

Particulars from Manufacturers, JEYES' SANITARY COMPOUNDS CO., 64, Cannon Street, London, E.C.

have evidently occupied the same position without manurial assistance for some years past, and each year the whole of the growths have been allowed to remain. We should advise you to root them out early in the autumn, liberally manure and deeply trench the ground, and early in the spring replant. The varieties you are growing have long since been superseded by finer forms. If you can devote a fresh border to your phloxes do so, but they will do very well in the same border provided the soil is treated in accordance with our advice.

GOLDEN-LEAVED TREES. — W. S., Sussex: The number of really first-class trees with golden leafage is not very numerous, but there are more than enough to produce distinct effects in the pleasure grounds. Those of exceptional merit include: Acer palmatum aureum, one of the many fine forms of the elegant Japanese maples; it has yellowish leaves, and is of much value for associating with the dark-leaved varieties. Alnus glutinosus foliis aureis, a golden form of the common alder, and one of the best of its colour for planting in moist positions. Castanea vesca aureo-variegata, a very handsome variety, with leaves so richly coloured as to rival the crotons. Catalpa bignonioides aurea, a handsome tree, with pale yellow leafage; effective when grown in groups in the shrubbery border, and the growths cut down annually to within a few inches of the surface of the soil. Corylus Avellana aurea, this is a shrub, rather than a tree, but it will in course of time make a small tree, and is therefore admissible; it is rich in colour and effective. The golden poplar, Populus canadensis aurea, Quercus pedunculata concordia, and the golden elms, Ulmus campestris Dampieri aurea, and U. Rosseeli aurea, are the finest of all the strong-growing golden-leaved trees, and should in all cases have the preference in making a very limited selection.

BEGONIAS.—D. C., Shropshire: You might adopt either of the two courses you suggest for obtaining a stock for bedding out next year. It will probably be advisable for you to strike a certain number of cuttings during the next few weeks, and to pot up some of the most promising of the plants that have done duty in the beds during the summer when they begin to lose their beauty, and before they have been injured by the frost. The plants lifted should be put in pots just large enough to receive the roots, but for the majority those five inches in diameter will be the most suitable. Use a light sandy compost, and keep the plants during the winter in a warm greenhouse, near the glass, in which a rather dry atmosphere is maintained. Cuttings taken from plants that have been kept over the winter can be readily rooted in the spring.

UNHEALTHY TOMATOES.—R. B., Leicester: Judging from the fruits and foliage before us the tomato plants are in an unhealthy state. They have evidently been kept too close and moist during the cold wet periods that have been experienced during the summer. It may be too late to greatly improve the present state of things, but the only means by which an improvement can be effected are a reduction in the atmospheric moisture, and an increase in the temperature. We would also suggest that for a short time they be kept rather dry at the roots. In the case of tomatoes it is unwise to endeavour to prevent a material lowering of the temperature during periods of cold weather by closing the ventilators. The proper course during such periods is to ventilate freely, and maintain the temperature by means of a little fire heat.

UNHEATED ORCHARD HOUSES.—M. K., Lancashire: Opinions are somewhat divided as to whether houses devoted to peaches and nectarines that are required to attain maturity during September should be heated or not. This difference of opinion is a proof that good crops may be obtained from trees growing in heated and unheated structures. The balance of opinion is in favour of providing sufficient hot-water pipes to enable the cultivator to maintain the temperature above 32 degrees during sharp frosts. It is very important when such houses are heated to avoid subjecting the trees to more artificial heat than is absolutely necessary to exclude frost and maintain a dry atmosphere. If you are anxious to produce a plentiful supply of peaches and nectarines in the month stated without the trouble incidental to the management of a heating apparatus, you may have no hesitation in dispensing with the latter in furnishing the house you are about to build, as you may depend upon having good crops provided the weather is not exceptionally severe when the trees are in bloom. It is an important point in the management of an unheated peach house to keep the house so freely ventilated that the trees will not come into bloom in advance of those on the open walls.

HOUSING DECORATIVE CHRYSANTHEMUMS.—Amateur Cultivator, Leeds: The following extract from "Chrysanthemums for Garden and Greenhouse" (Messrs W. H. and L. Collingridge, 148 and 149, Aldersgate Street, E.C.), will give you the information you require on the housing of chrysanthemums: "The mid-season sorts in pots should be placed under glass during the closing days of September, or the early days of October. Previous to this, however, the glass structure should be carefully overhauled, and, if needs be, a coat of paint given both inside and outside, to prevent drip from the roof. This should be done previous to the housing, as it is impossible to do it afterwards, and not a season should pass without these precautions being taken in good time. Not only should the glass structure be painted when that already on the woodwork is impoverished, but the glass should also be cleaned as a work of preparation. It is an excellent thing to arrange some system of shading on the inside of the glass structure. This is much better than putting any shading of a permanent character on the glass, as the latter cannot very well be removed when the weather is dull and unpleasant. A simple means of shading may be erected by running a few lines of galvanised or other wire from one end of the greenhouse to the other, and stretching on this tiffany or muslin, arranged to run on brass rings. This may be pulled across at will during periods of bright sunshine, and by its use the display may be prolonged, and the colours of the flowers, some of which are very susceptible to the influence of the sun, be saved from scalding or burning. If under cover, the shading material is so well controlled, and has the advantage in the dull weather of exposing the blooms to the whole of the light available. When arranging the plants in the glass structure, see that they are brought up well under the glass, not too near, certainly, but leaving sufficient space overhead to control and inspect them as desired. Each plant, previous to being taken indoors, should have the surface soil cleaned of weeds, and any unpleasant excrescence removed. The pots should be brushed clean, and seared and decaying leaves also removed. Plants affected with mildew should be housed in a cool glass structure, the colour of the blossoms will be of the best, and their form all that one could desire."

NAMES OF PLANTS.

W. W. H., Lincoln.—Your plant is Acanthopanax variegatum.

Amateur Orchidist.—A very good form of Odontoglossum crispum, but in no way exceptional.

E. G.—1, Stenochlæna scandens; 2, Phlebodium sporodocarpum; 3, Davallia elegans polydactyla; 4, Selaginella flagellifera.

British Gardeners' Association.—A meeting of this association will be held at the Alexandra Hotel, Bath Street, Glasgow, on Wednesday next, September 1, when Mr. J. Weathers will give an address. On the following day a meeting will be held at the Y.M.C.A. Rooms, Carlisle, which also will be addressed by Mr. J. Weathers. Both meetings will commence at 6 p.m.

? What is
QUASSOP
PATENTED REGD
A solution made from Quassia chips has long been recognised by the leading horticulturists to be
the best Insecticide

The advent of QUASSOP for the first time enables the preparation of the soap solution and the extraction of the bitter principle from the wood to be carried out efficiently without heat and in one operation.

Quassop is not soap and does not contain an "Extract." It only requires the addition of cold water to produce a solution which possesses all the fine qualities of Quassia and soft soap in an enhanced degree.

Sold in packages with full directions, 10 gallon size 1s., 50 gallons 3s., 200 gallons 10s, One trial will convince you. Sample packet (to make 3 gallons, 6d., from Seedsmen, &c., or post free, from

TO-DAY! AND FOR YEARS AND YEARS PAST the XL ALL Specialities are and have been the best on the market. Where is the Gardener who does not pin his faith to one or the other of these celebrated Insecticides or Fertilisers? XL ALL FERTILISER has pleased all who have used it this season. The Sales of XL ALL FUMIGATOR prove that it is more popular than ever. XL ALL LIQUID NICOTINE INSECTICIDE is always spoken of by gardeners and growers as the most deadly to Mealy Bug, Thrip, etc. XL ALL WEED KILLER used once a year "No weeds can live." RICHARDS' ARSENATE OF LEAD for all leaf-eating insects. CUCASA (fungicide), the finest preparation of copper ever offered to gardeners. Please ask your Nurseryman, Seedsman, or Florist for a copy of my small pink list, giving particulars of these and many other XL ALL Preparations, which can be obtained from the Horticultural Trade throughout the World. G. H. RICHARDS, Manufacturer and Patentee, 234, Borough High Street, London, S.E.

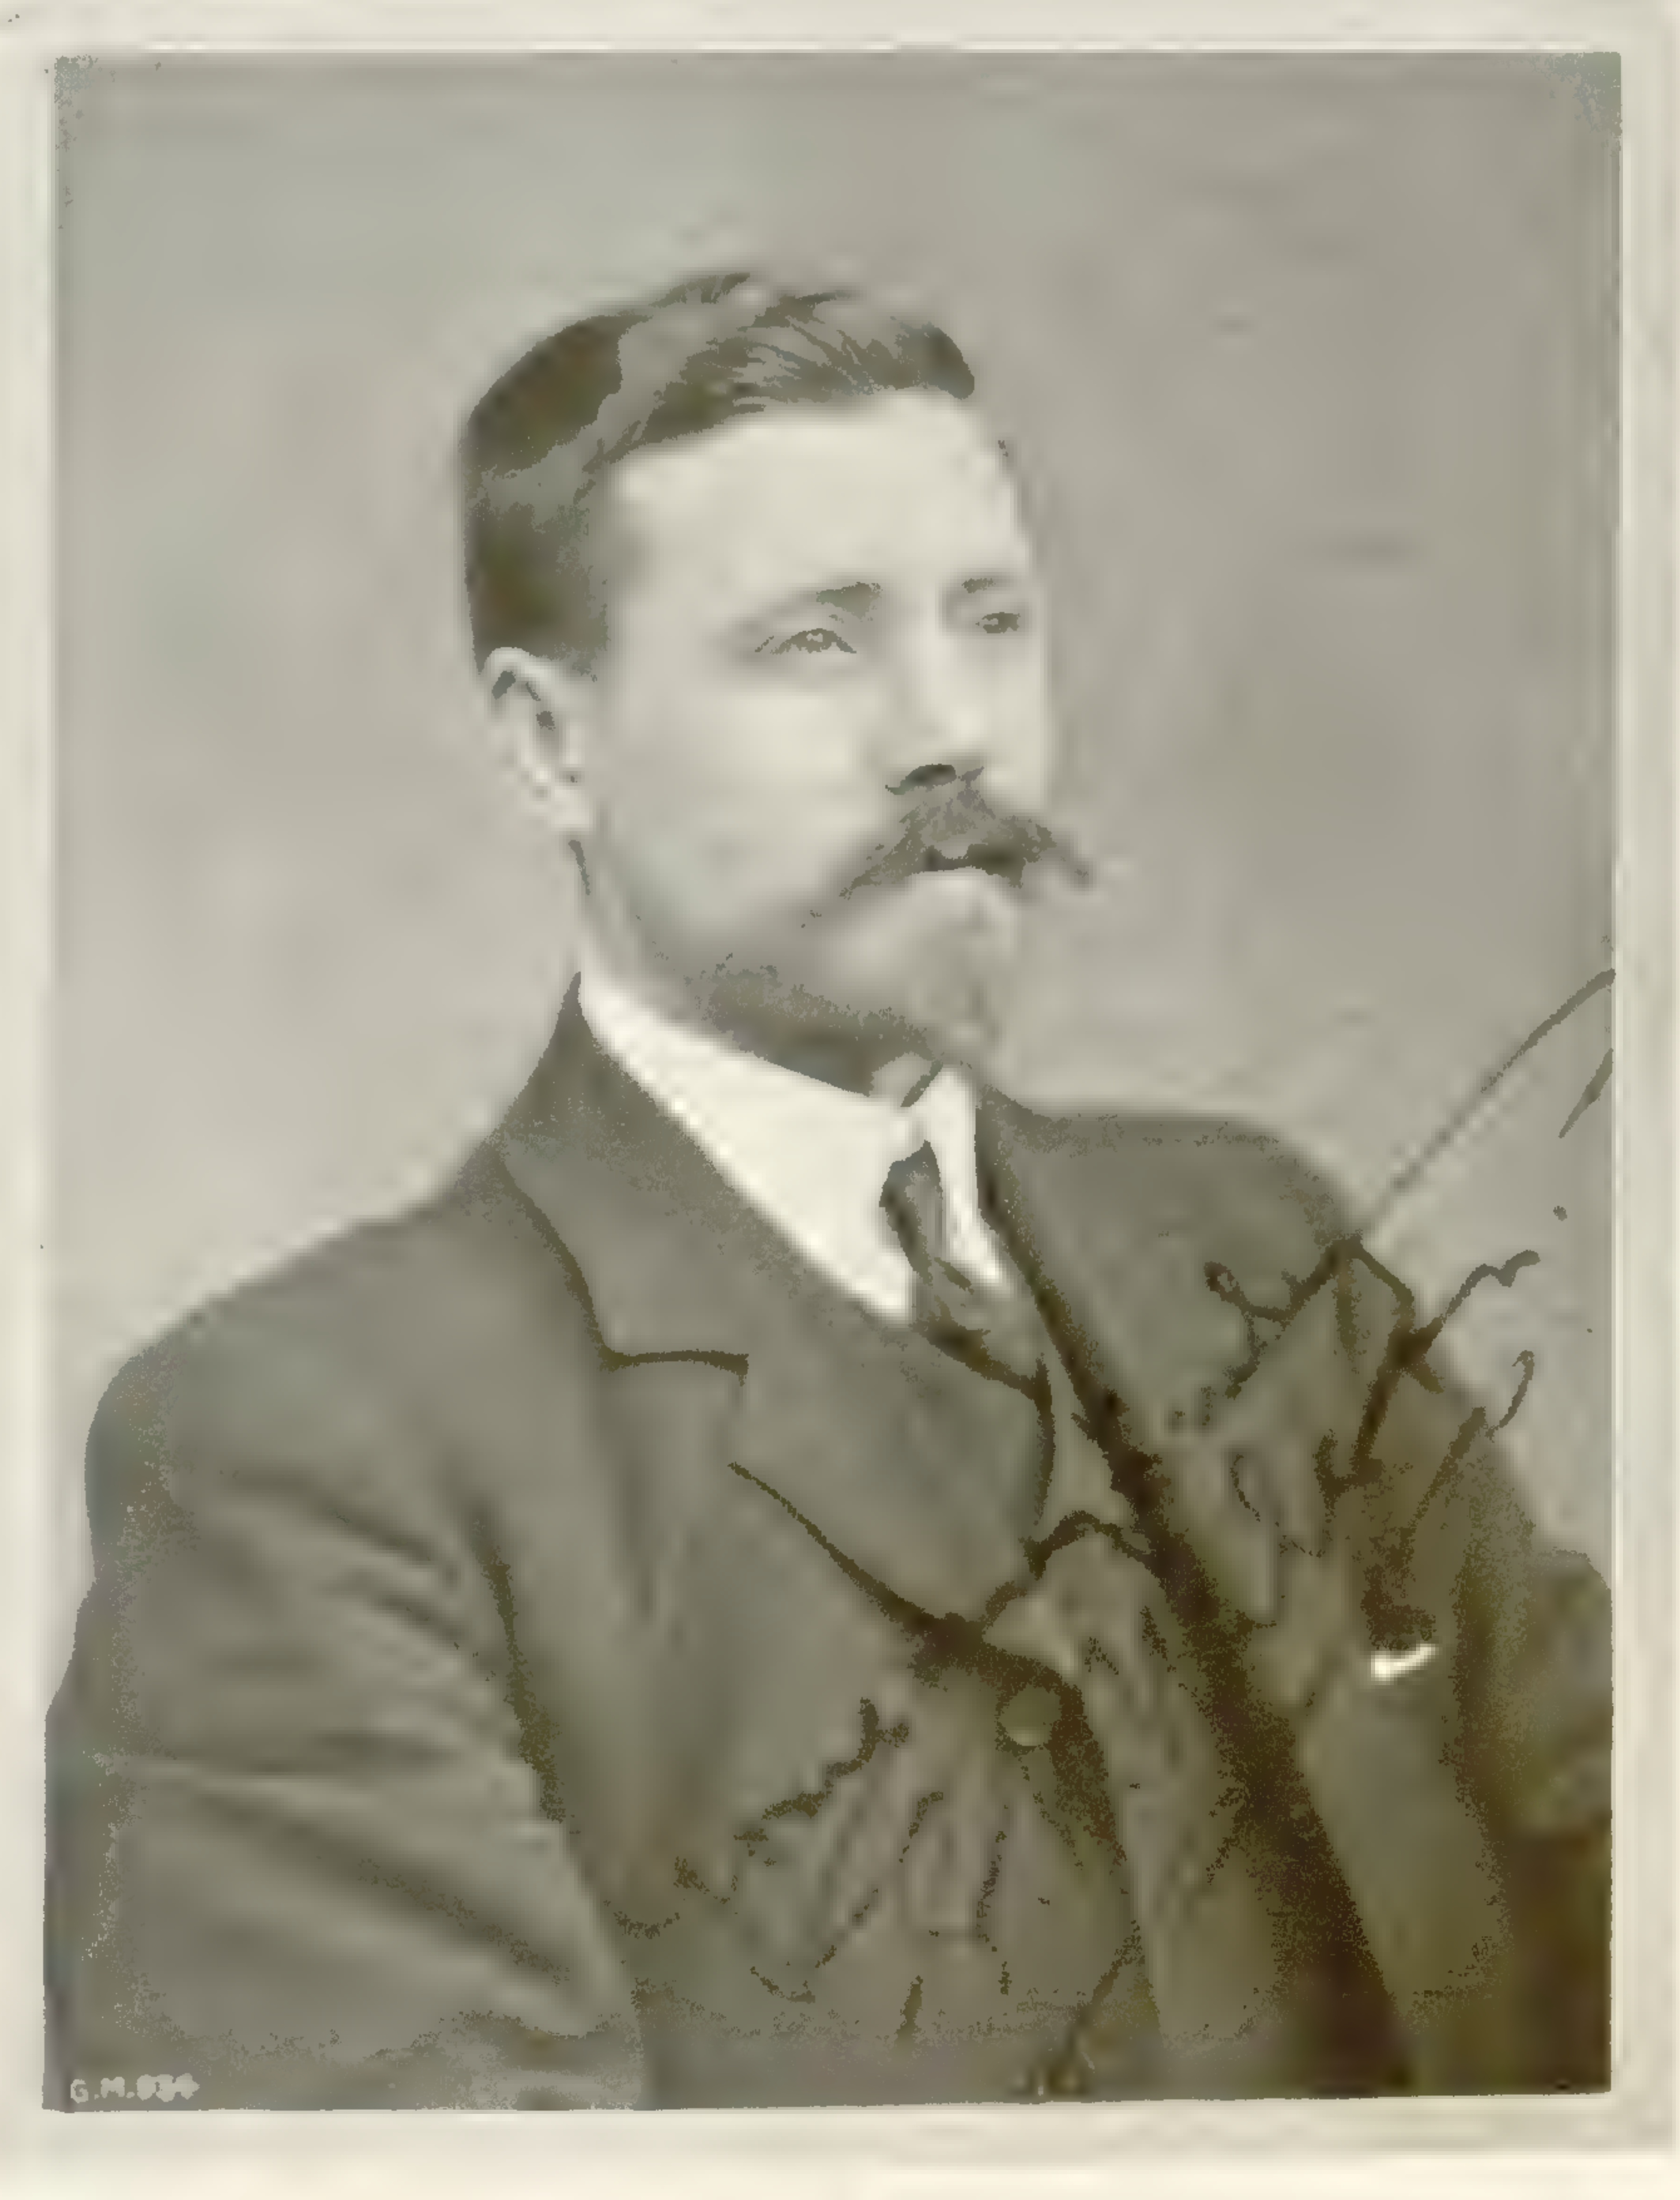
THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Pot Plants.

The successful culture of plants in pots presents many puzzling features to amateurs, especially as regards the proper supply of water. This is due to the fact that in a mixed collection we have a number of very variable factors concerned, viz., the nature of the compost, and the drainage, the requirements of the plant species concerned, the relation of its root system to the size of the pot, the state of the weather, whether humid or dry, the question of temperature, and of exposure to sun or shaded conditions. Here at once we see a fair number of circumstances, each involving many grades, and it becomes abundantly obvious that unless most plants possessed a wide margin of adaptation, pot culture, as a rule, would be a dismal failure. The first thing then to remember is that if the two extremes of constantly sodden soil and dusty dryness be avoided, a large number of plants will manage to grow fairly successful; but a thoroughbred bog plant will thrive in the first, and such drought lovers as cacti and other succulents seem to enjoy the second, while the reversal of such conditions would mean death to both. Generally speaking, the great secret of success is the supply of just sufficient water and no more. Under natural conditions in the open soil any surplus immediately drains away, and thus the healthiest condition, involving access of air to the root system, is secured by the porosity of the soil, and its unconfined state. In the pots this can only be secured by careful drainage, but the pot itself, if of the ordinary porous material, and clean, is always absorbing water from the inside, and evaporating it from its outside, thus inducing a circulation to which, as every gardener knows, the plant responds by forming a more or less mat-like mass of roots in contact with the sides of the pot, partly, of course, due to the check to their spreading laterally, but also, beyond a doubt, equally due to the stimulus of the circulation aforesaid. In this fact we see a potent argument in favour of clean pots and pans. This stimulus also undoubtedly plays a part in the health of young plants grown in small pots, and only potted on when the soil is fairly well pervaded with roots. A small plant in a large pot finds itself in a mass of soil, much of which its roots fail to reach until sourness has set in, due to stagnancy, a sourness which is poison to the growing root tips, and failure is the result. A like result also occurs when the pots are constantly standing in full saucers, the soil being thus supersaturated to the exclusion of that air between its particles which, as we have seen, is a vital desideratum for active root growth. Many failures result from unsuspected drought, due to the fact that a vigorous plant is constantly absorbing water from the soil at the bottom of the pot, while water is only supplied in driblets on the surface, which seems, therefore, wet enough, though an inch or two below it is dust dry, a state of affairs which necessitates plunging under water for an hour or so to secure a thorough soaking. On the other hand, over-abundant watering is apt to impoverish the soil by washing out of it all those soluble earthy salts which it is the province of the root system to collect and transmit to the foliage as a contribution to the elements of growth. The use of saucers is, for the reasons given, to be generally deprecated, but in the case of thoroughly established plants which are practically pot-bound, saucers may often be used with advantage, provided drainage of the pots or pans has been properly attended to, the risk of sourness or stagnancy in such cases being minimised by the abundant root action, especially in dry, hot weather. It is clear that in a mixed collection of plants some attention must be paid to their individual nature, as natives of dry or moist habitats, as rapid or slow growers, and so on, and, above all, watering should not be done if it is clear that the soil is already moist enough. Finally, a word about deciduous plants in pots, that is, plants which die down in the autumn to the ground level, and are consequently too often regarded as requiring no water at all. Naturally, having no aerial growth to make they require but little. That little, however, must be supplied, and the soil must never be allowed to dry out entirely, since there is still a living plant ensconced within it; root action is often going on as a preparation for next season's growth, and if this be checked, the apparent death is followed by a real one, and the plant lover is so much the poorer for his lack of common sense.



MR. E. H. WILSON,
The famous collector of new Chinese and Thibetan plants.

Mr. E. H. Wilson.—It is with an unusual degree of pleasure we are able to present to our readers this week a portrait of Mr. E. H. Wilson, through whose courage and energy our gardens are being enriched by many plants from Southern and Western China. After some experience in other gardens Mr. Wilson entered the Birmingham Botanical Gardens, and served under Mr. W. B. Lathom, and there he laid the foundation of that botanical and horticultural knowledge that has stood him in such good stead in recent years. In 1897 he went to Kew, there adding largely to his knowledge of plants. During the winter of 1898 he was at the Royal College of Science, and in February of 1899 he was engaged by Messrs. James Veitch and Sons, of Chelsea, to visit Southern and Central China for the purpose of collecting new and rare plants. For the greater part of three years Mr. Wilson laboured in this enormous district, and in the earlier part of that period he obtained considerable help from Dr. Augustine Henry, himself a keen botanist and collector. The chief results of this mission were the finding of Jasminum primulinum, Davidia involucrata, Ilex Pernyi, Astilbe Davidi and A. grandis, Buddleia variabilis Veitchi and B. v. magnifica, Corydalis thalictrifolia, Lonicera Maacki, Senecio clivorum, Populus lasiocarpa, Viburnum rhytidophyllum, and numerous Vitis and Rubi. So successful was Mr. Wilson that he undertook a second journey for the Messrs. Veitch, during 1903-4, to Western China and the Thibetan border, returning in March, 1905. During this trip he found Meconopsis integrifolia, M. punicea, Primula pulverulenta, P. Cockburniana, P. Veitchi, about fifty species of rhododendrons, including R. Soulei and R. intricata, Larix Potanini, Clematis montana Wilsoni, Berberis Wilsonæ, Rheum Alexandræ, Cotoneaster applanata, and a whole host of new berberis, pyrus, hollies, etc. Mr. Wilson also sent home quantities of Lilium Henryi, L. sutchuense, and L. myriophylla, and some idea of his great work may be gathered from the fact that besides collecting and forwarding plants and seeds, his herbarium specimens on these two journeys amounted to 30,000 sheets, these now being distributed among the British and Continental herbaria. Long before his return from the second journey Mr. Wilson's fame had spread throughout the Continent and in America, and so it was not surprising that he was asked to undertake a third expedition to China, this time under the direction of Professor C. S. Sargent, of Harvard University. This expedition, financed by Professor Sargent, Harvard University, and several keen American and British horticulturists, was readily undertaken, and Mr. Wilson started again for Western China in December, 1906, returning in May, 1909. The chief aim of this journey was to secure new and rare trees and shrubs of botanical and horticultural interest. It is yet too early to say very much concerning the results obtained, other than that they have been beyond the most sanguine hopes of the promoters, and even the intrepid collector himself. Nearly 30,000 sheets of herbarium specimens give some idea of the richness of the flora of Western China, and it may be mentioned that new magnolias, pyrus, prunus, berberis, and cerasus in considerable numbers have been collected, while Cercis racemosa and Catalpa Fargesi have been found. Specimens of many of the new plants, small ones, of course, are now in cultivation at Harvard, Kew, Glasnevin, Edinburgh, Aldenham House, Warley Place, etc., and there is a fine promise of the addition of many good garden plants. This very bald statement of Mr. Wilson's work must conclude with the notice that he has discovered ten new genera at least, and about 1,000 new species or well marked varieties of old species. The Royal Horticultural Society has already granted about fifty certificates and awards to plants he has introduced, and this alone indicates the great value of his introductions. On September 18 Mr. E. H. Wilson sails for America, and he will be engaged for some time at the Arnold Arboretum and Harvard University, with Professor Sargent, in arranging, identifying, and naming his collections. Mr. Wilson has a great love for Western China, and, if needs be, is quite ready to make another trip to "Far Cathay." The two Chinese scenes depicted in the present issue are from photographs taken by Mr. Wilson during his recent expedition, and we are greatly indebted to him for the opportunity of reproducing them.

The French Gardeners' Society of London is now too well known to need any reference to its aims and objects, and we can only refer enquirers to the newly-issued volume bearing the title of "Bulletin de la Société Française d'Horticulture de Londres," which contains a mass of literary matter concerning the past year's work. Briefly stated, it contains the rules, balance-sheet, lists of members, library catalogue, and condensed reports of the monthly meetings at which papers on various subjects are read by the members. A capital account of the annual dinner, presided over by Sir Albert Rollit, is given, with the principal speeches in extenso. Among the papers given in the body of the work are Pear Culture in England, Etherisation of Plants for Forcing, The Temple Show, The Bouvardia, Fruit Culture at Vitry-sur-Seine, Roses for Forcing, and A Chat about the Leading London Parks. The frontispiece is an excellent portrait of Mr. Harry J. Veitch, V.M.H., who took the chair at the annual dinner last year.

Bust of Darwin at Kew.—The centenary of the birth of Darwin has been marked by the presentation to Kew of a bronze bust of this very distinguished naturalist. For this gift the institution is indebted to the generosity of the Bentham Trustees. The bust is the work of Mr. Horace Montford; it has been placed in Museum No. I., and was put in position on June 23, 1909, the central day of the Darwin Centenary celebration at Cambridge. At this celebration Kew was officially represented by the Director.

Railwaymen's Flower Show.—Organised by the Clapham Junction branch of the London and South-Western Railway Temperance Union, the second annual exhibition of garden produce was held in one of the spacious and well-fitted arches at Clapham Junction on Wednesday, September 1. The encouragement given by the higher officials, and many friends of the railwaymen, has resulted in an immense improvement of the employees' gardens and produce, and on this occasion some sixty-three competitors, drawn from a radius of twenty-five miles of the famous junction, contributed rather over three hundred exhibits. The onions, carrots, beet, potatoes, parsnips, marrows, and cabbages were particularly good, onions and potatoes especially so. Of potatoes there were sixty-three entries, in four classes; while onions, runner beans, and beet were represented by twenty-three, twenty-seven, and eighteen dishes respectively. Collections of six dishes of vegetables formed a fine feature. Although the competitors came chiefly from Raynes Park, Worcester Park, Clandon, Twickenham, Richmond, Ewell, Malden, Strawberry Hill, Epsom, Weybridge, Barnes, Leatherhead, and Wimbledon Park, there were five who showed excellent produce grown at Clapham Junction. Plants and flowers added to the attractions of this display. Efforts of this kind are worthy of every encouragement, and deserve to be made widely known.

Our Bulb Number.—We propose to devote our issue of September 18 to a consideration of bulbs and bulbous plants for garden, conservatory, and home, and we shall include interesting and illustrated articles on Lachenalias for the Conservatory, Bulb Culture in Fibre, Tulips for Garden Decoration, Inexpensive Daffodils, Bulbs for the Rock Garden, Uncommon Bulbous Plants, Propagation of Hyacinths, Jonquils in the Wild Garden, etc. etc.

The Flora of Western Ireland.—From a contribution to the current issue of the "Kew Bulletin" we learn that in April of the present year a natural history survey was commenced of Clare Island and the adjoining mainland in the county of Mayo. The locality was selected on account of its relatively primitive nature, two of the principal objects of the investigation being (a) a detailed study of the fauna and flora of a promising portion of the West Coast of Ireland; and (b) a comparative study of the fauna and flora of Clare Island with those of the mainland, with a view of elucidating the history of the fauna and flora of the island. The survey will extend over a period of two or three years, and will be carried out under the leadership of Mr. R. Lloyd Praeger by means of monthly trips, except in the winter, when special visits will be arranged as occasion may require. It is well known that the phanerogamic flora of the West of Ireland presents features of remarkable interest. There is the striking mixture of South-west European plants with those characteristic of North America. Erica mediterranea, E. Mackai, Arbutus Unedo, Saxifraga Geum, and Pinguicula grandiflora may be taken as representatives of the first group; whilst Eriocaulon septangulare, Sisyrinchium angustifolium, and Spiranthes Romanzoffiana are examples of the second. In addition to these there is the remarkable sight of such alpine plants as Gentiana verna, Dryas octopetala, and Euphrasia salisburgensis growing in immense quantities right down to sea level, and that in a warm humid climate. Mr. Lloyd Praeger has stated that such a startling mixture of types is not to be found elsewhere in Europe.

Royalty at Messrs. Sutton and Sons' Trial Grounds.—On Wednesday, August 25, Messrs. Sutton and Sons, Reading, were greatly honoured by a Royal visit to their trial grounds. Their Royal Highnesses the Duke and Duchess of Connaught and the Crown Prince and Princess of Sweden paid a lengthened visit to their trial grounds, and remained an hour and a-half, during which time they evinced great interest in the flowers, both in the open ground and in the houses, and subsequently commanded large consignments to be forwarded to Bagshot Park, and Sofiero, Helsingborg, Sweden. Before leaving, the Royal party expressed their great satisfaction with all they had seen, and the Duke of Connaught and the Crown Prince signed the visitors' book.

Plum Fruit Sawfly.—In a contribution to the current issue of the "Journal" of the Board of Agriculture, Dr. R Stewart MacDougall writes: There is no doubt that the plum sawfly, which has been recorded from different parts of the country, is a very dangerous enemy of the different varieties of plum, and efforts should be made to restrict the damage and to prevent the spread of the insect. As regards destructive measures, the plum sawfly is most vulnerable in its larval stage before it has left the plum, and in the cocoon stage in the soil. The adult sawflies appear in spring or early summer with the opening of the blossom buds. The female saws a slit by means of her egg-laying apparatus in the calyx, and in it lays an egg, one egg for each flower bud. When the egg hatches the larva eats its way to the kernel of the ovary—the stone is at this time quite soft—and feeds on it, and it may be on the surrounding tissue. In a month and over the larva is full grown, two-fifths of an inch in length, and falls to the ground in the spoilt fruitlet: it leaves the plum by means of a round hole, and passes into the soil to make the cocoon, under cover of which the winter is passed. The cocoon is made in June and July. In the spring of the next year pupation takes place, and the adults appear in due course. In the Continental literature it is suggested that the trees should be sprayed just before the opening of the flower buds with a liquid which will be distasteful to the sawfly, and will prevent egg-laying. Mr. MacDougall points out that there is no record of the value of this mode of treatment. Cultivators are advised to: (1) Collect and burn the infested fruits before they fall, so as to prevent a new brood of sawflies. Infested fruit can be recognised by the hole, blocked, it may be, with adhering excrement or a drop of gum. (2) Shake infested fruits off the higher trees—they fall easily—and collect and burn them. (3) Collect at once and burn any fruits that have fallen and are lying under the trees, before the larvæ leave them. (4) As the cocoons lie in the soil from summer to the next year, the soil below trees that were infested should be dug and worked, the turned-up layers being beaten.

Black Scab in Potatoes.—The Board of Agriculture and Fisheries desire to remind all growers of potatoes that it is their duty, under the Destructive Insects and Pests Order of 1908, to report all outbreaks of Warty Disease or Black Scab (Chrysophlyctis endobiotica) on their premises to the Board. The penalty for failing to report the disease is ten pounds. Certain British Colonies now require a certificate from the Board with every consignment of potatoes exported to them from this country, to the effect that the potatoes have been grown in a district not infected with this disease. Exporters who require further information can obtain it on application at the Offices of the Board, 4, Whitehall Place, London, S.W. This disease appears to be rapidly on the increase in the Northern counties of England, and, speaking at a meeting of farmers, held at Ormskirk, Mr. Gant, lecturer to the Lancashire County Council, said there was no doubt that farmers in Lancashire and throughout the country were face to face with a great difficulty. Lancashire was practically the worst of the counties affected, although Cumberland and Cheshire ran it very close indeed. The disease was notifiable, and unless farmers co-operated with scientific efforts to stamp it out, the Board of Agriculture would have to take the drastic step of prohibiting potato growing in the districts affected. The disease was spreading all over the country, and there was scarcely any part free, except the eastern counties.

Vacant Land Cultivation. If any demonstration were needed to prove the usefulness of the efforts made by Mr. Joseph Fels to place vacant land at the disposal of casual labourers for the purpose of cultivating vegetables in quantity during their unoccupied time, it was found at West Ham on Thursday last. The Gas Light and Coke Company have given the use of about thirty-three acres of land, rent free, to the Vacant Land Cultivation Society, and this has been cut up in 260 plots, the majority of which are well cultivated by casual dock and gas workers. The good influence these gardens have exerted is extraordinary, and scores of men have, through them, been reclaimed from drunkenness and loafing, and have entered into the work with a spirit that is very refreshing. On the date mentioned the first exhibition was held, and some idea of the keenness of the men may be gathered from the statement that there were over a hundred collections of vegetables in the three leading classes, one hundred and thirteen exhibits of cabbages, fifty-eight of onions, forty-nine each of carrots and parsnips, and fifty-seven of potatoes. There were altogether about six hundred exhibits, and a great deal of the produce was of excellent quality. Instruction and advice have been given by Mr. R. Lewis Castle, the society's superintendent, and Mr. H. Gardner, who supervises this set of gardens, and this, like the ground, is free of charge to the workers. At present the demand for garden plots is far in excess of the supply. It may be added that very many of the men sell a good deal of produce, and thereby add materially to their casual earnings. The plots are each an eighth of an acre.

She had no use for Flowers.—The following pathetic story comes from the "New York Tribune": A big box of pæonies, roses, and lilies of the valley had come to the day school through one of the flower missions that do what they can toward equalising things between people who live where flowers grow and the unlucky ones who don't. One of the teachers was doing her best to distribute the blossoms fairly among the grimy, eager little hands that reached out ravenously for them. But there was one mite of a child who seemed quite indifferent to the gift: she just sat stolidly looking on while the others gloated over the blossoms. "Don't you want some roses, Annie?" the teacher asked her. "Here's a nice bunch." A pair of unresponsive eyes looked up from the sharp little face, and the frowsy head shook slowly. "No'm," she said, shortly. "I don't want no flowers. I ain't dead." She had never seen flowers used except at funerals, and that, she supposed, was what they were for.

LIBONIA FLORIBUNDA.

It is rarely one sees as fine plants nowadays as twenty-five years ago. I once heard a noted horticulturist and journalist, who was acting as one of the judges at a large show in the provinces, say, when passing a number of plants of libonias, "it is a real treat to see such specimens as those are, it does one's eyes good to look at them"; and I noticed he often feasted his eyes on them when passing to and fro during his morning's work. In the autumn libonias are grand subjects for the decoration of the conservatory, and also for placing in vases in the dwelling-house rooms.

Ordinarily-grown plants always lack colour in the leaves, and also in the blooms. If the leaves are deep green in colour, the flowers will be richer, too, and the contrast in foliage and flowers very agreeable. Young plants will now need to be repotted. A suitable compost is the following: Fibrous loam, two parts, leaf-soil or peat, one part; well-rotted manure and old lime rubble, one part. I prefer a heated pit or frame to a dry shelf in a greenhouse for the plants during the summer months. See that they do not become unduly pot-bound before the final potting is done, and afterwards feed carefully and use the syringe. Admit air freely in fine weather.

G. B.

A VISIT TO BELGROVE.

Towards the end of July I was enabled, greatly to my delight, to renew my acquaintance with Mr. W. E. Gumbleton's charming garden at Belgrove, County Cork. This garden is well known, by repute at least, to the horticultural world, and is famous for being the first flowering place in the British Isles of many of the best introductions of recent years. Among the interesting plants in the conservatory were the new Arctotis regalis, a hybrid between A. aureola and A. grandis, and a perennial like the first, which was sent out by Sprenger. It has orange flowers. The Himalayan climber, Dicentra torulosa, Vilmorin's introduction of last year, is an extremely rapid grower, and bears yellow flowers. Ceratostigma Polhilli is a pretty plant with blue flowers, and Campanula primulifolia, or peregrina, is an interesting biennial. Three of Lemoine's new hydrangeas were present, namely, H. Dentelle, a hybrid with delicately fringed petals; Bouquet Rose, and Ornement; and Erlangea tomentosa, with lavender-blue flowers, closely resembles an ageratum.

In the neighbouring garden was Lemoine's Hydrangea arborescens grandiflora, a fine plant, producing large white sterile flowers. In another garden I saw this growing against a wall, and the bloom trusses were fully 18 inches in width. A handsome, very free-blooming perennial is Dimorphotheca Barberiæ rosea, with pink flowers, 1½in. across, while D. aurantiaca, a splendid annual, was a sheet of glowing orange. The double and single varieties of Pelargonium Fire Dragon, very rarely met with in gardens, were in bloom, as was the new white-flowered Rehmannia Henryi. Antirrhinum calycinum, bearing white flowers flushed with pink, was pretty, and a variegated antirrhinum was interesting. Of dahlias there were D. odorata Bruanti, which bears sweet-scented blossoms; D. lignea, an evergreen, with a woody stem that never goes to rest; and D. Collarette, with a single row of outer petals, but having short curled petals round the eye. Verbascum rubrinervum was a handsome plant, with branching sprays of yellow flowers, and long leaves with red veins. Gladiolus Evolution, with flowers of a deep violet colour, was a striking plant, and Begonia Lafayette made a blaze of scarlet. Montanoa molissima, from Kew, was 4ft. high, and bears ivory-white flowers 2in. across with golden centres. The yellow Californian Tree Poppy, Dendromecon rigidum, was in the best of health, and blooming freely. The specimen of the rare Olearia insignis, which is probably the finest in the British Isles, had gone out of flower, but was bearing seed heads, but O. angustifolia was in bloom.

On the same wall were the South African Bowkeria Gerardiana, a rare shrub not in commerce, that bears flattened, calceolaria-like blossoms; Lagunaria Patersoni, from Norfold Island; Correa magnifica, Tricuspidaria lanceolata fruiting freely, the rare Crossosoma californica, Perowskia atriplicifolia, very beautiful in the autumn when bearing its long, lavender flower sprays; Fallugia paradoxa, and a species of aconitum from Lake Baikal. At the corner of the wall was a huge specimen of Freylinia cestroides, about 20ft. in height, which, however, has never flowered, and which Mr. Gumbleton is, in consequence, inclined to cut down. This freylinia has, I believe, never flowered in England, though it blooms freely on the Riviera. Other plants were the new Anthericum Burkei, the splendid Salvia dichroa, from the Atlas Mountains, which was in profuse bloom; the double Tunica saxifraga, Nemesia Blue Gem, Brachycome iberidifolia Blue Star; the first of the double Michaelmas daisies, Beauty of Colwall, Echeandia eleutherandra, with yellow flowers an inch across, which last one day; Senecio Hectori, Gilia coronopifolia, and G. aggregata coming into bloom; Lathyrus pannonicus, a pale yellow pea about 18in. in height; Calandrinia chromantha, Potentilla comarum, or salisovianum, Trollius ranunculoides, from Siberia, a very rare plant, and probably the only one of its kind in the British Isles; the South African Anemone Fannini, the new Tigridia The Giant, very large; Genista hirsutissima, with pale yellow flowers, a very free bloomer; Pittosporum Fairchildi, the flame-coloured Glaucium Fischeri, Campanula amabilis, the pink New Zealand broom, Notospartium Carmichæliæ, in full flower, and Peraphyllum ramossissinum.

Outside this garden was an enormous bush of Spiræa discolor, or ariæfolia, 20ft. in height, and 18ft. in diameter. In front of the house is a walk a sixth of a mile in length. On the further side of this a number of interesting plants are grown, the handsomest of which at the time of my visit was a splendid specimen of Beschorneria Decosteriana, with six flower spikes about 10ft. in height, the red stems and red bracts giving the plant an extremely handsome appearance. Other plants by the path were Sprenger's new grass, Miscanthus japonicus, Cortaderia Stœnackeri, with white leaves, very striking: C. Wesserlinghi, having leaves variegated with white: nearly fifty species and varieties of kniphofia, among which were noticed K. nobilis pallida, a very large plant of K. præcox, which comes into bloom in April, and K. Triumph, that sometimes carries three blooms on the same stem; some of the best of Sprenger's yuccas, the white deciduous Agapanthus St. Pauli, and twenty-three varieties of the best of Lemoine's deutzias.

Hard by was Laurus camphora, the colouring of the young leaves being very attractive. On the other side of the path is a large bed of the best of the colchicums. On the way to the upper garden is a monstrous specimen of Daphniphyllum glaucescens over 20ft. in height, which must be the finest in the British Isles.

In this portion of the garden there is a fine collection of rare shrubs. Of the Berberis family were noticed B. Egberti, the young foliage of which is variegated; B. langleyensis, one of the best; Lemoine's B. sanguinea, B. bullata, B. acuminata, B. dictophylla, B. Wallichiana, the newly-introduced B. Wilsoni, two unnamed species from Thibet and the Himalayas, and B. diaphana. Cotoneaster angustifolia, about which many complaints have been made owing to its failure to fruit, was in profuse flower, so that fruit, in this case, will doubtless follow in quantity, and others of the same race were C. bullata, the very scarce C. Fontanesi, with deep red berries; C. Franchetti, C. pannosa, C. rugosa Henryi, and C. applanata fruiting freely. Spiræa Aitchisoni never flowers here, neither has it bloomed at Bitton, and Canon Ellacombe has, in consequence, discarded it. At Abbotsbury Castle, however, it has blossomed freely for the past three years. Close by the last-named was the graceful Spiræa assurgens. Leptospermum grandiflorum is a fine bush, and there are small examples of the new rose-coloured L. Chapmanni, and the blood-red L. Nicholli. The olearias included O. virgata, O. nitida, O. Traversi, O. Forsteri, O. furfuracea, O. moschata, and O. nummularifolia. Phellodendron amurense bloomed for the first time this year. A fine example of Chimonanthus fragrans is 20ft. in height.

Other noteworthy plants in this portion of the garden were a variegated form of Azara microphylla, probably the only one in existence. This was thrown up as a sucker a few years ago by a large bush of the type, and was carefully severed from the parent plant and set out by itself, since when it has made good growth, and is now a shapely little shrub with beautifully variegated foliage; Coprosma acerosa, with pale blue berries; Cornus foliosa, Hamamelis mollis, Adenocarpus fruticosa, Fuchsia excorticata, from New Zealand, Itea ilicifolia, Rhapithamnus cyanocarpus, Hypericum Henryi, Davidia involucrata, and Viburnum Carlesi from Korea; while V. rhytidophyllum was also present, and Exochorda Alberti macrantha was bearing fruit.

In the field hard by is a fine specimen of Juglans ailanthifolia, a very scarce tree, about 35ft. high and the same in diameter. This was fruiting for the first time, and the fruit will be sent to the Royal Horticultural Society this autumn for inspection. Near at hand was a fine collection of about twenty species and varieties of cratægus from America, some of them with beautifully coloured foliage. On the sunny side of a high wall bounding the kitchen garden was a splendid example of Wistaria multijuga, covering a spread of about 30ft. W. sinensis, the double form, and W. rosea are also grown. Here Magnolia Watsoni was in flower, and the climbing Decumaria barbara from Florida, which clings like an ivy to the wall, was flowering for the first time. Several species of Cestrum were present, Plagianthus Lyalli had bloomed well, Ampelopsis Engelmanni was remarkable for its ornamental foliage, and Rubus deliciosus and Xanthoceras sorbifolia were noted.

In the kitchen garden the new Servian quince, whose fruits are said to weigh 2lbs., was bearing well. The great Buddleia Colvillei, which was the first of its species to flower in the British Islands, is about 22ft. in height, and as much through. Carpenteria californica is 8ft. by 9ft., and a fine example of the rare Eucryphia cordifolia about 10ft. in height was bearing seedpods, and E. pinnatifolia was close at hand. Clerodendron trichotomum Fargesi was a new form of this flowering shrub.

Some plants of the new Citrange, a hybrid between Citrus trifoliata and the sweet orange, a present from the American Government, were inspected. On a wall was Codonopsis tangshen, a creeper from China, and on another wall the beautiful Chilian Mutisia decurrens was clambering through a fine plant of Fremontia californica. On a third wall a good specimen of Feijoa Sellowiana 9ft. in height and 10ft. in diameter, was flowering freely. The flowers are pink, and the edges of the petals turn inward, revealing their white reverse. Mr. Beamish, at Ashbourne, has this plant flowering well as a bush in the open. Both the blue and white forms of Myosotidium nobile were in the best of health. The shrub universally grown in the south-west as Corokia buddleoides, is now found to be incorrectly named, its proper title having been decided to be C. macrocarpa.

Other plants were Aplopappus ericoides, Philadelphus Rosace, the finest of the family, Cotoneaster frigida, Myrtus obcordatus, with lovely foliage, Myrsine Urvillei, Pittosporum crassifolium, and Pæonia arborea lutea. Two pretty blue annuals that sowed themselves were Anchusa capensis and A. petiolata, and self-sown plants of Milla longipes had sprung up everywhere in the beds. There is a fine collection of the Hemerocallis family, and in a frame are nearly all the known species and varieties of the Nerines, while in the greenhouse is a splendid display of glorious double begonias.

The foregoing article is by no means exhaustive, as from lack of space many rare and valuable subjects are necessarily omitted.

Wyndham Fitzherbert.

THE FRUIT CROP.

The variable quantities of fruit in different localities will be manifest this season, and are probably due to a variety of causes. It may be that the non-bearing of some trees this season is caused by the trees taking a rest after a previous heavy crop; yet when one considers the profusion of blossom on most trees, there must be other causes than heavy cropping in the year before. There was abundance of apple blossom, but the fruits are very thin; this is the case on garden trees, as well as in the orchard. Many of the orchard trees were defoliated by caterpillars, and, although spraying was resorted to, it was something like "locking the stable after the steed has gone," for it is quite possible that if banding of the trees early in the autumn, and winter spraying had been done, a crop might have been saved. However, the spraying killed the caterpillars, washed the trees, and the frequent rains soon caused new leaves to push forth.

Shelter is a question that often arises when advice is given on orchard planting, but when deciding on the trees for that purpose, do not plant oak near; neither plant the orchard near oak trees. The fruits in both orchards and gardens, whether apples or pears, have not reached anything like the usual size at the present time, but this is not surprising when we consider the wet and comparatively sunless weather that prevailed up to the end of July. A more agreeable, though sudden, change since will have its effect on the fruit, but severe thinning, if not already done, of the ill-formed fruits must follow if fair samples are desired.

The majority of garden trees which I have seen this season have been much affected with aphis and dirt on the leaves, and those not sprayed present an unsatisfactory appearance. The fruits of apples and pears, while below the usual size at this date, are not clean in the skin, and we may probably have to look to several causes for this. With regard to trees I have in mind, two very cogent reasons may be given for the fruits being so affected, i.e., a total absence of spraying, and the roots allowed to reach and remain in unsuitable subsoil. Applying the one, and lifting the roots out of the other, would doubtless effect the necessary improvement. If, however, the trees were grown on a suitable stock for garden trees, they would usually remain healthy. Plums are a fair crop. Bush fruits have been good. Where cherries succeed, these also have produced a very good crop. Though the two principal fruits for autumn and winter use are a thin crop, no doubt, later on the show boards will display good fruits, if not in quantity.

T. H. Slade.

USEFUL GUIDE TO GARDEN WORK.—A handy all-round guide to work in the garden month by month is the Gardening Year Book, by George Gordon, V.M.H., price 1s. net from booksellers, or by post 1s. 3d., from W. H. and L. Collingridge, 148, Aldersgate Street, London. The book is freely illustrated and the cultural details thoroughly practical and up to date.

THE ALPINE AURICULA.

Auriculas are alpine, every one of them, being garden forms of various alpine primulas, but for garden purposes there are two distinct types. The stage or show auricula has been developed during the past 350 years from Primula auricula, and this section comprises the green-edged, grey-edged, white-edged, and selfs. Most of them are freely dusted with a white farina on flower and leaf, just as P. auricula is found in its wild state.

The Alpine auricula is presumably descended by ordinary selection from Primula pubescens, but this type of primula never appears to have become such a popular garden favourite as its more aristocratic relation. Drawings of both are to be found in the old herbals, but no such clearly defined history can be traced of the Alpine auricula as of the stage or show varieties. Indeed, the auricula is one of the oldest exhibition plants of our gardens, and takes its place with the show tulip in that respect.

The Alpine auricula was but little known in gardens before the middle of the last century. A few amateurs in the Midlands and the late Mr. Charles Turner, of Chalvey, and later of Slough, did some good work in the improvement of this flower in the South of England, but for many years improvement was slow. I may write of it with some authority as I have watched its progress for half a century. The Alpine auricula is a hardy garden flower, and is best adapted for the rock garden or the front row of a well-drained herbaceous border. What is termed calcareous loam seems to be the best adapted to its wants. I am trying it in a quite new class of soil, such as I have never seen it grown upon, a medium loam crowded with flint stones over chalk; there is only 15 inches of soil over the chalk. Previously I had grown the plants out of doors on light soil over gravel, and also in heavy loam over clay, in both the plants succeeded well, but they must have a free and open position. I have seen auriculas planted amongst shrubs and under trees, where few plants will thrive, and they die out in two or three years under such conditions. They are most effective in colonies of six to a dozen, and if well placed, with a surface dressing annually, they give no trouble for many years.

On one occasion I planted a group of twelve Alpine auriculas in a herbaceous border. They remained undisturbed for fifteen years, and flowered freely, producing as many as a hundred trusses of bloom at one time. It has been asked why grow such hardy plants in pots? They are grown so to produce the best results for exhibition, and it is only by the persistent application of fanciers through the stimulating influence of the National Auricula and Primula Society, holding exhibitions in London, Manchester, and Birmingham, that such splendid results have been obtained.

Quite a revolution has taken place in the character and quality of the auricula during the past decade. Moreover, amateurs have a very high standard of excellence to work up to, and this is well so far as it conduces to the highest development of plant and flower; but the raiser of seedlings would do well to look for some breaks from the regular standard that has been raised for him to follow. It is only by doing this that new types of flowers can be obtained.

At present the Alpine auricula is divided into two sections: one has a deep yellow centre, and the other whitish or cream-coloured, and it is rather curious that the marginal colour of the corolla when the centre is yellow, always runs to shades of red, crimson, maroon, or some shade of red with a yellowish or bronze tinge. The white or cream centres are always encircled with shades of purple, lilac, bluish and all intermediate shades. The marginal colour is always shaded, darkest at the centre and shading off to lighter colours at the margin. There is no meal on the leaves or flowers of the Alpines, even the centre of the corolla or "pip" is free from powder, whereas the centre of a show auricula is always densely coated.

Decayed stable or cow manure should be freely used for both garden and pot culture. I use good turfy loam, with which is mixed a fourth part of leaf-mould and a fourth part of well-rotted stable manure. Coarse sand or powdered oyster shells may be added. It is not well to use large flower pots, even the larger plants will have ample space for their roots in a 5in. or large 48-sized pot. Drain well with potsherds, and secure the drainage with some turf fibre from which the soil particles have been shaken. The plants should be placed near the glass in garden frames, and they do best when slightly shaded from hot sunshine.

NEW ALPINE AURICULA PHYLLIS.

A beautiful variety with finely formed flowers having a cream-coloured centre.

Offsets are very freely produced, and by these they are propagated. The offsets may be removed as soon as they have formed roots. They are planted in small flower pots, and placed under handlights. An offset would take from 12 to 18 months to grow into a large specimen plant. There are numerous named varieties which can be obtained at a cheap rate. Gold-centred varieties are Admiral, Argus, Byron, Dean Hole, Duke of York, Ettrick, Firefly, Flora McIvor, Mrs. Martin Smith, Mrs. Danks, Rosy Morn, The Bride, Urania, and Ziska. White or cream centres: Admiration, Blue Bell, Elegant, Euterpe, Mrs. Douglas, Miss Berkeley, Phyllis, Martin Smith, Teviotdale, and Thetis. There are other new varieties not yet in commerce.

James Douglas, V.M.H.

Edenside, Great Bookham.

CABBAGE.

Kitchen garden resources are often taxed to their fullest capacity in the endeavour to maintain an adequate supply of tender cabbage throughout the year. Demands are generally most exacting early in spring, and again late in the autumn. For the earliest heads nothing surpasses a sowing of Ellam's Early Dwarf cabbage made the previous autumn. This variety is most reliable, and is absolutely non-bolting, while it readily responds in spring to any favourable influence employed to hasten maturity. Seeds of Winningstadt cabbage sown in March or April in the open will produce plants to give heads late in the autumn, carrying the supply of this vegetable into the season of savoys. Cabbage being grown for the utility of the leaves, readily respond to light, and frequent applications of nitrogenous manures applied during the growing season. These are represented among artificial manures by sulphate of ammonia and nitrate of soda. **T. Smith.**

THE HARD FERN.

Although one of the prettiest of our hardy evergreen native species the Hard Fern (Blechnum spicant) is so rarely seen in our gardens as to be popularly unknown, which is a great pity, since it is of easy culture, and, given a shady position in leafy, loamy soil, forms very pretty specimens. It is also admirably adapted for pot culture in cold conservatories facing north or east, where flowers languish for want of sunshine, in this respect resembling the bulk of our native ferns, which in their varietal forms should be largely utilised in such situations.

The Hard Fern is very distinct from any other of our native ferns. Its fronds are once divided like a double broad-toothed comb, tapering to a bluntish point, they are dark green and very tough, whence its name, and are perfectly evergreen, so that even in the winter it is a pretty plant. It is also distinguished by producing two sorts of fronds, viz., those already described, which predominate and are barren, and which are lax in growth, forming a rosette, and others which grow perfectly erect and have much narrower divisions set wider apart, these are the fertile ones bearing the spores. It needs plenty of moisture and cannot stand lime, either in the soil or in the water, so that rain-water should be used for pot plants if the ordinary water supply be hard.

In those parts of the country where it is plentiful it is found in abundance on sloping hedge banks, and in the woods growing in the leafy soil, and under the most favourable conditions produces fertile fronds two feet high, while the rosettes of barren ones may be as much across. As regards varieties it has been fairly liberal in sports, some of which are much prettier than the common form. These have been found wild among the common ones, and decidedly one of the prettiest of all was found by the writer, viz., B. s. concinnum Drueryi. As a little note on how this was found may stimulate others to try their luck in fern hunting, I will give the particulars. After a barren day's hunt on Exmoor, barren as regards finds, but glorious as to the weather and surroundings, I and my companions, a local fern hunter and another man, reached a little inn at Simonsbath, a small village in the very heart of the moor, and sat down to rest and refresh ourselves. Several of the villagers were in the parlour, and one of them, an old man, hearing me mention ferns and our want of luck, for in that particular locality ferns were apparently few and far between, he said, "There's a zoight o' fearns in the dyke down yonder," and, as a forlorn hope we sallied forth to inspect the "zoight." Sure enough we came to a stone dyke or wall composed of a bank of soil faced and backed by rough stones, the chinks between which were crowded with young ferns, Lady ferns, Male ferns, blechnums, etc., etc., in hundreds.

My guide, the local fern hunter, rushed ahead of me to see what he could see, while I, at that time with less experience, followed him slowly, examining every plant I saw. All of a sudden, peeping out of a chink crammed with youngsters of the common blechnum, I noted about an inch of a slender frond of the same species, but, instead of a blunt toothed double comb it resembled an even string of twin scallop shells, and hastily pushing the other fronds aside, I found to my extreme delight, six thoroughbred fronds of the same type issuing from the same centre, implying a constant and thoroughbred discovery. Sorted out from the clump of common ones, with which it was entirely unassociated as an individual, its roots were packed in wet moss, and a year or so afterwards some hundreds of seedlings proved true, and were distributed widely, the fern being now in every collection worth the name.

This recital will give some idea of how such "finds" occur, and incidentally of how far the true variety hunter differs from the ordinary fern vandal. How they arise no one knows, all that we do know is that every now and again new forms are discovered under more or less similar conditions. Among such there are prettily tasselled varieties, cristatum, ramo-cristatum, serrata-cristatum, and polydactylum; narrow ones, like the one described, and lineare Barnes, with smooth-edged divisions, and plumose ones like B. s. serratum Airey and B. s. plumosum Forster. The crested ones are peculiarly pretty, since the fertile erect fronds partaking also of the tasselling, they resemble green flowers springing from a rosette of green foliage. The best compost is one consisting of friable loam and leaf-mould in about equal parts.

CHINESE TEMPLE ON THE CHEN-TU PLAIN, WESTERN CHINA.

The trees behind the temple are the Nan-mu (Machilus Nanmu), from which the Chinese Coffin-wood is obtained. On the left is a clump of bamboos (Phyllostachys mitis), and in the foreground is a Paddy field, with rows of Soja beans.

Monarda didyma is an old and familiar subject to many, nevertheless, few plants so well repay timely forethought when planting. Though only of ordinary beauty, the flowers are of such a colour as readily become effective when boldly planted, yet the merit of the species lies less in this direction than in the leaves, which at the slightest motion or touch exhale an odour that is most refreshing to the senses. For this reason, it should be given a position of easy access, so that one may almost literally stumble over it, and thereby quicken its virtue, for amid the plenitude of garden subjects of the present time none, I believe, awaken more pleasing memories than our old friends the bergamots.—THOMAS SMITH.

THE PERFECT ROSE GARDEN

A vast space, cunningly laid out in winding walks meandering between shrubberies of the rose; paths canopied here and there, in others spanned by just a garland branch, or open to the blue of heaven; seats just at the fairest vista-views, banks crimsoned over with those red tea roses that offer shades unknown a few years back; walls crowned by pendant masses of gold and white, pink bushes wide as shrubs, arbours dense as though of evergreen, pillars to show the height to which a rose will reach. All these are but features of a perfect rose garden. In addition to space there must be a variety of levels; as well as pergola walks, we require open glades and lawns; and the borders need the background of blossoming hedges. In short, there are no limits to the beauty that the mind can imagine as existing in that perfect rosery which will never, alas, be seen on earth, but towards which all our endeavours loyally tend.

A VIEW ON THE CHINA-THIBETAN BORDERLAND AT 12,000FT. ELEVATION.

This view shows the home of the yellow-bracted Rheum Alexandræ found by Mr. E. H. Wilson, and now being introduced by Messrs. Jas. Veitch and Sons. In the foreground and among the rheums is Primula siberica chinensis, and in the background is a wood of the new Larix Potanini, both found by Mr. E. H. Wilson.

A narrow taste in roses is a sin to be avoided. There is as great genuine loveliness in the clustered tiny flowrets of a dwarf polyantha as in the giant snowy cups of Frau Karl Druschki. The single briar has a form that artists of all ages have made their model; the striped York and Lancaster breathes forth historical lessons as well as perfume; the old pink cabbage, the Austrian briar, the spined Scotch rose, and the dainty moss must claim their places if a collection is to be poetic and representative.

New effects in the rosery need to be jealously considered ere they are introduced. Among modern intensely double varieties there is exquisite contrast to be found in single flowers. Surely there should be a notably old-fashioned portion of the rose garden, too, a surrounding for the sundial or quaint carved fountain, maybe also for the grotto holding some stone nymph or goddess. If so, no trouble should be grudged in seeking out and bringing there the roses that were loved so long ago that fickle memories are losing touch with them. Striped varieties were once immensely valued; we can succeed in purchasing numbers still, first of all, Œillet Parfait, Red Damask, Rosa Mundi, or the Village Maid. Perhaps we can yet discover Boule de Nanteuil, Briseis, Tricolor, of pink, red, and purple, the velvet crimson Tuscany, Harlequin, Abesses, and Pamela, those companions of the former in our great-grandfather's gardens. Borders and beds of great capacity will be needed for this old-world collection; there are hundreds of past favourites, such as La Belle Distinguée, Stanwell Perpetual, La Constance, or Pæony-flowered, the delicate blush La Chérie, the dusky moss known as Comtesse de Noé, the Rose de Meaux, the Pompon Provence, the striped Unique, and Maiden's Blush.

Probably there must be a water scene in the perfect rose garden, for the exquisiteness of the flower is not realised until it is seen mirrored in some still pool, and dipping luxuriant garlands in the stream or lake. Wichuraianas, rambling down a steep bank to touch the ripples of a trout stream, a Crimson Rambler pillar of marvellous height rising from a tiny islet, a cavern-like low arch of Euphrosyne, the pink rambler, outlining the span beneath a rustic or stone bridge, these are delights not to be owned by all, of course; but to be recommended to the few.

Monotony in planting has spoilt many a rose garden; there should exist no flat shrubberies, but standards, pillars, bushes, dwarfs, even arches set to span other roses, can be so arranged as to lead the eye gently onwards to fresh vistas and rival groups. Up hill and down dale the paths should lead, aided by steps where necessary, those steps themselves edged closely by trailing and pegged-down roses, with perhaps hand-rails that serve as supports for climbers of no great altitude. Edgings may well be various, the green mossy turf in places, rough grey stones in others, miniature hedges of small kinds of roses here and there, but not a trace of formal tiles. A rosery that has no unexpected nooks and arbours can scarcely be called a success, but it is wise to beware of erecting the usual so-called rustic summer-houses, all shiny with varnish, and of a crude brown never seen in nature.

A trellis arbour is generally excellent in effect, thatched huts built of pinewood or natural larch poles can be cordially recommended. The terrace may be made a portion of the rose garden; if this is so, let delicate growers only be trained against the stone parapets, supported on wire-netting, painted to match the background.

M. H.

HARDY AZALEAS.

The hardy azaleas might readily claim regal rank amongst deciduous shrubs, for there is nothing to surpass them in beauty whilst in flower, and the blossoms are deliciously fragrant. Added to this they have a second period of beauty which occurs in autumn, for the leaves assume brilliant shades of scarlet, orange, bronze, and red previous to falling. The group is composed of a number of species of North American and Asiatic origin and a large number of varieties and hybrids, many of which have been raised or selected by English nurserymen, whilst others have originated in Holland, France, and other countries. Although they are effective when dotted about a shrubbery, their greatest beauty is developed when a large number of plants are grouped together to form a distinct garden, and it is difficult to imagine a more lovely sight than a tastefully arranged collection of hardy azaleas in full bloom, for the numerous shades of colour, which range from white to blood red, from cream to orange, from orange to scarlet, and from pink to deep rose, are peculiarly delicate, and a harsh note is rarely struck.

GENERAL VIEW OF AZALEA GARDEN, KEW.

A Beautifully Situated Garden.

One of the accompanying illustrations shows a portion of the Azalea Garden at Kew, which is recognised as one of the most attractive features of the Royal Gardens. Situated on the northern side of the Syon Vista, a few minutes' walk from the Palm House, it occupies an open glade in the midst of large specimens of beech, oak, and lime, and consists of beds, the majority of which form two circles, and the remainder occupy positions along the numerous grass vistas which lead up to the centre of the garden. The beds are divided by grass paths, and the centre of the garden consists of a lawn on which large specimens of rare magnolias are dotted about. The nucleus of this garden was formed about fifty-five years ago at the time when Sir William Hooker was director of the gardens. That, however, was but a small affair compared with what the garden is now, for it has been enlarged on several occasions, and was partly remodelled about fifteen years ago, whilst additional beds have to be made every few years to accommodate the collection as it constantly increases in size. When the azaleas are in full bloom, about the end of May, this garden presents a sight not readily forgotten. Away in the distance one notices a vivid patch of colour, and, after traversing a long grass vista, suddenly finds himself in the midst of an acre or so of flowers of the most delicate shades imaginable, whilst round about the delicate green of the young leaves of beech, oak, lime, and hornbeam form an admirable setting amongst which touches of colour are given by copper beech.

Cultivation.

There is one thing which forms a grave stumbling block in the culture of azaleas—that is lime. In ground containing lime in any appreciable quantity it is practically impossible to grow azaleas, but in most other kinds of soil they thrive. They succeed best in that of a peaty character, but do quite well in sandy or even heavy loam when lime is absent. In preparing ground for azaleas some people go to the trouble of providing 18in. or so of peat. This is, however, quite unnecessary, and, in fact, the plants will thrive better with one-third that quantity, providing the natural ground is not of a peaty character. Should the soil be fairly light loam, dig the ground over to a depth of 18in. and take out a few inches of the lower material; then, after the trenching is done, spread 6in. of peat over the ground and fork it in. In this the plants will grow far and away better than if 18in. of peat had been provided. When planting, care must be taken to tread the plants in firmly, and keep the top roots near the surface of the soil, for deep planting is very injurious. Water will probably be required occasionally during the first year after planting, but it is a mistake to be too generous with artificial watering, though, providing the drainage is good, an abundance of rain does no harm. On the approach of hot, dry weather the beds may be mulched with a good dressing of half rotten leaves. This will prevent excessive evaporation, keep the roots cool and provide an excellent rooting medium for the surface roots. This top dressing should be left loose on the ground, and no attempt made to cover it with soil or dig it in. To keep the plants in good health it is necessary to remove the flower heads as soon as the flowers fade, to prevent the production of seed.

Azaleas for Forcing.

No better subjects can be found for forcing than the various hardy azaleas, more especially those of the sinensis or mollis class. Of compact habit, free flowering, and rich in colour, they well repay the little trouble they give, and form excellent plants for conservatory, ball-room, or dwelling-room. Quite a large industry has developed of late years, notably in Holland, by growing plants especially for forcing, and it is possible to obtain fine bushy plants 1ft. to 2ft. high, carrying 40 or 50 flower buds for a shilling or so each. If well treated it is possible to force some of these plants two successive years, though many people force them once and then plant them out, whilst other people destroy them as soon as the flowers are over.

Selection of Varieties.

As a general rule, the various varieties and hybrids are planted more extensively than the species, not so much on account of their being better, but by being more easily obtained. The species that have entered most largely into the production of this garden race are A. nudiflora, A. calendulacea, A. occidentalis, A. arborescens, and A. viscosa from North America, A. sinensis from China and Japan, and A. flava from the Caucasus. Although all are kept up under the name of azalea for garden purposes, they are now included under rhododendron.

A WELL-DEVELOPED SPECIMEN OF A VARIETY OF AZALEA MOLLIS.
Flowers bright red.

A. nudiflora (R. nudiflorum) is sometimes called the "American Honeysuckle," and the "Pinxter Flower." It forms a dense bush 3ft. to 6ft. high, with lanceolate leaves and showy flowers, which may be white, pink, red, or striped red and white in colour. It has been responsible for many of the light coloured varieties. It is widely distributed from Canada to Georgia, and has been known in English gardens since 1734. A. calendulacea (R. calendulaceum), occasionally called the "Marigold-flowered Azalea," is distributed from Pennsylvania to Georgia. It has oblong leaves which are more pubescent than those of the last-mention species. According to the conditions it is growing under, it is found from 3ft. to 6ft. in height. The flowers are orange, red, scarlet, or yellow, those on some plants being self coloured and on others composed of two shades. Many of the rich reds, scarlets, and orange-scarlets have arisen from this.

A. occidentalis (R. occidentale) is a tall-growing, white-flowered plant from California. It flowers rather later than the previously-mentioned kinds, and is very fragrant.

A. arborescens (R. arborescens) occupies mountainous parts of the country from Pennsylvania to North Carolina and Tennessee. It acquires a height of at least 8ft. to 12ft., and is distinguishable by means of its glossy leaves and white or pink fragrant flowers. It blossoms several weeks later than nudiflora and calendulacea, and is usually at its best about the end of June.

A. viscosa (R. viscosum) the "Swamp Honeysuckle," or Clammy-flowered Azalea, is widely distributed in North America. It is readily distinguished from other sorts by means of its very sticky white or pink flowers which are extremely fragrant, and borne in July. Between this and the last-named species a number of hybrids have been raised which are very floriferous and flower in July.

A. sinensis (R. sinense) is well known in gardens under the name of A. mollis. It is a native of China and Japan, and is remarkable for its large orange, yellow, red, or scarlet flowers. Out of doors it blooms in advance of the American sorts, and is frequently at its best about the end of April and early part of May. This early flowering is not in its favour for a late frost sometimes spoils the whole of the flowers. It is the most popular of all for forcing, and is now being used largely for crossing with the American species.

A. flava (R. flavum) is found wild in the Caucasus, and is distinguished by its yellow flowers. From it many good yellow and orange forms have originated.

A well-marked type is in commerce, with double flowers of different colours, the various varieties being known collectively as A. rustica. It has originated by selection. The well-known term Ghent azaleas is applied to the varieties and hybrids of the above-mentioned species from the fact of many varieties having been raised, and a large quantity of plants grown in Ghent.

Although these conclude the sorts usually grown in gardens, there are others which have equal merits that are not so well known, and brief notice may be taken of some of them. Keeping to the generic name of rhododendron they are as follows: R. dilatatum, a rare reddish purple-flowered species from Japan; R. quinquefolium, an ornamental species, curious by reason of the leaves being borne in whorls of five; very few plants of this exist in the country; R. rhododora, a purplish-flowered North American plant; R. rhombicum, a reddish-purple flowered Japanese shrub, and R. Vaseyi, a very beautiful species from North America, with white or pink flowers.

We have also several evergreen sorts, which are included in the group known as azaleas. The Indian azalea, for instance, possesses several hardy forms, such as amœnum, amœnum splendens, balsaminæflorum, and Kæmpferi, a form from the mountains of Japan, with brilliant coloured flowers produced in great luxuriance.

Then there is R. ledifolium, with large white flowers, a native of China and Japan, and its variety narcissiflorum with double pink flowers, and R. linearifolium with long, narrow, hairy leaves, and reddish-purple blooms, which comes from Japan.

With this wealth of material, it is not surprising that a garden planted with azaleas can be made a very beautiful place, and in it flowers can be found from mid-April until the end of July. W. D.

NOTES ON POTATOES.

It is satisfactory to be able to record the fact that first and second early potatoes are turning out well this season. The crops are excellent, with hardly any disease. Duke of York showed some disease, but, nevertheless, it gave a marvellous crop, and fine-shaped tubers of good cooking quality. Carter's First Crop, very perfect and prolific; May Queen, excellent, and a big crop; while Snowdrop produced a wonderful crop. White City (Sutton's) is very prolific, and the tubers remarkably good. A pink variety sent out this season by Messrs. Sutton has very handsome tubers, is a fine cropper, and cooks well. Long Keeper (Carter's) has for the second season turned out remarkably well, producing an excellent crop of good-sized tubers, quite free from disease, and of good table quality. It should become popular for maincrop.

W. A. Cook, Leonardslee.

A TYPICAL SPECIMEN OF GHENT AZALEA.
Flowers rich golden yellow, with dark blotch.

NOTES FROM KEW.

Hydrangeas.

For flowering during the late summer and early autumn months, several of the hydrangeas are of high ornamental value, and though the common kind cannot be regarded as hardy at Kew, there are others worthy of especial note. Some, the climbing H. petiolaris or volubilis in particular, are now over, but H. paniculata is only just unfolding its blossoms. The variety grandiflora, so popular from the fact that it produces its flowers in large pyramidal-shaped heads, is a general favourite, but the typical H. paniculata, whose sterile flowers are, compared with those of the variety grandiflora, less in number, is superior as an outdoor shrub, the growth being more robust and the foliage of a richer green. An exceedingly pretty hydrangea, introduced, I believe, by Robert Fortune, and known at different times as H. Lindleyi and H. roseo-alba, is at Kew regarded as a form of the common hydrangea (H. Hortensia). Though this may be botanically correct, there is a great difference between the two from a horticultural point of view, as Lindleyi flowers from the axillary as well as the terminal shoots, so that should these last be killed by the winter the display of flowers is but little affected thereby. Compared with the ordinary H. Hortensia, the flower clusters are small and the large sterile blooms are limited to a few scattered around the outside of the cluster. They are suffused more or less deeply with a bright reddish rose-tint. In stature, too, this variety is less than the common kind, while the leaves are smaller. Hydrangea radiata, a native of the Southern United States, is also flowering freely. This forms a somewhat spreading shrub 4ft. to 5ft. in height, clothed with large ovate leaves of a bright green above, and white underneath. This last-named feature is particularly noticeable when the foliage is stirred by the wind. The flowers, borne in flattened clusters, are white, but the large showy ones are very few in number.

Clethra alnifolia.

This deciduous member of the heath family which is known in the United States (where it is a native) as the White Alder and Pepper Bush, is an exceedingly valuable shrub for flowering at this season. It forms a rather compact growing bush, whose ascending branches are clothed with ovate leaves, somewhat soft in texture. Just now the plants are plentifully sprinkled with spikes of white flowers, which in general appearance suggest those of a veronica. Clethra alnifolia being of wide geographical distribution in North America there are several forms, differing more or less from each other. By far the most distinct is tomentosa, whose leaves have a whitish down on the undersides, while the plant is of looser growth. The most important feature, however, is the season of blooming, for whereas Clethra alnifolia is now in full flower, the variety tomentosa is only in the bud state, and this is always their relative times of blooming. Given a cool moist soil, such as azaleas and rhododendrons delight in, these clethras are well worthy the attention of the planter.

Hardy Heaths.

Of late years considerable stretches of the different hardy heaths have been planted at Kew, and though their flowering period is not limited to this particular season, the greater number are now in bloom. When one sees considerable breadths of such kinds as Erica cinerea represented by several varieties, Erica ciliaris and its variety Maweana, the Cornish Moor Heath (Erica vagans), the St. Dabeoc's Heath (Dabœcia polifolia), with its particularly large bells, and the numerous varieties of the ling or heather, it is then that hardy heaths appeal to ever lover of flowers as they brighten up the declining days of summer, and bloom till the autumn nights get cold and damp.

Tamarix Pallasi rosea.

This, which is often known in nurseries as Tamarix hispida æstivalis, forms an exceedingly graceful and charming specimen throughout the entire growing season, but in August and even later when the plumose shoots are wreathed for some distance with little spikes of pink blossoms, it stands out absolutely without a rival. Several examples of it occur at Kew, a bed near the succulent house being very noteworthy. K.

HARDY FRUITS IN SCOTLAND.

With the single exception of apples, which, in many places, are below the average, the present season promises to be a record one for most kinds of outdoor fruits. Gooseberries are abundant everywhere; in some cases the bushes are badly broken with the weight of the crop. Notwithstanding the heavy yield, the size and quality of the fruit is not deficient, while the loss caused to the latter by cracking through excess of moisture is less than usual. In the markets the prices obtained for good sound berries are so low that growers declare that the cost of gathering is scarcely cleared. At present the green, thin-skinned varieties are most in evidence, and as these will not keep long when pulled, and quickly deteriorate in quality, this of itself tends to lessen their value. In the course of a few days Warringtons and Whinham's Industry will be ripe, and these apparently are the market gooseberries in Scotland, great quantities being disposed of daily by auction and otherwise at prices that, though quite normal in the markets, seem ridiculously low to private growers, and one might be pardoned for thinking unequal to the cost of picking, carriage, commission, and other incidental expenses, leaving out of consideration any profit to the grower.

Raspberries.

These, too, have been a heavy crop, and still continue to yield well. The dry period in June caused grave apprehensions for this crop, as at one time both growth of foliage and fruit seemed at a standstill. Several weeks of very wet, cool weather followed, which was in turn succeeded by a spell of heat, which, together with ample moisture at the roots, caused the fruits to swell and ripen quickly, consequently record daily gatherings were made, more particularly in districts very favourable to the culture of these fruits. At present the two most extensive tracts of land devoted to raspberries in Scotland are Blairgowrie, Perthshire, and Barr, near Girvan, Ayrshire, the former being the longer established, but the acreage under crop at the latter district is increasing very rapidly. How long, or to what extent, this extension can profitably be carried out, is, of course, uncertain, but judging by wholesale market returns, prices are falling yearly, in many cases as much as several pounds per ton, so that to continue remunerative it would appear that fresh markets or better means for distribution of the crop must be found. Taking the former district, the sum collectively paid to gatherers, packers, and carters, until the time the crop is placed with the railway companies, must represent a huge total.

Strawberries.

This crop, on the whole, has been a disappointing one, not, however, because of scarcity of berries, for towards the end of June there was promise of abundance, but cool, moist, and almost sunless weather setting in as the maincrop varieties should have ripened, great quantities failed to arrive at proper maturity; or where the growth was extra vigorous or the plants very close together, almost complete failure resulted, while lack of flavour was the general comment. The advantage of young plants for fruiting was more than usually manifest this year, through the inclement weather conditions referred to, as a large plantation here put out last autumn of most of the leading sorts, both old and new, produced more fruit than a similar-sized plot a year older, which should properly have been at its best. Included in the first-named were several rows of The Bedford, an excellent strawberry for private use, though, I fear, it would prove too large and soft for travelling a long distance, or for market purposes. But fruiting freely, and being but little hampered by foliage, the individual fruits grew large, ripened thoroughly, and the colour and flavour made it much appreciated at table. Laxton's Reward appears to withstand wet seasons well, and although its quality may not quite equal that of its reputed parent, British Queen, it is certainly well ahead of many of the new varieties in this respect.

For very late use Givon's Prolific, Elton Pine, and Laxton's Latest have done well, and very good fruits were obtained until quite the end of August. Whether very late strawberries are worth the space for growth, time, and attention to preservation bestowed upon them is questionable. In the first place a cool and more or less shaded position for the plantation must be chosen, and this of itself implies that with shortening days and waning sun heat the fruit must arrive at maturity without a great amount of this most beneficial of all aids to quality. Apart from this, the trouble of protection from birds and the smaller rodents is very great: furthermore, other fruits are at this time plentiful, and although inferior quality may be tolerated early in the season, it will hardly pass muster at the end, so soon after the passing of the maincrop varieties and their due appreciation.

Currants.

Black and red varieties have both borne full crops, the former particularly so, the dampness appearing to suit them well, for as fast as the fully-developed berries were pulled those later advanced and took their place, and but few were lost in the end. The seemingly precarious condition of the foliage of these at one time caused some anxiety, for in spite of washings, as far as time would allow, insects of the aphis family appeared to increase, and the glistening of the foliage owing to their presence was not pleasing. The heavy rains, however, gave the foliage a good washing, and the bushes soon assumed their usual healthful appearance. For the first time for many years a superabundance of this crop has been produced, all requirements being fully supplied, and still fruit to spare. This fruit is in great demand in Scotland by both rich and poor, the latter thinking the winter store of preserve incomplete until several jars containing a preserve of some kind of this homely, but useful, fruit is added to it. James Day.

Galloway House, Wigtownshire.

ISOLATED ROSES.

I am at a loss for a better title to these few notes than the above. With the advent of so many charming roses of extra vigorous habit, much more use might be made of roses as specimen flowering shrubs. Nothing can be more imposing and attractive than a pyramid or standard of Dorothy Perkins in full flower. Year by year we secure suitable growth of this class of rose that is readily trained into any desired form, and only exceptionally unfavourable weather can prevent a pleasing display.

At present we have several fourteen to twenty feet pillars of these and other roses in full beauty. Most of them are trained against or around larch poles that had [illegible] one to two feet of the side spurs left on. Some are between three ordinary hop poles, and others climbing among conifers that died last season. In the latter case most of the branches were cut off, the soil made very rich at the base, and the rose set in without further trouble or disturbance. Very gratifying results were obtained, and the extreme beauty of these specimens against the various greens of the conifers is most striking, the roses themselves being a mass of colour, and growing more or less at will.

But we are by no means tied to Dorothy Perkins. There is a beautifully pure white form of this rose now. We can also use Crimson Rambler and Blush Rambler in the same connection, only these do not droop over in quite so fascinating a manner. In the Wichuraianas, too, we have a very large choice, both in time of flowering and colours. Evergreen Gem, Gardenia, Joseph Billard, François Foucard, and by no means the least, our old favourite, Wichuraiana "Type," the parent of so many of this beautiful race of roses.

On the lawn, in the shrubbery around [illegible] in fact, heaps of suitable spots can be found for this class of rose. In tall standard form they are superb, and few sights surpass a good weeping standard of these varieties. Another purpose which these roses can be put to is as a small summer house or immense umbrella shade, quite sufficient for a seat beneath, and answering the same as the weeping ash or willow; and here again the umbrella frame is a great assistance.

When we consider that the class of rose more particularly under notice makes growths of ten to twenty feet or more in length, which frequently bloom throughout, carrying immense trusses of flowers, it is easy to realise how much they are in advance of ash or willow. One can imagine few things more ideal than to sit beneath the shade, beauty, and perfume of roses.

With so many roses it is almost compulsory to plant in batches to obtain much effect, but it is not so with these. Of course, they can be so grown, or upon pergolas, etc. Then again, we have many good varieties that do well when isolated. Ards Rover, with its deep crimson, sweet-scented flowers; Conrad F. Meyer, Mrs. Paul, Gruss an Teplitz, and others of like habit, although these do not equal the drooping habit of the many graceful Wichuraianas and their hybrids. If standards are used, they need to be very tall indeed to allow of any subject being cultivated beneath them, such as violas, etc. In most cases, the lengths of growth will hang to the ground, and even if they do not quite achieve this, they never leave a gaunt or leggy effect. As for the varieties suitable, there are far too many to mention here.

A. Piper.

Uckfield.

A NEW WATER LILY.

The beautiful Nymphæa Mooreana, of which an illustration is given herewith, is of special interest from the fact that it has been received from Australia, and is of a much finer colour than the well-known and highly-popular N. Marliacea chromatella. Some eight years since this water lily was sent to Mr. James Hudson, V.M.H., by a friend of his resident in Australia, and since it became established, two years later, it has been one of the most conspicuous of the many fine nymphæas in the large collection of these beautiful aquatics in the gardens of Gunnersbury House. The variety has proved quite hardy at Gunnersbury, has a good constitution, and is profuse in flowering. The flowers are large in size, have rather short and very broad petals, and the colour is a rich lemon-yellow. The leaves of N. Mooreana differ from those of N. Marliacea in being of greater substance and quite free from marbling. This fine form attracted much attention when exhibited by Mr. Hudson at the meeting of the Royal Horticultural Society, held on July 20, when an Award of Merit was made in its favour.

NYMPHÆA MOOREANA.

A beautiful hardy water lily received from Australia; the colour rich lemon-yellow. The flower is shown much reduced below natural size.

GRAPES AND HOW TO GROW THEM.—An illustrated guide to propagation, culture, and management in vineries, greenhouses, and in the open air. By J. Landell, F.R.H.S. Price 1s. net, by post 1s. 2d.; cloth, 1s. 6d., by post 1s. 8d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

WINTER - FLOWERING CYPRIPEDIUMS.—Many of the autumn and winter-flowering section of cypripediums will now be producing their flower scapes. From this stage until the flowers have become expanded the plants will need careful attention, and every encouragement. While protecting the foliage from any possibility of disfigurement from the direct sun's rays, they will be considerably benefited by plenty of light. Where they have been for some considerable period in the same pots, so that they have become matted at the roots or pot-bound, every care must be observed to supply them with ample root moisture. While not advocating feeding of any description for cypripediums, I would say that if any assistance be given to them those that have become pot-bound will most likely be benefited. At the time they are pushing up their flowers, a little soot water or weak liquid cow manure can do little harm, and the latter will certainly assist in retaining the roots in a moist state should the next few weeks prove dry and warm. At this season insect pests are most troublesome, black thrips blown through the ventilators or carried after a shower into the rain-water tanks from the roofs of the houses, where they have been carried from surrounding trees or herbaceous borders. It may frequently be observed after a rain that the surface of the rain-water tanks become literally covered with thrips and other insects. Consequently in watering and syringing we readily convey some of the most injurious insects to our plants. Constant observation and precautions are necessary with young growths and advancing flower scapes at this season. Where the pests are observed spray the plants with some safe insecticide, and vaporise the houses at regular intervals. If the growths have become disfigured, dip them about once or twice a week; afterwards rinse them by dipping in tepid soft water and lay them on their sides to drain, so that there may be no excessive accumulation of moisture at the base of the leaves.

THE MEXICAN LÆLIAS and other light-loving orchids, should now have all permanent shading removed. Should it be necessary to protect during the hottest part of the day, a mat or piece of old shading may be temporarily laid over the glass roof for a few hours, but where ample ventilation can be given, there is little danger of injury from the sun. Syringe these plants overhead in bright weather, and close the house reasonably early in the afternoon, and thus obtain a moist warm atmosphere. Syringing should be done sufficiently early in the day to permit the foliage becoming dry before the cool evening temperatures are reached. It is desirable to have the roof ventilators open a little at night in this division, which will, with the aid of a little fire-heat, prevent any possibility of a stagnant atmosphere.—H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

IPOMÆA RUBRO-CÆRULEA.—To secure an abundance of the sky-blue flowers of this climber for autumn and winter use upon the breakfast and lunch tables, the plants that have been growing under cool treatment should soon be removed to their winter quarters in an intermediate house. When planted out or in pots, train near to the glass. If in pots be careful when these become full of roots; feed the plants liberally, and freely syringe the growth to prevent the attacks of red spider.

CLIMBERS IN POTS.—When the flowering season is over, and when as a rule space becomes limited, a well-heated dry pit is useful for the accommodation of those passing into the resting stage. Their removal very considerably improves the appearance of the stove, and the well-being of the inmates remaining therein. Some of the dipladenias, such as boliviensis, may continue to bloom for some time yet, and are well worth the space required. Allamandas planted out may still continue to bloom, but where the bloom buds are not set the wood may be thinned out; gradually reduce the water supply, giving only sufficient to keep the wood plump.

STEPHANOTIS. — When good early growth has been secured, with the object of obtaining early flowers, the plants should now be given more exposure to light and air, and be kept drier at the roots for a couple of months. Then with gradually increased temperature early supplies may be relied upon.

FERNS. — Keep the stock of decorative ferns and also the ferns that are being grown for supplying cut fronds as light and airy as possible with safety to the plants. Adiantum cuneatum in particular, when grown for the production of fronds for cutting should be treated in this way, the fronds being much more durable than when the plants are grown under the usual conditions. Remove all old fronds to prevent damping, and do not overcrowd the plants. Take every opportunity of increasing the stock of the more useful kinds, such as davallias, as these last for a considerable time in a cut state. Seedlings of many ferns will be found springing up in different directions, and these may now be potted up and established by winter. It is always necessary to keep a sharp outlook with a view to prevent the depredations of insect pests amongst ferns. If brown scale or black thrips gain a foothold to any extent the fronds are disfigured for the remainder of the season, and as many of these cannot be removed with the hope of being replaced, keep them as clean and healthy as possible.

CLEANING.—Take every opportunity to clean both the interior and exterior of all plant houses, and in the rearrangement many plants will be benefited by being given a lighter position. When collections are mixed the best culture is seldom secured, and as far as practicable separate structures should be provided for both flowering and foliage plants.—W. Fyfe, Lockinge Park Gardens.

FRUITS UNDER GLASS.

PEACHES AND NECTARINES.—Where the fruits have all been gathered the houses should have the ventilators opened to their widest, so that growth now pretty well complete may have the benefit of all the light and air possible. Where the lights can be taken off let this be done at the earliest possible opportunity. Examine the trees and cut out any shoots that are unnecessary, and these can easily be distinguished. Much of the old fruiting wood should be dispensed with. This is beneficial to the trees, as the removal allows more room for the foliage of the new growths, and without proper leaf development one cannot reasonably expect proper bud development. See that a proper supply of moisture is given the borders, especially should the weather be hot and dry, and let the foliage be well syringed morning and evening. If a little insecticide is applied now and then it will serve to keep the foliage absolutely clean. In the earliest house the leaves will be turning yellow, and these may be assisted to fall with a fine twiggy broom, and thus promote final bud development.

TREE LIFTING AND ROOT PRUNING.—If it is intended to remove any trees that may have made too much growth, or from any other cause, preparations should be made for carrying out the operation, as the earlier it is done the better. More care is required in lifting trees thus early in the season to prevent the tree flagging too much. As soon as the foliage is mature the buds will be far enough advanced for the operation, and a sufficiently large hole should be made to be able to reach the roots all around. Proceed carefully, and if the sun is hot the tree or trees should be sufficiently shaded, but it becomes a very simple matter to lift the roots if the trees have been lifted several times. It is when the roots are left undisturbed for some years that much damage is often done. The roots should be damped when exposed, and as the work proceeds some moist mats may be placed over the roots, although, if the house is shaded, this may not be necessary. The roots of peach and nectarine trees do not travel very far, and if any ramblers are found they should be severed with a sharp knife. When the soil is put back again some lime or mortar rubble may be mixed with the soil, and the whole should be well rammed firm. If the lifting is well done it will be seen in about a month that the roots are running freely in the new soil.

MELONS.—If the weather is hot cut the fruits and keep them in the fruit room till required for use, as they shrivel in an excess of heat. Those growing in frames should be kept clean, and should be shut up early to assist the fruits to ripen quickly. The latest plants in the melon house will now be swelling their fruits rapidly, and every attention must be paid to them. If the weather is dull some fire heat must be used to assist in the development of a rich flavour, and give a little manurial stimulant when they commence their last swelling, and then gradually reduce moisture after the netting process begins.—W. A. Cook, Leonardslee Gardens, Horsham.

THE KITCHEN GARDEN.

ASPARAGUS.—The asparagus plants will be completing their growth and forming their crowns for next season's supply of heads. This year seems to have especially suited this vegetable, and in most cases very satisfactory growth has been made. After the past dry and hot weather considerable support may be given the plants, and the quantity of next year's crops will be increased by giving the beds a good watering with diluted liquid manure from cattle sheds. Failing this, a dressing of an approved artificial manure, gradually washed down by supplies of water, will be highly beneficial.

CABBAGE.—During the next week or two the main plantation of spring cabbage must be made. Good rich land is of importance to this crop to give the best results. A site that has produced a crop of second early peas or onions is generally suitable, as it has usually been generously treated. Very little preparation is required beyond a dressing of soot and lightly forking over before planting. The rows should be arranged at about two feet apart, and the plants in the row at one foot from each other. Each alternate plant, if cut clean out when fit for use, will allow the standing ones to develop into larger and more profitable produce. Preserve the roots as much as it is possible when lifting them from the seed-bed, and plant firmly. I much prefer the trowel to the dibber in planting, as the roots are more naturally distributed with the first-named, if ordinary care is used.

LATE PEAS. — Mildew is often troublesome by attacking the foliage of late crops and reducing the vigour of the plants, the result being badly-filled pods. Examine the rows frequently, and give dustings of sulphur to the affected parts when the foliage is moist, and apply nutriment to the roots at short intervals with liquid manure water, etc. With such attention, and given a fine autumn, a much-appreciated supply of peas may be had through October.

SALADING.—As late sowings of endive and lettuce become large enough for thinning out, have them planted in quantities in available warm situations, where frames can be placed over them, or other protection given. There is mostly a considerable loss through various causes, such as damping, etc., that due allowance must be given by planting extra plants over the amount required. A large sowing of radishes made now will prove useful for the salad bowl through October. Protection of a glass frame will preserve them from frost, and keep the plants growing on when the weather outside becomes unfavourable.

TOMATOES.—The early trusses of flowers outside owing to the continual cold weather did not set so well as usual, but those formed later under more favourable circumstances are satisfactory, and are now swelling their fruit rapidly. Encourage the plants in doing this by giving them liquid manure, and mulching the surface with manure. Remove the fruits at once as soon as ripe, and keep the trusses of bloom well exposed to sun and light by removing all surplus growth.

GENERAL REMARKS.—In all crops keep the surface soil moved by constant hoeing for the benefit of the plants, and to destroy weeds. This is best performed during the hot part of the day. Give light to the early Brussels sprouts by removing a few of the bottom leaves that may be partly decayed; this will have a tendency to harden the sprouts and make them of better quality. All crops that have completed their growth and are occupying space, should, as far as practical, be taken up and stored. This applies to turnips, beet, carrots, etc.—Charles Flack, Cholmondeley Castle Gardens.

Erythræa gothica and E. Massoni are two of the daintiest alpine plants that bloom in autumn. They belong to the same family as the gentians, and when out of flower might readily pass as dwarf forms of Gentiana acaulis. The flowers in both species are borne upon slender, branching, leafy stems, in the form of flat heads, and are of a clear rosy pink colour. The flowering season extends over August and September, when the rock garden glories are decidedly upon the wane, consequently at this season these subjects become doubly welcome. Like the gentianella, they succeed best when planted firmly in limestone soil, and are most effective when represented by a strong colony.—Thomas Smith.

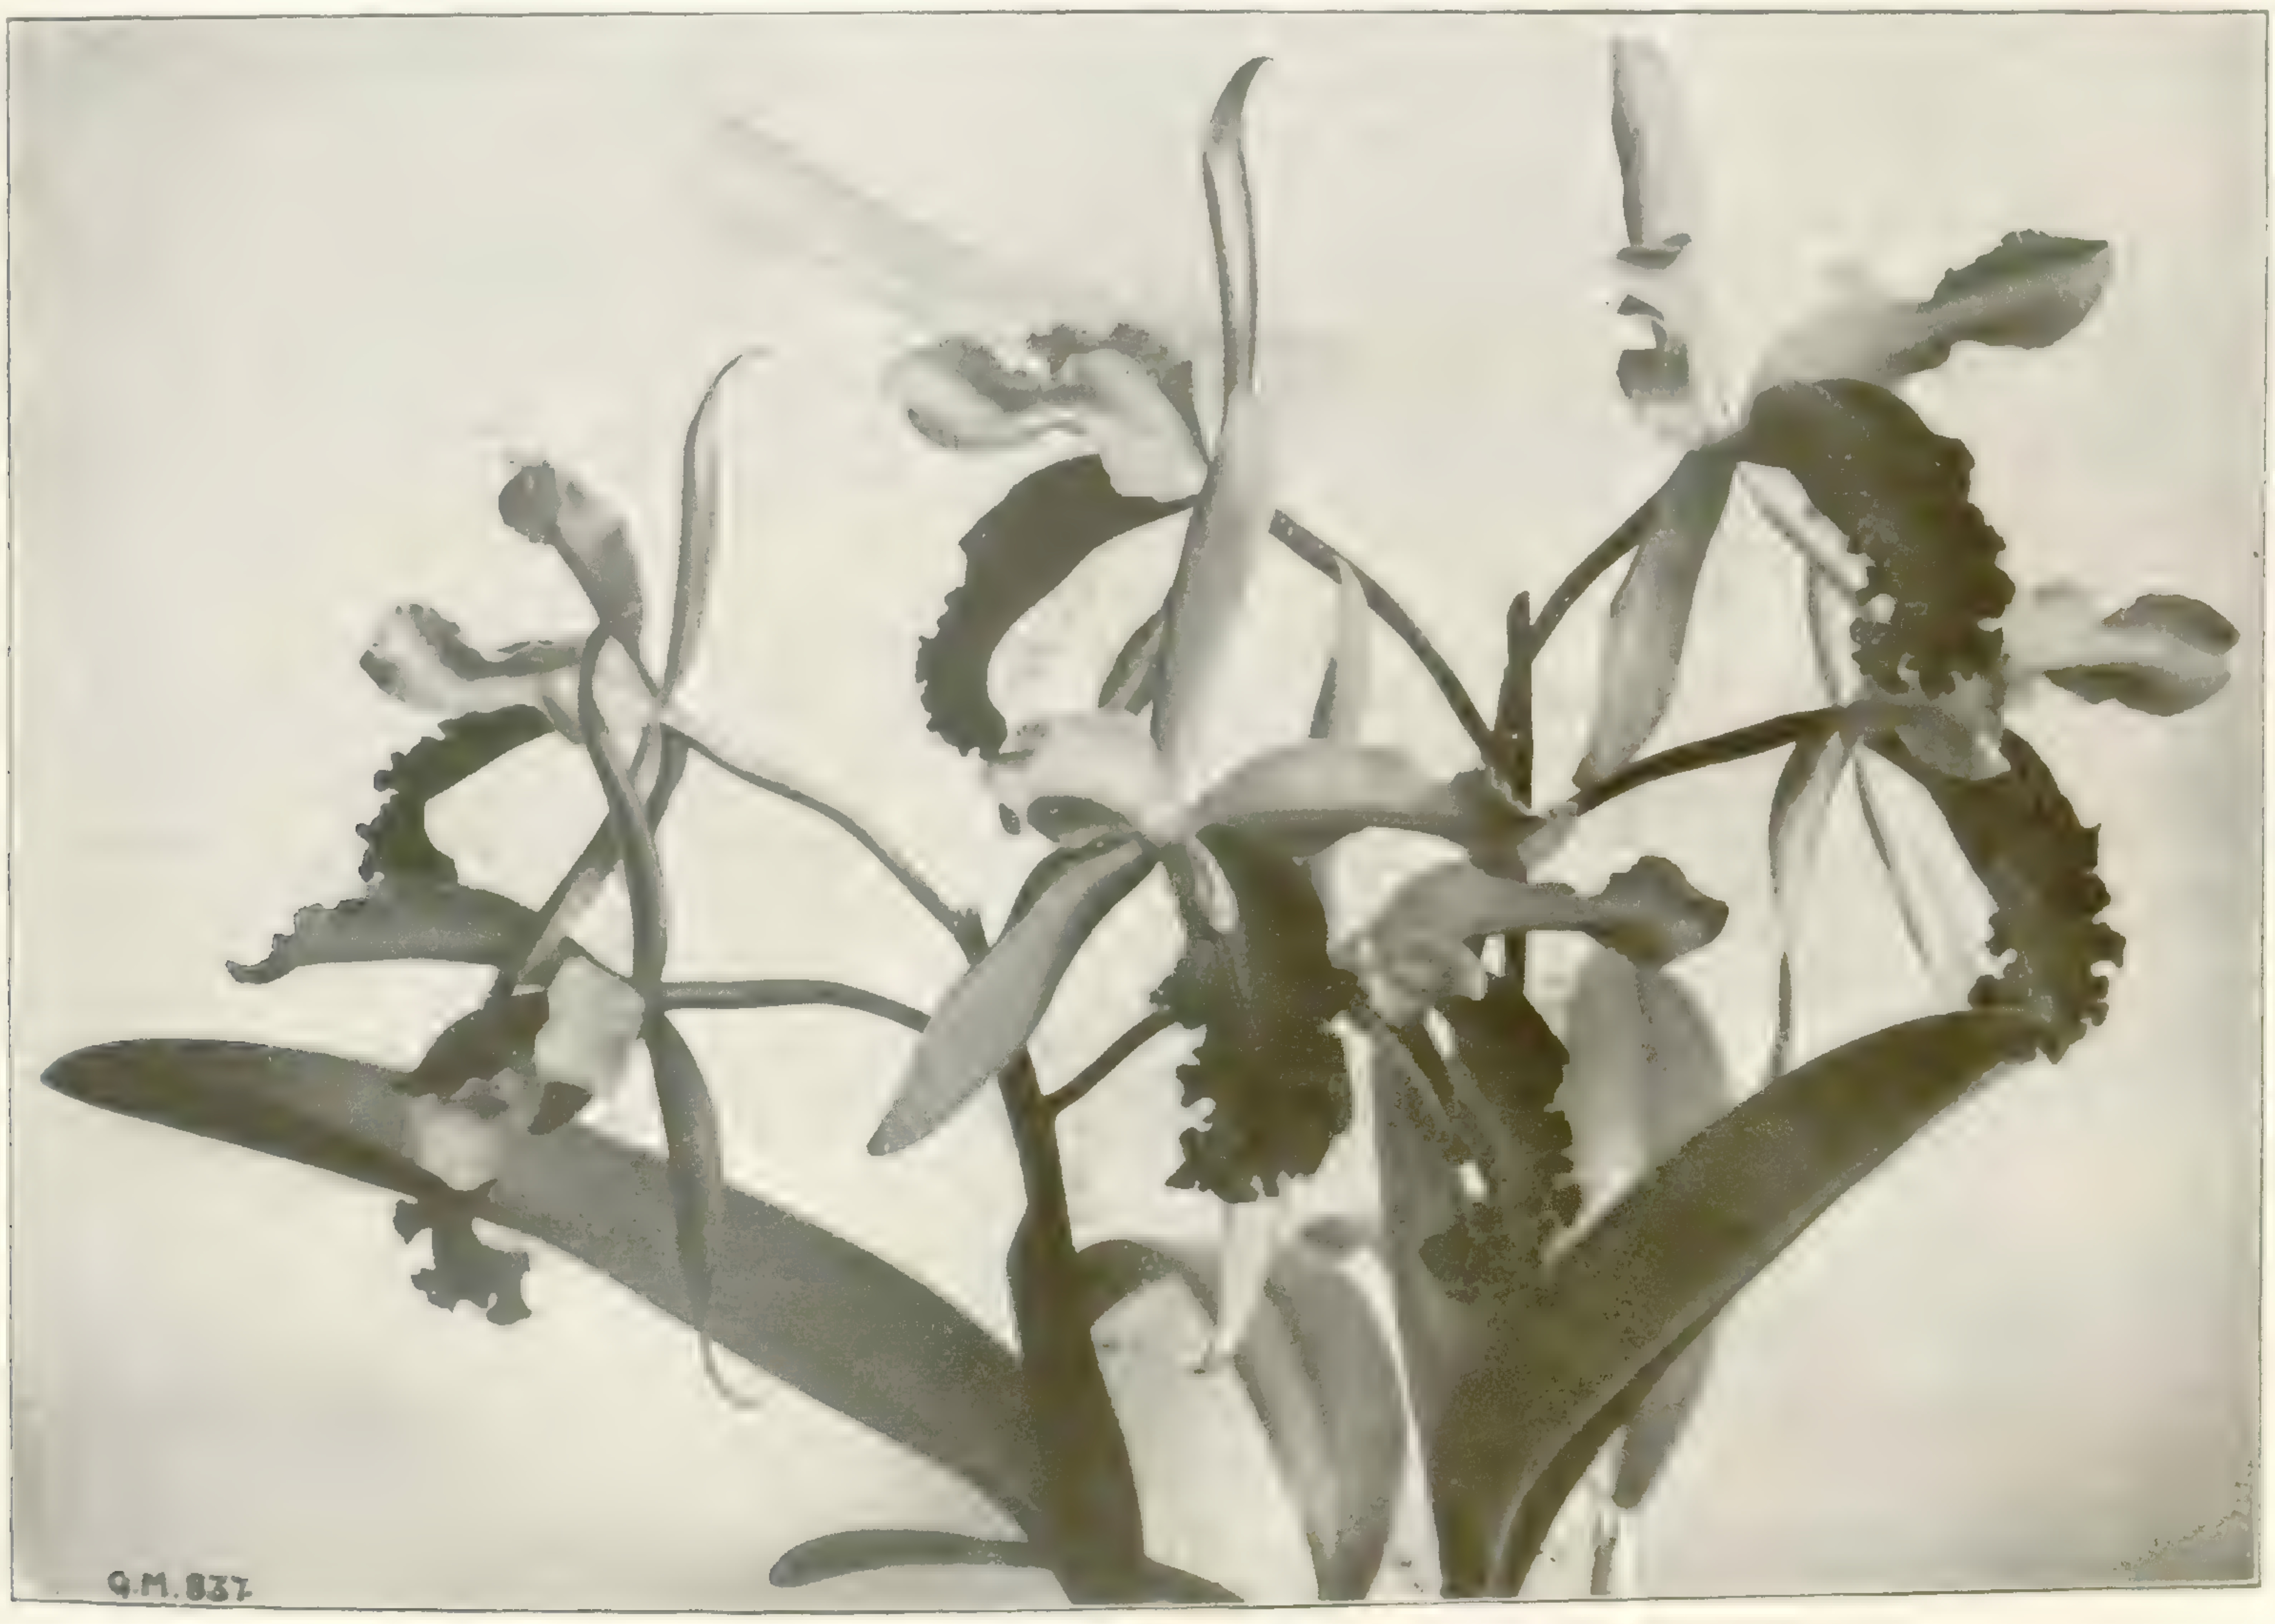
HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Royal Horticultural Society.

Dahlias and early chrysanthemums were very much to the fore at the Royal Horticultural Hall on Tuesday, August 31, and these, together with a biting wind outside, told their tale of a waning season. Hardy flowers were plentiful, and there were excellent exhibits of orchard house fruits, and some good roses. The newly introduced Chinese plants shown by the Chelsea firm, and the photographs of Chinese scenery and plants, by Mr. E. H. Wilson, formed a fine feature of the meeting.



G.M. 837.

LÆLIO-CATTLEYA GOLDEN ORIOLE, WESTONBIRT VARIETY.
A.M., R.H.S., August 31, Lieut-Colonel Holford, Westonbirt, Gloucester. Flowers, golden-yellow, crimson, and bright red-brown.

During the afternoon Mr. Jas. Hudson, V.M.H., delivered a very interesting lecture upon "The Gardens of the Lake of Como" before a good attendance, presided over by Mr. Joseph Cheal.

FLORAL COMMITTEE.

Particularly fine on this occasion was the great bank of elegant montbretias staged by Messrs. R. Wallace and Co., Colchester. The display consisted of large sheaves of [illegible] of the newer varieties, such as Prometheus, the new orange-yellow Pageant (A.M.), Hereward, E. Davison, Westwick, St. [illegible] Lord Nelson, Lady Hamilton, and G. Davison. This was a splendid exhibit of these delightful flowers. The Messrs. Wallace also showed kniphofias, gladioli, and Lilium Henryi. Mr. Amos Perry, Enfield, displayed liliums, delphiniums, phloxes, [illegible], pentstemons, rudbeckias, and a [illegible] of the beautiful Amaryllis Belladonna. Messrs. H. B. May and Sons, Edmonton, set up little groups of perpetual carnations full of flowers and buds, and representing the popular varieties; they also contributed a collection of bouvardias and the fine Lord Roberts heliotrope.

Mr. Henley, gardener to S. Morris, Esq., Thetford, contributed a very brilliant display of montbretias, showing large vases of such fine and attractive varieties as Hereward, Lord Nelson, King Edmund, Westwick, Ernest Davison, George Davison, Prometheus—very fine, and Lady Hamilton. Messrs. Hjalmar Harlmann and Co., Copenhagen, sent over a curious buff-coloured carnation, named Comtesse Knuth, very free-flowering, but not up to English form and quality. A selection of the beautiful javanico-jasminiflorum rhododendrons, brought up by Messrs. Jas. Veitch and Sons, Chelsea, were much admired, especially the varieties President, Cloth of Gold, Primrose, and Souv. de J. H. Mangles.

Of very great interest was the big group of Chinese plants, chiefly Mr. Wilson's finds, displayed by Messrs. Jas. Veitch and Sons, Chelsea. Here were Ilex Perneyi, Lilium Henryi, Buddleia variabilis Veitchiana, B. v. magnifica, Davidia involucrata, Senecio clivorum, S. Wilsonianus, Viburnum rhitidophyllum, Artemisia lactiflora, Populus lasiocarpa, Tilia Oliveri, Astilbe Davidi, Decaisnea Fargesi, Vitis Henryana, Clematis montana Wilsoni, and a host of other subjects of value for garden and park adornment. These plants were especially interesting, because just opposite the group was the fine exhibit of about 150 photographs taken in Central and Western China by Mr. E. H. Wilson on his recent expedition on behalf of Professor Sargent and the Harvard University. In many of these views could be seen the native homes of the plants staged by the Messrs. Veitch. Each photograph was mounted on a herbarium sheet, with a descriptive note attached. Two of these views, and they give a fair idea of the scope of the collection, are reproduced by special permission in the present issue. The homes of Pinus Armandi, Larix Potanini, Cunninghamia sinense, Berberis Wilsonæ, Cypripedium tibeticum, Primula Veitchi, etc., were well shown. The views of Chinese temples, the splendid views of snow-clad mountains, river scenes, Chinese carriers, etc., etc., were all vastly interesting; and what made the collection so attractive was the fact that in every case Mr. Wilson had succeeded in making a picture of his subject, and consequently the photographs were not passed over like severely technical ones would have been, but they were inspected by a crowd of visitors all the afternoon.

A magnificent exhibit of dahlias was arranged in a most effective manner by Messrs. Carter Page and Co., London Wall, E.C. This was set out across the top end of the hall. Cactus varieties were very fine, and there were splendid examples of Amos Perry, Nelson, C. E. Wilkins, Dainty, Francis Graham, Etruria, A. D. Stoop, Dr. Gray, H. W. Sillem, Buttercup, etc. Pompon, single, and pæony-flowered varieties were also well represented. Messrs. J. Cheal and Sons, Crawley, contributed a display of single dahlias, and a selection of pentstemons, solidagos, and other useful hardy flowers. Early-flowering chrysanthemums were well shown by Messrs. W. Wells and Co., Merstham, and reminded one of the nearness of autumn; with these were phloxes in quantity, pentstemons, and a few Michaelmas daisies. Mr. Wilhelm Pfitzer, Stuttgart, exhibited some interesting and bright-flowered gladioli, rather small-flowered, however.

Probably the last exhibit of sweet peas for this season was the one put up by Messrs. Dobbie and Co., the flowers coming from their Mark's Tey grounds. The blooms were clean and bright, and of good size, the leading varieties being Constance Oliver, St. George, Helen Lewis, Mrs. Hugh Dickson, Mrs. Andrew Ireland, Audrey Crier, The Marquis, Sunproof Crimson, Mrs. Chas. Foster, Clara Curtis, Mrs. Hardcastle Sykes, and John Ingman. Mr. Eames, Frome, Somerset, displayed a large collection of hardy flowers that included some excellent pentstemons and gladioli, and good spikes of Crinum Powelli and C. P. alba; Mr. Eames also had a large collection of herbaceous phloxes that contained all the leading varieties. From Messrs. J. Peed and Son, West Norwood, came a collection of phloxes, some water lilies, and the golden Anthemis Kelwayi. Some splendid tuberous begonias, single, double, and frilled varieties, were submitted by Mr. A. L. Gwillim, Cambria Nursery, New Eltham, and attracted a great deal of attention. The plumose forms of Celosia pyramidalis were grandly shown by Mr. L. R. Russell, Richmond, and the colouring and dense pluming of the flower spikes were particularly good.

Mr. Frank Brasier, Caterham Valley, showed phloxes largely, together with early chrysanthemums, perennial asters, scabious, carnations, gladioli, and other useful hardy autumn flowers. Roses were contributed by Messrs. R. Harkness and Co., Hitchin, who showed such varieties as Frau Karl Druschki, Mrs. J. Laing, Hugh Dickson, Mdme. Abel Chatenay, Victor Hugo, Ulrich Brunner, and Lady Ashtown in quantity. The Messrs. Harkness had also a goodly display of gladioli. A regiment of stalwart gladioli spikes from Messrs. Kelway and Son, Langport, once more demonstrated the value and beauty of these autumn-flowering plants; the salmon and pink shades were particularly pleasing. Artemisia lactiflora was largely shown by Messrs. Thos. S. Ware, Feltham; this is a graceful free-flowering plant of great value in the autumn; the same firm sent a small collection of alpines.

Montbretias and helianthuses made a very bright show in the group of hardy flowers set up by Mr. G. Reuthe, Keston, Kent. With these were numerous heaths, herbaceous lobelias, scabious, phloxes, and rudbeckias. Phloxes were extensively displayed by Messrs. Gunn and Sons, Olton, Warwick, who put up good spikes of Selma, Regulus, Marie Corelli, Princess Marie, Lord Curzon, F. von Lassberg, G. A. Stroechlin, and Tapis Blanc.

Messrs. J. Stredwick and Son, St. Leonards, displayed a few new cactus dahlias, their Harmony and Territorial being very good. Mr. H. Shoesmith, Woking, had a fine white cactus dahlia named Prima Donna. Mr. L. R. Russell, Richmond, filled one corner of the hall with clematises. Messrs. Barr and Sons' display consisted of hardy flowers, chiefly phloxes, kniphofias, scabious, gladiolus, etc. Messrs. W. H. Rogers and Son, Lim., Red Lodge, Southampton, showed a batch of their new scarlet pelargonium named James T. Hamilton.

ORCHID COMMITTEE.

Messrs. Charlesworth and Co., Haywards Heath, showed a group of interesting and useful orchids, the display containing Lælio-cattleya callistoglossa, L.-c. Domini, Cattleya Mrs. Pitt, the brilliant C. Venus, C. Rheda, and the handsome C. F. W. Wigan. Oncidium ornithorhynchum and its variety album, several odontoglossums, and Cypripedium A. de Lairesse and C. Lawrebel were other good things in the exhibit. Mr. Edward V. Low, Haywards Heath, sent two plants of Cattleya Gaskelliana alba. From Baron Schroder's collection Mr. Ballantine brought up some good cypripediums.

Mr. G. Day, gardener to H. S. Goodson, Esq., Fairlawn, Putney, displayed Lælio-cattleya Luminosa, L.-c. St. Gothard, L.-c. callistoglossa, Brasso-cattleya Mdme. Hye, Cypripedium H. S. Goodson, and other orchids. Messrs. Sander and Sons, St. Albans, had a display in which the leading features were Cattleya Armstrongiæ, C. Hardyana, Brasso-cattleya Maroni, Cattleya Pittianum, L.-c. Henry Greenwood, Rhyncostylis retusa majus, the interesting Angræcum Chaillui-anum, and A. infundibulare, and the handsome Dendrobium Dalhousianum.

Messrs. Stuart Low and Co., Enfield, showed a small collection of orchids that contained the white Cattleya Gaskelliana Fairy Queen, Odontoglossum Pescatorei, and numerous cypripediums. Mr. H. Alexander, orchid grower to Lieut.-Colonel Holford, Westonbirt, showed grandly grown specimens of Cattleya fulvescens, L.-c. Golden Oriole Westonbirt var., L.-c. illustre Westonbirt var., Brasso-cattleya Digbyano-Warneri, Cattleya Iris, and L.-c. Berthe Fournier Westonbirt variety; a cultural commendation was granted. Mr. Black, gardener to R. G. Thwaites, Esq., Christchurch Road, Streatham, sent Cattleya Adula, somewhat like C. Iris, Odontioda Thwaitesi, and Sophro-cattleya Blacki (A.M.), a bright hybrid between Sophronitis grandiflora and Cattleya Hardyana. The lovely Zygopetalum Lindeni was shown by Sir Trevor Lawrence, Bart., Burford Lodge, Dorking. From Messrs. William Bull and Sons, Chelsea, came a few plants of Cattleya Pittiæ, Lælio-cattleya Parysatis, Cattleya Maroni, and the bright C. Macænus, the latter representing a good form of this hybrid.

FRUIT AND VEGETABLE COMMITTEE.

A large, excellent, and interesting display of grapes came from the Royal Horticultural Society's Gardens, Wisley, and the size of bunch and berry, as well as the colour of the grapes, reflected the greatest possible credit upon Mr. S. T. Wright and Mr. Smith, who have them under their care at Wisley. The varieties shown were Canon Hall, Bowood Muscat, Black Prince, Black Monukka, Diamant Traube, Duchess of Buccleuch, Appley Towers, Muscat Hamburgh, Lady Hastings, the huge White Nice, Chasselas Napoleon, Golden Queen, Diamond Jubilee, Gros Maroc, White Frontignan, Foster's Seedling, Mrs. Pearson, the splendidly flavoured Muscat Champion, Grizzly Frontignan, and Madresfield Court. Mr. A. Mackellar, gardener to His Majesty the King, showed ten very fine, splendidly coloured bunches of Black Hamburgh grapes cut from the famous vine at Hampton Court, now 141 years old; these bunches show how greatly Mr. Mackellar has improved the vine.

A very large and interesting group of fruit trees in pots came from the King's Acre Nursery Company, Hereford, and in every case the plants carried grand crops of excellent fruits. The Queen, Emperor Alexander, Washington, and Gascoyne's Scarlet apples; Coe's Golden Drop and Jefferson plums; Triomphe de Vienne, Pitmaston Duchess, and Conference Pears; Black Hamburgh, Alicante Muscat of Alexandria, and Melton Constable grapes, trained flat and also in umbrella fashion; and the Early Silver, Barrington, Dymond, and Thos. Rivers peaches, were all very finely represented; but the great attraction was a trained Thos. Rivers peach, carrying about fifty good fruits, and growing in a 15-inch pot. A collection of melons grown without artificial heat by Mr. T. Simpson Jay, Holmwood, Putney Hill, S.W., proved very interesting; the fruits were on the small side, but were otherwise good.

Very fine was the contribution of fruit trees in pots from Messrs. Thos. Rivers and Son, Sawbridgeworth, Herts. The neat trees were grandly cropped, the plums, peaches, and nectarines being wonderfully fine. Chaucer nectarine, Sea Eagle and Dagmar peaches, and the picked fruits of Cox's Orange Pippin, Ribston Pippin, and Peasgood's Nonsuch apples were a very great attraction. Mr. Nicholls, gardener to Sir Mark Collett, St. Clere, Kemsing, Sevenoaks, sent up six dishes of grand pears, the varieties being Mdme. Treyve, Marguerite Marillat, Beurre Mortillet, Triomphe de Vienne, Souv. du Congres, and Gansel's Bergamot. Messrs. S. Spooner and Sons, Hounslow, exhibited a collection of early apples, plums, pears, raspberries, and cherries, all the fruits very clean and bright.

In the fruit classes Mr. T. Stevenson, Addlestone, gained first prize for two dishes of peaches with Rivers' Early and Royal George; he also led for two dishes of nectarines, with Pineapple and Elruge. Mr. Markham, Wrotham Park Gardens, Barnet, was first for three dishes of plums, and Mr. Tidy, Cobham Park Gardens, gained second place. Mr. J. Vert, Audley End Gardens, Saffron Walden, had the best collection of six dishes of plums, showing Golden Esperen, Pond's Seedling, President, Jefferson, Rivers' Orange, and Reine Claude d'Althan.

AWARDS.

No first-class certificates were granted.

Award of Merit.—To Lælio-cattleya Golden Oriole Westonbirt var., from Lieut.-Colonel Holford (orchid grower, Mr. H. Alexander), Westonbirt, Gloucester; to Montbretia George Henley, from S. Morris, Esq. (gardener, Mr. Henley), Thetford; to Montbretia Pageant, from Colonel Petre (gardener, Mr. G. Davison), Westwick, Norwich; to Gentiana ornata, from Messrs. Jas. Veitch and Sons, Chelsea; to Sophro-cattleya Blacki, from R. G. Thwaites, Esq. (gardener, Mr. Black), Chessington, Christchurch Road, Streatham.

Certificate of Appreciation.—To Odontioda Grairiana, from Messrs. Sander and Sons, St. Albans.

MEDALS.

Gold Medal.—To the Harvard University, U.S.A., for a collection of photographs of Chinese scenery and plants, taken by Mr. E. H. Wilson during his recent collecting tour; to the King's Acre Nursery Company, Hereford, for a display of fruit trees in pots.

Silver-gilt Flora.—To Messrs. Carter Page and Co., London Wall, E.C., for an exhibit of dahlias; to Messrs. Jas. Veitch and Sons, Chelsea, for Chinese plants; to Messrs. R. Wallace and Co., Colchester, for montbretias and gladioli.

Silver-gilt Knightian.—To Messrs. Thos. Rivers and Son, Sawbridgeworth, Herts, for fruit trees in pots.

The Hogg Medal.—To Mr. A. Mackellar, gardener to his Majesty the King, for grapes from the Hampton Court vine.

Silver-gilt Banksian.—To Messrs. R. Harkness and Co., Hitchin, for roses and gladioli; to Mr. Henley, gardener to S. Morris, Esq., Thetford, for montbretias.

Silver Flora.—To Mr. Eames, Frome, for phloxes; to Messrs. Kelway and Son, Langport, for gladioli; to Mr. L. R. Russell, Richmond, for clematises; to Messrs. Sander and Sons, St. Albans, for orchids; to Mr. Day, gardener to H. S. Goodson, Esq., Putney Hill, for orchids; to Mr. Alexander, orchid grower to Lieut.-Colonel Holford, Westonbirt, for orchids; and to Messrs. Charlesworth and Co., Haywards Heath, for orchids.

Silver Knightian.—To Mr. Nicholls, gardener to Sir Mark Collett, St. Clere, Kemsing, Sevenoaks, for pears.

Silver Banksian.—To Messrs. S. Spooner and Son, Hounslow, for hardy fruits; to Messrs. Stuart Low and Co., Enfield, for orchids; to Messrs. Barr and Sons, Covent Garden, for hardy flowers; to Messrs. Dobbie and Co., Rothesay, for sweet peas; to Messrs. Gunn and Sons, Olton, for phloxes; to Messrs. H. B. May and Sons, Edmonton, for carnations, etc.; to Mr. Amos Perry, Enfield, for hardy flowers; and to Mr. G. Reuthe, Keston, Kent, for hardy flowers.

Dundee Horticultural Association.

AUGUST 26, 27, and 28.

The Marchioness of Tullibardine gave a very happy send-off to the annual three-days' show of this society. On the whole, the show was an excellent one. No doubt the backward season had to some extent affected the exhibits, but nevertheless the display was very favourable. All the exhibits inside the large marquees were admirably arranged, and reflected great credit on the Staging Committee. The entries numbered close upon 2,000, a slight reduction from the numbers of last year.

POT PLANTS.

The marquee devoted to this section presented an exceedingly fine spectacle, the large palms, the foliage and flowering plants, and the finely-arranged exhibition stalls forming a beautiful picture. The entries for the best group of plants on a ground space 15ft. by 12ft., at once attracted the eye. Here the ingenuity and skill of Mr. James Beats, Binrock, Dundee, were indeed the envy and admiration of his professional brethren. The originality displayed in the building up of his group was quite unique, and certainly never has been bettered at any show here. The judges had no difficulty in awarding Mr. Beats premier honours. The second and third prize entries were also very good, but a long way behind that of Mr. Beats. For the best table of stove or greenhouse plants arranged for effect, Mr. George Reid, Inver-

LONDON, E.C.

tay, West Ferry, Dundee, was first with a capital entry. Mr. James Bethel, The Grange, Monifieth, was second and third. The latter undoubtedly lost points through his edgings being composed too much of one colour. The whole of the entries for the best six stove or greenhouse plants (unrestricted) were exceedingly fine. Here Mr. John Forbes, Taypark, West Ferry, Dundee, won with a very meritorious entry, his palms and Asparagus deflexus being enormous in size, well grown, and fine and healthy. Ferns were a charming display, Mr Beats, with his finely-grown and extraordinarily large specimens of davallias, handsomely leading the way. Begonias, both single and double, were really fine entries, and Mr. George Scott, Seathwood, Dundee, led the way in both classes. Liliums (auratum excluded) were a good average, Mr. John S. Summers, Ashcliffe, Dundee, carrying premier position with very well-grown specimens of L. speciosum album Krætzeri. For Lilium auratum Mr. James Bethel, The Grange, was first.

Chrysanthemums were exceedingly good, and the judges had little hesitation in giving first place to Mr. Beats for both disbudded and not disbudded. They were indeed splendid specimens, and reflected no little credit on the grower. In dracænas there was little to choose between the first and second prize lots sent in by Mr. R. W. Saunders, Lismore, Broughty Ferry, and Mr. John Forbes, Taypark. There was one of the finest displays of pelargoniums ever seen in Dundee. The judges found no little difficulty in apportioning the honours here, but ultimately the entries sent in by Mr. George Scott, Seathwood (singles), and Mr. James L. Gray, Dundee (doubles) could not be denied. Coleus were an average lot, and Mr. James Bethel well deserved the first place. For the best six stove or greenhouse plants, pots not to exceed 9in. in diameter, Mr. R. W. Saunders had a fine set, the outstanding plants in which were superbly grown specimens of Alocasia Sanderiana and Ixora Williamsi.

CUT FLOWERS.

Notwithstanding that the weather during the week previous to the show was not very favourable to flowers grown in the open, there was a display that evoked the liveliest admiration. The great and outstanding feature here, as at the other shows held recently throughout Scotland, was the magnificent array of sweet peas. For twelve varieties of sweet peas, distinct, Mr. George Reid, Downfield, had a capital victory, and specially attractive in his collection were Black Michael, Mrs. Routzahn, and Asta Ohn. Mr. Beats, Binrock, had matters pretty much his own way for hand bouquets and wreaths, while Mr. George Reid, Downfield, was first for lady's sprays and buttonhole bouquets. In Mr. Beat's hand bouquets carnations were the dominant feature. Mr. Scott, Seathwood, was first with an excellent basket of flowers, consisting mainly of roses, carnations, and begonias. Mr. R. W. Saunders, Lismore, had a fine win for twelve trusses or bunches cut from stove or greenhouse plants, not less than nine varieties, and not more than two trusses or bunches of orchids. It was a really fine entry. Chrysanthemums were here, as in the pot division, a very good turnout. Mr. W. Cook, Duncraig, had a notable win. Mr. G. Scott, Seathwood, also secured premier honours.

Roses were a fine display, and here Mr. D. Keillor, Seabourne, Broughty Ferry, scored finely both for H.P.'s and H.T.'s. Cactus dahlias were an exceedingly fine show, and it was not a little surprising to see so fine a turnout, considering the cold season we have had. For twelve blooms Mr. Charles Shaw, Boquhan, had a very fine set, and for six varieties Mr. H. Rutherford, Balfour, Brechin, was a good first. Pompon dahlias were a good average, the leading place being taken by Mr. J. Dobbin, Broughty Ferry. Carnations formed a capital feature, and Mr. D. Halley, Broughty Ferry, worthily won the leading place, as did also Mr. J. A. Nicoll, Taypark, for twelve vases of border varieties. Begonias were a prominent feature, being of enormous size and most excellent quality. Mr. Rutherford, Balfour, led the way very finely. Of pelargoniums it may with truth be said that there was not a bad one in the show—all, indeed, were exceedingly fine. Mr. Scott, Seathwood, carried premier honours here. Asters were fairly good, but many, owing to the lack of heat, were not thoroughly matured. Mr. J. S. Summers, Dundee, was a good first. Hardy herbaceous flowers were a splendid class, and Mr. Scott, Seathwood, is to be warmly congratulated on his fine winning entry.

FRUIT.

The fruit display was slightly below the average for Dundee, the best exhibits being amongst the hardy varieties. Grapes, of which there were over a hundred bunches, made a good show. The whites were wanting in colour somewhat, and a month or so longer on the vine would have meant a world of difference. This was very apparent in Muscat of Alexandria. Blacks were a good average. The leading winners here were Mr. James Beisant, Castle Huntly; Mr. William Green, Mylnfield; Mr. John G. Clark, Elmslea; Mr. Scott, Seathwood; Mr. D. McKenzie, Dunninald; Mr. James Kinnear, Fernbrae; and Mr. John Forbes, Taypark, all of whom were first prize winners.

Apples were well shown, but not quite so large as usual, owing to the cold season. One exception has to be noted, however, and that was the fine specimens of Emperor Alexander, shown by Mr. Alexander McIntosh, Graystane. These were very meritorious. The best entries were from Mr. W. Benvie, Murie, Errol (Dessert and Bismarck); Mr. Harry Tait (Culinary and James Grieve); Mr. R. Kirkwood, Pinegrove, Dundee (Stirling Castle and Warner's King); Mr. James Benvie, Inchmartin (Lord Suffield); Mr. W. Goodall (Ecklinville); Mr. John Machar, Fotheringham House (Lord Grosvenor); Mr. Scott, Seathwood (Duchess of Oldenburg); Mr. J. E. Davis, Stanley (Prince Albert); and Mr. John S. Summers, Ashcliffe, Dundee (Cellini). Melons looked well, Mr. Cook, Duncraig, and Mr. John Machar, Fotheringham House, having the best. Nectarines, peaches, and apricots were very well shown, but the latter were not numerically strong. For these Mr. James Beisant, Castle Huntly; Mr. Hugh S. McGlynn, Helenslea, Broughty Ferry; and Mr. J. Farquharson, Dundee, led respectively. Orchard house fruits were a good average, Mr. J. Farquharson leading again.

Hardy fruits were a capital display. Pears, although a bit late, were of good size, Mr. Alex. McIntosh, Greystane, Invergowrie; Mr. Beats, Binrock; and Mr. John Simpson, Panmure Gardens, leading the way. Plums were a good average, Mr. McIntosh leading for yellows; Mr. Nicoll, Taypark, for reds; and Mr. Bethel, The Grange, Monifieth, for purples.

VEGETABLES.

Despite a season which has not been very favourable until the later stages of growth, the quality of the vegetables was admirable, and the competition very keen. There were some splendid collections, the outstanding exhibitor being Mr. Charles Shaw, gardener at Boquhan, Kippen, who secured the beautiful Corporation Challenge Cup. Mr. William Harper, Tulliebelton, Perthshire, was placed second for a collection which was but little inferior to that of the first-prize winner. Cauliflowers were small and fewer in number than usual. Mr. Harper had it all his own way here with splendid specimens. Beetroot was only fair, Mr. Nicoll, Taypark, coming first with roots of fine shape, grain, and colour. For peas Mr. James Kinnear, Fernbrae, led with a fine dish of Gladstone, the pods being of good size and well filled. French beans were a good lot, chief place going to Mr. John Laing, Craighall, whose entry was much admired. Tomatoes were exceedingly good, Mr. Forbes, Taypark, having a very meritorious win. Potatoes were grandly shown, being clean, finely grown, and thoroughly ripe. The honours for these were divided between Mr. J. Ednie, Carnoustie House, and Mr. W. Morrice, Parkneuk House, Invergowrie. Celery and turnips were all of excellent quality, Mr. Nicoll, Taypark, and Mr. Harper, Tulliebelton, sharing chief honours. The latter also led handsomely for cabbages. Altogether the display in this division was very good.

CURE FOR MILDEW.

One ounce of Cyllin Soft Soap to a gallon of water is the surest remedy for mildew, green fly, and all forms of insect blight in the garden or greenhouse

CYLLIN SOFT SOAP

Is a reliable all-round non-poisonous insecticide and germicide. It does not injure the tenderest shoots, and it cleanses the surface soil, thus safeguarding against further attack.

Particulars from Manufacturers, JEYES' SANITARY COMPOUNDS CO., 64, Cannon Street, London, E.C

ROSE COMPETITIONS.

In these competitions, open to nurserymen and florists, the honours were pretty evenly divided between Messrs. Croll, of Dundee, and Messrs. Cocker, of Aberdeen.

MISCELLANEOUS DISPLAYS.

A considerable number of nurserymen and florists added much by the excellence of their displays to the success of the show. They staged their newest and their best, and gave a capital idea of what is being done in the evolution of new varieties and the perfection of the old ones. The outstanding display here was that forwarded by Messrs. Storrie and Storrie, Dundee. Their exhibit formed quite a miniature orchard of peaches, nectarines, plums, apples, cherries, and pears, all shown in pots. Prominent was a magnificent standard nectarine, with a remarkable crop. There were also over a hundred varieties of gooseberries, including the very latest introduced. Messrs. Thyne and Son, Downfield Nurseries, had as chief attraction a group of plants of the new Wonderberry raised by Luther Burbank. It made a good display, and proved to be very prolific. Sweet peas were also another exquisite feature of the Messrs. Thyne's group, their collection embracing over sixty varieties. Mr. Forbes, Hawick, showed a fine selection of herbaceous plants, but the great feature here was the magnificent display of pentstemons. Nothing finer has been seen at Dundee. Messrs. Dobbie and Co., of Rothesay, had a superb display of dahlias, and their quality was unimpeachable. Messrs. Mair and Sons, Prestwick, had a grand collection of gladioli. The splendid positions this firm has taken at the leading competitions throughout Scotland and England for these beautiful flowers during the past twenty years make comment superfluous. Then there were the Messrs. D. and W. Croll, Dundee, with their famous roses; Mr. D. C. Hutcheson, with ferns; Messrs. W. P. Laird and Sinclair, with a fine herbaceous display; Messrs. Alfred Young and Co., Elgin; and Messrs. George Paton and Sons, Dundee, with chrysanthemums.

Chester.

AUGUST 25.

This exhibition, as usual, was held on the Roodee, and the exhibits compared favourably with those at former shows, while the entries were up to the average.

Three groups were arranged for effect, the premier one being set up by Mr. W. H. Shaw, gardener to Alfred Ashworth, Esq., and it contained the usual assortment of plants, his crotons and liliums being prominent. Mr. E. Stubbs, gardener to J. MacGillycuddy, Esq., was second, and Mr. J. Breen, gardener to the executors of John Mosford, Esq., third. For six stove or greenhouse plants, Mr. A. Ellams, gardener to A. Tyrer, Esq., led, his best plants being an eucharis and a begonia; Mr. W. Reeves, gardener to E. Peter Jones, Esq., second, and Mr. J. Breen third. For four ferns Mr. J. Williams, gardener to A. E. Hall, Esq., led with fair plants. For four pelargoniums Mr. A. Ellams won with well-flowered specimens, and for six table plants Mr. A. Billington, gardener to G. B. B. Wilbraham, Esq., was first. The best single specimen plant in flower came from Mr. A. Ellams, and was a well-flowered pelargonium.

In the cut-flower section Mr. Harold Peerson won for twelve cactus dahlias, and for six varieties, Mr. E. Jones, gardener to G. H. F. Robertson, Esq., had the leading stand. For twelve asters Mr. Jones was again to the fore, and Mr. W. H. Shaw staged the best six annuals. The best twelve bunches of herbaceous flowers came from Mr. W. Shaw, while Mr. E. Smith took the lead for six bunches. In the class for twelve distinct varieties of sweet peas, Mr. E. Jones had the leading award, but the best lot was disqualified because it contained more than the proper number of spikes; Frank Dolby, John Ingman, and White Waved were noteworthy varieties. For six vases, prizes offered by Messrs. Webb and Sons, Mr. G. Faulkner led.

Mr. A. Bruckshaw, gardener to B. J. [illegible], Esq., had the best dozen roses out of a moderate lot, and for twelve gladiolus, Mr. J. C. Thornton led with very fine spikes.

For a collection of nine dishes of fruit, Mr. E. F. Hazelton, gardener to the Earl of Derby, won with a good all-round collection of grapes, melons, peaches, etc. For two bunches of white grapes Mr. E. F. Hazelton won with well-coloured Muscat of Alexandria. For two bunches of black grapes Mr. W. Pilgrim, gardener to Sir G. Meyrick, Bart., was well to the fore, with splendid bunches of Madresfield Court, excellent in every way. For six peaches Mr. E. F. Hazelton won with well-coloured fruits; Mr. J. Breen had the best nectarines. Mr. J. Clack, gardener to J. G. Frost, Esq., led for apricots and for a melon. Mr. E. F. Hazelton showed the best [illegible]. Mr. G. Aitkens, gardener to P. L. [illegible], Esq., led for culinary apples, and Mr. J. Dean, gardener to G. R. Darsie, Esq., for dessert apples and for a collection of hardy fruits.

Mr. C. Goves, gardener to Sir Gilbert Greenall, Bart., won in three classes for collections of vegetables, the prizes being given by Messrs. Sutton and Sons, Messrs. Clibrans, and Messrs. Webb and Sons. Mr. Charles Parker secured Messrs. Dickson and Robinson's prizes for a collection.

Mr. N. F. Barnes, gardener to the Duke of Westminster, contributed the finest feature of the show in the form of a grand collection of fruit, including twenty-six good bunches of grapes, a dozen large melons, richly coloured apples and plums, a dish of Royal Sovereign strawberries, figs, etc. Messrs. Dicksons, Chester, staged a fine bank of herbaceous cut flowers in which liliums were conspicuous. Mr. T. W. Darlington set up a good selection of sweet peas.

Bembridge, Isle of Wight.

AUGUST 26.

The newly-formed Bembridge Horticultural and Cottage Garden Society held its first exhibition on the above date in the grounds of Hill Grove, Bembridge, the residence of the president, Lieut.-Colonel Mac[illegible] Moreton. Considering the short time that has elapsed since its inauguration, the society has been a decided success. Two marquees were filled with meritorious exhibits.

For the best arranged dinner-table decoration, 4ft. 6in. by 3ft., ladies only, a valuable silver rose bowl, on plinth, was offered as a special first prize by Captain Sparks, and this brought eleven competitors, all of whom staged most tasteful and varied arrangements. The bowl was won by Miss Collins, [illegible], with an elegant arrangement of light blue delphiniums and Wichuraiana roses with foliage as tracery. The society's first prize fell to Miss E. Sillence for a neat table of blue delphiniums, though of a somewhat sombre appearance; the second prize

went to Mrs. C. Orchard for a light arrangement of Constance Oliver, and other shades of sweet peas, and gypsophila, with ampelopsis tracery; and the third award fell to Mrs. W. A. Morley for a light and pleasing table of coreopsis. These tables made an attractive feature of the exhibition.

J. H. Ismay Esq. (gardener, Mr. J. Holbrook), had a splendid display of Lilium auratum and L. speciosum in variety, both flowers and foliage being good. Lady Alice Fitzwilliam (gardener, Mr. A. Parry), was first for fruit, and Mr. W. Burden, Bembridge Harbour Gardens, first in the open class for vegetables. The latter exhibitor showed an excellent collection of vegetables not for competition, the produce of the garden on reclaimed land. J. B. Denison, Esq. (gardener, Mr. G. Fry), secured Messrs. Sutton and Sons' special prize for vegetables; Mr. Parry won Messrs. Webbs' prize, and Mr. A. Smith led in the class for Messrs. Toogood's specials.

The produce from the School Gardens, for which special prizes were offered, was very meritorious. Mr. F. Weaver received a Certificate of Merit for one root of Factor potato, the produce being 111 tubers weighing 16¼lb. Messrs. Alfred Smith, E. Sillence, and C. Orchard superintended the staging arrangements; Mr. A. Parry is hon. secretary, and Mr. C. Love treasurer.

TRADE NOTES.

From Messrs. John Forbes, Hawick, Lim., we have received a box of splendid spikes of glorious pentstemons. Those who have seen the wonderful spikes and flowers of these beautiful plants, as raised and grown by the Scottish firm, will understand something of the feast of beauty we are now enjoying as a result of Messrs. Forbes' kindness.

The reference to umbrella supports for isolated specimens of roses, in the current issue, reminds us of Messrs. Walters and Co.'s catalogue of garden requisites. This firm makes a speciality of these umbrella-shaped supports, of an eminently useful and durable character. Their address is 16. Water Lane, E.C.

ANSWERS TO CORRESPONDENTS.

INSECT IN WOOD.—A. L., Blackrock: We regret we have not been able to identify the insect sent.

SPENT HOPS.—J. F. O., Amhurst Park: Many thanks. We should like to have an opportunity of considering the matter.

SEEDLING ORANGES.—F. S., Egham: The seedling oranges will produce flowers without the intervention of grafting; indeed, it is not worth while grafting them until you have fruited them, and know whether they are worth perpetuating. Do not overpot them.

LOUDON'S ENCYCLOPÆDIA.—J. C. C., Bishops Waltham: This is by no means a valuable book, but it is of great horticultural interest, and everyone having a library of gardening books desires to own a copy. The value of your copy depends upon its condition and binding. We saw a fine copy, bound in solid calf, a few days ago, that was purchased for six shillings.

BOOKS ON MARKET GARDENING.—J. H. S., Swindon: There is a series of shilling handbooks dealing with market garden crops published by Messrs. W. H. and L. Collingridge, 148, 149, Aldersgate Street, E.C., that we can recommend. No. 1 deals with green crops; No. 2 with root crops; No. 3 with asparagus, marrows, beans, peas, etc.; and No 4, with mushrooms, cucumbers, tomatoes, and salads. Two other books you will find of great value are "Packing and Selling Fruit and Vegetables," by R. Lewis Castle; and "Profitable Fruit Growing," by John Wright, V.M.H. These are one shilling each, and obtainable from the same publishers as the handbooks already referred to.

FLOWERING SHRUBS FOR PEATY SOIL.—J. L., Buxton: Quite a number of flowering plants thrive in peaty soil, and many of these, though not wedded to peat, have a strong objection to lime. Peat-loving plants are rhododendrons, azaleas, andromedas, heaths, arbutus, Calycanthus floridus, cassiopes, ceanothus, clethras, Cornus florida, Daphne Cneorum, gaultherias, Halesia tetraptera, laburnums, magnolias, mespilus, Nuttalia cerasiformis, Olearia Haasti, pernettyas, philadelphuses, Pyrus aucuparia, skimmeas, Spiræa Thunbergi, S. prunifolia fl.-pl., S. ariæfolia, S. Lindleyana, Staphylea colchica, lilacs, gorse, viburnums, vacciniums, Wistaria chinensis, Xanthoceras sorbifolia, and Zenobia speciosa.

DISEASED MUSHROOMS. — S. W., Brighton: The disease is evidently caused by the fungus Hypomyces perniciosus, which appears to be parasitic on many species of mushrooms and toadstools. Well-marked symptoms are evident from the earliest stages of disease, the mycelium of the parasite growing up with that of the mushroom. The latter, instead of gradually developing into a cap and stem, becomes an irregularly-shaped monstrous soft mass, which, if allowed to grow, often exceeds in size that of a full-grown mushroom. Sometimes a small, deformed cap is present, but, as a rule, the entire mass of a diseased mushroom consists of a much swollen stem. After a time the parasite forms its spores on the surface of the diseased mass, appearing under the form of a snow-white, minutely velvety covering. After the spores are scattered the diseased mushroom rapidly decays, forming a putrid mass having a very disagreeable pungent smell. The Board of Agriculture recommends that when a house or other structure in which mushrooms are grown has become infected, it should be completely emptied and thoroughly sprayed, both roof, walls, and floor, three times, at intervals of ten days, with a solution of sulphate of copper—one pound of sulphate to fifteen gallons of water. During this period of spraying the house should be kept warm and moist, for the purpose of favouring germination of the spores of the parasite, which are destroyed with greater certainty when growing than when in a resting condition.

LODDIGES' BOTANICAL CABINET.—C. S. Blackheath: Unless you can dispose of the books privately your best method will be to advertise them in our columns, as many of our readers are always ready to obtain good copies of famous works.

NAMES OF PLANTS.

W. K.—1, Dipladenia insignis; 2, Conoclinium ianthinum; 3, Heliconia illustris rubricaulis; 4, Campylobotrys refulgens.

H. B. K.—1, Callistemon speciosa; 2, Chironia ixifera; 3, Lomatia silaifolia; 4, Diplacus puniceus aurantiacus; 5, Pentapterygium serpens.

F. M.—We cannot undertake to name florists' flowers. The delphiniums you have sent us appear to be unnamed seedlings of average merit.

FORTHCOMING ENGAGEMENTS.

TUESDAY, September 7.—Derbyshire Horticultural Society; two days.

WEDNESDAY, September 8.—Royal Caledonian Horticultural Society; Autumnal Exhibition at Edinburgh; two days.

Situations Wanted.

A. H. E. WOOD, Esq., Browhead, Windermere, recommends for first-class place his HEAD GARDENER, G. HARDY; nearly three years present situation; experienced in fruit, plant, and vegetable forcing, kitchen gardens, pleasure grounds, rookeries, roses, lawns, etc.; age 32, married; eighteen years' experience in first-class places.

HER GRACE THE DUCHESS of DEVONSHIRE wishes to recommend J. THOMPSON to any Lady or Gentleman requiring the services of a HEAD GARDENER, where several are kept; 20 years' experience in all branches. Holker Gardens, Cark-in-Cartmel, Lancs.

MESSRS. LADHAMS, Nurserymen, Shirley, Southampton, can confidently recommend W. GUNSTON, age 35, as HEAD WORKING GARDENER to any lady or gentleman requiring the services of a good all-round man, who is conversant with the requirements of a well-kept establishment; excellent references. Apply as above.

MR. BOUVERIE CAMPBELL-WYNDHAM wishes to recommend GEORGE MERRETT as HEAD GARDENER, where two or three are employed. G. Merrett is thoroughly up to all glass work, understands hothouses, vines, and growing of carnations; he is married, no children; leaving for no fault, but to better himself; age thirty. Apply to Mr. Cawte, Head Gardener, Corhampton House, Bishop's Waltham.

GARDENER (Head) seeks SITUATION where three or more are kept; age 30; married, two children; six years Escrick Park, five years Campsall Hall; three years as Head at present situation. SKILBECK, Nunthorpe Hall, York.

GARDENER (Head, where two or three are kept or good Single-handed), thoroughly experienced in all branches, Inside and Out; management of cows and poultry, if required; good references; married, two children. A. GOODFELLOW, 94, Sherrard Road, Forest Gate, Essex.

GARDENER (Head), age 41, experiences in all branches; grapes, roses, carnations, and chrysanthemums a speciality. F. BLACKITH, 12, Black Lion Lane, Hammersmith, W.

GARDENER (Head), in first-class establishment; life experience in all branches, both Inside and Out; five years in last situation, and can be well recommended; age 38; married, one child. Apply fully to W. DUNKLEY, Stokelake Gardens, Chudleigh, South Devon.

GARDENER (Head), or GARDENER and BAILIFF; life experience; thoroughly efficient in all branches, Inside and Out; including Orchids; land, stock, and bees; three years present situation as Head; age 35, married, one child. C. JONES, The Gardens, Woodview, Watford, Herts.

GARDENER (Head Working, five or six kept), 17½ years' experience, Inside and Out; 3 years as Head; married, two children; age 33; good references. H. JONES, Brownslade Gardens, Pembroke.

GARDENER (Head Working), age 28. JOHN CARTER, Gardener to Sir Walter Greene, Bart., highly recommends his late Foreman as a good practical Man; life experience, Inside and Out. SIMS, Brooklyn, Watlington, Oxon.

GARDENER (Head Working), good, practical life experience in all branches, Inside and Out; early and late forcing; especially good with Melons, Violets, and Chrysanthemums; nine years with last employer as Head; can have excellent references. H. TURNER, 4, Glenton Street, Peterborough.

GARDENER (Head Working, where one or two under are kept); life experience; excellent references; married, no family; both abstainers; age 29. E. FLETCHER, Holmbury St. Mary, Dorking.

MR. T. KEANE, Moreton Hall Gardens, Moreton Morrell, Warwick, highly recommends his Foreman, GEORGE COLLINS, as GARDENER (Head Working, where two or three are kept); 13½ years' good practical experience in all branches; excellent references; abstainer; married when suited; age 28.

GARDENER (Head or Single-handed) seeks RE-ENGAGEMENT; life experience Inside and Out; poultry, etc.; age 30; married when suited. State wages, to GARDENER, 18, Gowland Place, Beckenham, Kent.

GARDENER (Single-handed or with help); good Second's place not objected to; married; age 36; tall; one child; life experience, Inside and Out; good references. H. WARNER, 17, Salmestone Road, Margate, Kent.

GARDENER (Single-handed or Foreman, general); experienced in Fruit and Plant Houses, Pleasure, and Kitchen Garden; age 29; good references. D. HILLS, Bochanger Cottages, Kennington, Ashford, Kent.

GARDENER (Single-handed), good, practical experience, inside and out; age 27; can be well recommended. J. SHREEVE, The Gardens, Osterley Park, Isleworth, W.

GARDENER (Single-handed) requires SITUATION; life experience; age 30; married, three children. J. ROBBINS, 22, Olga Road, Victoria Park, Dorchester, Dorset.

GARDENERS (Single-handed or with help) seeks re-engagement; experience Inside and Out; poultry, etc.; good references by me; 18 months at present place in a nursery; willing to be useful; age 25, married; 1 child, boy, 6 years. C. SMITH, 44, Ravenbourne Road, Catford, S.E.

GARDENER (Single-handed), married, no family; experience Kitchen and Flower Garden, Greenhouse; good character. All particulars, C., Gardener's Cottage, Macaulay House, Greenwich Park.

GARDENER (Second), age 23; eight years' experience; highly respectable and energetic. —W. J. GRACE can recommend a Young Man with excellent character; Bothy preferred. Hampworth Gardens, Redlynch, Salisbury.

GARDENER (good Second or Single-handed), age 31, married, life experience, Inside and Out; 5 years last situation; good references. FOSTER, c/o S. Clark, Ramsden Heath, Billericay, Essex.

GARDENER seeks SITUATION, as Second or Single-handed; 18 months as Foreman; good references; married; age 24. Apply GARDENER, 10, Sanderstead Road, South Croydon, Surrey.

GARDENER seeks SITUATION as Under or Single-handed; odd jobs not objected to; 9 years' experience Inside and Out; 4 years present situation; age 24. Apply, W. GULLIFORD, 19, Mill Place, Chislehurst, Kent.

GARDENERS (Under) seek SITUATIONS, Inside and Out; 3 and 4 years' experience with good references; ages 19 and 21 years. Apply J. B. and E. P., c/o Mrs. Roberts, White Hill, Wrotham, Kent.

GENTLEMAN wishes to recommend YOUNG MAN as UNDER GARDENER; 7 years' experience Inside and Out; age 22; good references. N., Red House Gardens, Heatherside, Camberley, Surrey.

JOURNEYMAN (First, Inside); well up in Fruit and Plants; six years' experience; age 23; disengaged; good references. H. RICHMOND, Broad Green, Fulbourn, Cambs.

JOURNEYMAN (Inside or Inside and Out). Mr. NOBBS, Beech Hurst Gardens, Haywards Heath, wishes to highly recommend W. MEADS as above; age 21.

JOURNEYMAN; experienced Inside and Out; 12 months last place, six years previous; age 23; Bothy preferred. A. B. NEWMAN, Willow Walk, Ely, Cambridgeshire.

MR. A. RICE wishes to highly recommend T. HOLLOWAY as JOURNEYMAN (Second); three years here. Heywood Park Gardens, near Maidenhead.

WANTED, SITUATION as SECOND JOURNEYMAN, Inside or Inside and Out; age 25; excellent refs.; 8 years' experience in good establishments. Apply D. WOODLEY, Milton Hill, Steventon, Berks.

AS IMPROVER in Gentleman's Establishment; life experience Inside and Out; age 21. H. GILBERT, Gardens, Westfield House, Wimborne.

BELGIAN (25) requires SITUATION, London or neighbourhood, Nursery or Florist, understands all branches of trade; experience, Palms, Ferns, Chrysanthemums, Bulbs, and Florist's work; excellent references from Belgium and Germany. EMILE, Rose Lawn, New Road, Hillingdon Heath, Middlesex.

FLORIST.—YOUNG LADY seeks SITUATION as IMPROVER or ASSISTANT; London or Suburbs preferred. E. A., 16, Glyn Road, Clapton Park, N.E.

FRUIT GROWER recommends strong YOUTH, age 16, for General Gardening; wages low for a good situation. Address P. R. ELLIOTT, Fruit Grower, Over, Cambs.

GROOM-GARDENER seeks SITUATION, age 32; married, and two children. Strong and willing to make himself useful; good references. C. F. CARTER, Pantile Road, St. Mary's, Oatlands Park, Weybridge, Surrey.

HARDY PLANTSMAN seeks POST in Nursery or private garden, where exceptional knowledge of Alpine and Herbaceous Plants, etc., etc., would have plenty of scope, and be duly appreciated. E. H., "Gardeners' Magazine," 148 and 149, Aldersgate Street, London, E.C.

HELP (German), age 19 years; experience in hothouse, ferns, vegetables, etc., seeks situation in good firm. E. SQUAR, 8, Great Charlotte Street, London, S.E.

MR. J. MARTIN, Clarendon Park Gardens, near Salisbury, wishes to recommend a Young Man as GARDENER (under); age 28; four years present situation.

SITUATION required by HANDYMAN; assist Gardener; understands Bees (certificated expert); handy with carpentering tools, painting, etc. total abstainer; Single. SHORT, Langton Lodge Farm, Blandford, Dorset.

WANTED, to place a LAD, 17, where he can learn gardening; bothy preferred. State terms to A. LAY, 77, Hamilton Road, West Norwood, S.E.

YOUNG MAN (20) seeks SITUATION as Under, or Inside and Out; four years' experience; good reference; abstainer. W. FIELD, 18, Royal Oak Place, Lee, S.E.

BULL, Bulb Grower, 95, Ellington Road, Ramsgate.

EVERY GARDENER knows that the XL-ALL SPECIALITIES are the best on the market. The time is at hand for housing Plants for the Winter. When these are arranged under glass a fumigation with XL-ALL COMPOUND, or a syringing with XL-ALL LIQUID INSECTICIDE will at once free them from insect pests and save lots of trouble later on. Any plants or fruit trees suffering from Mildew should be sprayed with XL-ALL MILDEW WASH, or with the newly-patented CUCASA, the finest preparation of Copper ever offered to Gardeners. RICHARDS XL-ALL FERTILIZER is unequalled for finishing off fine blooms and fruit. Please ask your Nurseryman, Seedsman, or Florist for a copy of my small pink List, giving particulars of these and many other "XL-ALL" Preparations, which can be obtained from the Horticultural Trade throughout the World. G. H. RICHARDS, Manufacturer and Patentee, 234, Borough High Street, London, S.E.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Floral Beauty.

Beauty of any description is a very difficult thing to define, the factor of taste figuring so largely in judgment. In flowers this is particularly the case since some people, regarding them in the mass, would give the verdict to gorgeousness of colouring and broad effects, without caring for detail, while others would far more appreciate simplicity of type, delicacy of make, or subtlety of contrivance, as displayed in the individual flower, however otherwise insignificant. To the true lover and student of Nature, a very large number of our choicest flowers, popularly so considered, are nothing better than monstrosities, practically created by man by the selection of abnormal features, natural mistakes, so to speak, in which the normally beautifully simple type, marvellously adapted in the process of evolution to fulfil the reproductive functions of the race, have been gradually replaced by complex abnormal arrangements entirely unfitted to that end. Thus it is, more or less, with all our double flowers, in many of which those delicate adaptations of stamen and stigma, pollen, and ovary, into which Nature had transformed the foliage, are gradually replaced by a mass of barren petals, which from the insect point of view must be nothing better than frauds, since their visual attractiveness is increased, while the trouble of a friendly visit is altogether unrepaid by the normal hospitality of honeyed nectar. From the plant's point of view, too—assuming it to have one—the selective cultivator must be always on the wrong track, since the greater his success in the doubling direction the more is the normal reproductiveness of the plant—its own great end and aim—frustrated. In judging flowers, the question often arises as to how far mere size is meritorious, especially when the increase so upsets the natural balance of the plant concerned that all sorts of props and contrivances are needed to sustain the corpulent blossoms. In this connection we may point to the beautiful dianthus or pink family, and contrast the unsophisticated Alpine forms with their well-borne flowers and pretty effects with their sophisticated descendants, the tree carnations, with their defects of bursting calyces in many cases, and tall toppling stalks in all, to see that the truer beauty belongs to the former—taking, of course, the plants as a whole. Naturally, here comes in the question of decorative utility in the household as cut flowers, and in this connection it cannot be contested that, whatever view be taken of floral beauty in the abstract, the selective cultivator has enormously enriched humanity by his horticultural successes as regards diversity of colour and form—colour especially, since many flowers are now resplendent with hues which under natural conditions they would, presumably, never have assumed. It is, perhaps, in the chrysanthemum that we see this carried almost to the extreme, and certainly no other flower of similar normal simplicity and insignificance can approach it in the extent of development into diverse types, many of which, from the æsthetic point of view, are very beautiful, and all of which are interesting. That a little daisy-like flower should respond to high culture and selection to the extent of producing gigantic blooms over a foot in diameter and nearly as much deep, with tints ranging from snowy-white to richest crimson or ruddiest gold, with up-piled petals in pendulous ringlets, Medusa-like heads, starry radiations, imbricate spheres, etc., etc., is a veritable marvel of vegetative mutability. Recurring to the student of Nature and his appreciation of floral beauty from the constructional point of view and adaptation to evolutional forces, many other flowers than those popularly recognised as beautiful are charming to him. Under the lens the simplest flower expands into a glorious gem, presenting, possibly, most subtle contrivances either for self-protection or for reproductive ends. The explosive flowers of the common stinging nettle, the hooded ones of the dead nettle, and, in short, those of the humblest weed have only to be examined closely to betray their individual beauties and marvels, which, though on perhaps a smaller scale than our horticultural triumphs, have yet an abundant beauty of their own, apart entirely from any question of taste.

MR. ARTHUR WILLIAM PAUL.

Mr. Arthur William Paul, whose portrait we have the pleasure of giving in the present issue, represents the third generation of a family engaged in horticultural pursuits, his grandfather, Mr. A. Paul, having left the North of Scotland at the close of the eighteenth century to establish a nursery in the more genial climate of the London district; and his father, the late Mr. William Paul, having founded the present nurseries at Waltham Cross fifty years ago, on the dissolution of the old firm of A. Paul and Son. Since the death of his father, Mr. A. W. Paul has had the sole direction of the firm of William Paul and Son, and, although with an area of nearly one hundred acres various hardy trees and plants and fruit trees are successfully cultivated, the name has always been especially associated with the rose, the late Mr. William Paul having been one of the pioneers of its culture in its present extended form in this country. The magnificent groups of both forced and outdoor roses which the firm has been accustomed for many years past to exhibit at the Temple Flower Show and other exhibitions, are no doubt familiar to our readers. To Mr. A W. Paul's successful efforts in exhibiting roses in the autumn some few years ago may be attributed much of the popularity of the late-blooming varieties now so largely planted, and the paper on "Autumn-blooming Roses" which he read before the Royal Horticultural Society in 1901 assisted in stimulating what was, at that time, a somewhat neglected phase of rose-culture. Under Mr. A. W. Paul's direction, also, his firm was the first to demonstrate how successfully the stronger-growing kinds of rambler roses may be grown and forced in pots. As raisers of new varieties of roses the Waltham Cross firm has always been eminent, such beautiful varieties as Pride of Waltham, Beauty of Waltham, Corallina, Sulphurea, Queen Mab, Earl of Warwick, Dr. William Gordon, Waltham Rambler, Juliet (the newest), and many others being too well-known to require more than passing mention. At the last show of the National Rose Society, on the 16th inst., the variety Earl of Warwick received the silver medal as the best hybrid tea rose in both the amateur and professional classes. Mr. A. W. Paul contributed a paper on "The Hybridisation of Roses" to the International Conference on Genetics in 1906, and both in this country and on the Continent he is recognised as an authority on the raising and testing of new varieties. We may add that Mr. A. W. Paul possesses at his private residence an extensive horticultural library of reference, including a large collection of works on roses, some being of considerable rarity.

Our Planting Number.—In view of the immense amount of work that has to be done in the garden during the autumn months in connection with planting operations, we shall devote our issue for October 16 to articles that have special reference thereto. These will include contributions on the selection and planting of various kinds of fruits, the making and management of herbaceous borders, the selection and planting of roses for various purposes, and on several classes of ornamental trees and shrubs of special value in the creation of distinct and beautiful features in the garden. We suggest that our readers should make special note of this announcement.

R.H.S. Spring Bulb Show, 1910.—A special exhibition of forced spring bulbs will be held at the Royal Horticultural Hall, on March 8 and 9, 1910. The object of this show is to demonstrate the best varieties suited for general forcing, and exhibits of small and large collections are invited from amateurs and the trade. R.H.S. medals will be awarded according to merit. At this exhibition, the council also offer (subject to the general rules of the society) the following prizes, presented to them by the General Bulb Growers' Society at Haarlem. For amateurs and gentlemen's gardeners, eighteen hyacinths, distinct. Prizes, £6 6s., £5 5s., £4 4s., £3 3s., £2 2s., £1 1s. Twelve hyacinths, distinct. Prizes, £5 5s., £4 4s., £3 3s., £2 2s., £1 1s. Six hyacinths, distinct. Prizes, £2 2s., £1 10s., £1 1s., 10s. Four pans containing hyacinths, ten roots of one variety in each pan. The blooms of each pan to be of distinctly different colour to those of the other three pans. Prizes, £4 4s., £3 3s., £2 2s., £1 1s. For trade growers. Collection of 200 hyacinths in at least 36 varieties, grown in pots or glasses. The Gold Medal of the General Bulb Growers' Society at Haarlem. Collection of 200 hyacinths in 20 varieties in pans, 10 roots of one variety in each pan. The Gold Medal of the General Bulb Growers' Society at Haarlem. All bulbs must have been forced entirely in Great Britain or Ireland. Bulbs grown in moss fibre, etc. Also subject to the general rules of the Royal Horticultural Society, the council offer the following prizes, presented to them by Mr. Robert Sydenham; for bulbs grown in moss fibre or similar material (not earth), and without drainage. The classes are open to amateurs and gentlemen's gardeners, and are as follows: Six single hyacinths, in separate vases, not exceeding six inches in diameter. Prizes, 25s., 21s., 15s., 10s. 6d., 7s. 6d. Six vases of tulips (vases not exceeding seven inches in diameter), no restriction as to the number of bulbs in a vase. Prizes, 25s., 21s., 15s., 10s. 6d., 7s. 6d. Six vases of narcissi (vases not exceeding seven inches in diameter), no restriction as to the number of bulbs in a vase. Prizes, 25s., 21s., 15s., 10s. 6d., 7s. 6d.

Bean Disease.—Two cases of a remarkable disease of beans, which has completely baffled investigation, have been submitted to the Board of Agriculture. The first report came from North Bute parish, in the Isle of Bute. The plants were said to look healthy, and promised a good crop until the end of July, when they ceased to grow, and subsequently turned black, and apparently decayed. The second case occurred near Wokingham, where a field of ten acres, well manured, produced excellent flowers but no pods. The soil was medium clay, and the beans followed wheat. The form of the disease is not unfamiliar to the Board's advisers, and cases occur from time to time, but no trace of any fungus disease can be found, and though in both cases several specimens of thrips, aphides, and some other injurious insects were found, nothing sufficient to account for the damage could be traced. The Board would be glad to hear of other cases in order that an investigation may be made.

Brussels Exhibition, 1910.—In connection with the great International Horticultural Exhibition to be held next year in Brussels, there will be a Horticultural Congress, at which amateurs, gardeners, and nurserymen are invited to attend. A committee, formed of many eminent Belgian Ministers and horticulturists, are carrying out the details of the congress, at which various subjects will be studied and discussed. Among the leading sections are floriculture, fruit tree culture, market gardening, science and instruction, horticultural economy, horticultural mechanics, special processes. An eight-paged programme has been issued containing full details, and may be obtained from the Secretary, Congrès International d'Horticulture, Brussels, 1910, 28 rue Ste. Catherine, Brussels.

A Fine Specimen of Erythrina Crista-galli.—Mr. J. Rundle, Bosahan Gardens, St. Martin, S.O., Cornwall, sends us a photograph of a remarkably fine specimen of this shrub, and with reference thereto writes: "I venture to send you a photograph of a fine specimen of Erythrina Crista-galli, growing here at the end of a greenhouse. Owing to our favoured climate, it is not pruned back to the ground level as generally recommended, but has been allowed to form a main stem and branches, from which an abundance of new shoots are produced each year. Its height is 13ft., and it is 11ft. through. It has upwards of 90 flower spikes, making, with its bright scarlet flowers, a fine display. It delights in plenty of sunshine and frequent supplies of water. Rich loam with some peat added is a most suitable soil."

Royal Botanic Society.—The annual meeting of the society was held on Tuesday, September 21, when Mr. Brinsley Marley presided. Mr. Rubinstein's proposal for the amalgamation of the society with the Royal Horticultural Society was not accepted by the chairman. The financial situation is at present not a pleasant one. With reference to Mr. Rubinstein's letter, published on page 738, in our issue of September 18, Mr. A. Kingsmill remarks that Mr. Rubinstein favours amalgamation of the R.B.S. with the R.H.S. because the latter is "a well-managed and consequently flourishing body." Surely a shareholder of a bank in a weak position might as sensibly and for identically the same reasons suggest an amalgamation with the Bank of England.

Blairgowrie Fruit Harvest.—The fruit season, which has finished in the Blairgowrie district, has (according to the "Scotsman") been a record one in more ways than one. The quantity despatched by rail is fully 800 tons more than last year, having been 3,329 tons 11 cwt. gross, or, allowing one-fifth for weight of casks, crates, etc., almost 2,664 tons net. The market has been the worst ever experienced, and prices were never at such a low figure before, £6 10s. to £7 per ton having been offered for a considerable time, while the average for the season is not expected to be much over £10. The crop of raspberries was a particularly heavy one, in some places yielding four tons per acre, though the average will be about three tons, and never before were so many tons left unpicked, it being unprofitable for the grower to continue picking.

A Great Gardener.—In connection with Lord Kitchener's relinquishment of his Indian command, those who know him most intimately maintain (according to the "Globe") that his one wish on leaving India was to settle down quietly in England and spend his time gardening. Lord Kitchener's great interest in anything to do with flowers is well known at Simla, where he has the most beautiful garden, and has cultivated every conceivable kind of rose. It is said that he knows as much about roses as he does about military matters.

Fungus on Apple Trees.—The most interesting of the fungus pests forwarded for investigation to the Board of Agriculture is described as having been found on some leaves of Cox's Orange Pippin, grown at Aspall, in Suffolk. The disease had been noticed in previous years, but had not been reported, and seems to have spread. The leaves were blotched by the fungus Cladosporium herbarum Link., an exceedingly common saprophyte, which, under certain conditions, becomes parasitic, and injures living plants, especially if these are weakened by weather or other unsuitable conditions. The foliage of many apples is liable to attack, and Cox's Orange Pippin often suffers severely. Treatment with dilute Bordeaux mixture in the spring would probably check the development of the spores.

Mauritius Chrysanthemum Society.—Although a British possession, the majority of the Europeans in Mauritius are of French origin, the island having formerly belonged to France. We have recently received from a friendly correspondent there several interesting letters relating to chrysanthemum culture in the island, and finally the rules of the Société des Chrysanthémistes de l'ile Maurice." The society started in May last with nine members, and now numbers twenty-six. M. René de Rauville, an enthusiast, has written a little cultural guide to initiate the members into the art of big bloom culture, and has given a lecture on the chrysanthemum at the Mauritius Horticultural Society, both of which have been printed in pamphlet form.

NOTES FROM KEW.

Abutilon Triomphe.

Within the last few years that celebrated hybridist, M. Lemoine, of Nancy, has distributed a few varieties of abutilon which differ much from the garden forms already in cultivation. One of these is the variety Triomphe, whose flowers are unusually large, almost saucer-shaped, and the massive petals are more or less crimped, thus giving to a flower a somewhat semi-double appearance. Instead of drooping as in the older varieties of abutilon, the flowers of this are disposed in a more or less horizontal manner. The colour is pinkish, with deeper veins. Whether these new forms are prettier than the older kinds is at least an open question, but their distinct character, as represented by the variety Triomphe, may now be seen in the greenhouse at Kew.

Chironia linoides.

This pretty shrubby member of the Gentian family forms just now a very effective greenhouse plant, several neat little specimens being laden with blossoms. It is of rather erect growth and branches freely, the slender shoots being clothed with narrow pale green leaves and terminated by a number of pleasing pink flowers. They are somewhat over an inch across, and have a long, prominent, peculiarly bent style, such as may be seen in the members of the allied genus exacum. Though the specific name of linoides is regarded as botanically correct, this species is more often met with in gardens and nurseries as Chironia ixifera. It is a native of South Africa, and by no means new, but within the last decade or so greatly increased attention has been directed to its merits. It flowers during the late summer and early autumn months, a succession being kept up from one individual for a considerable time. A second species also represented is C. floribunda. The flowers of this are of a deeper pink than the other, but it does not appear likely to make so good a decorative plant..

Gilia coronopifolia.

The "Dictionary of Gardening" gives the date of the introduction of this showy plant as 1726, but it was quite unknown to many when a couple of years ago it was given an award of merit by the Royal Horticultural Society. Since then it has become generally known, but is usually referred to as an outdoor subject. As may be seen, however, at Kew it is also valuable for greenhouse decoration, as the tone of colour and contour of the plant is quite distinct from its numerous associates.

Pavetta caffra.

An exceedingly free-flowering indoor shrub, which, being a native of Caffraria, needs for its successful culture rather more warmth than the plants from the southern portion of Cape Colony. It is thus seen at its best in the temperature of an intermediate house. Introduced about thirty years ago, this pavetta is but rarely seen in gardens, perhaps because it is not sufficiently showy to suit many tastes. It is, however, very pretty, forming as it does a neat-growing, freely-branched bush, clothed with smooth obovate leaves, while the terminal clusters of flowers, which are borne in compact rounded heads, are white with long, prominent styles. It is not at all of difficult culture, and flowers for a considerable time at this period of the year.

Allamanda grandiflora.

This very showy species of allamanda was introduced about 70 years ago, and it soon after became popular for specimen culture. Nowadays, however, it is decidedly uncommon, though it is remarkably distinct and beautiful. Such strong-growing forms as A. Hendersoni and A. Schotti are in general cultivation, principally trained to the roof or as large specimens, but are now not popular. Compared with these two kinds just mentioned, A. grandiflora is more slender and compact in growth, the shoots being clothed by small thin leaves, while the comparatively large flowers are a beautiful shade of lemon yellow. This may be trained up the rafter in a small or medium-sized structure, or it can be successfully grown as a loose bush. In the intermediate portion of the T range at Kew it is, and has been for some time, remarkably effective. A singular thing connected with this allamanda, which probably to a certain extent accounts for its scarceness is that, though cuttings are not difficult to root, the plants so obtained rarely grow in a satisfactory manner, for which reason it is usually grafted on to one of the strong-growing kinds, such as A. Schotti, and in this way good healthy plants are obtained.

Dædalacanthus Watti.

Many acanthaceous plants contribute towards the embellishment of our glasshouses at this season of the year. Among them is this dædalacanthus, which bears a certain amount of resemblance to the popular Dædalacanthus nervosus—Eranthemum pulchellum of gardens. From this better-known kind D. Watti differs in being of lesser stature, in the flowers being in short spikes, and of their distinct metallic purple colour. This, in company with several allies, is in flower in the intermediate portion of the T range. There has been a good deal of confusion regarding the name of this dædalacanthus, for eight years ago it was given an award of merit as D. Watti, which specific name had been given it by Colonel Beddome. Then this was altered to the inappropriate name of D. parvus, but botanically I believe D. Watti is now regarded as correct. It sometimes produces small abortive flowers, and an instance of this may have led to the specific name of parvus being applied to it.

K.

MATRICARIA EXIMIA GOLDEN BALL.

This is an excellent dwarf subject for producing a display of flowers in the open garden during autumn. It is raised from seed sown in a cold frame in April, and transplanted either to a nursery bed or to permanent-flowering quarters. Unlike many annuals, this variety is slow in growth, the stems having short joints and tolerably hard wood, a fact which enables it to withstand the roughest weather with impunity. The flowers of this variety are a delicate cream-yellow colour, in the form of small buttons, the disc florets being tubular, as in the familiar quilled asters, the ray florets being absent. Individual flowers scarcely exceed a half-inch in diameter, but as they are produced in crowded, flattish heads, one can readily conceive their beauty, and appreciate their merit when freely massed in quantity. The leaves very much resemble the green form of the bedding pyrethrum, and the odour is quite suggestive of a "Feverfew." It grows to a height of thirteen inches, forms a dense compact bush, and flowers during August and September. There is a white counterpart, having all the good qualities of the lemon form.

Thomas Smith.

SCHAFTA'S AUTUMN CATCHFLY.

Late-flowering alpines have special claims upon us, as the number of rock plants which come late in the season, or which favour us with their blossoms for a lengthened period, is but too limited for the requirements of those who wish to have their gardens bright for months at a time. To such Schafta's Autumn Catchfly (Silene Schafta) is a veritable boon, and they can hardly overestimate or overpraise this neat rockery plant, although they may have a lurking feeling that they would rather have had it with flowers of a slightly different shade of colour. It is described as purplish-rose, and it is just this tinge of purple which depreciates it in the eyes of some.

The general appearance of the plant is not easily conveyed in words. It forms, however, a little tuft, rather trailing in its habit, of small, glossy green leaves, and gives a great number of little purplish-rose flowers of the shape so characteristic of the silenes. It is a plant which I have long had in my garden, since it found its way there in the form of a packet of seeds. These were sown in spring and placed in a cold greenhouse. When the seedlings came through the soil, they were slightly shaded from the strong sun, were given a place as airy as possible, yet free from draughts; were pricked off about three inches apart when large enough to handle, and planted out in autumn where they were to bloom.

This little silene is best when grown over a low stone, either in the rock garden or such as is sometimes employed for an edging to the herbaceous border. A native of the Caucasus, Silene Schafta is perfectly hardy, and plants will live long in the garden when in either sun, half-shade, or even in shade, provided that they are not beneath trees, whose drip will be injurious to them.

S. Arnott.

ARUM LILIES.

As soon as our arum lilies have ceased blooming in the spring we generally plant them out in the open, selecting a pieces of land in fairly good heart, and allowing a distance between the plants of from 15 to 20 inches. So far, I have every reason to continue this practice, seeing that during the very busy months of the year they take care of themselves, with the exception of keeping the land free from weeds and an occasional deluge in hot weather with liquid manure. Our plants at the present time are strong and healthy, and in a fit state to be taken up and potted. If the weather should prove dry and the roots are in need of moisture they will receive a thorough soaking of water a day or so before being lifted and transferred to pots. Probably the soil most suitable to their growth when in pots is a sweet fibrous loam, a little well decayed manure, and sufficient grit to keep it open and sweet.

When lifting the plants be careful not to mutilate the roots more than can be helped, but no harm will accrue to the plants by a slight reduction of the roots which is necessary in some cases to get them into pots of a size useful for a particular purpose. After the plants have been lifted and potted, they are stood in a shady position for a few days, kept syringed at intervals in bright weather, and well supplied with moisture. With this treatment we experience no difficulty in getting arum lilies to flower from Christmas and onwards.

H. Markham.

Wrotham Park Gardens.

THE LATE MR. PETER BARR, V.M.H.

The regret we feel in recording the death of Mr. Peter Barr, V.M.H., will be shared by a large number of our readers, for he enjoyed a world-wide reputation for the splendid work he accomplished in connection with the daffodil, was well known as a most estimable man, and held in the highest respect by all who came into personal contact with him. The death of Mr. Barr, who was in his eighty-fifth year, occurred at the residence of his youngest son, Mr. George Barr, on the 17th inst., from heart failure, and his sudden demise must have come as a great shock to the family, for he was until within a short time previous hale and hearty, and afforded but little evidence of his having to bear the weight of fourscore and five years. Mr. Barr, it may be mentioned, has for some years past resided at Kirn, Scotland, and he had a few days previous to his death come to London for a short time on a visit to his family.

THE LATE MR. PETER BARR, V.M.H.

Mr. Peter Barr was a native of Govan, in the early part of last century a flourishing village, of which the principal industry was weaving, and was born in April, 1826. His father was a millowner, and devoted a large proportion of his leisure to the cultivation of flowers, and achieved much success as a grower of tulips. The tulips and other flowers in the father's garden were of greater interest to the son than were the looms and their products, and, recognising the trend of the son's taste, the father gave him an opportunity for entering on a horticultural career. At a quite early age he was engaged in the seed warehouse of Mr. James Thynne, of Glasgow, and here he showed such remarkable aptitude for business that by his twentieth year he had full charge of the department. On leaving Glasgow Mr. Barr obtained an appointment in the establishment of Messrs. Daly, Drysdale and Co., seedsmen, of Newry, co. Down, Ireland, and was there during the terrible famine of 1846-47 consequent on the destruction of the potato crop by disease. Leaving Newry, Mr. Barr went to Messrs. Richard Smith and Co.'s nurseries at Worcester. Two years or so later he was appointed manager to Messrs. Butler and McCulloch, seedsmen, of Covent Garden; and, after having had several years' experience in the London seed trade, he engaged in business on his own account. It was in the autumn of 1861 that Mr. Barr started a seed business, under the title of Messrs. Barr and Sugden, and within a short period his firm obtained a prominent position among the London seed houses. Mr. Barr was one of, if not the first of, the seedsmen to issue freely-illustrated and attractively-got-up catalogues, and he was not slow to take advantage of the usual channels for obtaining publicity for his goods. As the result of this vigorous policy the firm not only soon became known, but the business expanded at a remarkably rapid rate. While busily engaged in the development of the business of his firm, Mr. Barr found time to devote attention to the Act for the Prevention of Seed Adulteration, and rendered assistance in the passing of that measure.

Mr. Barr had not long been in business on his own account before he turned his attention to daffodils, which were then much neglected, and, as regards their nomenclature, in a decidedly unsatisfactory state. He devoted much time and labour to collecting the various forms known to have been cultivated in this country, and he travelled through Spain, Portugal, and the Maritime Alps in quest of species indigenous to the regions in which the daffodil was known to grow in a wild state. In his collecting expeditions he achieved much success, and in submitting his finds to public notice, and in improving their nomenclature, he was not less successful. As an indication of Mr. Barr's remarkable activity, it may be mentioned that Mr. J. G. Baker published his "Classification of Narcissi" in 1869, and stated at the Narcissus Conference subsequently held that it was largely due to the aid given by Mr. Barr that its preparation had been possible. It was thought by some of his friends that he gave too much attention to the scientific aspects of these delightful flowers, but, with his remarkable foresight, he foresaw that to ensure for the flowers the attention they so well merited from the flower-loving public, the nomenclature must be clear and trustworthy.

In the course of his quest for daffodils Mr. Barr entered into a correspondence with regard to these flowers with the late Mr. Leeds, of Longford Bridge, near Manchester, who had achieved much success as a raiser of hybrids and varieties. Some of these were exhibited at the meetings of the Royal Horticultural Society at South Kensington, and, while they attracted considerable attention, there was but little demand, commercially, for them. Towards the close of Mr. Leeds' life a rumour reached Mr. Barr that the former had given directions that if his narcissi were not sold before his death they were all to be destroyed. This induced Mr. Barr to take counsel with some of his friends who were specially interested in narcissi, and as the result the Longford Bridge collection passed into Mr. Barr's possession. Later on Mr. Barr became acquainted with the fact that Mr. Milner, of Sheffield, had a stock of bulbs of new varieties of narcissi, and, on proceeding to Sheffield to see them, he learnt that they had been raised by Mr. W. Backhouse, St. John's, Wolsingham, Durham, Mr. Milner's brother-in-law. The latter's stock was divided between Mr. Barr and his friend, the Rev. J. Nelson, and the varieties were brought into prominent notice.

When the history of the daffodil is written the historian will have to state that when Mr. Barr first turned his attention to narcissi the species and varieties in cultivation were few, and that there were thousands of gardens in which not a solitary bulb was to be found; and that at the close of his life the varieties could be numbered by the hundred, the flowers were largely grown in the gardens of all classes, and their interest and beauty enormously increased.

To avoid the slightest misapprehension it should be stated that, great as were his accomplishments in connection with daffodils, he assiduously studied the hellebores, lilies, pæonies, and some other classes of flowers, in addition to bearing the responsibilities of an ever-increasing seed business, and doing much useful work. It may be mentioned that Mr. Barr was one of the founders of the Royal Gardeners' Orphan Fund, and served on the committee for several years; and three years since he presided at the annual dinner of the United Horticultural Provident and Benefit Society, when he charmed all who were present by his genial humour and his advocacy of the claims the society has on gardeners. Mr. Barr retired from business in 1896, and in the following year he started on his memorable voyage round the world, which occupied some five or six years. On his return home he went to reside with his sister at Kirn, near Dunoon, Scotland, where he turned his attention to the improvement of polyanthuses and primroses, in which work he was actively engaged until the close of his life.

In the conduct of the business, and in his study of the several classes of plants mentioned, Mr. Barr had for a long period previous to his retirement received much assistance from his three sons, the present members of the firm of Messrs. Barr and Sons. These are Mr. P. Rudolf Barr, Mr. J. W. Barr, and Mr. George Barr, and, inheriting in a marked degree the qualities which had enabled their father to achieve so high a degree of success, they had the advantage of being trained under him, and of this training they would appear to have taken full advantage. Certainly at no time in the history of the firm has it occupied a more important position among commercial establishments, or been held in higher repute.

Mr. Barr was laid to rest in the Islington Cemetery, at East Finchley, on September 21, and among those, in addition to the members of the family and relatives, who were present to testify to their respect for his memory were Mr. T. Bevan, Mr. E. T. Cook, Mr. Dawkins, Mr. G. Gordon, Mr. G. J. Ingram, Mr. J. W. Moorman, Mr. J. Witty, and Mr. B. Wynne.

LIFTING AND TRANSPLANTING PEACHES.

Although there may be ample time yet to make preparations for lifting and transplanting fruit trees, it is not well to defer them too long, for, as sometimes happens, the weather in November is unfavourable for several weeks together, and unless preparations have been made beforehand, there is no chance of completing the work while there is sufficient warmth in the soil to cause new root action.

In all well-appointed gardens there should be a sufficient number of young trees of various kinds to replace any that become old and worn out, as this will obviate the necessity of going to a nursery for those that are more than a couple or three years old. For my own part, I much prefer to purchase maidens, or those of one year's training, than older trees. My advice, then, is to either purchase maidens or those of one year's training. Such, if planted against a fence or low wall, and given plenty of room, will in a couple of seasons be fine trees, and usually well in advance of those purchased as fruiting specimens.

Now such trees will need lifting and transplanting each year, so that their roots may be kept within bounds, and their wood from becoming too gross; and as such work is best done the first showery weather towards the end of October, or early in November, everything should be in readiness, that the work may be completed with as little delay as possible. Where the soil is of poor quality this should be removed and replaced with material of a more suitable nature; drainage should also be provided, not only beneath the roots, but where the soil is stiff, and of a cold, retentive nature; old mortar, lime rubble, broken bricks, or sandstone should be added to make the soil more porous, and thereby admit air to warm the ground. In some soil it is absolutely necessary to lift peaches, nectarines, and apricots every autumn, so as to ripen their shoots properly. Such work takes time and needs great care, especially when the trees cover a space of from 100ft. to 150ft. Where trees of this description are lifted periodically there is, or should be, ample fibrous roots to support a healthy growth the following year, and bring a crop of fruit to perfection. On cold, heavy soils, where trees are not so treated, there is but little prospect of growing fine crops of fruit, the wood being so sappy and ill-ripened.

Peach trees are in many gardens sadly neglected. This may be no fault of the gardener, for many are handicapped in various ways. With some labour is none too plentiful, with others there is the lack of suitable material for planting the trees, while with not a few there is lack of interest. The most skilful gardener cannot grow fine fruit under such disadvantageous conditions. Whatever is worth doing at all is worth doing well, and unless time and material can be provided for growing peaches it is better to let the work alone; but if they are to be grown well in some [illegible], neither pains nor trouble must be spared, for where the natural soil is uncongenial that of a more suitable character must be provided.

Before liberating trees from a wall it is well to secure the shoots by tying some [illegible] bamboo canes across them to prevent them being injured during removal. Peach trees are usually grown against south walls, and in many instances the tree borders are far too narrow. Where a wall is 12ft. high, the border ought to be not less than 18ft. wide, and 4ft. next to the wall ought to remain uncropped (unless it be with such things as radishes or cabbage lettuce at the foot of the wall in early spring), so that free access may be had at all times to the trees. When these borders are cropped at all seasons of the year it is very difficult to attend to the fruit trees, especially in the way of lifting. Such borders ought to be kept free from a winter crop, unless it and the trees can be lifted at the same time. The amount of soil required to be removed must depend on the size and age of the tree.

If the trees are 15ft. apart on the walls, take out a trench halfway between them—that is, about 7ft. from the stem. The soil should then be carefully forked out until within a couple of feet, taking care to injure the roots as little as possible. Should there be any near the wall that go straight down, these ought to be severed, and if it is necessary to take the tree away from its present position to some other spot, have the place in readiness, so that the roots may not be exposed to the air longer than is actually necessary. The roots ought not to be deeper in the earth than a foot, therefore the hole should be filled in with well-prepared soil and made ready for the reception of the plants. When the tree is placed in position, allow a space of about three inches between the stem and the wall at the base; spread out the roots evenly all round, then fill in with the specially-prepared compost, and after this is done, give a mulching with some thoroughly decayed manure. Do not remove the bamboo sticks for the present, but fasten these securely to the wall to prevent the shoots from being injured by rough winds. When the soil has settled down after the first heavy rains, give a slight covering of rough litter. This will exclude frost and assist the roots to re-establish themselves in the fresh soil. It is not well to prune and nail peach trees until the buds begin to swell, especially in southern counties, for when the shoots are nailed to the wall in winter, the bright sun during February often excites the sap to such an extent that the flower buds swell rapidly towards expansion into bloom, and when this happens so early in the year the cold frosty winds during March are most trying, and unless the trees are well protected the crop is a failure. Therefore peach and nectarine shoots should be kept away from the wall as long as possible.

By lifting the trees as described, growth is somewhat checked, so that the trees do not start quite so soon as they otherwise would do, and as the wood will have become better ripened, the flower buds are better developed. It is a great mistake to lay in the young shoots too thickly, as this prevents a free circulation of air amongst the leaves, and such overcrowding, especially on young trees, should be avoided, for unless the foliage is properly developed it is impossible to have good strong flower buds, which are the foundation of fine fruit.

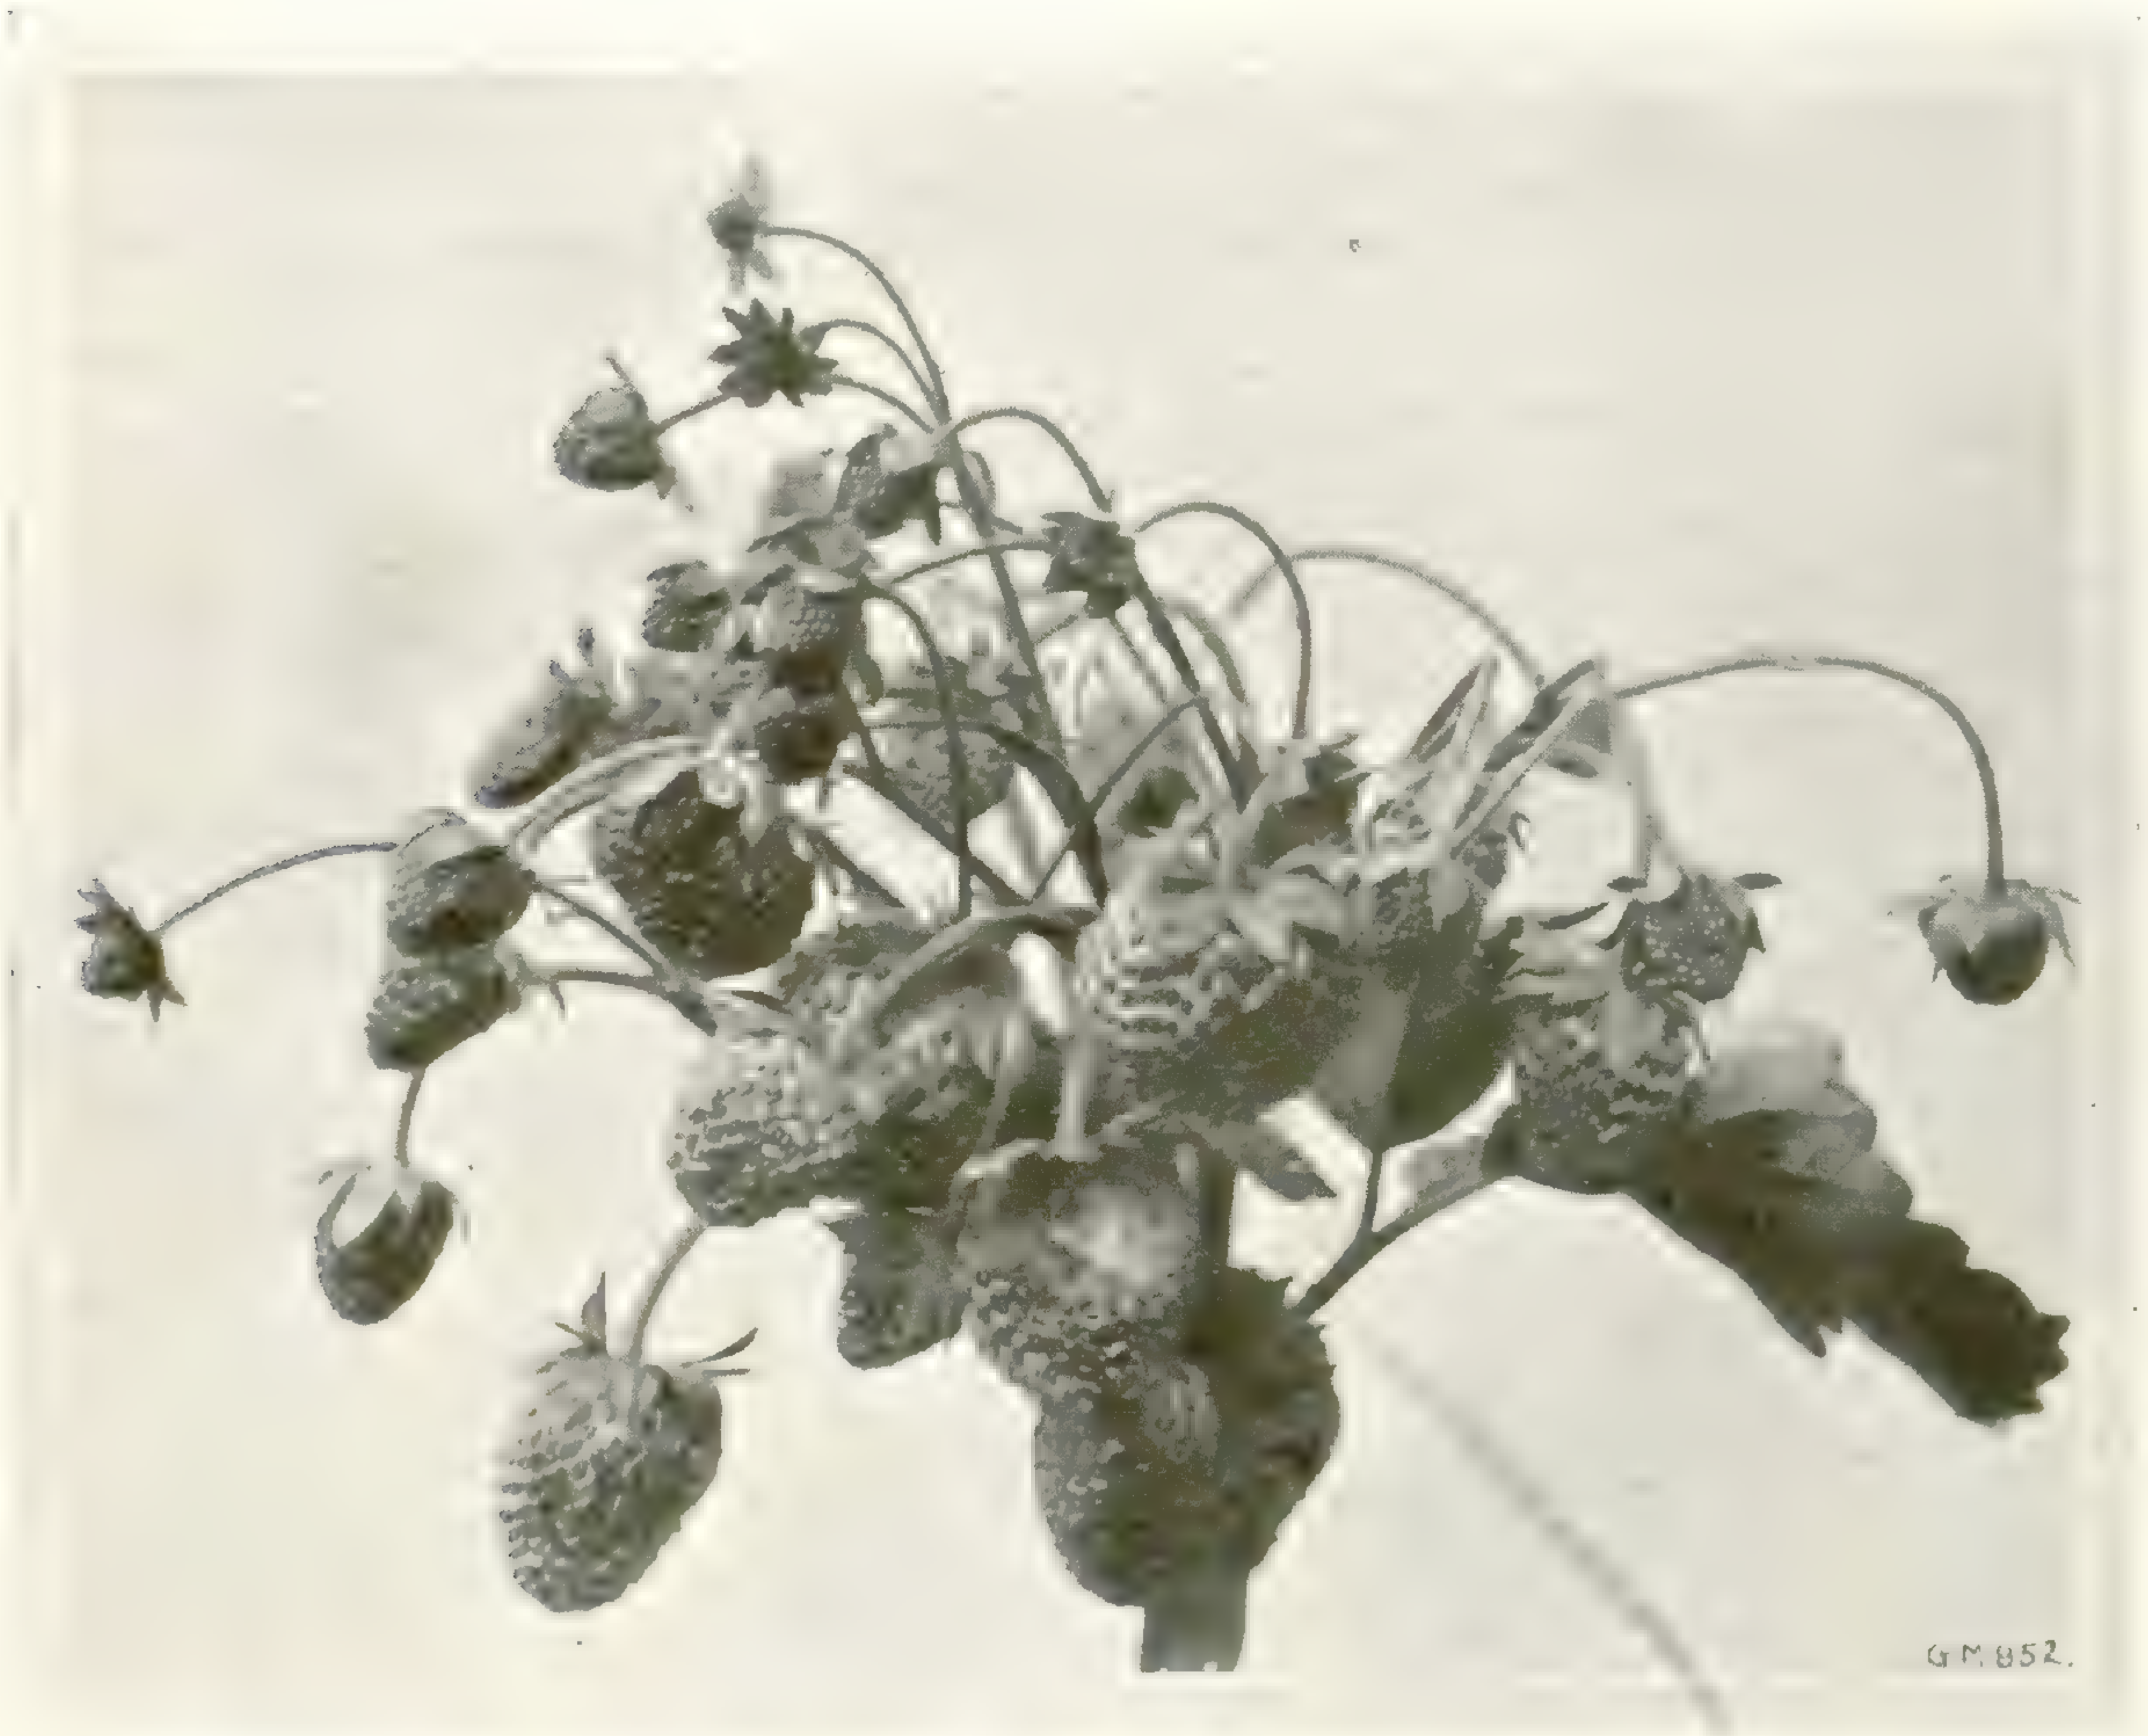
ROSES WITH YELLOW FLOWERS.

The question of employing roses of distinct colouring is one that frequently engages the attention of gardeners, and in this respect no group presents greater difficulties than that wherein the colour is some shade of yellow. With tea roses this difficulty is not so manifest, but in all other sections this colouring is restricted to comparatively few varieties. Within the last few years some valuable additions have been made to this colour group, particularly among dwarf bedding roses.

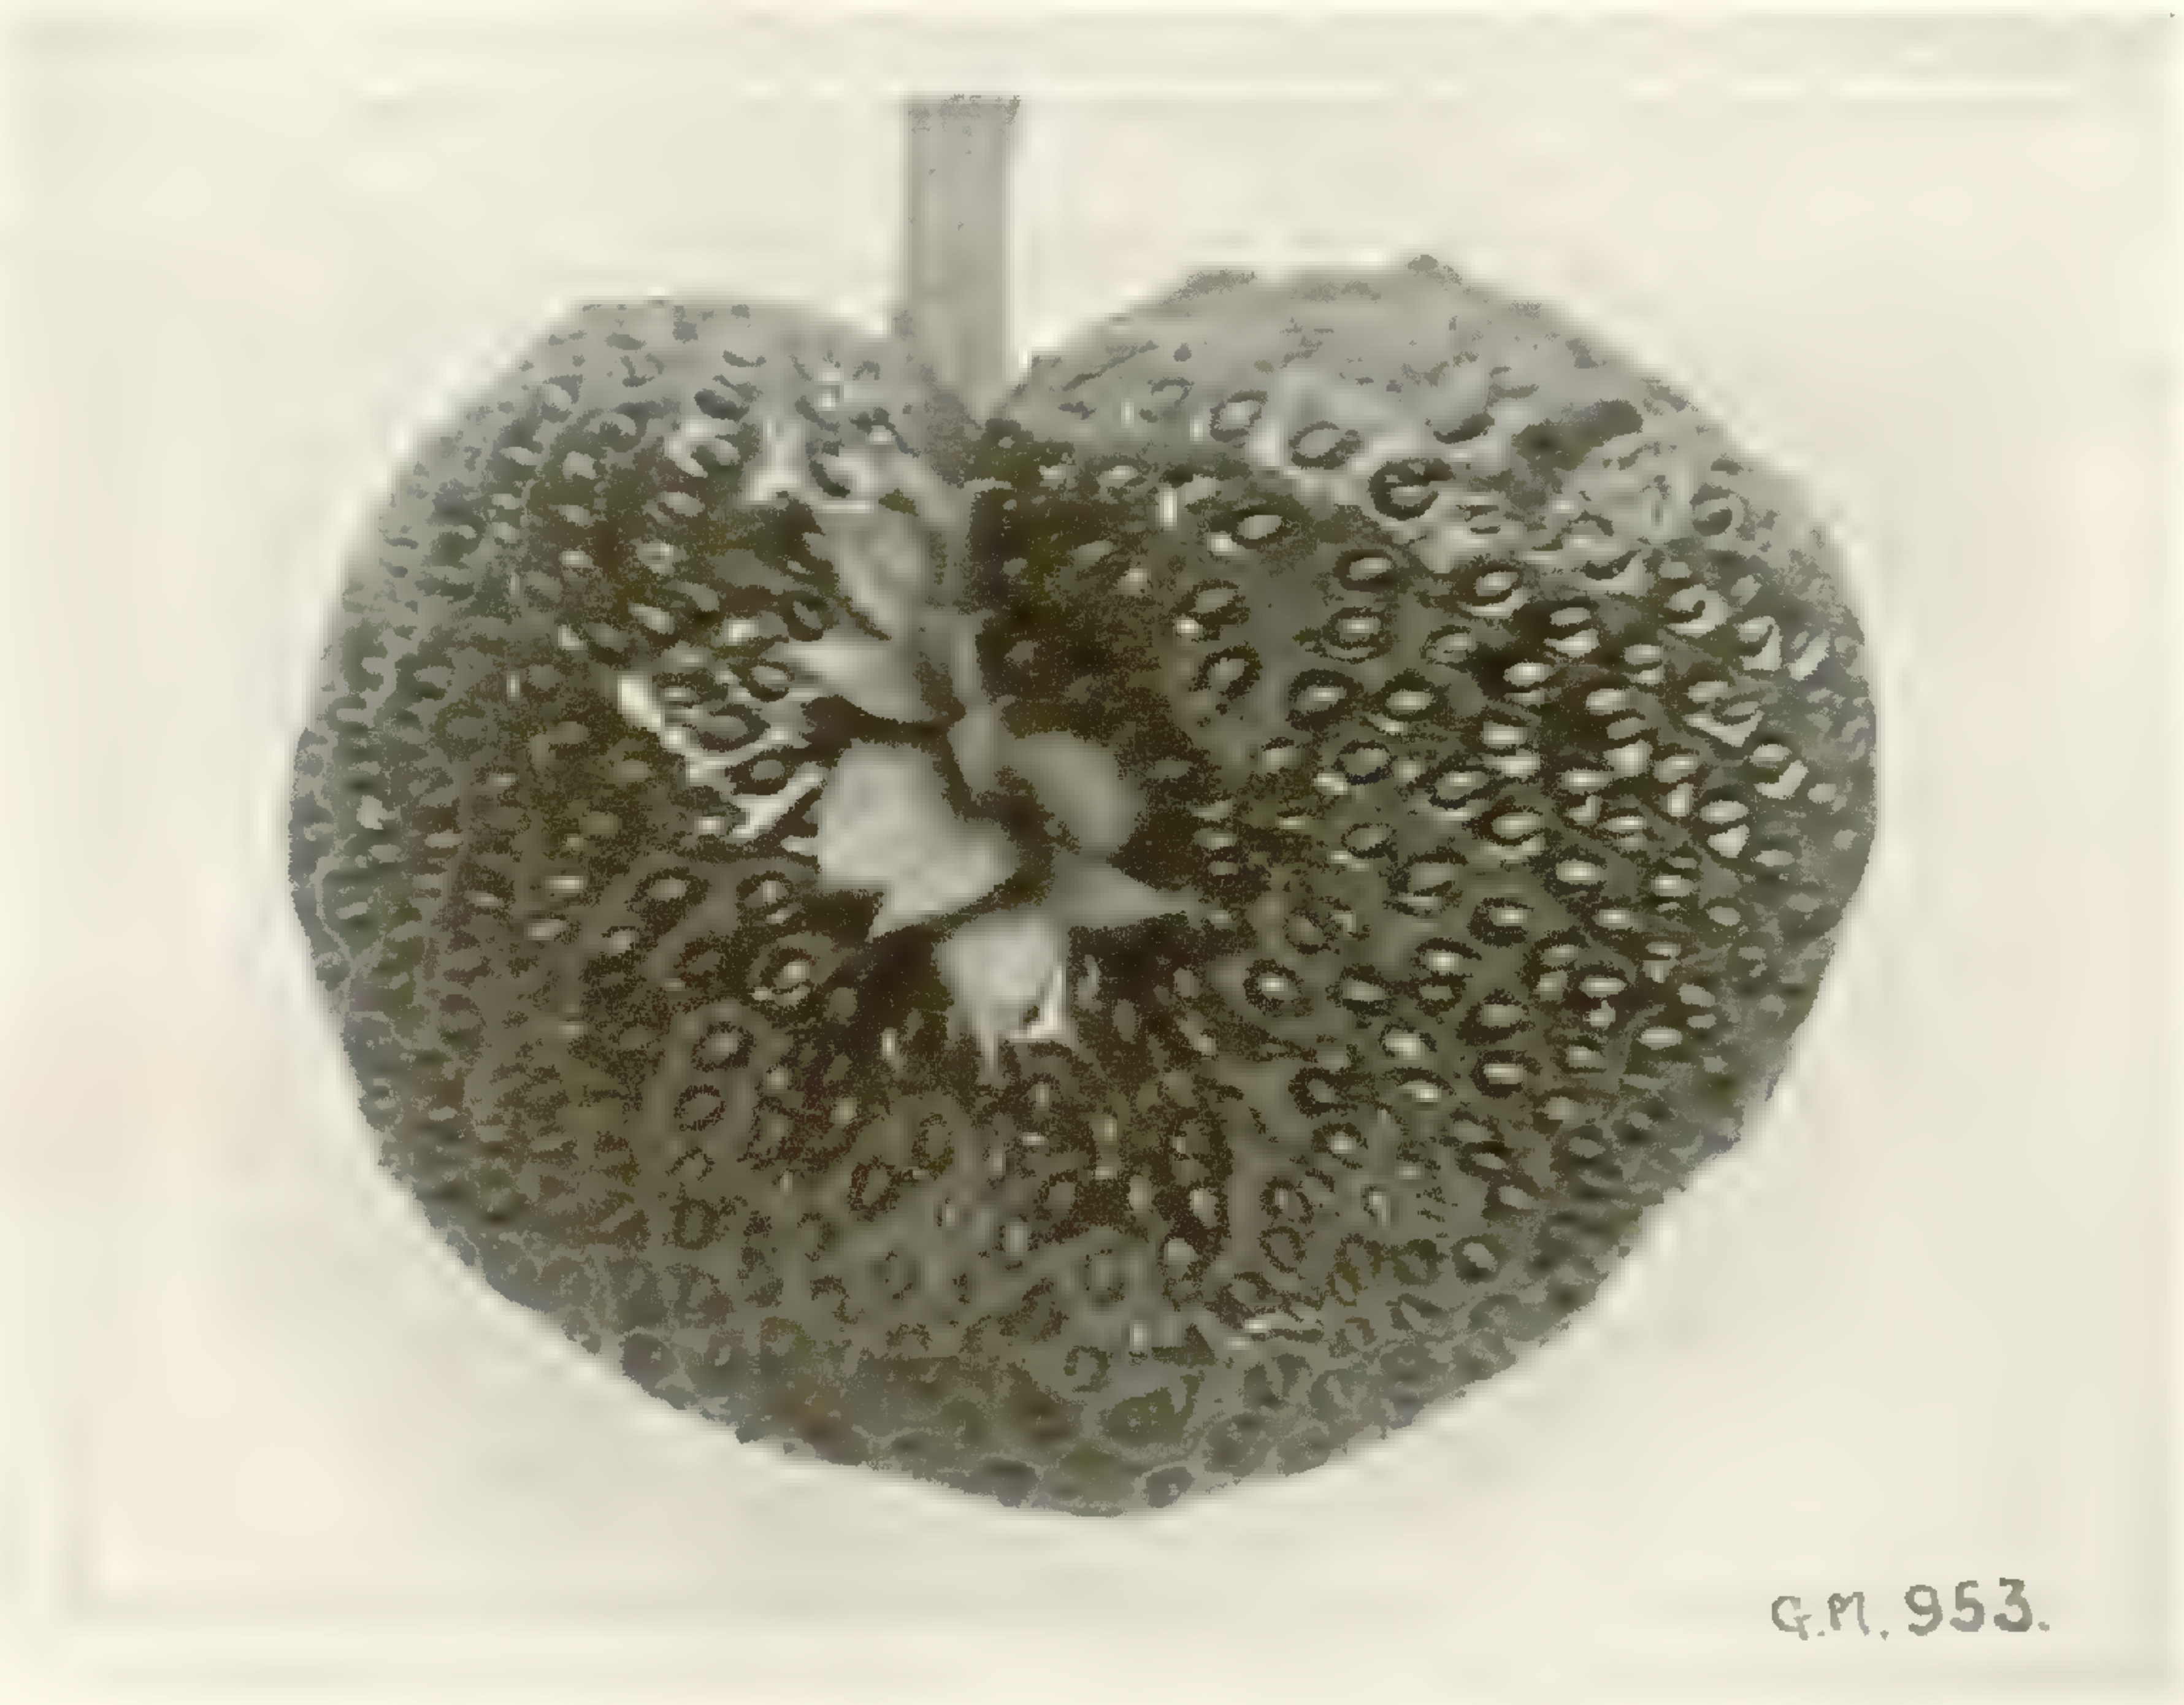


G.M. 952.

NEW STRAWBERRY, LAXTON'S PERPETUAL.
A.M., R.H.S., September 14. Messrs. Laxton Brothers, Bedford.
One of several trusses of fruit on the same plant.

Hybrid teas.—These include Mrs. Peter Blair and Betty, two varieties sent out by Messrs. Alex. Dickson and Sons, the former a lovely chrome yellow flower having a deeper coloured centre; the latter with a coppery tinge suffusing the golden-yellow ground. Mdme. Philippe Rivoire was introduced by M. Pernet-Ducher, and in this variety the flowers are globular, and of an apricot-yellow shade, the centre being generally paler. Instituteur Sirdey, from the same source, has very deep golden flowers. Florence Pemberton, also from Newtownards, is creamy-white, flushed with a pale shade of salmon-pink; while from M. Pernet-Ducher we have such well-tried sorts as Gustave Regis, creamy-yellow; Le Progrès, nankeen-yellow, deeper in bud; Mdme. Pernet Ducher, buds canary-yellow, the petals tinted carmine outwardly; and Mdme. Ravary, with golden-yellow buds, deepening to orange-yellow when expanded.

Tea roses exhibit a wider variety of yellow flowers, but as they are none too hardy their position should be carefully chosen and some protection be given around the base of the plants during winter. This section is characterised by having delicately coloured and richly perfumed flowers. Mdme. Falcot, nankeen-yellow; Mdme. Margottin, lemon-yellow with flushed centre; and Mdme. Hoste, yellow-white passing to a deeper shade, are three old varieties introduced by MM. Guillot and Sons. Isabella Sprunt (sulphur-yellow) and Jaune d'Or (golden-yellow) were both raised about the middle of last century. Medea (lemon-yellow) and Sulphurea (sulphur-yellow) were both raised by Mr. Wm. Paul; while Lady Mary Corry was raised by Messrs. A. Dickson and Sons. Mdme. Chedane Guinoisseau produces long, pointed buds, which open light canary-yellow; and Mdme. Jeanne Philippe is a beautiful variety with nankeen-yellow flowers. Perle de Lyon has dark yellow flowers, often tinted apricot; Perle des Jardins has globular straw-yellow flowers and orange centre, and Perle des Jaunes is a beautiful deep golden-yellow flower.



G.M. 953.

LAXTON'S PERPETUAL STRAWBERRY.
Single Fruit Natural Size.

Among new tea roses those that promise well include Azeline Morel, with long, tapering buds of creamy-yellow, with a distinct carmine reverse on outside petals; J. F. Giraud, a golden-yellow flower, the buds of which are oval; and Lena, an Irish rose with apricot buds, which open primrose-yellow. Mdme. P. V. Bernier is a fine deep yellow flower, paler towards the edges of the petals.

Noisette roses share with the hybrid teas a perpetual-flowering character, and they generally succeed best when lightly trained to cover walls; in nearly every instance the foliage is extremely beautiful, often ruddy-purple on the young growths, and the flowers are highly perfumed. Fortune's Yellow and Cloth of Gold are two lovely roses, somewhat tender, and both require a warm wall to develop their beauty to the utmost. The former has pointed buds, often tinted with carmine; the latter is of a chrome-yellow colour. Rêve d'Or is a vigorous subject, producing yellow flowers in great freedom. Mdme. Pierre Cochet and W. A. Richardson are somewhat similar in colouring and character of growth. Bouquet d'Or is a large, free, yellow flower.

A most distinct and graceful rose for a house wall is the yellow Banksian, and wherever its requirements are understood and provided, it forms a most charming feature in April and May, when in flower. Kronprinzessin Victoria is a splendid autumn-flowering Bourbon rose, with elongated buds, which open sulphur-yellow. Soleil d'Or is a hybrid rose, suitable for pillars; the colour is variable, opening yellow-orange and soon changing to reddish-gold.

Of the hardiest climbing roses yielding yellow flowers, Electra is conspicuous by reason of its dense panicles of small cream-coloured flowers; Aglaia, an effective variety, requires light training in order to thoroughly mature the wood; the flowers are of a good size, and of a bright canary colour. Gardenia is a lovely rose in bud; these are of the brightest yellow, but soon fade to a pale cream shade. Alberic Barbier and Jersey Beauty are Wichuraiana roses, with rich, glossy, metallic leaves. The former produces semi-double, creamy-white flowers, which are somewhat deeper towards the centre; the latter has single flowers of a pale yellow, the shell-like petals being much enhanced by the deep coloured stamens in the centre.

Thomas Smith.

Walmsgate Gardens.

NEW PLANTS, ETC.

◆

HELENIUM RIVERSLEA BEAUTY.

A very pretty and free flowering hardy plant, obtained by crossing H. pumilum with H. striatum. The flowers are freely produced, bright yellow, with brown centre. A.M., R.H.S., September 14. Mr. Maurice Prichard, Christchurch.

POTENTILLA ATROSANGUINEA GIBSON'S SCARLET.

A rather rare plant is this brilliant potentilla, but it is a good one, the flowers being especially bright and attractive. A.M., R.H.S., September 14. Mr. Maurice Prichard, Christchurch.

CHRYSANTHEMUM LESLIE WELLS.

This is a useful early-flowering variety, of good habit, and bearing a profusion of bright yellow, medium-sized blooms. A.M., R.H.S., September 14. Messrs. W. Wells and Co., Merstham.

RHUS SINICA.

The great value of this shrub lies in its elegant foliage, and especially in the brilliant scarlet colour the pinnate leaves assume in autumn. It appears to be an ideal shrub for a lawn specimen. We have referred to this species on several occasions, and illustrated it on p. 721. A.M., R.H.S., September 14. Messrs. Paul and Son, Cheshunt.

CATTLEYA IRIDESCENS SPLENDENS.

A distinct and effective hybrid, obtained by crossing C. bicolor with C. Eldorado. The flowers are of fair size and considerable substance, rounded, and well posed. The broad petals and less broad sepals are palest yellow, with a pink suffusion. The lip has a white base, and a broad, expanded purple apex, these being joined by a brilliant golden-yellow area. A.M., R.H.S., September 14. Messrs. Stanley and Co., Southgate.

DAHLIAS.

Edward Mawley.—A handsome rich crimson show dahlia, of excellent form. A.M., R.H.S., September 14. Mr. Charles Turner, Slough.

Prima Donna.—A large cactus variety of fine form; white, shading to cream at the bases of the florets. A.M., R.H.S., September 14. Mr. H. Shoesmith, Woking.

Little Beeswing.—This is a charming little show variety, the florets being yellow, neatly margined with bright red. A.M., R.H.S., September 14. Messrs. Keynes, Williams and Co., Salisbury.

Jupiter.—A fancy cactus dahlia, yellow ground, freely splashed with crimson, and with pink shading at the apex of each floret. A.M., R.H.S., September 14. Messrs. James Stredwick and Son, St. Leonards.

H. H. Thomas.—A brilliant crimson-scarlet cactus variety, of good form. F.C.C., N.D.S., September 2; A.M., R.H.S., September 14. Messrs. J. Stredwick and Son.

Indomitable.—An attractive cactus dahlia, the colour being an effective shade of mauve or deep lilac. F.C.C., N.D.S., September 2; A.M., R.H.S., September 14. Messrs. J. Stredwick and Son.

Iolanthe.—A very distinct cactus dahlia of reddish-rose colour, with yellow shading at centre and tips. F.C.C., N.D.S., September 2; A.M., R.H.S., September 14. Messrs. J. Stredwick and Son.

Red Admiral.—A brilliant rich orange-[illegible] cactus variety, of fine form and size. F.C.C., N.D.S., September 2; A.M., R.H.S., September 14. Messrs. J. Stredwick and Son.

STRAWBERRY LAXTON'S PERPETUAL.

This is a very fine addition to the section of late strawberries, for in an ordinarily good season it will fruit freely during September. It was raised by crossing Monarch and St. Joseph. It fruits most freely, the [illegible] much-divided trusses carrying a score or more of deep red, roundish fruits that are of very good flavour. A.M., R.H.S., September 14. Messrs. Laxton Brothers, Bedford.

ROSES.

Mrs. Edward J. Holland.—A beautiful pink hybrid tea rose, with full flowers of excellent form. Gold Medal N.R.S., September 16. Messrs. S. McGredy and Sons, Portadown, Ireland.

Miss Cynthia Forde.—A charming silvery-pink variety, somewhat after the style of Caroline Testout, but of rosier shade. A very fine and fragrant hybrid tea variety. Gold Medal, N.R.S., September 16. Mr. Hugh Dickson, Belfast.

Claudius.—A broad-petalled hybrid tea rose of great beauty and fine fragrance. It is of deep, glowing rose colour, and is of deep build and good form. Gold Medal, N.R.S., September 16. Messrs. Ben Cant and Son, Colchester.

NEW GOLD MEDAL H.T. ROSE MISS CYNTHIA FORDE.
Shown by Mr. Hugh Dickson, Belfast, at N.R.S. Show, September 16.

Mrs. Frank Bray.—A distinct and very delightful new hybrid tea rose, with medium-sized flowers of a pretty coppery-yellow shade, the open blooms being paler yellow. Card of commendation, N.R.S., September 16. Messrs. Alex. Dickson and Sons, Newtownards.

BEGONIA MODICA.

This distinct begonia comes from Tropical West Africa, and is a low-growing plant with undulating peltate leaves. The small yellow flowers are borne freely in umbels. The species appears to flower in autumn. "Bot. Mag.," t. 8,258.

CORNUS MACROPHYLLA.

This strong-growing cornel reaches a height of 10ft. at Kew, and has reached 17ft. at Coombe Wood. The species is widely distributed throughout Eastern Asia. It has yellowish-white flowers in large clusters, and small purplish fruits. Grown with a clean stem of 6ft. or so it makes a good lawn specimen, and it is hardy throughout the greater part of England. "Bot. Mag.," t. 8,261.

PINUS JEFFREYI.

A tall-growing species, allied to P. ponderosa. It comes from Western North America, and its branches are somewhat thinly set on columnar stems. It has long, rigid leaves, and bold brownish cones. "Bot. Mag.," t. 8,257.

SORBUS CUSPIDATA.

This is one of the finest, perhaps the finest, of the white beam trees, and it has been known as Pyrus aria himalaica. It has large leaves, flowers, and fruits, and is a most attractive tree, but, unfortunately, it may die off unaccountably in the growing season, and hence there are few fine specimens in the country. "Bot. Mag.," t. 8,259.

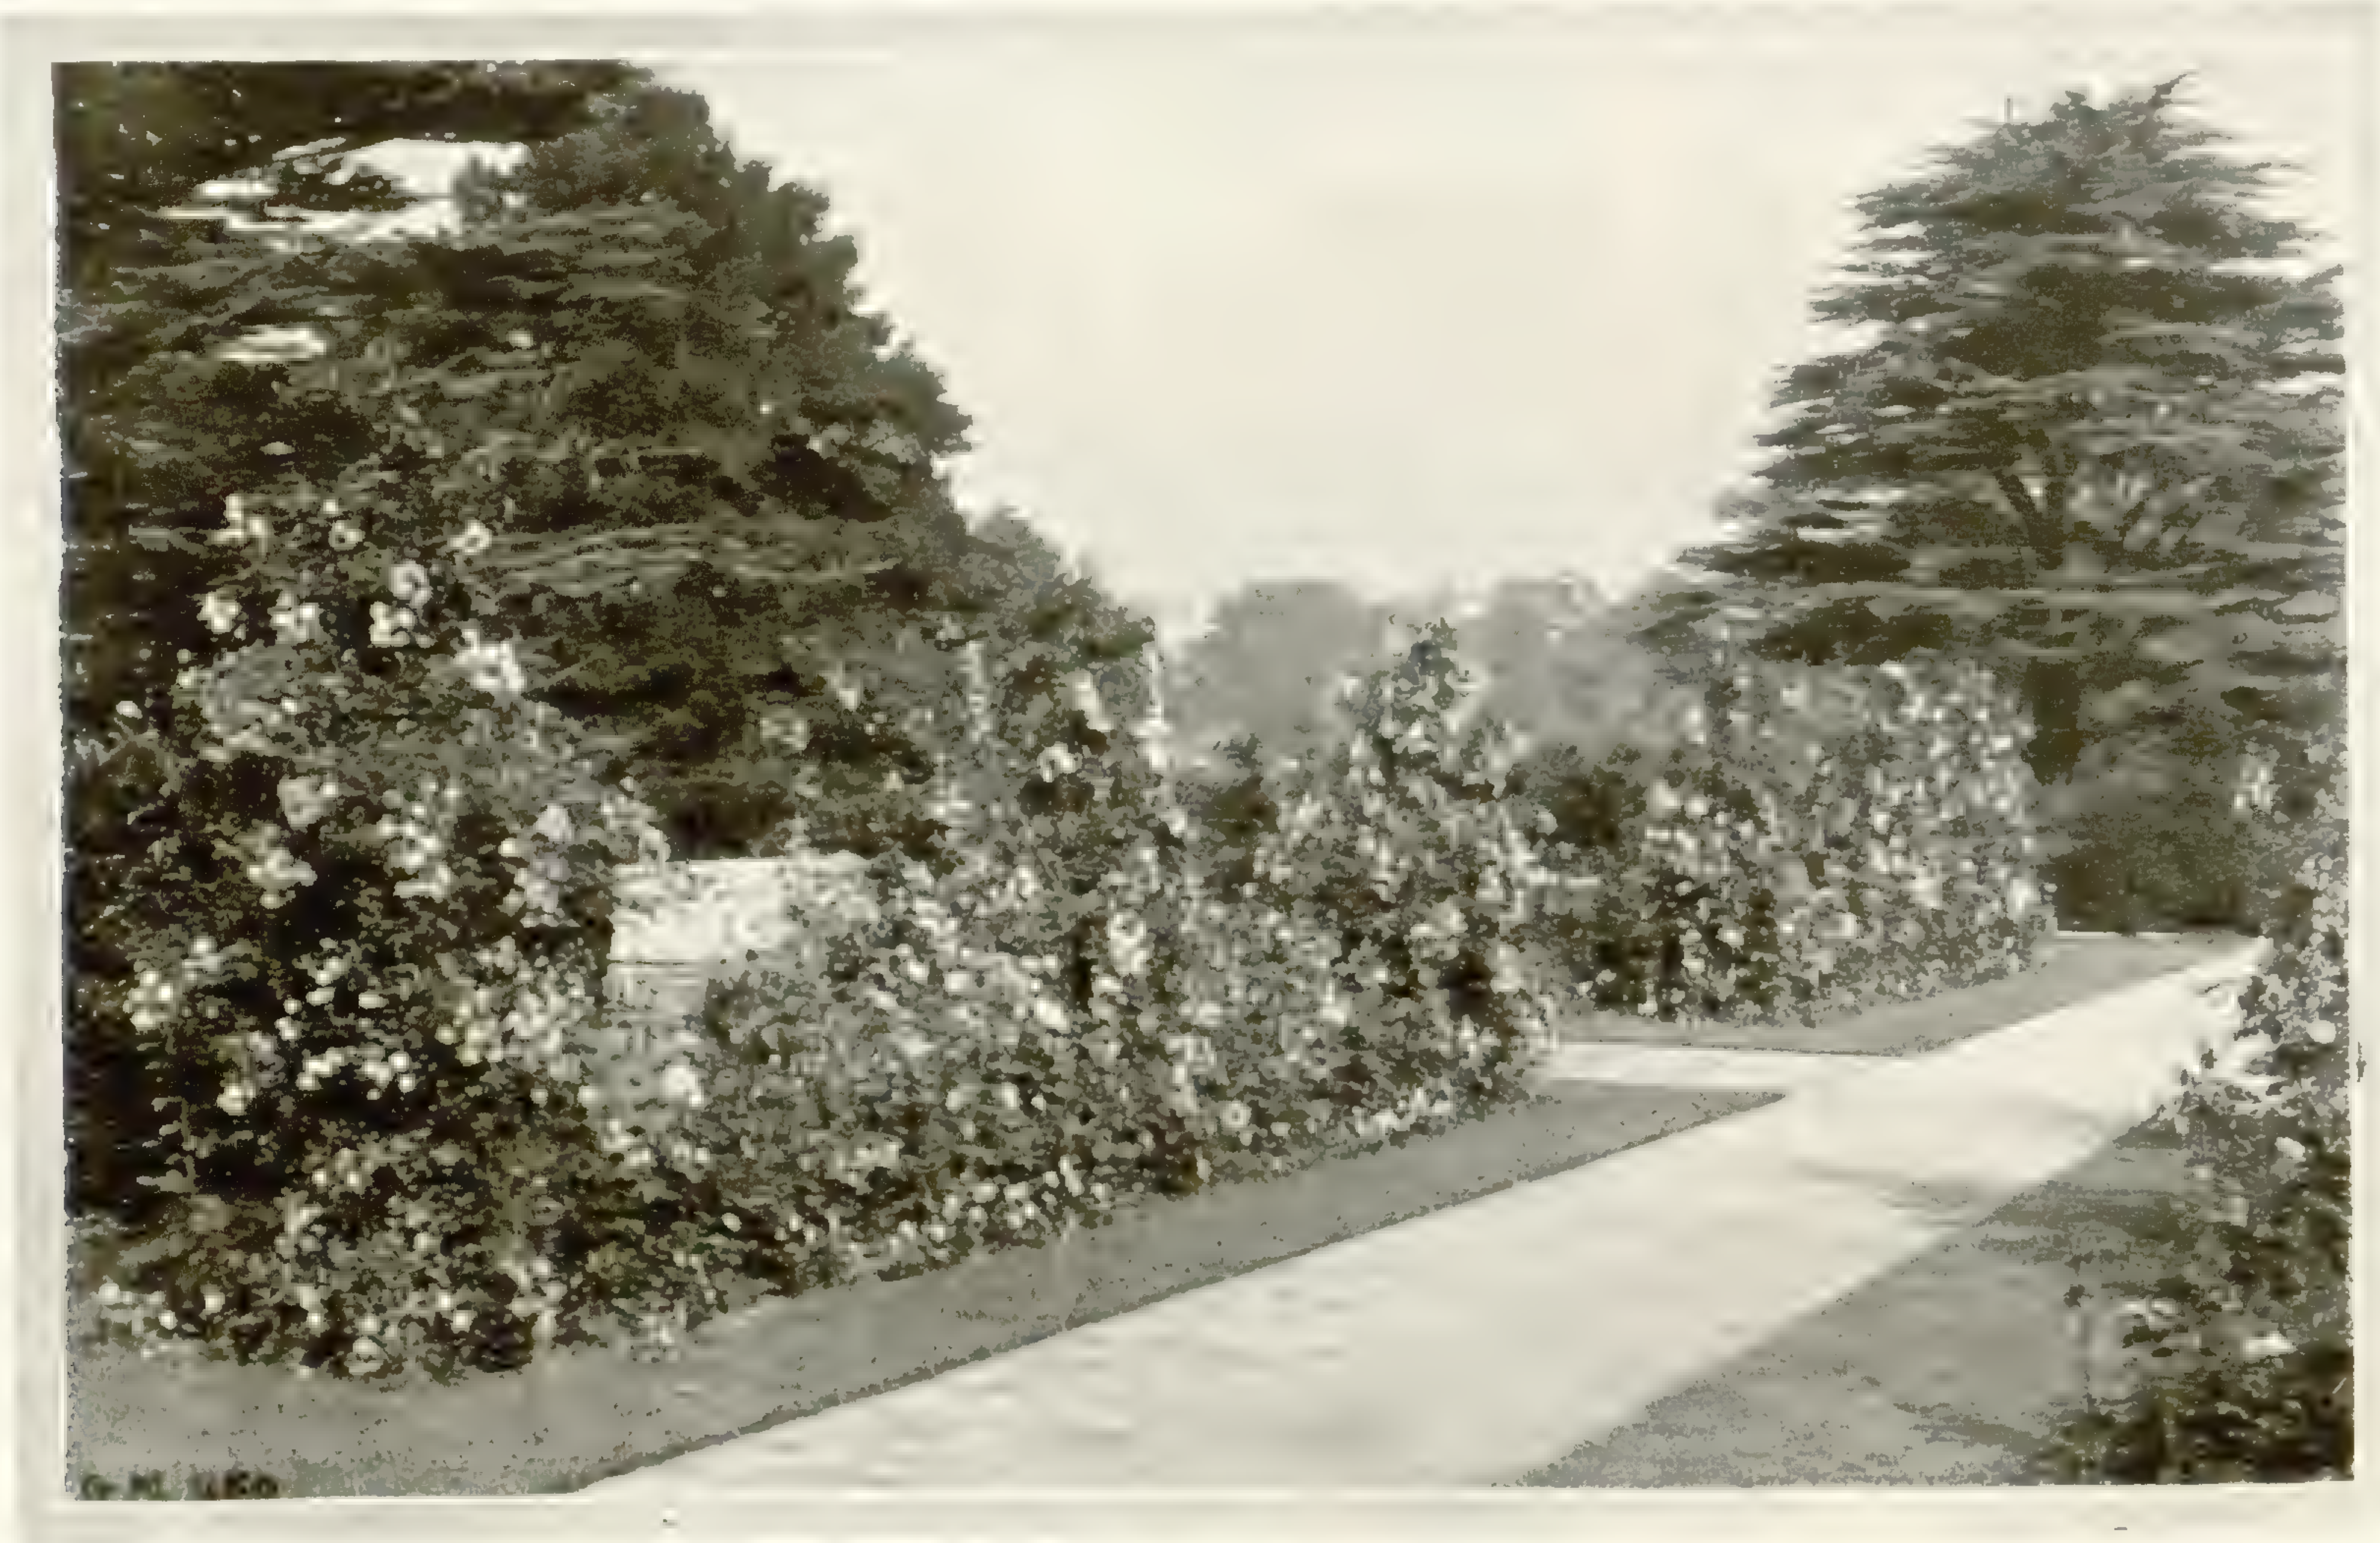
PRUNUS JAPONICA.

This low-growing shrub has rose-pink flowers, followed by an abundance of bright orange and scarlet cherry-like fruits. The double form is well known, and largely used for forcing, but the type is not so well known, and yet it is a most effective shrub in autumn when carrying a good crop of its acid and stringent fruits. "Bot. Mag.," t. 8.260.

BEST PLANTS FOR GREENHOUSE.—Nearly 300 pages are devoted to the description, propagation, and culture of the best flowers and plants for the greenhouse in The Amateur's Greenhouse, by T. W. Sanders, price 5s. net, or by post 5s. 6d., from W. H. and L. Collingridge, 148, Aldersgate Street, London

RAMBLING ROSES.

With the rose planting season near at hand, a reference to some of the more noteworthy of the rambling roses can hardly fail to be of interest or to prove useful, for no roses are more popular at the present time, and there are certainly none on which those who are not well acquainted with the relative merits of varieties are so greatly in need of advice. The immense popularity of the ramblers has so stimulated the activity of raisers that they have created with surprising rapidity such a large number of new forms as to render the task of making a small selection a somewhat difficult one. With but few exceptions all the Wichuraianas and multifloras possess sufficient beauty to add greatly to the charms of the garden when they are given suitable positions and receive proper attention. But while beautiful, they differ considerably in relative merit, and it need hardly be said that, whether the garden is large or small, the very best forms, whether of roses or other flowers, should be grown. It is important also that the varieties, especially where the garden is of limited area, should be selected with due regard to distinctness, and the purpose for which they are required, and to accomplish this without a knowledge of the characteristics of the many forms is not an easy matter.



RAMBLING ROSE LADY GAY.
Finely-furnished pillars of this charming rose-pink rambler in the Rose Garden, Welbeck Abbey.

Before passing on to refer to some of the more noteworthy varieties, it may be useful to remind readers that the rambling roses are admirably adapted for clothing pergolas, screens, arches, and pillars, for trailing up tree trunks, for running riot over the roots of trees that have been lightly dispersed in groups on the lawn, or on sloping banks in any part of the garden; and for trailing over rough banks in the wild garden, the Wichuraiana varieties are the most suitable for the last-named purpose. A deeply stirred and liberally manured soil is essential to the cultivation of these vigorous growing roses, whatever may be the position assigned them. There is one other point that must be mentioned, and that is the importance of preventing the overcrowding of the shoots. When this is allowed the growth is less vigorous than could be desired, and fails to become properly matured, with the result of the flowers being comparatively few and wanting in quality. The advice so frequently given in these pages that the old and exhausted shoots should be removed at the end of the summer, or at the beginning of the autumn, should be acted upon.

Aimée Vibert.—The climbing form of this fine old noisette is the best of all the white ramblers, and should be planted rather freely where these roses obtain attention. It is very vigorous, practically evergreen, and produces its clusters of pure white flowers in great profusion during the summer, and it continues in bloom until the autumn, but the flowers are sparingly produced after the principal display has been made.

Blush Rambler has much to recommend it. In freedom of blooming it is unsurpassed, and the large clusters of blush pink single flowers produce a remarkably beautiful effect. The suitability of this charming variety for arches is admirably shown in the illustration of an arch in the gardens of Englefield House, Reading.

Alberic Barbier is equally remarkable for its distinctness and beauty, and like some other of the Wichuraianas, is especially useful for trailing over tree stumps and for rustic trellises. The flowers are yellow in the bud state, and creamy-white when expanded.

Crimson Rambler still retains its position as the finest of all the crimson ramblers, and must therefore be included in the smallest selection. Philadelphia has not realised the promise of surpassing this old favourite, notwithstanding its great brightness of colouring. In many gardens Crimson Rambler fails to produce the effect of which it is capable, owing to the soil being in a more or less exhausted condition. Those who do not obtain large trusses of flowers should not fail to liberally enrich the soil about the roots of the plants with a dressing of half-rotted manure, or some approved artificial fertiliser.

Buttercup is a valuable addition to the multifloras; the growth is free, and the foliage dark in hue, and the comparatively small single flowers are rich orange; a new variety that should receive a largely extended trial.

Coquina, a charming Wichuraiana, of quite recent introduction. The growth is vigorous, and the flowers are single, pale pink suffused with rose at the tips of the petals, and borne in large clusters. The flowers have the merit of retaining their freshness and beauty for a comparatively long period.

Dorothy Perkins is too well known to need description. It is a remarkably fine rose, that should have a place in every garden; but it ought not, as in many instances, to be grown to the exclusion of other ramblers, with the exception, perhaps, of Crimson Rambler. This variety does well on any form of support suitable for rambling varieties.

Fairy.—This is a beautiful multiflora, less rapid in growth than some others of its section, but very free in flowering, and the large clusters of single white flowers are produced continuously throughout the summer. This fine variety is of quite recent introduction, and should be freely planted.

Hiawatha.—An effective Wichuraiana variety that deservedly enjoys a considerable popularity; the growth is vigorous, and the flowers are borne in large clusters, single, and are brilliant crimson with white centre.

Helene.—A beautiful variety belonging to the multiflora section. It grows rapidly and blooms profusely, the flowers double, pale pink, and borne in large trusses.

Lady Gay.—A highly effective form belonging to the Wichuraiana section, is said by some growers to so closely resemble Dorothy Perkins as to be indistinguishable from that variety. There is some resemblance, but it is not so close that the two varieties cannot be readily distinguished. The flowers are larger than those of Dorothy Perkins, and they are much deeper in colour. This variety is used with singularly good effect in the rose garden at Welbeck Abbey, and the long line of finely furnished pillars, of which an illustration is herewith given, presented an extremely beautiful effect when the photograph was taken in the second week of August.

Lady Godiva is a charming variety that originated as a sport from Dorothy Perkins, and has much to recommend it to the notice of planters. The flowers are soft flesh-pink.

Lyon Rambler, a distinct new multiflora with double flowers, bright red with white centres, that has the promise of proving a valuable addition to its section, and a trial is suggested.

Kathleen.—This is a new variety that may be described as a most valuable addition to the multifloras. The flowers are single, and produced in large trusses; the colour, soft carmine rose.

Mrs. F. W. Flight.—One of the finest of the multifloras, and deserves to be planted more freely than has yet been the case. It has a robust habit, the flowers are borne in large clusters where the plants receive generous treatment, and the colour is rich rose-pink.

Tea Rambler.—A strong-growing, free-flowering, and immensely attractive variety, with the perfume of the tea rose. The flowers are double, borne in large trusses, and the colour is rich salmon-pink.

Trier belongs to the multiflora section, and has much to recommend it, for in addition to other good qualities, it blooms continuously until the autumn. The flowers are white, and borne in large trusses.

Viator.

AN ATTRACTIVE ROSE ARCH

Successfully clothed with Blush Rambler in the gardens of Englefield House, Reading.

A SCARCE BOOK ON ROSES.

Within the last few months there has been offered for sale in London a complete copy of Miss Lawrance's work on roses, and as perfect examples are very seldom met with, a few notes on the book may not be without interest. So far as I am aware, the last previous appearance of a copy in public was at the Rose Conference held at the Chiswick Gardens of the Royal Horticultural Society in 1889, where, we are told in the society's "Journal," it "excited much attention." Redouté mentions that in his time copies of the book sold in London for 120 guineas.

The work is entitled "A Collection of Roses from Nature," and it is usually found in small folio size, although large paper copies of at least some of the plates are occasionally met with. The title page of the copy in question bears the date 1799, but some of the plates are dated 1796, which is about twenty years before the first edition of Redouté's great work "Les Roses," commenced to appear. There is a handsome frontispiece of a garland or crown of roses of various colours (an idea which Redouté appears to have copied), and ninety coloured plates of the most esteemed kinds of roses of the period. The text consists only of a two-page synopsis of species and varieties of roses at the end of the book, but from the present standpoint of horticultural taste and knowledge this is of little value, and the interest of the book centres in its coloured plates. These, although lacking the botanical accuracy of Redouté's drawings, present, nevertheless, to the ordinary eye, striking representations of the roses they are intended to represent, and the colouring is as bright and fresh as when it was first laid on. Horticulturally speaking, they are far in advance of any illustrations of roses that had previously appeared, and, with the exception of Redouté's drawings, I know of no collection of rose plates that has appeared since that will compare with them in magnitude and merit.

As may be supposed from the period at which the work appeared, varieties of the Provence rose (R. centifolia), the French or Provins rose (R. gallica), and the Damask rose (R. damascena) are freely figured, and, to a lesser extent we find varieties of the Austrian rose (R. lutea), the Alpine rose (R. alpina), the Scotch rose (R. spinosissima), the Alba rose (R. alba), the China rose (R. semperflorens), the Apple-bearing rose (R. villosa), the Musk rose (R. moschata), and the Sweet Briar (R. rubiginosa).

Of varieties still in cultivation as garden roses of interest and merit, the following are tastefully delineated: The Common Provence rose, the White Provence rose, the Austrian Copper rose, the York and Lancaster rose (true), the Austrian yellow rose, the Rosa Mundi, the Common Moss rose, the Maiden's Blush rose, the Miniature Rose de Meaux, the Common China rose, the Crimson China rose, the Apple-bearing rose, the Musk rose (single and double-flowered), the Sweet Briar, and Scotch roses (of various colours).

The single Macartney rose (under the name of R. lucida); also the Double Yellow or Yellow Provence rose (R. sulphurea), which is still grown in a few favoured localities are figured. The remaining plates give us a pleasing insight into the resources that were available for the formation of a rose garden 100 years ago.

The artist styles herself "Teacher of Botanical Drawing," and in addition to the work on roses she published a collection of illustrations of Passion-flowers, which is also very scarce. From "Sweet's Florists' Guide," we learn that she became, by marriage, Mrs. Kearse.

Arthur William Paul.

OLD VERSUS YOUNG VINES.

Mr. Mackellar's recent exhibit of Black Hamburgh grapes at Westminster, from the old vine at Hampton Court, should do much to check the uprooting of vines that have been in existence from twenty to thirty years. It is common knowledge that gardeners often condemn vines that have done excellent service for thirty years, especially when taking a new charge. Too often they do not wait to see the result of the first season's growth, but jump to the conclusion that because the vines are old they are useless.

Another cause of this premature uprooting of the vines is their inability to produce large bunches, owing to a lack of proper attention, especially during the early stages of the growth of the rods. Too often there is a distinct craving for huge bunches, but the experienced cultivator knows quite well these are not so satisfactory as compared with smaller bunches of superior berries, colour, and finish.

He, indeed, would be a bold man who would attempt to find fault with the bunches of Black Hamburgh cut from the 140 year old vine in question. The bunches ranged from 2½lb. to 4lb. each, and were perfect in shape, having heavy, well-formed shoulders and a tapering point. The berries were of good size (not excessively large), even, and perfectly coloured, with a density of bloom seldom seen in this variety, but which, when present, always carries weight with a judge, who realises how difficult it is to produce such examples under any conditions.

As a case in point of how old vines can be made to produce perfect grapes, I cite the above instance. It also proves that with judicious management vines are never too old to give good results. Thirty-two years ago I struck eyes from ten varieties of grapes, and grew them for a year in pots, in the Liverpool district, and planted them at Swanmore, in February, 1879. The results have been most satisfactory, as annual crops of really first-class grapes have been and are still produced. Bunches of Madresfield Court, Muscat of Alexandria, and Mrs. Pince especially, have this year weighed 4lb. each, with full-sized berries and good finish. Of the former two varieties the rods have carried from ten to fourteen bunches, Mrs. Pince naturally fewer, because the bunches are larger.

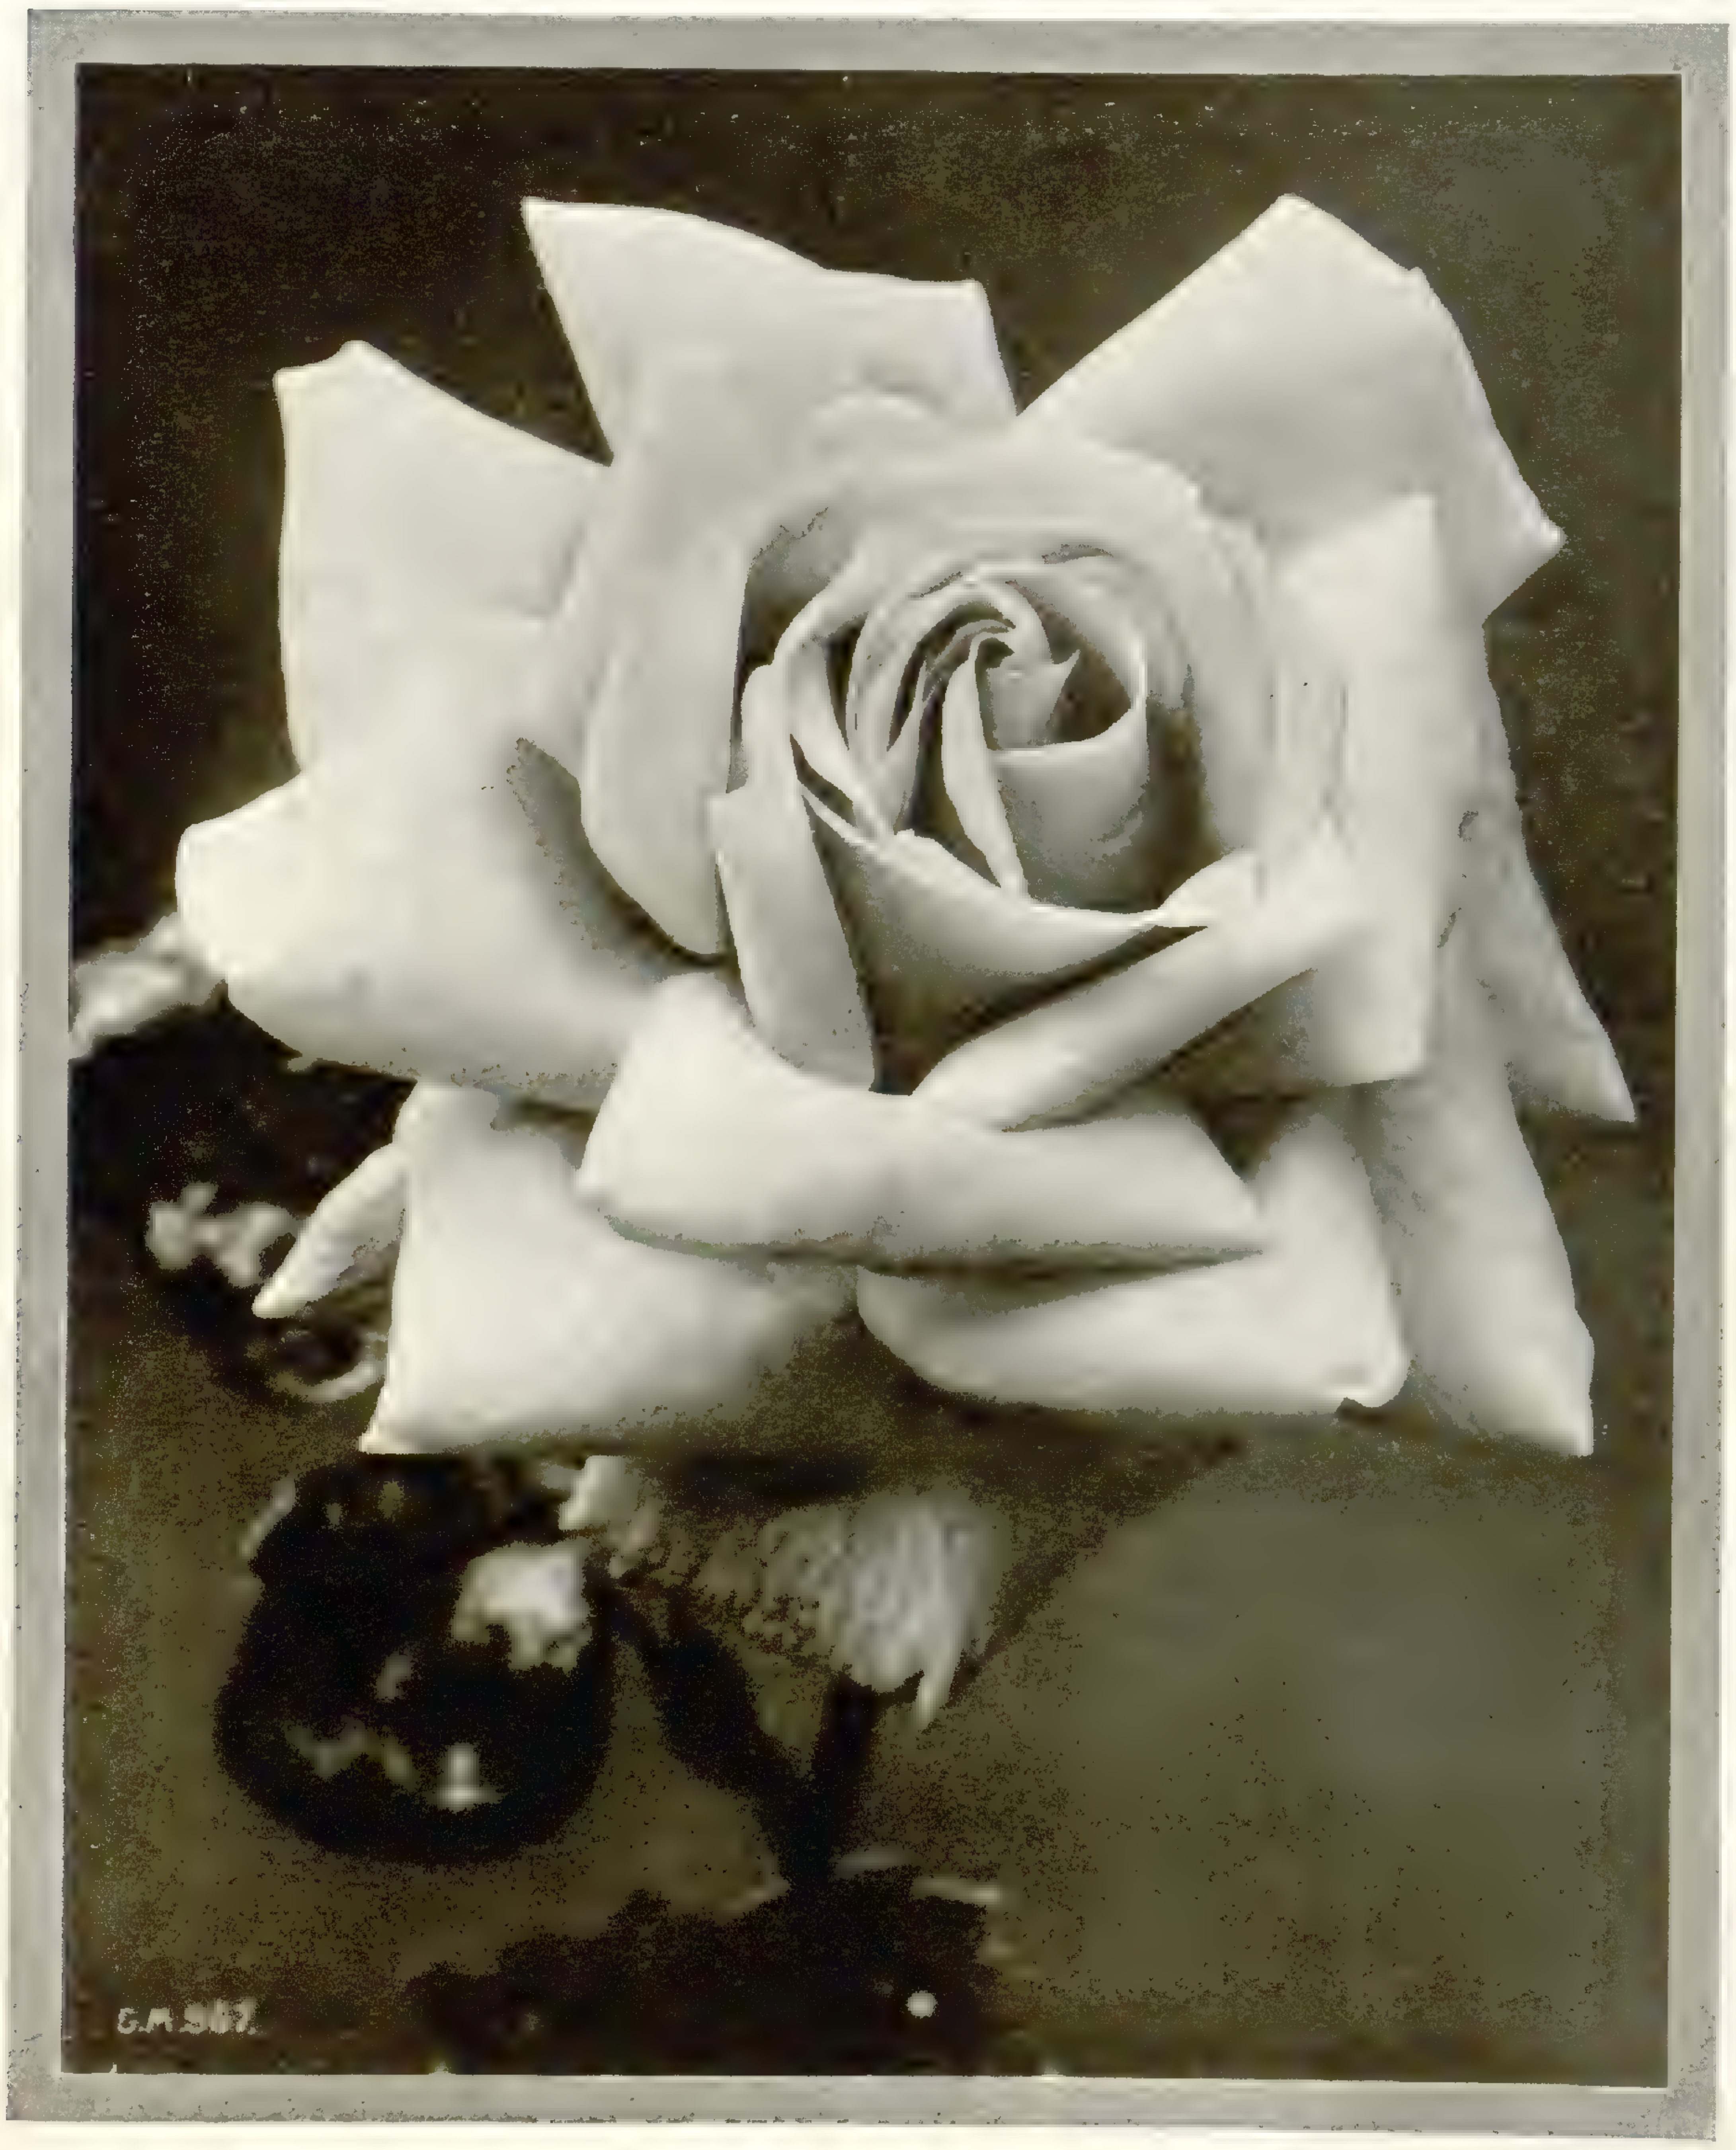
Now when such grapes can be produced after thirty years existence, there does not appear to be much reason for replacing the vines. The circumference of the vines at the base is as follows: Muscat of Alexandria, 10 inches; Alicante, 10¼ inches; Madresfield Court, 9¼ inches; Lady Downes, 9¾ inches; and Black Hamburgh, 9½ inches. Mr. Ellwood has, during the last three years, taken up from the base an occasional new rod in the Muscat house, with a view of invigorating the vines, but not with any other variety has he thought it necessary.

I have in my mind several instances of vineries planted during or about the same year as those at Swanmore, and in two cases the vineries have been replanted within the last ten years, on the plea that the vines were exhausted, and did not give bunches large enough!

What are the causes of deterioration in vines? There are several. Overcropping while the vines are under ten years old is a common cause; neglect to supply moisture to the roots after the crop is gathered is another, and the wish to fill the house too quickly is a frequent cause of failure. With some gardeners there is an undue craving to see the trellis covered in the shortest possible time, and instead of restricting the leader for the first few years to an annual extension of 2ft., as much as 6ft. is allowed to remain, and thus the vines are eventually weakened, not only in the thickness of the rods, but in the growth of the side shoots as well, so much so that many never do give a reasonable bunch of fruit.

My contention is now, and always has been, that where vines are expected to give satisfactory results for upwards of thirty years they must be restricted while in their infant state. I am, of course, referring entirely to vines growing on the single rod and spur system of culture. Vines grown on the extension or many rod principle, so as to fill a house with but one, or, at the most, four vines, in a 100ft. length, come under another category.

Swanmore Park. E. Molyneux.



NEW GOLD MEDAL H.T. ROSE MRS. EDWARD J. HOLLAND.
Shown by Messrs. S. McGredy and Sons, Portadown, Ireland, at N.R.S. Show, September 16.

ESCALLONIA MACRANTHA.

Although in most gardens about London and also in gardens north of the metropolis, it is only possible to succeed with this evergreen shrub when planted against a wall, it forms an extremely useful subject in the south and west counties, for, in addition to being an excellent evergreen, it is a charming late-flowering shrub. It is a native of Chiloe, and at its best forms a bush 10 or 12 feet high and as far through, well clothed with dark green foliage. The flowers are rosy-red, and borne in panicles from the points of the shoots during August and September.

As a wall plant, it has much to commend it, for it may be kept in moderately close by an annual pruning in spring, while it proves an attractive covering throughout the year. It is, however, in those gardens where it can be grown as a bush in the open ground that it is seen to the best advantage, for it is exceedingly handsome whether reckoned with from a floral or foliage standpoint. It stands severe cutting well, and for this reason is sometimes used as a hedge plant, for which purpose it is admirably suited, especially where something a little out of the common is required. D.

Plum, Rivers' Early Prolific.—In gardens where the walls are low, and wall space, generally, is limited, this plum will be found a sterling variety to grow. The tree makes moderately free growth, and rarely fails to bear a very heavy crop of fruits. The latter are of medium size, dense purple in colour, and of good brisk flavour. It is, undoubtedly, one of the best plums for ripening about the third week in July in the southern counties. With me, grown in a light soil, and on a wall facing south, it never fails to bear heavy crops. This variety should be included in orders given this autumn for plum trees.—G. B.

FERN SELECTION.

The fact that ferns, like other plants, when once, by virtue of their "sportive" character, they have adopted a form differing from the specific one, are apt to display the new character in a more or less varied form in the progeny obtained from their spores, renders them susceptible to great improvement on the varietal type if proper selection be adhered to. It may be accepted as a rule that entire reversion to the normal or parental form is rare when the new type is a thoroughbred one, that is, when all the fronds are similarly characterised and symmetrical.

Ferns are not infrequently found which are only partially affected, some of the fronds being normal and others of a different type, or the new character may only appear in parts of the fronds, and not throughout. Such forms are very apt to reproduce their imperfections, and are not, therefore, desirable parents. On the other hand, cases are on record in which only a small part of a frond has betrayed a sportive character, and spores taken from this have yielded a batch of plants so characterised throughout. Gymnogramma Laucheana grandiceps, raised many years ago, is a case in point, a merely dilated pinnule or minor sub-division having been noticed on an otherwise normal plant, and spores sown from this gave a large batch of finely and heavily crested ferns.

It is a common experience when fern hunting to find the Male Fern (Lastrea filix mas) with erratic fronds, the divisions forking and being otherwise varied on irregular lines. They are termed "rogues," since though sometimes promising enough to tempt even the expert to give them a trial, disappointment is the invariable result. One remarkable case, however, occurred in our own experience, in which the final result was not so unsatisfactory. The "rogue" in this case took the form of an apparently thoroughbred crested Male Fern found in Scotland, the side divisions having as many as thirty points. These plants were found in the same coppice, all alike, and all robust plants, with fronds over a yard long, tasselled throughout, and without a defect. Yet, though lifted and potted, and treated with the utmost care, the following season all three reverted to a ragged irregular "rogue" type of the worst kind, and with occasional feeble attempts at producing a decent tasselled frond, so they have remained for now about twenty years. Spores were produced in abundance on the perfect fronds as found, and, naturally, were immediately sown, with a view to propagation. Some hundreds of young plants resulted, but all, with one solitary exception, displayed their "rogue" character at the outset, the one exception, however, began well, and continued to throw up perfect tasselled fronds precisely on the lines of the original find, and this has remained constant to this day.

Obviously, however, it is better, and pays better, to start with constant varieties; and since, thanks to fern hunters, there is now such an abundance of good material, ferns with perfectly symmetrical fronds displaying special beauty, anything of an inferior character should be avoided, especially as some of the irregular laciniate or depauperate varieties possess in their spores such reproductive vigour as to become veritable weeds, and due to this, if sown with better ones, speedily oust and destroy them by overcrowding. Given careful selection of the parents, it is a period of absorbing interest when the young fronds of the progeny begin to develop sufficiently to show character, for it is now that the chances of improved type begin to present themselves.

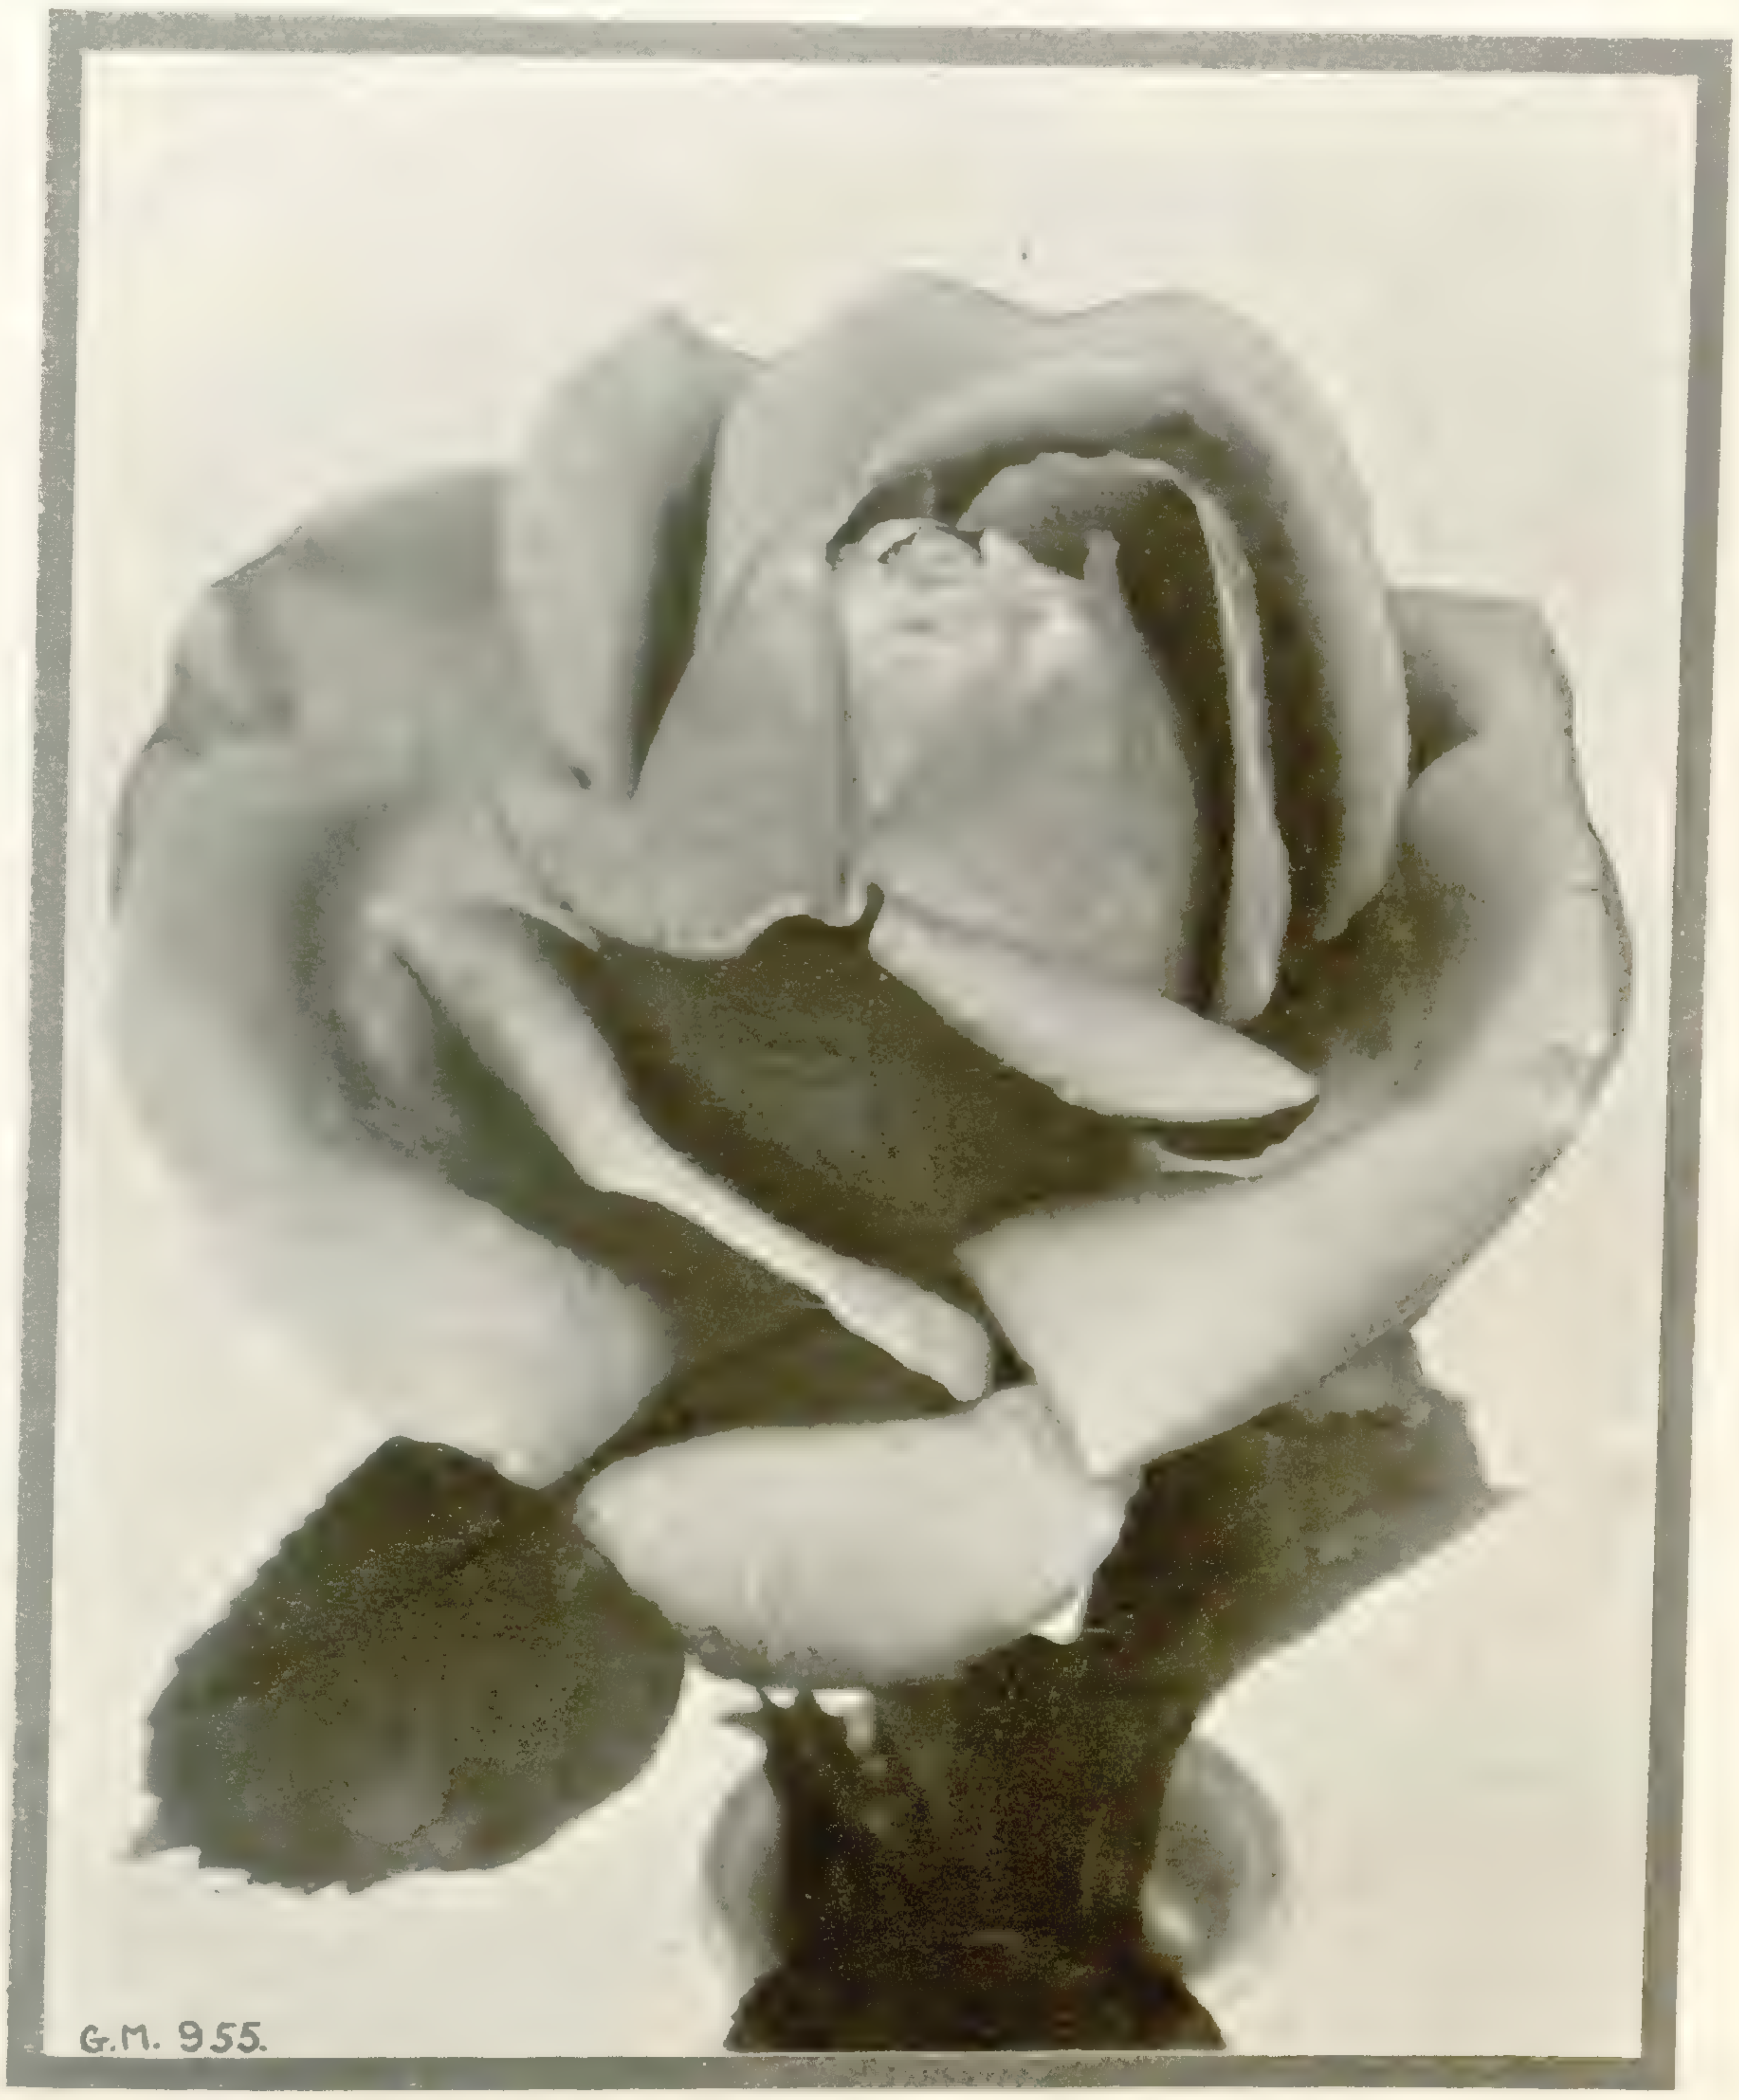
An ordinary sowing, even in a small pot or pan, if successful, is almost bound to yield far and away more plants than the amateur can accommodate as adults, and it is wise, therefore, to eliminate all inferior types as they appear, and to transfer to a special pan all such as distinguish themselves from the rest by superiority of character or distinctness of type. Spores are widely scattered when ripe, and hence with every care, stray spores are generally sown with the special ones, and when the resulting strangers appear these also should be removed, cutting them out with pointed scissors, or if they appear desirable, pulling them out roots and all, and installing elsewhere. It is in this connection that the weed forms above alluded to are likely to assert themselves.

The interest of spore sowing is greatly increased if a careful record be kept. Our plan is to keep a register with consecutive numbers, a corresponding number being marked on the outside of the pan, or on a small label inserted within it. Against the number in the register we give particulars of the sowing, with any remarks necessary to the history of possible results. The date is also attached. The cross-fertilisation of ferns has been often demonstrated as possible, but can only be effected by sowing spores of the intended two parents together, and when the prothalli or little green scales produced by the spores are full size, flooding them by holding the pan in water until it percolates through from the bottom and wets their undersides.

In this way there is a chance that the fertilising organisms of one prothallus may be floated to another, and thus lead to a cross. Without such flooding it is unlikely that the antherozoids can get beyond their own prothallus. The prothalli should remain soaking for half an hour or an hour. The microscopic character of the fern equivalent of pollen grain and stigma precludes manipulation as with flowers, and the above operation is practically the only one available. Such attempts at crossing should, of course, be made with a definite object. A non-crested fern of distinct character should be sown with a good crested one, for instance, and as these two types exist in many forms, a wide field is opened in this direction.

The forms, however, should be thoroughbred in both cases. Some ferns seem to be peculiarly adapted for crossing, and, as a result, if one variety is an irregularly crested one, occasionally failing to produce a tassel at all, we have, as in the beautiful Polystichum family, a whole range of defective combinations, in every one of which the faults appear, with the result that instead of being improvements and acquisitions they are good things spoilt.

Chas. T. Druery, V.M.H., F.L.S.



NEW GOLD MEDAL H.T. ROSE CLAUDIUS.
Shown by Messrs. B. R. Cant and Sons, Colchester, at N.R.S. Show, September 16.

SOME MORE GOOD NEW ROSES.

From time to time I have briefly described the newer roses as they have flowered with us, and since my last reference to them a few additional varieties have come out very prominently. Those that I mention have been growing under my own observation, and I am therefore in no way dependent upon the raisers for the descriptions, so that in some cases it may differ a little from theirs. I mention this because not all of us would describe a flower in the same words. Allowing for a little natural partiality I find the raiser's descriptions generally correct. I do not remember mentioning any of the following previously, and if I have done so, they amply deserve the few words repeated.

MR. GEORGE PRINCE'S GOLD MEDAL DISPLAY OF ROSES,
At N.R.S. Show, September 16.

Mrs. E. G. Hill, H.T., is a good grower that at a distance resembles Joseph Lowe, but when looked at closer is a greatly improved Grand Duc A. de Luxembourg; the deep coral-red on the reverse of petals being very pronounced.

Avoca, H.T., grows well, and whether in the maiden or cut-back stage, is a grand rose. Very sweet-scented and deepest crimson-scarlet. The growth as a maiden or cut-back is as strong as Margaret Dickson.

George C. Waud, H.T., gives a distinct colour among the many shades found in roses; a glowing vermilion touched up with a splash of orange which intensifies the colour. It also lasts well in the most brilliant sun that the present year has supplied.

Lady Ursula is a thoroughly distinct flesh pink that will find its way into any collection, whether for garden, pot, or exhibition. I like this rose very much. It is one of the best in its colour.

Barbarossa, H.P., the "red" Frau Karl Druschki, has not come so good this summer as we had it last autumn, nor do I think it quite so good a grower. If it proves as good late as Frau K. Druschki it will be exceptionally useful.

Colonel R. S. Williamson, a satiny blush, is perfection in form and size, and a good rose, but we do not want any more of these shades.

Elizabeth Barnes has been very pretty with its fawn centre passing to satiny salmon, rosy-red, and copper.

Laurent Carle, H.T., is a brilliant red, and brightens up the hybrid tea section.

Mrs. Stewart Clark, H.T., has been very showy with its cherry-pink flowers. Sure to be a grand garden rose and popular because it is so free and sweet-scented.

Madame Pol. Varin-Bernier, H.T., is one of the most distinct roses, rather like Richmond in growth and form, but a pale lemon-yellow, and stands better than most.

Aennchen Muller, P., has again been a picture among the dwarf polyanthas. One mass of immense trusses. The raiser claims the individual flowers to resemble cactus dahlias, and this is an apt description. Each bloom is looser than Dorothy Perkins and the trusses much larger. It comes remarkably clear under glass, so much so as to appear a distinct variety. This is really first-rate.

Mrs. Arthur Waddle, H.T., is a free grower and bloomer. Quite a new shade of burnished copper, apricot, and the deepest of all shades found in Mrs. Aaron Ward. The petals are large, but the flower only just exceeds the semi-double form. A very showy rose, and apparently one of the Soleil d'Or hybrids.

Blumenschmidt, T., is a citron-yellow sport from Francisca Kruger. There is a slight tinge of pale rose at the edges of petals, and it is equally free in growth and bloom as the old favourite it sported from. Not large enough for the present-day exhibition box, but good for coat and general decoration.

Celia, T., was really charming last autumn, and was good again during the cooler days of the past summer. A showy pure carnation pink.

Mrs. J. W. Budde, H.T., affords a glowing carmine among the Hybrid Teas. As it has grown here it is a decided advance upon Princesse de Sagan and Souvenir de Thérése Levet, especially in growth, and is sure to become a prominent garden rose.

Alice Roosevelt, H.T., is a most promising sport from Madame Abel Chatenay that has flowered well with us. It is deeper in colour, almost red in its younger stages, and apparently longer in the bud. A capital coat flower, very sweetly scented, and is most glowing in artificial light.

Madame Maurice de Luxe, H.T., has come very good in the open ground this season, and was one of our best under glass during winter and early spring. A large, well-built up flower, a good grower, with handsome foliage. Colour deep rose, with a cochineal-red centre. The reverse of the petals are a little lighter, and strongly remind me of an old favourite seldom seen now named Emilie Hausburgh.

Uckfield. A. Piper.

APPLE BEAUTY OF HANTS.

I, too, have not seen this variety other than in Hampshire. When the garden here was made in 1878 my attention was drawn to the variety in Messrs. R. Smith's nursery at Worcester, when selecting the fruit trees, and out of sentiment to the name I planted one tree, a standard. I have always looked upon the variety as a poor form of Blenheim Pippin, but with certain characteristics about it that made the variety desirable. While Blenheim Pippin is not in a fit condition to eat until November, Beauty of Hants is quite ready a month earlier, and as good dessert apples are scarce about that time, Beauty of Hants is a desirable crop to have. The trees does not grow so rapidly as the Blenheim, but it generally crops well. The fruit, being smaller, is of good size for dessert, whereas the Blenheim is too often over large. With me it never did keep until Christmas. October is its natural month of ripening. I know nothing of its origin, but assume it to be a seedling from Blenheim Pippin

E. Molyneux.

Swanmore Park.

Roses may be grown to perfection by following the instructions given in Roses and their Cultivation, by T. W. Sanders. A selection is given, with description of all the best varieties, and full details for culture outdoor and under glass. Price 2s. 6d. net, by post, in box, 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

BELLADONNA LILIES.

The Belladonna lily and its varieties appear in all their richness of colouring, and fill the garden with their sweet fragrance in autumn, when the power of the sun is on the wane. These amaryllis represent a very beautiful and refined type of bulbous plant, and are rendered very conspicuous by the fact that their inflorescence is produced in advance of the foliage. This, from an artistic point of view, may be termed a drawback, but we possess abundance of suitable material to associate with them in a cut state, while various plants of elegant and well-furnished appearance may be given a place in their immediate neighbourhood.

We are all reminded at this season of splendid colonies that have been in existence for a long term of years, and that become more profuse year by year, with but little attention beyond an annual top-dressing.

On the other hand, a huge number of failures are recorded with new plantations, and it may be explained that it is idle to conjure up scenes of extreme loveliness for a season or two after planting. This applies more particularly to bulbs which are imported from a much warmer climate than our own, and which require time to become acclimatised. It not infrequently happens that these bulbs are allowed to flower before they have become established; and, of course, the latent flower spike exists in the bulbs when purchased. This early flowering has a decidedly weakening effect upon them, the evil being aggravated by exposure to much colder conditions than they have hitherto experienced in winter. Hence the necessity of removing the flower spikes as soon as they appear, and of encouraging healthy growth by placing either frames or handlights over them.

Another and vastly more satisfactory way out of the difficulty, or, at least, to ensure success from the outset, is to purchase English-grown bulbs, and leave the others to the more skilled attention of trade growers. Other important points are a suitable position and efficient drainage. The greenhouse almost invariably occupies a sunny site, and is usually surrounded by a narrow border, and here we have an ideal spot for Amaryllis belladonna. If the soil is of a heavy, tenacious character, it must be taken out to a depth of 2½ft., and a 6in. layer of broken brick-bats, crocks, etc., be placed at the bottom, followed by a layer of turves, which will ensure perfect drainage. Then a liberal quantity of very light and sandy soil should be mixed with the loam as it is being replaced, the border being brought up 6in. above the surrounding level.

Early in October is the best time to form plantations, the bulbs being buried 6in. deep, and the soil very thoroughly solidified around them; in fact, I would advise a slight ramming of the ground after planting is completed. Abundance of water is necessary during the time leaf growth is being made.

As regards varieties, the old type plant is in every way excellent, and certainly was never so popular as it is to-day. A. Belladonna purpurea major stands alone in being indifferent to surroundings and position, and its great vigour enables it to flourish amazingly under circumstances where the others would cease to exist. A magnificent form is seen in Kewensis, which is far and away the finest of the family. It has enormous stems, and from eighteen to two dozen flowers are produced upon a spreading umbel, and these are of great substance, and of a beautiful shade of rose. The variety blanda does not find much favour in this country, but I understand it is largely grown on the Continent. The variety major is very fine, with dark-rose petals of great length; while rosea perfecta has the same colouring as blanda.

Amateurs who visit Kew Gardens during the autumn should make a point of inspecting the superb display of these refined subjects, and happily they are now represented in large colonies in the majority of the great London and provincial parks.

Walter H. Aggett.

MESSRS. FRANK CANT AND CO.'S FIRST PRIZE GROUP OF THIRTY-SIX BUNCHES OF DECORATIVE ROSES, at N.R.S. Show, September 16.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

COOL HOUSE ORCHIDS.—The general repotting of odontoglossums should now be proceeded with without delay. It is advisable that the plants should be given an opportunity to become rooted into the fresh potting compost before the colder nights set in, as they are less liable to become shrivelled or otherwise detrimentally affected when the potting is completed a few weeks before there is likely to be much artificial heat required. The atmosphere of the house should be kept moist and cool about the plants, as this will encourage root action, as well as prevent the pseudo-bulbs becoming unduly shrivelled. Constant observation for thrips is necessary at this season of the year, and as soon as any signs of the pest are found the necessary steps for their destruction must be taken. There is nothing more injurious to the growth of the plants, or anything more disfiguring to the foliage than thrips. Where the houses are situated close to herbaceous borders the difficulty of keeping odontoglossums free from thrips is considerably increased; but where the method of spraying at regular intervals is adopted the pest may be kept in check.

MASDEVALLIAS.—Where the necessary repotting of the large-growing kinds has not been done this should now receive attention. Before repotting it is well to have the foliage of the plants sponged. Care must now be observed to prevent any excessive accumulation of moisture towards evening. Now that the cooler nights are setting in it is well to see the moisture in the atmosphere is reduced to the minimum. I consider a great deal of the unsightly black spotting of the foliage is caused by an excess of moisture in the atmosphere, combined with a low reading of the thermometer. A minimum of 50 deg. is quite as low as can with safety be reached, with the atmosphere at all damp, at any season of the year.

DECIDUOUS DENDROBIUMS.—Many of the species and hybrids will now have completed their growth. Those that have matured should be removed from their growing quarters and placed in a drier atmosphere.

in a position where they may obtain the maximum amount of bright light, as this will assist them to properly ripen their flowering growths; and the fact should not be overlooked that the best quality of any flowers can only be procured from properly-ripened growths. Liberal ventilation should be afforded when the outside conditions permit, and an occasional syringe overhead will assist in keeping down red spider and other insect pests, which are liable to attack the plants as soon as the condition of the atmosphere becomes at all dry. Sufficient root moisture should be given to retain the pseudo-bulbs in a normal, plump condition, but care must be observed to prevent, as far as possible, the plants restarting into growth, which is very liable to take place when they are subjected to over-liberal treatment. There are some kinds, such as D. Wardianum, where it is natural for the plants to commence secondary growth, often before the last growth is completed. Where this is the case too much encouragement must not be given to the young growths, even if the lower leaves become discoloured, it will generally be found that they restart in due season.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

CONSERVATORY. — Serious thought must now be given to housing all plants that are likely to be injured by frost, especially so as already frost has been registered on the grass. The late batches of begonias, fuchsias, gloxinias, etc., etc., must be placed in the conservatory, and so make it bright for the last time this season with summer-flowering plants, and a good show they still ought to make intermixed with liliums, early-flowering chrysanthemums, and salvias. These will all make room in the greenhouses for other things.

CHRYSANTHEMUMS.—Where a large batch of the earlier flowering varieties is grown, such as Soleil d'Or, Le Pactole, Polly, Harry, Horace Martin, and others that do not quite come to perfection out of doors, these should, if possible, be placed in a house by themselves, and it will be found that they will be over in time to make room for the latest batch of decorative varieties. Preparations must also be made for housing the main batch of Japanese and incurved varieties, and usually these are placed in vineries and peach houses; this being the case, all unnecessary foliage must be cleared from the vines or peaches, afterwards giving the house a good syringing or hosing down, and at the same time giving the borders a thorough soaking of water. All the plants should be sprayed with sulphide of potassium before housing, taking care that they are dry before being taken in, or any paint work that is splashed by the wet plants will turn brown. Try to arrange all the earlier plants together in one house, and keep later ones separate, so that if they are wanted out by a certain date for a party or a show, a little heat may be given or withheld as they require it. If the pots are stood upon the vine or peach borders it is as well to use boards beneath the pots, and a good plan is to place clean straw among the pots, as this prevents the borders from becoming dry, and also keeps the moisture from rising and spoiling the flowers as they open. Keep the houses as cool as possible for a time, not giving any fire heat till the blooms begin to expand, when, of course, sufficient must be given to keep the atmosphere dry. Do not stint water at the root for the first week or two after housing, giving a little liquid manure to all the backward plants, but after the flowers begin to expand greater care must be taken with the watering.

ARUMS, EUPATORIUMS, SALVIAS, ETC., planted out in the open ground should be lifted at once and carefully potted, keeping them close and lightly syringed overhead until they get over the check. Half-hardy plants that may be plunged out on the lawn in exposed positions should be removed to more sheltered quarters on the first sign of serious frost.

POT ROSES.—The present is the best time for overhauling these, and, where necessary, they should be repotted; and those that do not require potting should be turned out to see that the drainage is quite clean, and then be given a good top-dressing of loam, with a little bone-meal and charcoal added. After potting, or top-dressing, all the pots should be plunged to the rim in straw litter or leaves, and this will encourage the formation of new roots much more quickly than if they were stood in the open without something to protect the pots. It is almost unnecessary to add that an open position is the best for the plants. In the case of climbing varieties and standards, they should be securely staked to prevent damage by wind.

BULBS.—Continue to pot up all bulbs for forcing directly they come to hand, plunging the same in ashes, preferably in cold frames, as there they can be dealt with even during the hardest of weather, which is not the case if they are plunged in the open. Further batches of freesias and lachenalias should also be potted, but these will not require covering. Roman hyacinths potted early in August should now be rooting freely, and may be removed from the ashes, and if wanted very early, may be introduced into a little heat.—Thomas Stevenson, Woburn Place Gardens.

THE FLOWER GARDEN.

PENTSTEMONS.—If not already done, no time should now be lost in propagating the best varieties of these for another season's supply, by cuttings, which should now be plentifully produced from the base of the plants. These must be firmly inserted in a sandy compost, either in frames, boxes, or pots. Personally, I prefer the latter, using five-inch pots for the purpose, placing six or seven cuttings in each. An unheated frame will suit them best. Keep shaded if the sun be unduly bright until they are established, afterwards give all the air possible. Care must be exercised during the winter, or frost will seriously injure them. Therefore cover the frames, and especially the glass, whenever the weather is doubtful. If it is desirable to increase pentstemons by seed, this must be collected, well dried, and cleaned. The seed should be kept dry, and sown early in the spring.

FLOWER BEDS.—Any cuttings that are now required from the occupants of these should be taken off without delay. These should be examined at frequent intervals and all decaying flowers removed. Aim at keeping the beds as attractive as possible for the short period that the summer occupants will remain in them. Slight protection when an early ground frost is likely to occur should be given to such tender subjects as heliotropiums, calceolarias, begonias, etc., and this will often prolong their attractiveness. When compulsory steps have to be taken to remove the plants, all those required for another season, such as standard fuchsias, lantanas, pelargoniums, etc., should be put into pots. These will require well picking over, the growths shortened back, and be put into pots, using the smallest size possible. Stand them closely together in cool houses or deep pits. All plants of echeveria should be boxed up or otherwise stored in a cool place from which frost can be excluded, keeping them in a fairly dry condition during the winter months.

MONTBRETIAS.—Rapid strides have been made during recent years in improving the quality and variety of these charming autumn-flowering bulbous plants. Their extreme vigour, many of them producing spikes three to four feet long, with flowers two to three inches apart, must secure for them a position in most borders. After the flowering period is past, it is an excellent plan to lift and put them in boxes, using a light leafy compost, and winter in cold frames, as our wet, cold winters are liable to cause them to rot.

BULBS.—The present affords a good time for the planting of many kinds of bulbs in the open ground, and the effect produced in the spring when the planting has been carried out in such manner as to give them a natural appearance, will be pleasing, and much appreciated. Large quantities of winter aconites (Eranthis hyemalis), a bulb which will grow almost anywhere, should be planted where the yellow flowers will be the first to herald the approach of spring. The mixed varieties of crocus will make a brilliant show, also amongst small bulbs the Dog's Tooth violets (Erythroniums) produce charming effects when liberally planted in grass. All varieties of narcissi are suitable for wild gardening, and all bulbs which have done duty for forcing should be carefully looked after, and planted for this purpose.—E. Beckett, Aldenham House Gardens, Elstree.

HARDY FRUITS.

FILBERTS AND COB NUTS.—These are a heavy crop with us this year, but owing to a most unpropitious season, the fruits are not so large as usual. Earwigs are very apt to secrete themselves in the husks of the filbert, and the latter should be closely examined before being sent in for dessert. Squirrels are very partial to these nuts, and if means are not taken to prevent them they will soon clear the trees. Filberts required for keeping should not be gathered until quite ripe, that is when the husks and nuts have become brown, and the latter parts freely from the husk. After gathering the nuts should be well dried by being laid out on some boards in the sun for two or three days before being stored. Earthenware jars or some large clean flower pots answer well for this purpose. Place the nuts in layers, and sprinkle a little salt between each layer until the pots are filled, then place a piece of slate on the top to prevent mice from getting to the nuts, and place the jars in a cool, but perfectly dry place, where the salt will not dissolve. Cob nuts should be gathered before they leave the husks, if not, many will fall out and be lost if the trees are growing on grass.

WALNUTS.—These are, with us, a very poor crop, owing to the greater portion of the blossoms being destroyed by late frosts. It is usual in many places to "thrash" the trees to get the nuts, but I think it a better plan to send a man up into the trees to give the branches a good shaking, when those nuts that are ready will fall, and in this condition they will part freely from the husks, and can be easily removed from the outer covering without staining the shell. Nuts so stained are not so eligible for the dessert table as those that are perfectly clean. For keeping purposes walnuts should not lay about or the kernels will soon shrivel after they are taken from the husks. We usually store ours away at once, and use receptacles as advised for filberts, but we cover each layer of nuts with a mixture of equal parts of silver sand and salt, and have no difficulty in keeping the nuts plump and fresh as long as required, but care is necessary to prevent the salt from dissolving, or the brine will enter the shells and spoil the nuts.

PLANTING.—After notes have been made as to the quantity of fresh trees that will be required for filling up vacancies, or for making new plantations during the coming season, special care should be exercised in selecting the varieties of each kind. In some establishments large quantities of fruit are often wanted at certain seasons of the year, while in other places a regular supply over as long a period as is possible is required, therefore the wants of each place must be taken into consideration when purchasing additional fruit trees. It is undesirable to plant more of the earlier varieties of apples and pears than is actually required, as the fruits from these so soon become useless after being gathered.

STRAWBERRIES.—Beds which are to remain for another season should have all runners removed, and a few of the outside and worn-out leaves trimmed off. Lightly prick over the soil with a garden fork, and give the beds a light mulching of well-decomposed farmyard manure. — Geo. Woodgate, Rolleston Hall Gardens.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

National Rose Society.

The autumn exhibition of this society, held at the Royal Horticultural Hall, Westminster, on Thursday, September 16, was a remarkable one, because, although there were many feet of blank spaces on the tables, there was a display of roses that must be regarded as wonderful, considering the unkind weather that has of late prevailed. Some fine blooms came from Scotland and Ireland, but the decorative roses from the south of England, and the amateurs' efforts, were splendid also. The greater enthusiasm in rose culture, and the production of varieties that bloom well in autumn, have done much to bring about such a result as was evident on Thursday last.

NURSERYMEN.

Messrs. James Cocker and Sons, Aberdeen, were awarded first prize for three dozen blooms, distinct varieties, and they won with a beautiful set of clean, bright flowers, their leading varieties being Mrs. J. Laing, F. K. Druschki, Madame Wagram, Caroline Testout, J. B. Clarke, The Lyon, Richmond, Captain Hayward, Mrs. W. J. Grant, Lohengrin, Hugh Dickson, Mrs. T. Roosevelt, Madame Melanie Soupert, A. Colomb, and Gladys Harkness. Mr. Hugh Dickson, Belfast, second; Messrs. Adam and Craigmile, Aberdeen, third; and Messrs. Alex. Dickson and Son, Newtownards, co. Down, an extra prize. There were ten competitors.

Premier place for a collection of thirty-six varieties of roses, in bunches of not fewer than three trusses each, was well won by Messrs. Frank Cant and Co., Braiswick, Colchester, with a glorious display that included Betty, Earl of Warwick, F. K. Druschki, Madame Melanie Soupert, Lady Ashtown, Liberty, Sulphurea, Irish Glory, Lady Waterlow, Mrs. T. Roosevelt, Madame Abel Chatenay, and Edu Meyer. Mr. John Crossling, Penarth, secured the second award with smaller bunches of beautiful blooms. Mr. J. Mattock, Headington, Oxford, third, with a splendid set that seemed to merit a higher award, the blooms being so fresh and bright. There were five displays, and these were very effective.

There were four entries in the class for eighteen tea and noisette roses, distinct varieties, and here the chief award fell to Messrs. Adam and Craigmile, Aberdeen, for a clean set of medium-sized flowers of White Maman Cochet, Madame C. Soupert, Madame Lambard, Lady Roberts, Luciole, Madame Hoste, Maman Cochet, The Bride, etc. Mr. George Prince, Longworth, second; and Mr. John Pigg, Royston, Herts, third. The best set of twelve varieties of exhibition roses, seven blooms of each, in vases, came from Mr. Hugh Dickson, Belfast, who scored with very good blooms of Dean Hole, Caroline Testout, J. B. Clarke, Mrs. Stewart Clarke, Madame Wagram, Gladys Harkness, W. E. Lippiatt, F. K. Druschki, Ulrich Brunner, Hugh Dickson, Princess Marie Mertchersky, and Mrs. John Laing; Messrs. Cocker and Sons, second; and Messrs. Alex. Dickson and Sons, Newtownards, third, the latter showing Alex. Hill Gray, The Lyon, Oscar Cordel, and Harry Kirk finely.

The best dozen blooms of any one rose, in a vase, were good examples of Mrs. J. Laing, shown by Mr. J. Mattock, Headington; Mr. W. Ferguson, Brucefield, Dunfermline, second; and Messrs. D. Prior and Son, Colchester, third, the latter showing F. K. Druschki.

For twenty-four distinct varieties of garden roses, in vases, arranged on a space 8ft. by 6ft., Messrs. Frank Cant and Co., Colchester, led the way, and put up a very attractive exhibit of G. Nabonnand, Edu Meyer, Lady Wenlock, Irish Pride, Beryl, Gustave Regis, Ecarlate, Sulphurea, Peace, etc.; Messrs. Paul and Son, Cheshunt, were placed second; and Mr. J. Mattock, Headington, third. The best set of twelve varieties of decorative roses, in vases, was adjudged to be the one from Mr. Charles Turner, Slough; Betty, Madame Ravary, Irish Elegance, Le Progres, and Madame Abel Chatenay were the leading varieties. Mr. J. Crossling and Mr. W. Ferguson were placed equal second; and Mr. G. Prince was awarded a third prize.

In the section for decorative roses there were three entries in the class for a dozen bamboo stands, each filled with blooms of one variety, and here Mr. Charles Turner, Slough, secured the premier award with a very fine exhibit, the varieties so well shown being Madame J. Grolez, La Tosca, Madame Ravary, Madame Abel Chatenay, Mrs. W. H. Cutbush, Viscountess Folkestone, Gruss an Teplitz, Dorothy Perkins, Betty, Madame P. Ducher, Papa Gontier, and Irish Elegance. Mr. J. Mattock, Headington, second; and Mr. H. Drew, Headington, third. Messrs. Frank Cant and Co., Colchester, scored for a set of twelve varieties of polyantha roses, in vases, their best varieties being Eugenie Lamesch, Mrs. W. Cutbush, Phillipine Lambert, Frau Cecilie Walter, and Leonie Lamesch; Messrs. Benjamin Cant and Sons, Colchester, second; and Messrs. W. and J. Brown, Peterborough, third.

Messrs. Hobbies, Lim., Dereham, won the gold medal and first prize offered for a representative group of roses in pots, baskets, vases, etc., arranged on a floor space of 100 sq. ft. They occupied the corner next the upper annexe, and filled it with standards of Wichuraiana varieties, filling up the space under these with large stands of cut blooms of Madame Abel Chatenay, General McArthur, La Tosca, Betty, Madame Ravary, Gustave Regis, Countess of Gosford, and other beautiful varieties, and making a foreground with baskets of Le Progres, Madame Melanie Soupert, Edu Meyer, Mrs. J. Laing, White Maman Cochet, etc. Messrs. Paul and Son, Cheshunt, filled the opposite corner of the hall, and set up large bowls of Mrs. J. Laing, Gustave Regis, Madame Ravary, La Tosca, Madame Abel Chatenay, F. K. Druschki, and the lovely Irish Glory; they won second prize.

The displays of roses on a staging space of 10ft. by 6ft. made a very fine feature of the show. There were three competitors, and Mr. George Prince, Longworth, scored, winning the gold medal and first prize with a most artistic display in which tall pillars, big stands, arches, and baskets were used effectively for the display of the blooms. The leading varieties were Mrs. J. Laing, Irish Elegance, Mdme. Abel Chatenay, F. Karl Druschki, Lyon Rose, Perle des Jardins, Mdme. Ravary, Gustave Regis, and Irish Harmony. This was a very fine exhibit. Messrs. W. and J. Brown, Peterborough, won the silver-gilt medal with a bold and attractive exhibit of good flowers, and the King's Acre Nursery Company secured the third prize.

The class for a representative group of cut roses arranged on an area of 60 sq. ft., and to include varieties of various sections, was a popular one, and there were four entries. The first prize was won by Mr. F. M. Bradley, Church Street, Peterborough, with a very prettily arranged display, but one in which the dressing of the blooms was rather too evident. There were tall stands and vases of Frau Karl Druschki, Mdme. Abel Chatenay, Mdme. Hoste, Pauline Bersey, J. B. Clarke, Betty, Climbing Lady Ashtown, etc., all very pleasingly arranged with long sprays of rose foliage. Messrs. R. Harkness and Co., Hitchin, were a very close second, and had grand stands of Mdme. Abel Chatenay, Hugh Dickson, Edu Meyer, Betty, Mrs. J. Laing, F. Karl Druschki, etc., but the front of their display was not so fine as the back and centre; Messrs. G. Jackson and Son, Woking, third.

For an exhibit of rose hips in vases, Mr. Chas. Turner gained first prize, and he had bright bunches of Rosa pyrenaica with elongated hips, grand vases of R. rugosa rubra, R. Rose Apple, and the double Pink Scotch with blackish fruits; Mr. George Prince, Longworth, second; and Messrs. F. Cant and Co. third.

AMATEURS.

The chief amateurs' class was one for eighteen blooms, distinct, and here Mr. E. B. Lindsell, Bearton, Hitchin, asserted his superiority once more, with a very even set of fair flowers, among which Suzanne M. Rodoconachi, Mrs. T. Roosevelt, Frau Karl Druschki, Maman Cochet, Mrs. J. Laing, Hugh Dickson, Comte de Laimbaud, Caroline Testout, and J. B. Clarke were the best varieties; Mr. Conway Jones, Hucclecote, Gloucester, came second; and the Rev. J. H. Pemberton, Havering, third; six entries. Mr. W. O. Times, Hitchin, scored for a dozen blooms, distinct, and he had good flowers of Mrs. Laing, Frau Karl Druschki, White Maman Cochet, Bessie Brown, and Mdme. Jules Gravereaux; Mr. G. Speight, Market Harborough, second; and Mr. W. C. Romaine, The Priory, Old Windsor, third; eight entries.

Nine fine blooms won first prize for Mr. Wm. Upton, Claremont Street, Leicester, and his varieties were Caroline Testout, Horace Vernet, Frau Karl Druschki, Bessie Brown, Ulrich Brunner, J. B. Clarke, Mrs. J. Laing, W. E. Lippiatt, and Maman Cochet. Mr. C. F. H. Leslie, Epcombes, Hertingfordbury, second, and Mr. E. B. Lehmann, Ifield Lodge, Crawley, third; three entries. Rev. H. S. Arkwright, Binfield Rectory, Berks, scored for six blooms, with Frau Karl Druschki, K. A. Victoria, La France of '89, Mrs. David McKee, Gustave Piganeau, and Earl of Warwick; Mrs. M. Barnes, Sydenham House, Rochford, second; and Mr. S. J. Hogg, Leaside, Hertingfordbury, third; nine entries.

In the amateurs' class for six blooms in four varieties, Mr. J. W. Kaisar, Heimat, Penarth, won the first prize, and Mr. E. W. Morris, Uckfield, Sussex, came second, with Mrs. V. Wood, Rosemont, Rickmansworth, third; seven entries. Mr. H. R. Darlington, Potters Bar, led for a dozen vases of roses, and he showed Papa Gontier, Mdme. Ravary, Gustave Regis, and Corralina in good form; Rev. J. H. Pemberton second, and Mr. E. B. Lindsell third.

Mr. Conway Jones, Hucclecote, Gloucester, led the way for a dozen tea and noisette roses, but his was a poor set, Mdme. Hoste and White Maman Cochet being the only decent flowers; Rev. T. E. W. Henslow, Stanton Rectory, Chippenham, second; and Mr. E. M. Eversfield, Denne Park, Horsham, third. Mr. M. Whittle, Belgrave Avenue, Leicester, scored for nine teas and noisettes, and had small bright flowers of Mdme. Pierre Notting, Mdme. Constant Soupert, and Maman Cochet; Rev. J. A. L. Fellowe, Bunwell Rectory, Attleborough, second; and Mr. C. F. H. Leslie third. Mr. Upton was first, Mr. W. O. Times second, and Rev. H. Tower, Holy Trinity, Windsor, third for six tea and noisette roses.

For six vases of exhibition roses the Rev. J. H. Pemberton led; Mr. E. B. Lindsell was second, and Mr. Eversfield third. There was only one exhibit of four vases of tea roses, and this, from Rev. T. G. Henslow, Chippenham, was awarded a first prize.

The Rev. J. H. Pemberton scored for a dozen vases of decorative roses, and his best were Gustave Regis, Gruss an Teplitz, Rosette de la Legion d'Honneur, and Dorothy Page Roberts. Mr. Conway Jones annexed the first prize for nine vases of decorative roses, and he had a pretty vase of Irish Elegance; Mr. H. R. Darlington second. For seven varieties of roses in bamboo stands, the Rev. J. H. Pemberton, Havering, was an easy first with charming sets of Trier, Dorothy Perkins, Hiawatha, Gruss an Teplitz, Leonie Lamesch, Daphne, and Blush Monthly; Mr. Conway Jones second, and Mrs. V. Wood third.

FLORAL DECORATIONS.

Premier award for a table decoration of roses was won by Miss A. F. Harwood, St. Peter Street, Colchester, with a particularly pleasing design of beautiful Mdme. Abel Chatenay blooms; Mrs. G. A. Hammond, Cambrian House, Burgess Hill, second with the single coppery-yellow Muriel Jamieson; Mrs. J. W. Smith, Sparrows Herne Hall, Bushey Heath, third, with Irish Elegance; and Mrs. E. P. Butcher, Upper Brook Street, Ipswich, fourth.

Miss A. Harwood, Colchester, scored for a bowl of exhibition roses, and was followed closely by Miss E. M. Robinson and Mrs. Edwin Mawley, who were second and third respectively. In the open class Mr. J. Mattock submitted the best bowl of China roses, showing the pretty Comtesse du Cayla; Mr. E. J. Hicks, Twyford, Berks, second; and Messrs. B. R. Cant and Sons third.

In the ladies' class for a bowl of roses, Miss E. M. Robinson, Emerson Park, Hornchurch, was first; Mrs. C. A. Tisdall, Trevor Road, Woodford Green, second; and Miss Jessie Langton, Raymead, Hendon, third, all showing Mdme. Abel Chatenay. The best basket of roses was a light arrangement of yellow blooms from Miss E. M. Robinson; Miss Jessie Langton was second with an equally beautiful design; and Mrs. E. Williamson, Wilstead, Canterbury, third.

SILVER MEDAL ROSES.

Nurserymen.—H.P., Mrs. J. Laing, from Messrs. Adam and Craigmile; H.T., Earl of Warwick, from Messrs. Adam and Craigmile; T., Souv. de Pierre Notting, from Messrs. S. McGredy and Son.

Amateurs.—H.P., Mrs. J. Laing, from Mr. W. O. Times; H.T., Earl of Warwick, from Rev. H. S. Arkwright; T., Maman Cochet, from Mr. E. B. Lindsell.

National Dahlia Society.

The second exhibition of this society for the year, held on September 21 and 22, at the Royal Botanic Society's Gardens, Regent's Park, was, in the matter of quality, far and away better than the show at the Crystal Palace a fortnight previous. It was also of considerable extent, and the competition was keen.

Only two new dahlias obtained the approval of the committee of judges, and these were Tristram, a crimson pompon variety, from Mr. Charles Turner; and Prima Donna, a white cactus variety, from Mr. H. Shoesmith. Unfortunately, the close of the business of judging was marred by an untimely and unconstitutional protest against the judgment given in one of the amateur classes for pompons.

OPEN CLASSES.

Fourteen open classes were provided, and in the first of these Mr. W. Stephens, Isleworth, offered prizes for three vases of cactus varieties put into commerce for the first time in 1907-8. The premier award fell to Mr. John Walker, Thame, for handsome vases of Harold Peerman, Helium, and C. E. Wilkins; Messrs. Keynes, Williams, and Co., Salisbury, second with T. A. Havemeyer, Ruby Grinsted, and Caradoc; Mr. M. V. Seale, third, with C. E. Wilkins, Frederick McQuade, and Harold Peerman. Messrs. J. Burrell and Co., Cambridge, led for nine bunches of pompon cactus dahlias, six blooms in a bunch, winning with neat flowers of Mercy, Alwyn, Argus, Minima, Cheerful, Martha, William Marshall, Lena, and Nora; Mr. M. V. Seale, Sevenoaks, second, and Messrs. J. Cheal and Sons, Crawley, third.

For show and fancy dahlias, twenty-four blooms, distinct, the chief honours were secured by Mr. J. Walker, Thame, Oxon, with a very fine set of blooms, the leading varieties being Thomas Pendered, Rothesay, R. T. Rawlings, Harry Keith, Chieftain, Duchess of York, A. M. Burnie, and Ethel Britton; Mr. S. Mortimer, Farnham, second, and Mr. M. V. Seale, third. The best dozen show and fancy dahlias were those shown by Mr. R. Burgin, 21, Bower Street, Bedford, who scored with Mrs. Sanders, Colonist, John Walker, Duke of Fife, Gracchus, H. Walton, William Rawlings, J. T. West, G. Rawlings, R. T. Rawlings, Rev. J. B. M. Camm, and Thomas Anstiss, in fine form; Messrs. J. Cheal and Son, Crawley, second, and Mr. S. H. Cooper, The Hamlet, Chippenham, third.

The class for a dozen bunches of cactus dahlias, distinct varieties, six blooms of each, proved an attractive one, and there were four contestants, first prize falling to Messrs. J. Stredwick and Son, St. Leonards, for a set that contained numerous varieties with incurving petal tips; the varieties were Snowdon, Quimbo, Satisfaction, Harold Peerman, W. H. Wenham, Red Admiral, Ruby Grinsted, C. E. Wilkins, H. H. Thomas, and William Marshall. Messrs. J. Burrell and Co., Cambridge, came in an excellent second, and Messrs. J. Cheal and Sons, third.

For twenty-four cactus dahlia blooms, distinct, staged on boards, the prizes fell, in order of merit, to Messrs. J. Stredwick and Son, St. Leonards; Messrs. J. Burrell and Co., Cambridge; and Messrs. Keynes, Williams, and Co., Salisbury. The former showed good examples of Quimbo, H. H. Thomas, William Marshall, J. B. Riding, Monarch, Glory of Wilts, W. H. Wenham, Mercury, Red Admiral, C. E. Wilkins, and Harold Peerman. For a dozen cactus dahlias, distinct, on boards, Mr. M. V. Seale secured the first prize with bright blooms of William Marshall, Mrs. T. W. Miller, Evening Star, Imperial, Diadem, C. E. Wilkins, Lady Kenmare, C. H. Curtis, Rev. A. Bridge, Sir J. Sinclair, Clincher, and Satisfaction; Mr. S. Mortimer and Messrs. J. Cheal and Sons were second and third respectively.

Mr. J. Walker, Thame, annexed the first prize for three vases of cactus dahlias, nine flowers in each vase, arranged with suitable foliage. Mr. Walker had first-class flowers associated with sprays of golden privet, purple plum, and tall grasses; Mr. M. V. Seale second, and Messrs. Keynes, Williams, and Co., Salisbury, third. There were four exhibits, all good.

Messrs. Keynes, Williams and Co. led for six cactus blooms, one variety, with Clincher; Mr. J. Hicks, Bensham Manor Road, Thornton Heath, second, with William Marshall; and the Rev. A. Bridge, Worth Rectory, Sussex, third, with C. E. Wilkins. Mr. Charles Turner, Slough, had a delightful set of a dozen bunches of pompon dahlias, ten flowers in each bunch, and he worthily won the first prize; his varieties were Isabel, Silvia, Clarence, Adelaide, Montague Wootten, Phyllis, Queen of Whites, Cyril, Nerissa, Jessica, Manetta, and Little Mary; Messrs. J. Burrell and Co., second, and Mr. M. V. Seale, third. Six entries.

The single dahlias shown by Messrs. J. Cheal and Sons, Crawley, were very fine in form and colour, and they won first place for a dozen bunches with Betty, Miss Roberts, Brilliant, Peggy, Flambeau, Flora, Princess of Wales, Stromboli, Winona, Miss Morland, Columbine, and Leslie Seale; Mr. J. Walker, Thame, second; and Mr. M. V. Seale, third.

From a competitor's point of view the pæony-flowered dahlias are not yet popular, as in the class for a vase of these there were but three contestants, the prizes falling, in order of merit, to Mr. Charles Turner, Mr. J. Walker, and Messrs. J. Cheal and Sons. A curious class was the one for six bunches of decorative dahlias, including garden cactus varieties. Mr. Charles Turner won first place with Eccentric, Lemon King, Jean Charmier, Mdme. Lumière, Mdme. Van den Dael, and Meteor; Mr. M. V. Seale, second, and Messrs. J. Cheal and Sons, third.

AMATEURS.

The best nine varieties of cactus dahlias, three blooms of each, in the amateurs' section, came from Mr. F. Grinsted, Beauport Park, Battle, who had a fine set of Snowstorm, J. B. Riding, Ruby Grinsted, Satisfaction, William Marshall, Snowdon, Dr. G. G. Gray, H. Peerman, and C. E. Wilkins; Mr. Charles Luckin, Apsley, Thakenham, second; and Mr. W. E. Peters, gardener to Sir John Kennedy, Holmhurst, St. Leonards, third. Rev. A. Bridge was first; Mr. A. Tofield, New Malden, second; and Mr. W. C. Pagram, Redfern Cottages, Weybridge, third, for a vase of pink or white cactus dahlias, but all showed pink varieties.

Mr. W. H. Jackson, The Leys, Woburn Sands, led for six varieties of cactus dahlias, three flowers of each, and was followed in order by Mr. Edward Mawley, Rosebank, Berkhamsted; and the Rev. A. Bridge. Mr. J. Hicks, Thornton Heath, scored for four varieties of cactus dahlias, three blooms of each, on boards, with Faunus, H. Peerman, Clincher, and William Marshall, in fine condition; Mr. F. H. Curtey, Osborne Road, Palmer's Green, second, and Mr. H. Brown, Dahlia Dene, Havelock Road, Luton, third. Six competitors.

Out of six competitors in the class for a dozen cactus dahlias, on boards, Mr. W. H. Jackson, Woburn Sands, won first place with Hyacinth, Mrs. W. Baxter, Ruby, Etruria, William Marshall, C. E. Wilkins, Mrs. F. Grinsted, Ruby Grinsted, Fred McQuade, Crepuscule, and C. H. Curtis; Mr. H. Brown, second, and Mr. F. Grinsted, third. Mr. J. Hicks scored for six cactus dahlias, on boards, and was followed by Mr. G. Davidson, Quadrant Road, Thornton Heath, second, and Mr. E. Mawley, third.

There were ten competitors in the class for one vase of cactus dahlias, staged for effect, and here Mr. H. Brown led with a bold arrangement of flowers, in which the wires supporting the stems were far too much in evidence; Mr. Thomas Jones, Bryn-Penylan, Ruabon, second, and Mr. A. H. Burgess, third.

Mr. C. Luckin was first; Dr. Roy Appleton, Beverley, East Yorks, second; and Mr. J. Cousins, May Cottages, Chippenham, third, for six show and fancy dahlias; while for a dozen blooms Mr. S. H. Cooper, Mr. R. Burgin, Bower Street, Bedford, and Mr. W. H. Jackson were placed as named. First prize for six bunches of pompon dahlias was awarded to Mr. A. P. Ironside, 43, Park Lane, Chippenham, for rather large flowers of Harbinger, Bacchus, Darkest of All, Tommy Keith, Violet, and Douglas; Mr. S. H. Cooper, second, and Mr. A. Brown, Frederick Street, Luton, third. The Rev. S. S. Pearce, Coombe Vicarage, Woodstock, was placed first for six bunches of single dahlias, with good blooms of Darkness, Miss Morland, Princess of Wales, Alice Searle, Polly Eccles, and Leslie Seale; Mr. A. Brown was placed second, and the Rev. A. Bridge third.

Mr. A. Brown won the silver-gilt medal offered by Messrs. J. Cheal and Sons for the best vase of twelve blooms of single dahlias, and he was followed in order by the Rev. A. Bridge and Mr. Thomas Jones. Mr. W. C. Pagram was the only exhibitor of nine pæony-flowered dahlias arranged in a vase, and he was awarded the first prize.

NON-COMPETITIVE.

Mr. J. T. West, Tower Hill, Brentwood, contributed a very fine display of dahlias, putting up a delightful set of neat cactus blooms representing all the leading show varieties, as well as the pompon cactus sorts. In front of the array of bunches Mr. West displayed beautiful bunches of pompons, and then, as a border, set up specimen cactus dahlias in small vases. Of special interest were the pæony-flowered varieties of Mr. West's own raising, and among these three varieties stood out particularly well, viz., the brilliant scarlet Liberty, the rose-pink, salmon flushed Rubens, and the more stiffly built Burne Jones, with broad, rosy-lilac petals, and a bright yellow centre. (Gold medal). Mr. Williams, Oxford Road, Ealing, put up a table of his rustic stands prettily filled with dahlias of various kinds.

Messrs. R. Harkness and Co., Hitchin, were represented by a remarkably fine display of autumn roses set up in vases and bamboo stands. The flowers were delightfully fresh and fragrant, and especially attractive were Caroline Testout, Madame Abel Chatenay, Mrs. P. Blair, Mrs. J.

Laing, Gruss an Teplitz, Alfred Colomb, and Frau Karl Druschki. (Gold medal.) Messrs. Webb and Brand, Saffron Walden, contributed beautiful spikes of finely-grown hollyhocks, and these made up an imposing display. (Silver-gilt medal.)

A very fine exhibit of dahlias, from Messrs. Dobbie and Co., Rothesay, made a fine feature. Cactus varieties in the usual triangular bunches made a bold background for tall stands of such varieties as Harold Peerman, Lusitania, Mauve Queen, Rev. A. Bridge, Primrose, and Elsa Elbrick. A row of vases of brilliant pæony-flowered dahlias was set just above a line of neat and contrasting bunches of pompon varieties, while singles, pompon cactus, single cactus, and specimen show, fancy, and cactus varieties filled in the foreground. The use of gypsophila with the flowers was a great success. (Gold medal.) A splendid array of very fine seedling gladioli spikes cut from bulbs flowering for the first time, was greatly admired; this was from Messrs. J. Burrell and Co., Howe House Nurseries, Cambridge. Some of the spikes carried as many as eleven full-sized blooms, and the range of colours was particularly wide. (Gold medal.)

Messrs. Thomas S. Ware, Lim., Feltham, were represented by a bold exhibit in which pæony-flowered dahlias in tall stands made a very prominent feature. Among these, the most attractive were Glory of Baarn, The Geisha, and Ruddigore (new and brilliant purple and flame colour), together with several new seedlings. Cactus dahlias were well shown in the foreground, and considerable numbers of flowers of a variety were effectively grouped together behind an edging of isolepis. (Gold medal.) Messrs. Hobbies, Lim., Dereham, had a large and tasteful display in the conservatory, and they put up pæony-flowered dahlias in great quantity, associating these with grasses and Michaelmas daisy sprays (unopened buds). Queen Wilhelmina, Paul Kruger, Glenton, Thunder, Glory of Baarn, Princess Royal, Careless, and Baron Grancy were well represented. Cactus varieties made a bold front to the display, Mrs. Alfred Dyer, Snowdon, Stormer, Vigil, C. E. Wilkins, Etruria, Dr. G. G. Gray, Caradoc, Flame, and Gazelle being the best varieties shown.

National Chrysanthemum Society.

The first meeting of the Floral Committee for this season was held at Essex Hall on Monday, September 20. Mr. D. B. Crane was re-elected chairman.

Messrs. W. Wells and Co., Merstham, made up a quite bright display of early-flowering varieties, showing fine bunches of the yellow Leslie, Nellie Riding, Crimson Diana, Mary, Wells' Primrose, J. Bannister—a fawn-coloured sport from Perle Chatillonaise, Parapan, Amber Queen—a new single; Firebrand (F.C.C.)—a handsome chestnut-scarlet single, with yellow zone round the orange-yellow disc; and Dolly Reeves (commendation), a large purplish-rose, early Japanese variety.

Mr. J. H. Witty, Rose Nursery, Highgate, contributed bunches of early chrysanthemums, of such varieties as Polly, Nina Blick, White Pitcher, Countess, Mrs. A. Beach, Carrie, Harvest Home, Goacher's Crimson, Roi des Blancs, etc., etc., these all making a bright and useful display. Mr. H. Woolman, Shirley, Birmingham, brought forward numerous new early singles, and gained a Commendation for Mrs. H. Statham, a fairly large silvery-rose variety, with white zone round the disc.

The General Committee met at 7 o'clock at Carr's Restaurant, when Mr. T. Bevan presided. A balance of £63 18s. 4d. was reported. Messrs. C. H. Payne, D. B. Crane, and C. H. Curtis outlined the programme for the conference to be held at Essex Hall on October 6, and this was approved. Full particulars will be published immediately. Two new members were elected, and judges were appointed for the November show.

NATIONAL VEGETABLE SOCIETY.

The following circular has been issued, and, being in full sympathy with the objects of the society, we strongly commend it to the notice of our readers:—

On behalf of the committee of the above-named newly formed society, we beg to invite your hearty co-operation in its aims and objects, and trust to have the pleasure of enrolling your name on our list of members. The society has been formed to promote the wider and more successful culture of vegetables, not only for private use, but also for commercial purposes, and especially their wider consumption as wholesome and healthful food. It is incongruous that whilst several special societies exist for the encouragement of diverse particular flowers no such special society should have so far existed to promote and encourage the wider cultivation of good vegetables, and it is to remove that incongruity the National Vegetable Society has been formed. Already not only has His Grace the Duke of Portland very kindly consented to act as president, but a large number of gentlemen and seed firms have consented to become vice-presidents, also a committee of twenty-four persons well known in horticulture has been formed, constituting a very representative body.

The society trusts later on to have demonstrations in the form of vegetable exhibitions, conferences, and other public functions. At present, however, it has been determined to restrict operations to the very practical work of conducting trials of vegetables on ordinary cultural or commercial lines, and, as the season is now advanced, a selection of seeds of cabbages and onions for immediate sowing has been obtained gratuitously from many eminent seed firms whose hearty co-operation in the aims of the society we gladly acknowledge.

From year to year as funds permit similar trials will be instituted of all known vegetables. The result of these trials it is hoped will be to eliminate the many synonyms and worthless varieties on the market, and to make it easier both to the amateur and private gardener to select the kinds and varieties he may wish to plant. These trials it is also hoped will prove of considerable service to seed growers and merchants in enormously reducing the number of varieties they are now compelled to grow. The society hopes to be able to give every new kind and variety an impartial and thorough trial, and the public may implicitly rely on their verdict. A register of the trials will be kept and varieties only worth growing will be recorded in its pages, and this will be at the service of all members. Awards will be given to new varieties or novelties which after trial may be thought deserving.

With the support and encouragement of all those interested in the improved and increased culture of vegetables either for home consumption or for market purposes, the committee hope soon to be in a position to deal effectively with all aspects and questions bearing on the successful growth of this great national food commodity. The committee is composed of practical gardeners all thoroughly conversant with the work they have taken in hand (some are market gardeners and some are private gardeners), and each one is giving his services gratuitously. Naturally there must be considerable expense in carrying out experiments and other work associated with the society, and the committee earnestly hope for a generous and numerous response to this appeal.

Members subscription has been fixed at 5s. per annum, and the vice-presidents at one guinea.

The present season's trials will by kind consent be conducted simultaneously by Mr. C. Foster, Director of "The Times" Experimental Station, Sutton Green, near Guildford; on Mr. W. Poupart's Marsh Farm at Twickenham; and on stiff soil at Romford, Essex, kindly furnished by Mr. G. Hobday. The instructions given in each case are to sow cabbage seed in drills July 31, and again same varieties on August 14, for planting out in rows 18in. apart when ready. The onion seed to be sown where to bulb in rows, alternate drills to be left for transplanting into from the sown rows in the spring. A full report of the result of these trials will be furnished next autumn to each member.

CATALOGUES RECEIVED.

DICKSON AND ROBINSON, CATHEDRAL STREET, MANCHESTER.—Roses and sundries, as well as bulbs and flowering roots are listed in this illustrated catalogue.

J. R. PEARSON AND SONS, LOWDHAM, NOTTS.—An illustrated and indexed catalogue of roses.

J. A. COOPER, LISSADELL, SLIGO.—A neat and handy catalogue of daffodils grown on Sir J. Gore Booth's bulb farm in the West of Ireland. All the varieties are carefully described.

GEORGE BUNYARD AND CO., LIM., MAIDSTONE.—This list comprises bulbs, vines, strawberries, figs, violets, and carnations.

ANSWERS TO CORRESPONDENTS.

MILDEW ON OAK SHOOTS.—R. H. W., Dorking: We have not seen shoots affected by Oidium quercinum, but, judging from the description of the disease, it would appear that your tree is suffering from an attack. Spraying with sulphide of potassium would do good if such is practicable.

GALLS ON RHODODENDRONS.—S. E. G., Wexford: The galls on the leaves of Rhododendron hirsutum are caused by a fungus named Exobasidium rhododendri. These galls may vary in size from that of a pea to a large marble. The leaves bearing galls should be removed and burned, but to render the work really effective these leaves should be destroyed when the galls are quite young, early in the season, because this prevents the distribution of spores, and consequently materially reduces the possibility of attack the following season.

POTATOES FOR TRIAL.—C. R., Barnsley: We do not know whether the Royal Horticultural Society proposes to conduct potato trials during the coming season, but even if not, we have no doubt they would be pleased to test your new varieties at Wisley. You should communicate with the Secretary, Royal Horticultural Society, Vincent Square, Westminster, on this matter. Further, the newly-formed Vegetable Society may have opportunity for testing the varieties next year, and if so Mr. Quick, Kelmscott, Harrow View, Wealdstone, Harrow, the hon. secretary, will be able to furnish information. In either case the cost to yourself will be very small.

BROWN SPOTS ON VINE LEAVES.—J. W., Wakefield: The brown spots are due to scalding, and the fact that the vinery root is in a very bad condition aggravates the evil, as globules of moisture will often be on the leaves, acting as burning glasses during sunshine, no matter how carefully the house is ventilated. Have the roof thoroughly cleaned, make good all broken panes of glass, and paint the woodwork. If it is necessary to remove all the glass and putty and reglaze the house, the work must be deferred until the vines are resting, and then the house should be thoroughly painted both inside and out. We do not recognise the peach.

DWARF JAPANESE TREES.—W. J. C., Overstrand: These dwarfed trees need no special treatment, but as they are in fancy pots it is desirable to house them for the winter in a cool greenhouse. There is no need to keep them from the sun provided always that they receive ample supplies of water. Watering them once in ten days will often be much too seldom in spring and summer, and it may be too often in the winter. The state of the soil must govern the supply of water.

SHANKED GRAPES.—P., Swansea: The bunch of grapes sent shows a very bad case of shanking. So far as we can gather, the vines are not over-cropped this season, but they may have been enfeebled in the past. It is to the roots you will have to look for the cause of the trouble, and if you find the root tips dead in many cases, then there is something wrong with the drainage or watering, and this must be rectified.

PERPETUAL CARNATION SHOW.—J. B., Lynn: The next exhibition of the Perpetual Flowering Carnation Society will be held at the Royal Horticultural Hall on Wednesday, December 8. You may register a name with the society, but "the fact of a name being registered by the society must not be advertised by any raiser in such a manner as may convey to the public the idea that registration is synonymous to receiving an award. If referred to in catalogues, advertisements, or any other printed matter, it must be confined to the use of the following

? What is
QUASSOP
PATENTED REG.D

A solution made from Quassia chips has long been recognised by the leading horticulturists to be
the best Insecticide

The advent of QUASSOP for the first time enables the preparation of the soap solution and the extraction of the bitter principle from the wood to be carried out efficiently without heat and in one operation.

Quassop is not soap and does not contain an "Extract." It only requires the addition of cold water to produce a solution which possesses all the fine qualities of Quassia and soft soap in an enhanced degree.

Sold in packages with full directions, 10 gallon size 1s., 5[illegible] gallons [illegible], 200 gallons 10s. One trial will convince you. Sample packet (to make 3 gallons, 6d.), from Seedsmen, &c., or post free, from

Send for Illustrated Catalogue, free. BOULTON and PAUL, Ltd., Manufacturers, Norwich.

EVERY GARDENER knows that the XL-ALL SPECIALITIES are the best on the market. The time is at hand for housing Plants for the Winter. When these are arranged under glass a fumigation with XL-ALL COMPOUND, or a syringing with XL-ALL LIQUID INSECTICIDE will at once free them from insect pests and save lots of trouble later on. Any plants or fruit trees suffering from Mildew should be sprayed with XL-ALL MILDEW WASH, or with the newly-patented CUCASA, the finest preparation of Copper ever offered to Gardeners. RICHARDS XL-ALL FERTILIZER is unequalled for finishing off fine blooms and fruit. Please ask your Nurseryman, Seedsman, or Florist for a copy of my small pink List, giving particulars of these and many other "XL-ALL" Preparations which can be obtained from the Horticultural Trade throughout the World. G. H. RICHARDS, Manufacturer and Patentee, 234, Borough High Street, London, S.E.

FLOWERS IN THE HOME

OUR CATALOGUE OF SELECTED BULBS, profusely illustrated from photographs, tells you how you can have, at a trifling cost, a display of beautiful flowers in your home from Christmas till April, with as good results as if you had a greenhouse. The instructions are so clear, and the method so simple, you cannot fail. It also describes the best bulbs and plants for making a brilliant display in the greenhouse and garden during spring, and contains very cheap offers of herbaceous plants. Send for a copy to-day—it will interest you.

MR. CHAMPION can thoroughly recommend good, all-round, hard-working GARDENER, single-handed, or with one under; married, no children; age 36. Apply H. HANCOCK, Sibdon Castle, Craven Arms, Shropshire.

GARDENER (Single-handed or Head where two or three are kept); thoroughly experienced, Inside and Out; 9½ years in present Situation; good reference; age 37; married, small family. RICHARD NEWMAN, Moor Cottage, Crondall, Farnham, Surrey.

GARDENER (Single-handed or with help); good Second's place not objected to; married; age 36; tall; one child; life experience, Inside and Out; good references. H. WARNER, 17, Salmestone Road, Margate, Kent.

GARDENER (Single-handed or Foreman, general); experienced in Fruit and Plant Houses, Pleasure, and Kitchen Garden; age 29; good references. D. HILLS, Bochanger Cottages, Kennington, Ashford, Kent.

GARDENER (Single-handed), good, practical experience, inside and out; age 27; can be well recommended. J. SHREEVE, The Gardens, Osterley Park, Isleworth, W.

GARDENERS (Single-handed or with help) seeks re-engagement; experience Inside and Out; poultry, etc.; good references by me; 18 months at present place in a nursery; willing to be useful; age 25, married; 1 child, boy, 6 years. C. SMITH, 44, Ravenbourne Road, Catford, S.E.

GARDENER (Single-handed), married, no family; experience Kitchen and Flower Garden, Greenhouse; good character. All particulars, C., Gardener's Cottage, Macartney House, Greenwich Park.

GARDENER (Second), age 24; Inside and Out; 10 years' experience; highly recommended. E. AUSTIN, The Gardens, Brantwood, Langly Avenue, Surbiton, Surrey.

GARDENER seeks SITUATION, as Second or Single-handed; 18 months as Foreman; good references; married; age 24. Apply GARDENER, 10, Sanderstead Road, South Croydon, Surrey.

GARDENER (Second of three or four) seeks Situation; last place three years; good references. W. ORCHARD, Furzehill, near Wimborne.

GARDENER, age 23, seeks SITUATION as Second, where 3 are kept; have had 7 years' experience, Inside and Out; is well recommended by late Head Gardeners. A. SMITH, Dippenhall Street, Crondall, Farnham, Surrey.

GENTLEMAN wishes to recommend YOUNG MAN as UNDER GARDENER; 7 years' experience Inside and Out; age 22; good references. N., Red House Gardens, Heatherside, Camberley, Surrey.

GARDENER seeks SITUATION as Under or Single-handed; odd jobs not objected to; 9 years' experience Inside and Out; 4 years present situation; age 24. Apply, W. GULLIFORD, 19, Mill Place, Chislehurst, Kent.

GARDENERS (Under) seek SITUATIONS, Inside and Out; 3 and 4 years' experience with good references; ages 19 and 21 years. Apply J. B. and E. P., c/o Mrs. Roberts, White Hill, Wrotham, Kent.

GARDENER (Under); five years last place, and can be well recommended; age 21; disengaged. Address R. P., 113, Nutley Lane, Reigate. (No circulars.)

GARDENER, age 27; single; in Pleasure Grounds or good Single-handed with help; life experience; four years last situation. W. FREEMAN, 22, High Street, Roehampton, S.W.

JOURNEYMAN (Inside or Inside and Out). Mr. NOBBS, Beech Hurst Gardens, Haywards Heath, wishes to highly recommend W. MEADS as above; age 21.

ADVERTISER seeks SITUATION; 16 years' experience in Shop work (Seeds, Bulbs, and Making-up, etc.); Nurseries and Landscape work; age 33. H. D., 49, Ormeley Road, Balham.

AS IMPROVER in Gentleman's Establishment; life experience Inside and Out; age 21. H. GILBERT, Gardens, Westfield House, Wimborne.

COWMAN on Gentleman's Estate; Pigs and Poultry; handy at repairs; good references; disengaged. H. N., Stonerwood Farms, Petersfield, Hants.

CARPENTER and JOINER, single, seeks SITUATION on Estate, or as House Carpenter; abstainer; excellent references, own tools. FEARN, Moseley Terrace, Rolleston, Burton-on-Trent.

DUTCHMAN (23), having a practical experience in Forcing all kind of Bulbs, seeks SITUATION as BULB FORCER. Address W. F. v. d. POEL, 3, Carew Terrace, Oak Avenue, Hampton, Middlesex.

FLORISTS.—MAN (26) requires RE-ENGAGEMENT as MANAGER or HEAD SHOPMAN. 11 years' experience in Provinces; excellent Maker-up, Decorator, and Buyer, used to high-class trade; obliging Salesman; splendid references. STEAD, 23, East London Street, Edinburgh.

FLORIST.—YOUNG LADY seeks SITUATION as IMPROVER or ASSISTANT; London or Suburbs preferred. E. A., 16, Glyn Road, Clapton Park, N.E.

GROOM-GARDENER seeks SITUATION, age 32; married, and two children. Strong and willing to make himself useful; good references. T. C. CARTER, Pantile Road, St. Mary's Road, Oatlands Park, Weybridge, Surrey.

IMPROVER (Inside and Out).—Mr. TAMPLIN, Gardener to W. R. Mitchell, Esq., will be pleased to recommend H. HALSON, age 18, as above; able to take duty; good references. Seaborough Court, Crewkerne.

LAD, age 16, seeks SITUATION to assist Gardener; slight experience; fond of Gardening. R. BROWN, 7, Cottenham Terrace, Hornsey Rise.

SITUATION COUPON

To the Advertisement Manager of "THE GARDENERS' MAGAZINE,"
148 & 149, Aldersgate Street, London, E.C.

For SEPTEMBER 18, 1909.

Please Repeat my Advertisement.

Name...

Address...

....

Date............................

THIS COUPON, duly filled up, should be forwarded not later than Tuesday for the next issue.

Kent, The Garden of England.

GEORGE BUNYARD
AND CO., LTD.,

beg to call attention to their extensive well-grown stock of the following, and solicit a visit from all interested in Horticulture.

SPECIALITIES:

FRUITS.

GRAPE VINES, stout, clean, well-ripened, and short-jointed.

PEACHES AND NECTARINES. Dwarf trained, and on stems 2 to 5½ ft. Extra fruiting fans, in pots, and Orchard House Trees.

FIGS, in fruiting condition.

APPLES, PEARS, PLUMS, CHERRIES, in all forms; some 500 varieties.

MULBERRIES, QUINCES, MEDLARS—Standards.

STRAWBERRIES. Pot plants and runners, extra fine.

GOOSEBERRIES AND CURRANTS in 100 varieties.

CATALOGUES WITH FULL PARTICULARS ON APPLICATION.

TREES, SHRUBS, CONIFERAE, PARK TREES, FLOWERING SHRUBS, in 2,000 varieties.

STREET AND AVENUE TREES,

New Book of Shrubs, etc., etc., 3/9 post free.

HARDY CLIMBERS, in 500 varieties.

ROSES.

EXTRA FINE DWARFS, H.P., H.T. and Teas, 500 varieties.

LONG CLIMBERS in pots, extra fine and bushy. Cheap Climbers from the open and species.

"England's National Flower," 3/9 post free.

HERBACEOUS PLANTS in 2,000 varieties.

AQUATICS AND ALPINES. Decorative Tulips, Narcissus, Violets and Carnations, &c,, &c.

CATALOGUES FOR EACH DEPARTMENT.

THE ROYAL NURSERIES, MAIDSTONE.

Established 1796. **200 acres, 60 houses.**

VOL. LII.—No. 2,915. SATURDAY, SEPTEMBER 11, 1909.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Dahlias.

Although the exhibition held by the National Dahlia Society at the Crystal Palace on the 2nd and 3rd inst. was rather below the high average of recent years, the display of flowers was more than sufficient to show that the dahlia is held in high estimation by a large and important section of the flower-loving community, and that it has no superior in its season for beautifying the flower garden and supplying flowers for indoor decorations. Such falling-off in the quality of the blooms as was evident in a critical examination of the competitive and other collections was unquestionably due to the unfavourable weather conditions that have obtained during the past summer. The dahlia in its many and varied forms has a strong constitution, and will thrive in gardens that are within the range of atmospheric conditions decidedly unfavourable to plant life, but, as in the case of many other plants, the degree of development to which the blooms attain is largely dependent upon the weather experienced during the period of the greatest vegetative activity. The past summer has not been favourable to the production of blooms of the highest quality at the beginning of September, and consequently the exhibition suffered. Had the weather experienced during the first half of August continued during the month, the growth would have had an opportunity of becoming moderately firm, and the development of the blooms proceeded more rapidly. This, however, was not the case, and growth and flower production proceeded at a very slow rate. As might have been expected, the vigorous growing pæony-flowered varieties suffered as much from the low temperature and frequent rains as did any of the sections, and, in consequence, but one vase of blooms was exhibited. This was unfortunate, because the society had, in carrying out its more expansive policy, provided a class for them, and an adequate representation of the pæony-flowered type would have materially enhanced the educational value of the exhibition. If this was matter for regret, one had as a counterbalance the satisfaction of seeing that strenuous endeavour is being made by raisers to improve the cactus section for garden decoration and the supply of cut flowers. Three new cactus varieties were submitted that are remarkable for the length and rigidity of the flower stalks. The blooms were not considered sufficiently high in quality to merit the award of a first-class certificate, but the value of the improvement in the stalks was recognised by their being commended for special trial next year. This recognition was sufficient in the case of these varieties, but we would suggest that in determining the merits of varieties with long, stiff flower stalks, too much importance should not be attached to the size and form of the individual blooms. There is at the present time no lack of cactus dahlias of a high degree of excellence for competitive purposes, but the cactus varieties that are capable of producing rich colour effects in the garden are comparatively few. Hence the necessity for making such awards as will clearly indicate their value for garden decoration, and thereby induce cultivators to buy and plant them. The unfavourable weather that has characterised the past summer has brought into prominence the great value of the pompon and single varieties, for where strong plants were used, they have been flowering freely for some time past. The blooms of the first-named section are decidedly formal, but they are bright in colour, decidedly elegant, and borne on long stiff stems well above the foliage. Single dahlias are rather fugacious, but the blooms are produced in great profusion, and have the advantage of being lightly poised on their stems and attractive in colour. To maintain the single varieties in their most attractive form for as long a period as possible, the seed heads should be removed at intervals, as they are exhausting to the plant, and anything but pleasing. The present season affords unquestionable proofs, both in private and public gardens, of the importance of having strong and well-established plants of all sections for bedding out at the end of May. These, where they have been grown under ordinary conditions as regards soil, are now blooming freely and contributing their full share to the attractions of the gardens, whereas plants that were kept in three-inch pots until they were bedded are only coming into bloom. We have no wish to unduly labour this point, to which we have on several occasions directed special attention, but the English summer is so short that unless the plants are well advanced when put out, it is not possible to obtain a full return for the attention devoted to them. It would be better not to attempt their culture than to bed out plants so weakly that there is not time for them to reach the flowering stage before they are liable to injury from early frosts. Such plants certainly do not contribute to an appreciable extent to the attractions of the garden, and in many cases they bring the dahlia into disrepute. The chief points, we would mention in the preparation of dahlias, whether intended for garden decoration or the production of exhibition blooms, are to commence the work of propagation early; to give the plants from an early stage a light position near the glass, where they will have a free circulation of air about them; and to transfer them immediately they have filled the small pots with roots to others 6in. in diameter, using a rather rich compost. Plants so prepared will come into bloom several weeks

MR. H. K. JUDD.

in advance of those raised from cuttings rooted late and kept in small pots until bedded out, a point of much importance, considering that they are usually cut down by the frost within four months of their being transferred to beds and borders.

Mr. H. K. Judd, whose portrait we have the pleasure of giving in this issue, occupies a commanding position among amateur horticulturists, for, while devoting special attention to sweet peas and various other subjects, he labours with a zeal that is beyond praise in the promotion of horticultural activities among his friends and neighbours at Edgware. Mr. Judd's energy is certainly remarkable, for while bearing the responsibilities inseparable from the position of managing director of an important city firm, he is honorary secretary of the Edgware Horticultural Society, and discharges the duties connected therewith in such manner as to enjoy the golden opinions of all who are acquainted with the society and its accomplishments. This society is by no means the largest of the organisations which have for their object the advancement of horticulture, yet at its annual exhibitions visitors have the opportunity of enjoying displays of roses and sweet peas of great magnitude and the highest quality. Many other classes of useful and ornamental subjects are largely and well shown, but the two classes of fragrant flowers mentioned are the outstanding features, and we were informed by members of the executive, when two years ago we expressed our surprise at the distinctive character and the attractiveness of the exhibition, that the results were largely due to Mr. Judd's strenuous efforts to break away from the course of procedure that is usually followed in the management of local horticultural societies and to give special encouragement to the two classes of flowers that now enjoy so high a degree of popularity. We are not quite certain as to the classes of flowers for which Mr. Judd has the strongest affection, but we know that he is a formidable competitor in the classes for roses and sweet peas, and for several subjects that require glass culture. In addition to being the honorary secretary of the Edgware Horticultural Society, which, by the way, gives special encouragement to cottagers and allotment holders, Mr. Judd is the local secretary of the National Rose Society, a past master in Freemasonry, a member of the Board of Arbitration of the Bookbinders and Machine Rulers of the United Kingdom, a Commissioner of Land Tax for the County of Middlesex, and Rector's Warden at Edgware parish church, a post which he has occupied during the past fifteen years.

Perception of Light by Plants.—In the botanical section of the meeting of the British Association, which has recently been held at Winnipeg, Mr. Harold Wager read a paper on the perception of light in plants. As so well known, various organs of plants exhibit a definite response to light, and in his introductory remarks Mr. Wager pointed out that it was shown by Charles and Francis Darwin in 1880 that the illumination of one part of the sensitive organ determined the movement in another part; that one part of the sensitive organ perceived the light and that a stimulus was set up which was transmitted to another part, where the movement took place. In ordinary leaves the leaf blade was usually the perceptive region, the movement being brought about by the petiole. It was clear that the object of these heliotropic movements was either to protect the plant from a too intense light or to bring it into such a position that it could take the fullest advantage of the light which fell upon it. There could be no doubt that this was effected with considerable precision. But how it was that the plant was enabled to perceive that it was or was not in the right position, and the means by which the light stimulus was set up, were not yet clearly understood. In dia-heliotropic foliage leaves Haberlandt suggested that the epidermal cells or special modifications of them functioned as ocelli or rudimentary eyes by converging the light so as to bring about a differential illumination of the cytoplasm on the basal wall of the epidermal cells, by means of which the stimulus was set up. The layer of cytoplasm lining the epidermal cells would therefore in this case be the percipient organ. The evidence in favour of this view was, however, not very satisfactory. As an alternative it was suggested by Mr. Wager that the chlorophyll grains were the percipient organs. It was well known that they were sensitive to light, and that in some cases they showed this by definite responsive movements. The unequal illumination of the chlorophyll grains when the rays of light fell upon the leaf in a slanting direction would, he considered, be sufficient to account for the generation of the stimulus, and it was possible that the optical behaviour of the epidermal cells might be of importance in this respect. The rays of light which were absorbed by the chlorophyll were the only ones which appeared to be functional in heliotropism, and these by their action upon the various colouring matters contained in the chlorophyll might set up in the cytoplasm immediately adjacent changes necessary to bring about the stimulus.

Masters' Lectures.—The second of the two Masters' lectures by Professor Hugo de Vries, will be delivered at the meeting of the Royal Horticultural Society on the 28th inst. The subject will be the "Production of Horticultural Varieties," and the chairman will be Mr. A. D. Hall, F.R.S., Director of the Rothamsted Experimental Station.

August in the North.—Our Aberdeen correspondent writes: The weather experienced during August has been very varied. We had an exceedingly fine spell from the 4th to the 12th, which did a vast amount of good to vegetables and fruits, so that strawberries turned out well. This fine spell of weather also practically saved the situation, from the farmer's point of view. From the last-mentioned date, however, the weather became cloudier, colder, and more showery, especially during the closing days, the last day, the 31st, being the coldest of the whole month. August and October are the two months in which most rain falls in the North-east of Scotland, and there is in that respect little difference between them. This year, however, we have had no heavy spate of rain such as we sometimes have in August. The rainfall registered over the whole north-east would average about 2.50 inches, a trifle below the average for the last 42 years. Rain fell on 17 days, and the maximum temperature in the shade was 81 degrees, and the minimum 40 degrees. On an average of years July is our warmest month, August coming next with a mean temperature of 56.6 degrees. This year its temperature has varied much. The 25th was a very bad day, wet from morning till night, with a murky sky, and a cold north-east wind. This broke down and twisted the heaviest crops of grain, so that they will be bad to cut. Turnips, however, have done well, making a great advance. The frequent showers have kept the leaves of trees, etc., fine and healthy. Potatoes are looking remarkably well, and show little signs of disease.

British Association.—It has been decided to hold the meeting of the British Association at Sheffield in 1910, and the Rev. Thomas G. Bonney, F.R.S., Professor of Geology at the University College, London, has been elected president for the ensuing year.

Fruits of Foreign Growth contributed but little to the large increase in the value of the imports into this country during August, as the increase was only £848, as compared with the corresponding month of last year. In the imports of apples there was again a large decrease, and in the imports of grapes the decrease in quantity was considerable. The imports of the first-mentioned of the two classes of fruits were 59,436 cwt., of the value of £34,591, or a decrease in quantity of 29,196 cwt., and in value of £13,135. Peaches and apricots, on the other hand, show a big increase, the aggregate having been 12,345 cwt., of the value of £16,366, against 3,014 cwt., of the value of £5,500. A large proportion of the imported peaches came from France, and in the second half of August they were so plentiful in the London markets that boxes containing twelve medium-sized fruits were selling at eighteen pence each. Bananas were rather more plentiful, the imports aggregating 649,337 bunches, of the value of £175,143. Cherries also were received in larger quantities, the total imports of these fruits having been 3,315 cwt., of the value of £2,566, as compared with 760 cwt., of the value of £689 in August, 1908. The imports of currants also were larger, the total having been 11,495 cwt., of the value of £12,957, or an increase in quantity of 7,784 cwt., and in value of £9,250. Of gooseberries the imports were only 12 cwt., of the value of £10, against 937 cwt., of the value of £468 in the corresponding month of last year. The imports of grapes aggregated 74,742 cwt., of the value of £59,266, or a decrease in quantity of 20,583 cwt., and in value of £16,379. Oranges, lemons, and almonds were received in larger quantities, as also were pears. Of the last-named, the aggregate imports were 222,994 cwt., of the value of £191,501, these figures representing an increase in quantity of 12,699 cwt., and a decrease in value of £25,822. In the imports of plums there was an increase in quantity of 8,038 cwt., and a decrease in value of £6,449, the total having been 252,695 cwt., of the value of £240,227. Of strawberries the imports were 16 cwt., of the value of £15, and those of unenumerated fruits aggregated 171,759 cwt., of the value of £71,037. The total value of the fruit imports was £923,297.

Our Bulb Number.—We shall devote our next issue (September 18) chiefly to a consideration of bulbs and bulbous plants for garden, conservatory, and home, and we shall include interesting and illustrated articles on Lachenalias for the Conservatory, Bulb Culture in Fibre, Tulips for Garden Decoration, Inexpensive Daffodils, Bulbs for the Rock Garden, Uncommon Bulbous Plants, Propagation of Hyacinths, Jonquils in the Wild Garden, Hyacinths for Beds and Borders, Outdoor Culture of Hippeastrums, etc., etc.

A Fortunate Gardener.—Under the will of the late Lady Saye and Sele, Mr. William Clarke, her gardener, received a legacy of £200.

ROYAL CALEDONIAN HORTICULTURAL SOCIETY.

There was a brave turnout of exhibits and exhibitors at the Waverley Market, Princes Street, Edinburgh, on September 8 and 9, on the occasion of the centenary show of the above society. The exhibition was of about the usual character and quality, though interest had been stimulated by the offer of four Centenary Cups, and hence everyone wanted to know who had won these coveted awards. Grapes, hardy fruits, vegetables, and cut flowers were abundant and good, but the plant classes were only moderate.

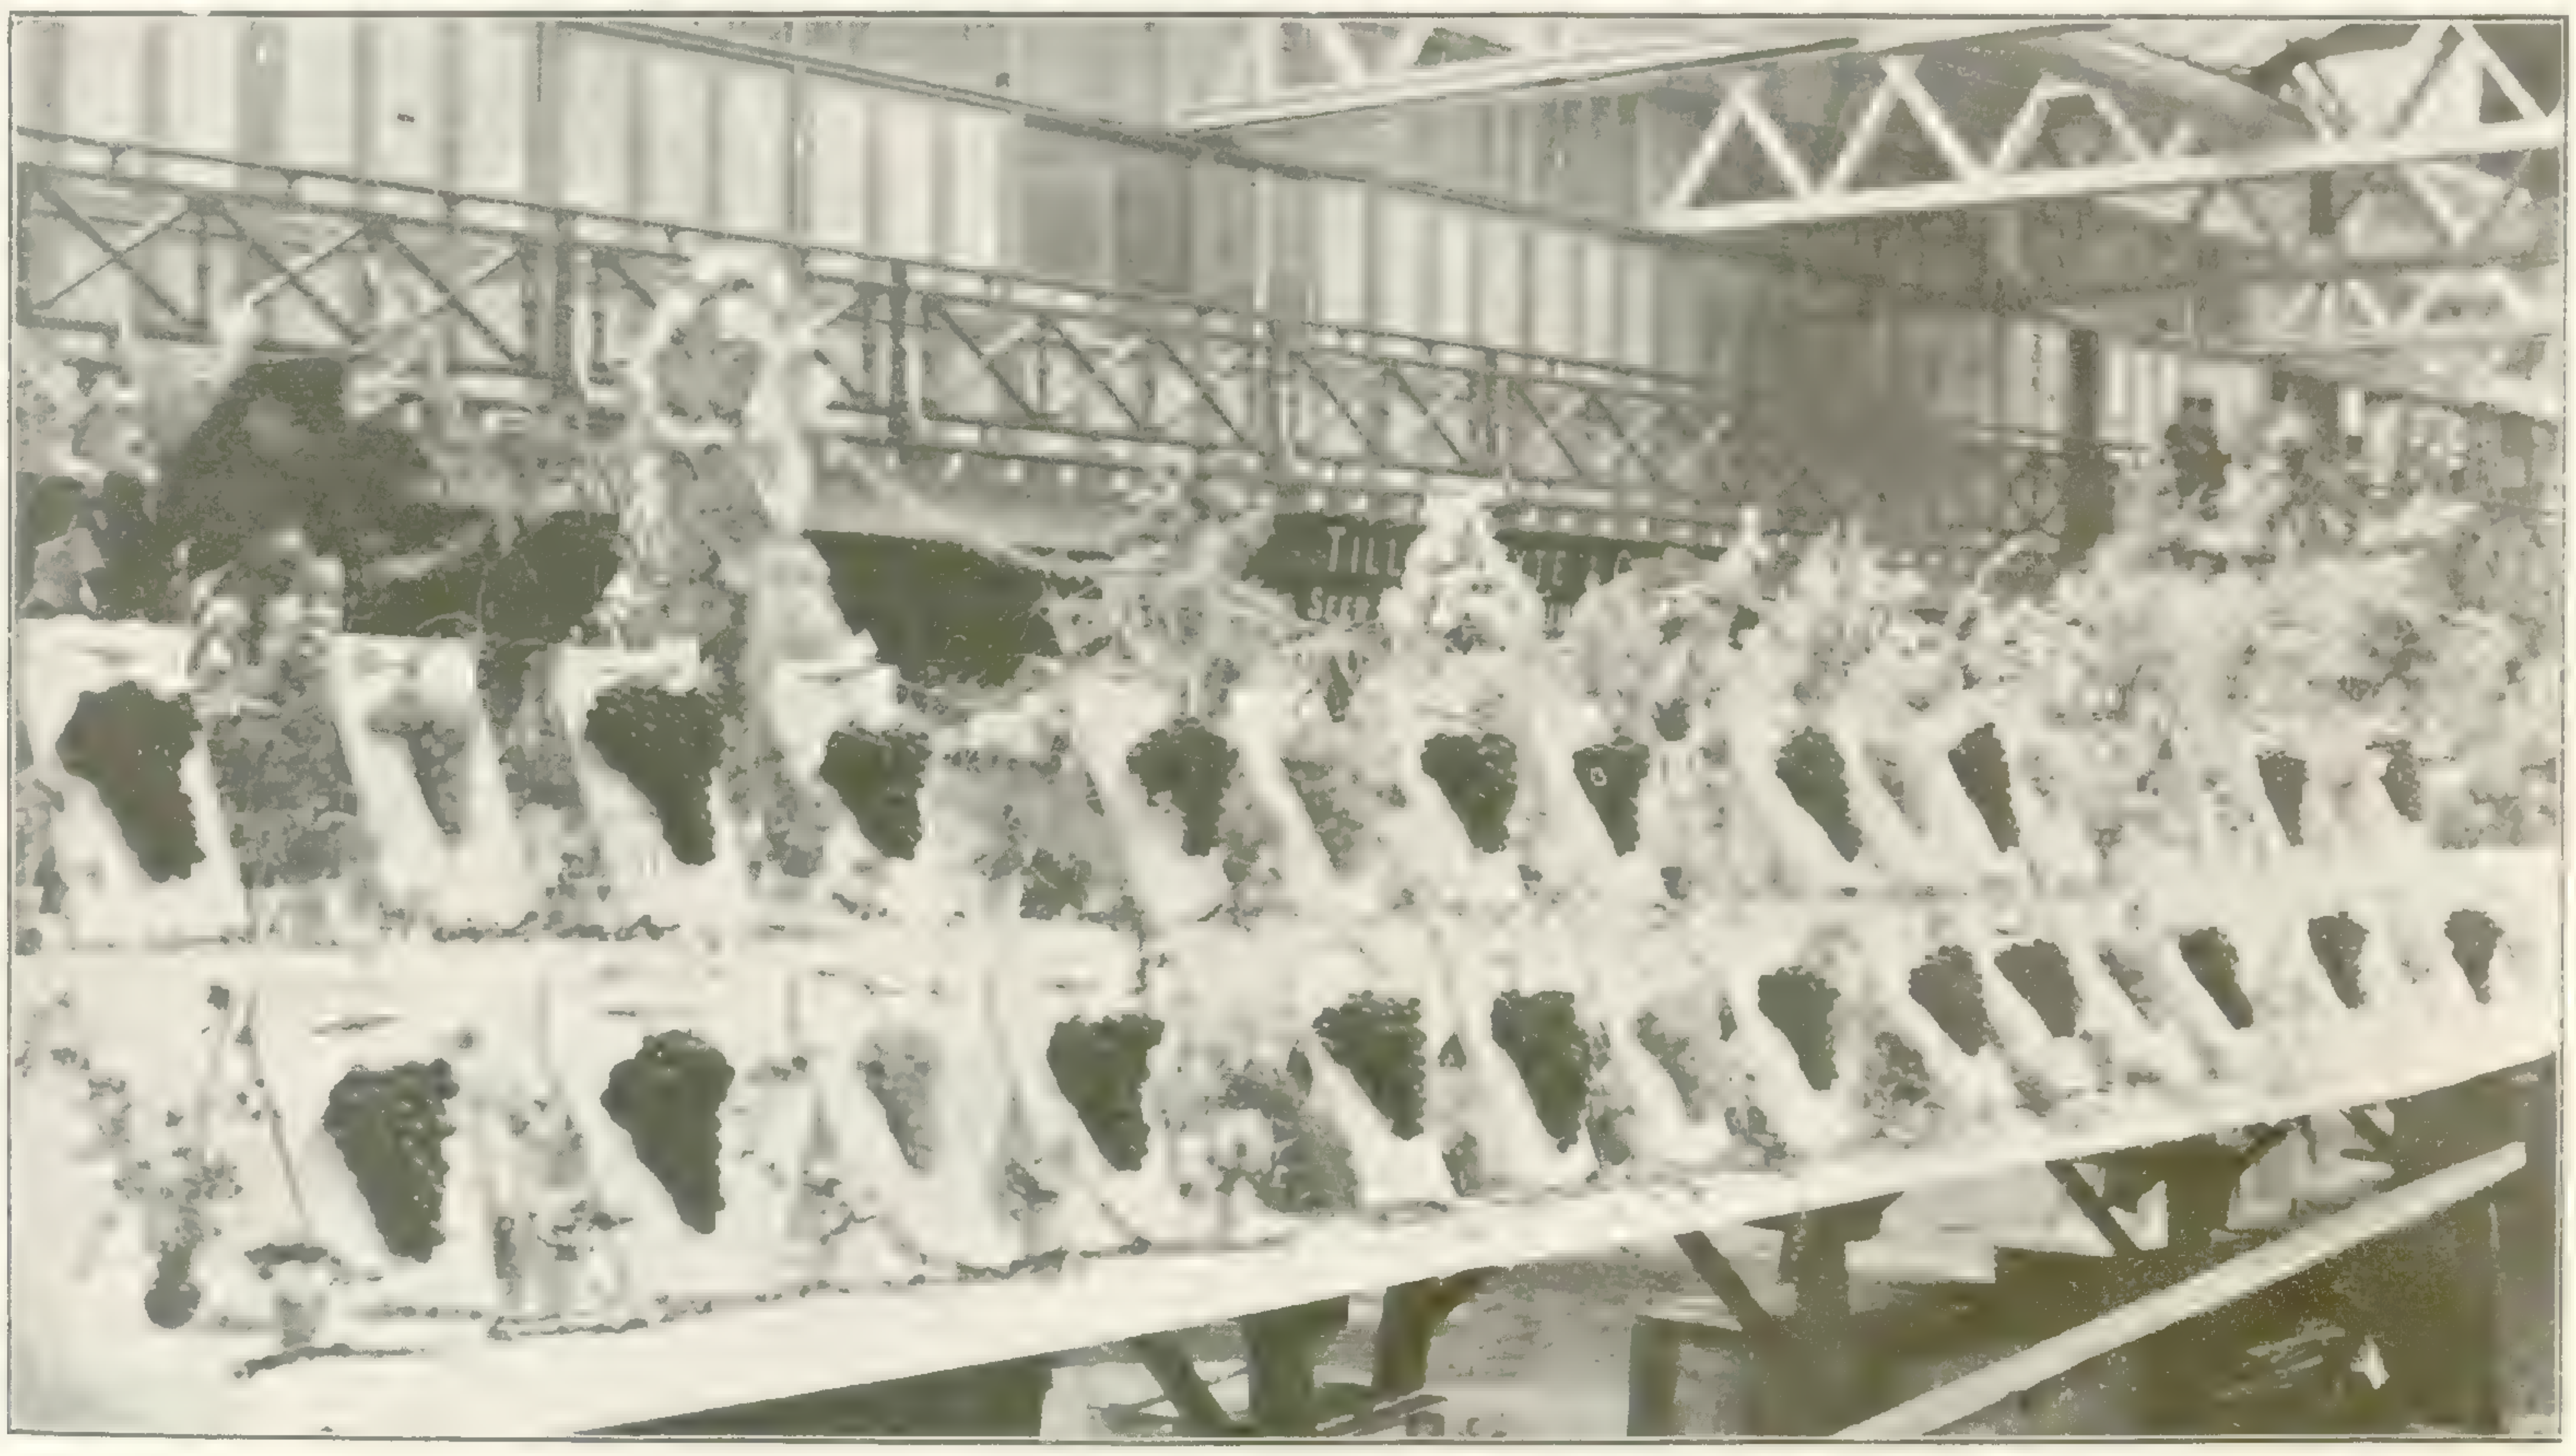
In Mr. Mackenzie's enforced absence through illness Mr. A. D. Richardson took over the secretarial duties, and was ably supported by Mr. J. W. McHattie and others.

Fine weather attended the first day of the show, and the attendance was very good.

DESSERT TABLE CLASS.

Two competitors entered in the class for a table of dessert fruit, decorated with flowers. Not more than sixteen dishes of fruit were permitted, and the size of the table was 10ft. by 4ft. 6in. Mr. J. H. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, Derby, gained the premier award with a total of 107 points for fruit and 18 for decoration—125 points. He showed Madresfield Court (8), Chasselas Napoleon (6½), Muscat Hamburgh (7½), and Muscat of Alexandria (8½) grapes; Dr. Jules Guyot (6), and Margaret Marillat (7½) pears; Elruge (5) and Pineapple (6½) nectarines; Princess (7) and Bellegarde (6) peaches; Cox's Orange Pippin (6½) and Ribston Pippin (6½) apples; Negro Largo figs (5); Washington (5½) plums; Seedling (7) and The Budget (7½) melons. The decorations consisted of montbretias and francoa sprays.

Mr. James Gibson, gardener to the Duke of Portland, Welbeck Abbey, Worksop, secured the second prize with 103 points for fruit and 17 points for decoration—120. He was equal with Mr. Goodacre for grapes, but lost a little on peaches and melons. It was a splendid fight for the premier place.



THE CHAMPION GRAPE TROPHY CLASS.

Mr. Lunt's first prize collection is the second from the left; Mr. Kirk's set on the extreme left; Mr. Goodacre's on the extreme right; and Mr. Beisant's, the second from the right.

CHALLENGE TROPHY GRAPE CLASS.

For the Scottish Challenge Trophy for the best eight bunches of grapes there were four competitors, and these made up a most interesting and effective display. The cup was won by Mr. Thomas Lunt, gardener to Captain A Stirling, of Keir, Dunblane, with one of the best sets of grapes we have seen for a long time, the bunches being of even size and splendidly coloured. The bunches were arranged as follows, and we give the pointing, with the possible points in brackets. Cooper's Black (8), 7½; Alnwick Seedling (8), 6½; Mrs. Pince (9), 8½; Muscat of Alexandria (10), 10; Muscat of Alexandria (10), 9; Cooper's Black (8), 6½; Madresfield Court (9), 7½; Madresfield Court (9), 7½; total, 62½, out of a possible 71. We congratulate Mr. Lunt upon his splendid grapes and excellent win. Mr. J. H. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, was second, with Madresfield Court (9), 7½ and 8; Cannon Hall Muscat (10), 8 and 7; Muscat of Alexandria (10), 8 and 7; Muscat Hamburgh (9), 6 and 7; total, 59½ points, out of a possible 76. Mr. James Beisant, gardener to Lady Armistead, Castle Kennedy, third, with 51 points, out of 71; Mr. A. Kirk, gardener to J. Thomson Paton, Esq., Norwood, Alloa, fourth, with 46½ out of a possible 70.

COLLECTIONS OF FRUIT.

There were only three competitors in the important class for a dozen dishes of choice dessert fruits, not more than two dishes of any one kind allowed. The chief award fell to Mr. J. H. Goodacre, who showed big bunches of Muscat of Alexandria grapes, and smaller ones of Madresfield Court, Princess and Sea Eagle peaches, Victoria and Pineapple nectarines, grand Peasgood Nonsuch apples, giant Margaret Marillat pears, Kirke's and Washington plums, Negro Largo figs, and a seedling melon; Mr. W. Galloway, gardener to the Earl of Wemyss, Gosford, Longmiddry, was placed second for a very fair set; and Mr. David Murray, gardener to the Marquis of Ailsa, Culzean Castle, third, the latter showing a small pineapple.

There were three entries in the class for a dozen dishes of orchard-house fruits, and here Mr. James Gibson, Welbeck Abbey Gardens, won the premier place with Peasgood's Nonsuch and Emperor Alexander apples, Souv. du Congres and Margaret Marillat pears, Dymond and Stirling Castle peaches, Pitmaston Orange and Humboldt nectarines, Hemskirk apricots, Kirke's and Jefferson plums, and Negro Largo figs; the apples were especially good; Mr. J. H. Goodacre came second, his best dishes being Margaret Marillat and Souv. du Congres pears; Mr. G. Mackinlay, gardener to the American Ambassador, Wrest Park, Beds, third.

GRAPES.

In addition to the trophy class, there were fourteen classes for grapes, and the competition was keen as a whole. First prize for four bunches was awarded to Mr. George Stewart, gardener to Sir Jas. Sivewright, K.C.M.G., Fullallan Castle, for excellent clusters of Madresfield Court, Black Hamburgh, Alicante, and Muscat of Alexandria; Mr. S. Gordon, gardener to Sir H. E. Maxwell, Bart., Monreith, Wigtown, came second with Alnwick Seedling, Black Hamburgh, Alicante, and Muscat of Alexandria; Mr. J. Highgate, gardener to the Marquis of Tweeddale, K.T., Yester, third; there were seven competitors.

The best pair of bunches of Muscat of Alexandria grapes were shown by Mr. Thos. Lunt, who staged splendidly coloured, weighty clusters; Mr. J. Highgate second; and Mr. Thos. McPhail, gardener to Mr. and Mrs. Hamilton Ogilvy, Ascherfield, third; four entrants. Mr. S. Gordon scored for a pair of clusters of Black Hamburgh grapes with neat examples; Mr. W. Galloway, Gosford Gardens, second; and Mr. J. Highgate third; fifteen entries. Mr. Lunt also led the way for a single bunch of Muscat of Alexandria, again showing finely; he was followed in order by Mr. Thos. McPhail, and Mr. W. Clanachan, gardener to J. S. Crawford, Esq., Melton Mowbray; eight competitors.

There were seventeen competitors in the class for one bunch of Black Hamburgh, and here Mr. S. Gordon scored with a very weighty, nicely-coloured cluster; Mr. R. Stuart, gardener to Lord Lauderdale, Thirlestone Castle, second; and Mr. T. MacPhail third. The best single bunch of Alicante came from Mr. S. Gordon, and was a shapely, well-coloured one; Mr. G. Pirrie, gardener to

C. W. Cowan, Esq., Dalhousie Castle, second; and Mr. J. Beisant third; twelve entries. Mr. S. Gordon scored again for one bunch of Alnwick Seedling, and was closely followed by Mr. Thos. Lunt and Mr. T. MacPhail. Mr. J. Shiells, gardener to Sir Jas. King, Bart., Carstairs House, led for one bunch of Gros Colmar, with a medium sized, large-berried bunch; Mr. H. E. Hughes second; and Mr. Jas. Todd, gardener to P. Ray Geddes, Esq., Colinton, third. For one bunch of Lady Downes, Mr. Thos. Lunt was placed first, Mr. T. MacPhail second, and Mr. J. Highgate third. One bunch of Madresfield Court made a good class, and here Mr. J. Stewart led with a very good bunch; Mr. W. Buchanan, Forth Vineyard, Kippen, second; and Mr. J. Highgate, third; eight entries. For a bunch of any other black grape, Mr. Jas. Beisant scored with Gros Maroc, a big cluster, finely coloured; Mr. T. Lunt second with Cooper's Black; and Mr. T. MacPhail third with Gros Maroc.

For any other white, Mr. M. Matheson, gardener to the Dowager Lady Kinross, North Berwick, scored with Buckland Sweetwater, beautifully finished; Mr. S. Gordon second, and Mr. H. E. Hughes third. For a bunch of black grapes showing the finest bloom, Mr. T. Lunt led with Cooper's Black.

DOBBIE & CO
ROTHESAY

MESSRS. DOBBIE AND CO.'S GOLD MEDAL DISPLAY OF DAHLIAS AND CHRYSANTHEMUMS.

HARDY FRUITS, ETC.

Mr. J. Brown, gardener to F. Balfour, Esq., Fernie Castle, Fife, had the best dish of figs. Mr. J. Highgate led for a dish of peaches with Royal George, Mr. J. Gibson coming second with Bellegarde; sixteen entries. Nectarines were best shown by Mr. T. Lunt, who scored with a grand dish of Pineapple; Mr. R. Greenlaw second; seventeen competitors. In the melon classes Mr. B. Ness, gardener to the Earl of Stair, Oxenford Castle, Dalkeith; and Mr. R. Greenlaw, gardener to H. J. Younger, Esq., Benmore, Kilmun, won the leading awards.

Mr. R. M. Whiting, Credenhill, Hereford, won the first prize for a dozen dishes of apples with medium-sized, clean specimens of Cox's Orange Pippin, Worcester Pearmain, Queen Caroline, Baron Wolseley, Lord Suffield, Glory of the West, The Queen, Stirling Castle, James Grieve, Lady Sudeley, Charles Ross, and Duchess of Oldenburg; Mr. J. Mackinlay, Wrest Park Gardens, second, and Mr. J. Lee, Kingscroft, Cheshire, third. Mr. James Duff, gardener to Colonel Gordon, Castle Douglas, won first place for a collection of apples grown in Scotland, his varieties, all clean and well developed, being Duchess of Oldenburgh, King of the Pippins, Emperor Alexander, Worcester Pearmain, Lady Sudeley, Cox's Pomona, Peasgood's Nonsuch, Ecklinville, Yorkshire Beauty, Warner's King, Stirling Castle, and Gascoigne's Scarlet; Mr. R. G. Sinclair, Congleton Gardens, Drem, second, and Mr. D. Nicoll, gardener to Messrs. Bell, Forgandenny, third. Mr. Robert Currie, gardener to the Rev. G. H. Davenport, Hereford, scored for six dishes of culinary apples, and was followed in order of mention by Mr. J. Lee, Kingscroft, Bebington, and Mr. R. M. Whiting, Credenhill, Hereford.

For a dish of gage plums Mr. B. Ness led, with Mr. T. MacPhail second. Mr. J. E. Davis scored for a dish of yellow plums, with Jefferson; Mr. G. Watson, Walkinshaw, second; nine entries. For red plums, Mr. G. MacKinlay scored with Fonthill; Mr. J. Duff second, and Mr. J. Fairholm third; fifteen entries. Mr. J. E. Davis had the best dish of purple plums, showing Kirkes; Mr. J. Mackinlay second; eight entries. Mr. G. Mackinlay had the best collection of dessert plums, scoring with Transparent Gage, Washington, Jefferson, and Kirkes; Mr. R. G. Sinclair second, and Mr. W. Galloway third. For a collection of culinary plums Mr. Mackinlay was again to the front with Magnum Bonum, Belgian Purple, Fonthill, and Diamond; Mr. R. G. Sinclair second, and Mr. Hugh McFadyen, gardener to L. Breitmeyer, Esq., Cuckfield Park, Sussex, third. Mr. David Nicoll was a capital first for four dishes of orchard house apples with grand (but polished) specimens of Peasgood's Nonsuch, Emperor Alexander, James Grieve, and Gascoigne's Scarlet; Mr. James Gibson second. Mr. P. McAndrew, gardener to the Earl of Home, The Hirsel, Coldstream, led for six dessert apples.

APPLES AND PEARS.

Numerous classes were provided for single dishes of certain varieties of apples, and in these Mr. R. M. Whiting led for Charles Ross; Mr. J. Duff for Gascoigne's Scarlet; Mr. Robert Currie for James Grieve; Mr. R. Currie for Irish Peach; Mr. J. Duff for Lady Sudeley; Mr. J. Duff for Worcester Pearmain; Mr. A. Hogg, gardener to H. W. Hope, Esq., Abercady, for Baillie Nelson; Mr. R. Currie for Beauty of Kent and for Bismarck; Mr. R. G. Sinclair for Cellini; Mr. R. Currie for Cox's Pomona; Mr. J. Duff for Duchess of Oldenburgh and for Emperor Alexander; Mr. J. Lee for Ecklinville, for Golden Spire, and for Grenadier; Mr. Currie for Keswick Codlin, for Prince Albert, and for Lord Derby; Mr. J. Lee for Lord Grosvenor and for Mère de Ménage; Mr. Currie for Lord Suffield and Peasgood's Nonsuch; Mr. Whiting for Stirling Castle; Mr. Lee for Pott's Seedling; Mr. Whiting for Wellington; Mr. P. McAndrew for any dessert apple; and Mr. Currie for any culinary apple.

Mr. James Gibson staged the best collection of pears, his varieties being Beurre d'Amanlis, Doyenne Boussoch, Magnate, Beurre Clairgeau, Beurre Benoist, Pitmaston Duchess, Margaret Marillat, etc.; Mr. G. Mackinlay second, and Mr. Robert Currie third; six competitors. For six dishes of Scottish-grown pears Mr. P. McAndrew was an excellent first with unnamed varieties; Mr. D. Murray second, and Mr. W. Galloway third. Mr. J. Scott, Mr. R. Currie, Mr. Mackiniay, Mr. R. Greenlaw, and Mr. J. Gibson were the leading prizewinners in the single dish classes for pears.

GROUPS AND PLANTS.

The chief plant class was for a circular group, arranged for effect, on a space 18ft. in diameter. There were only two competitors, chief honours falling to Mr. J. E. Davis, gardener to Colonel E. R. Stewart Richardson, Battachie, Stanley. Although campanulas were largely used to secure effect, these were not specially good, but the humeas and celosias were good points. Crotons and variegated abutilons figured largely also. The design was a central mound, with an outer irregular ring of tall plants. The second prize was awarded to Mr. Adam Knight, Brayton Gardens, Carlisle. His was a bold group, and contained a number of finely-grown and well-coloured crotons, liliums in variety, and francoas.

Premier place for six foliage plants was won by Mr. A. McMillan, gardener to the Earl of Home, K.T., Douglas Castle, Lanark, with large examples of Alocasia metallica, Phyllotænium Lindeni, Dieffenbachia magnifica, Alocasia spectabilis, Anthurium crystallinum, and Maranta zebrina. Second prize was won by Mr. Adam Knight, Brayton gardens; and third by Mr. J. McKenna, gardener to Sir Robert Usher, Bart., Norton, Ratho. First prize for four stove plants was won by Mr. Duncan Mackay, gardener to C. Dickson, Esq., Lasswade, who showed Oncidium incurvum, Statice protu-

(*Continued on page 713.*)

THE CHARM OF OLD GARDENS.

If we inquire into the reasons of the great loveliness of English country villages and their neighbourhoods, we shall find that a considerable measure of them are owing to the flowers

"In green old gardens, hidden away."

There are visions of ideal beauty to be seen wherever pleasure grounds are lovingly cultivated, vistas of vivid or cool colour, groups of noble plants, lawns of the hue and softness of moss, all chequered by the shafts of sunshine and lines of shade that differ in size and shape every instant of daylight: modern gardens can boast many such attractions, of course, but it is in the ancient gardens, in which growth has been restrained just enough but not too much, that the perfection of charm exists.

Probably we sacrifice luxuriance to neatness nowadays; when creeper boughs hang in festoons from walls or arches we consider the use of ties and nails has become necessary; when trailing boughs exceed the space of beds we turn them inwards again and peg them to the soil; when the perennials and annuals of our borders twine about one another, thrust branches through branches, lean together, we come with stakes, raffia, and scissors to restore tidiness among them. In some degree restrictions must be pursued, of course, yet the tangled flower and foliage masses of an old garden should be imitated as far as may be where tall and lesser plants are grown together in borders.

As with roses we cherish the distinction between those fittest for exhibition and those admirable for decorative garden effect, so with the delphiniums, dahlias, and hollyhocks we should recognise that some are to be grown for the production of giant blossoms, others for the improvement of the scene; overcrowding is a thing quite distinct from massing for effect, but even massing is tabooed by the cultivators who aim only at gaining blooms of a record number, circumference, or breadth. With many a fruit and vegetable this straining after size has been pursued at the sacrifice of flavour: with many a perennial fineness has been studied rather than elegance. Take, for example, the much-vaunted foxgloves, that produce an extra-large blossom at the summit, just where gracefulness requires tapering of buds and partly open blooms; such a monstrosity could not be valued except for its curiosity.

Our grandfathers' gardens were planned essentially for comfort more than for grandeur; the arbours faced the best views and overlooked bowling greens and other lawns, the cut-out beds were not too numerous to be well filled with choicest plants; the borders frequently showed the more ornamental vegetables, such as scarlet runners, marrows, peas, lettuces, and carrots, growing in close proximity to flowers, and this not only in the vegetable plots.

One feature of old style that we miss was the union of roses with all the usual border plants: great round bushes of Aimeé Vibert, Maiden's Blush, York and Lancaster, Persian Briar, and other roses towered among pentstemons, pansies, columbines, and lilies, and certainly seemed to take no harm from their surroundings. While admitting that delicate roses must be grown in beds almost by themselves, I would draw attention to the splendid effects obtained in earlier years, by associating strong kinds with flowers of other species. There is a monotony about a dozen rose bushes with no other plants visible; colour harmonies of ideal exquisiteness result from the use of blue and mauve with pink and yellow, and we have, as yet, neither of those first hues in roses.

The proper creation of an arbour is always a work of time, but our ancestors threw all their skill and energy into such labour; a well-made honeysuckle, jasmine, sweet briar, or even ivy arbour constituted a show spot in the garden, as well as one of great comfort and service; nowadays the purchase of an almost ready-built summer-house is generally preferred, and, though that kind of structure forms a good support for well-trained climbers, the whole must be well grown over before it can become at all a poetic sort of bower.

When a sun-dial was set up it was always with a view to its giving time-warming and intelligence, not as a freak, or a costly plaything; consequently it was placed where the sunshine could reach it most of the day, and tall shrubs and plants were not permitted near. Too often can a sun-dial be found to-day exhibited where it is not the slightest service, and giant vegetation is allowed to still further shadow its dial; indeed, the sole reason why it appears at all is that it is a feature costly and uncommon. This, to my thinking, is vulgarity as applied to gardening.

Perhaps the former ages were less lacking in patience, and that is why screens were made of shrubs and hedges, instead of the now ubiquitous trelliswork; though there is nothing inartistic about the unobtrusively painted mesh of wood, no gardener can surely claim that natural tracery of branches, with their clothing of foliage and blossom, sometimes of fruit also, is not more charming. We should do well always to consider whether it is not worth while to slowly build up a garden beauty rather than construct a less attractive feature in a few hours.

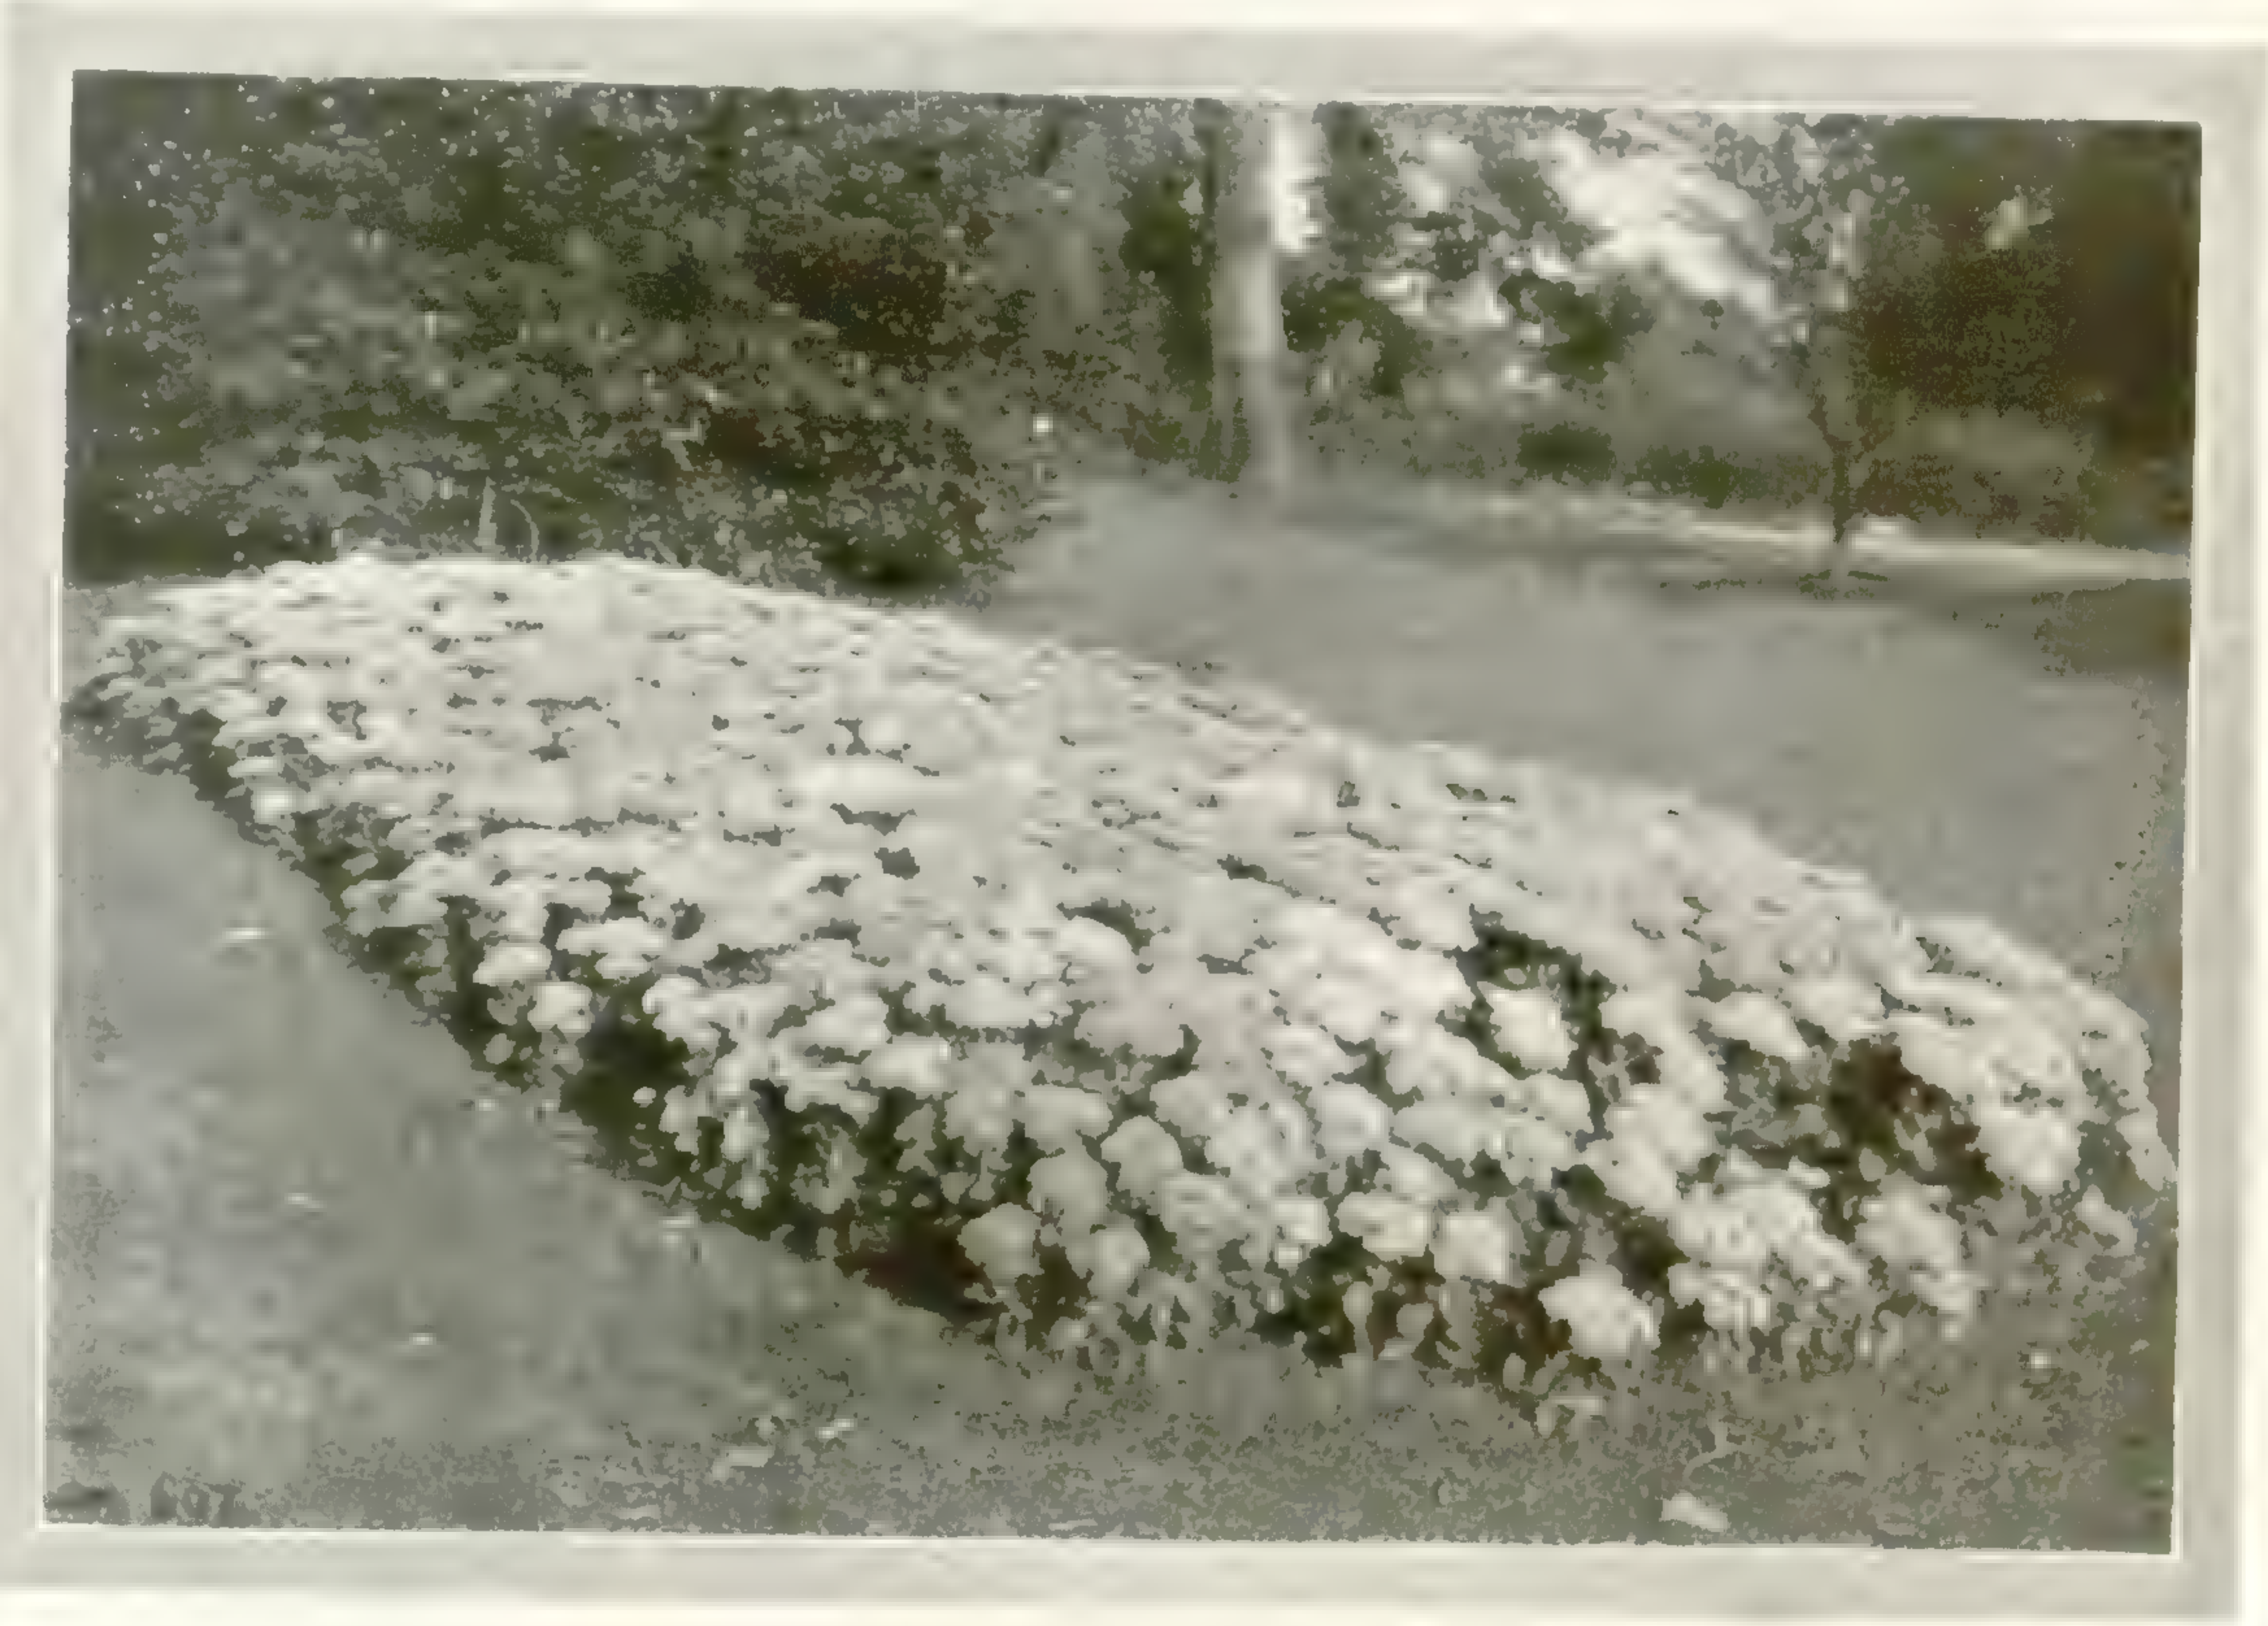
Lastly, the old-fashioned flowers are charming still, so let us not suffer any of them to die out of knowledge; the ancient roses especially have a claim upon our grateful memory, and if we do not wish to grow them in the actual rosery we can place them among the annuals and perennials in borders. For freedom of bloom and decorative value what can surpass the old China roses, crimson, pink, and white, the autumn luxuriance of such Bourbons as Souvenir de la Malmaison, and Acidalie, or the buttonhole furnishing of the common moss? Pentstemons, monkshoods, Turk's-cap lilies, hen-and-chicken daisies, carmine phloxes, crimson sweet williams, purple columbines, brown wallflowers, we can surely find space for them all, with the prim asters that mostly surrounded the sun-dial, and the snapdragons and sedums which revelled even upon the summits of antique walls?

A little less regularity, more appreciation of natural methods of plant growth, some reluctance to put similar sized plants in lines or plots at equal distances, and then we shall be possessors of gardens that combine both olden and modern merits.

M. H.

SEDUM SPECTABILE.

Few autumn-flowering hardy plants are more familiar than the fine old Sedum spectabile, a species loved by keen cottagers, and the old folks in country districts. Fortunately, it has not been ousted from the more highly cultivated gardens by modern introductions, but still holds a place as an autumn-flowering plant of high merit. Good groups of S. spectabile form a striking feature in the herbaceous border in September, and, during the hours of sunshine, the flattish heads of deep pink flowers are almost alive with bees and butterflies, Red Admiral and Peacock butterflies appearing to have a very great liking for the plant.



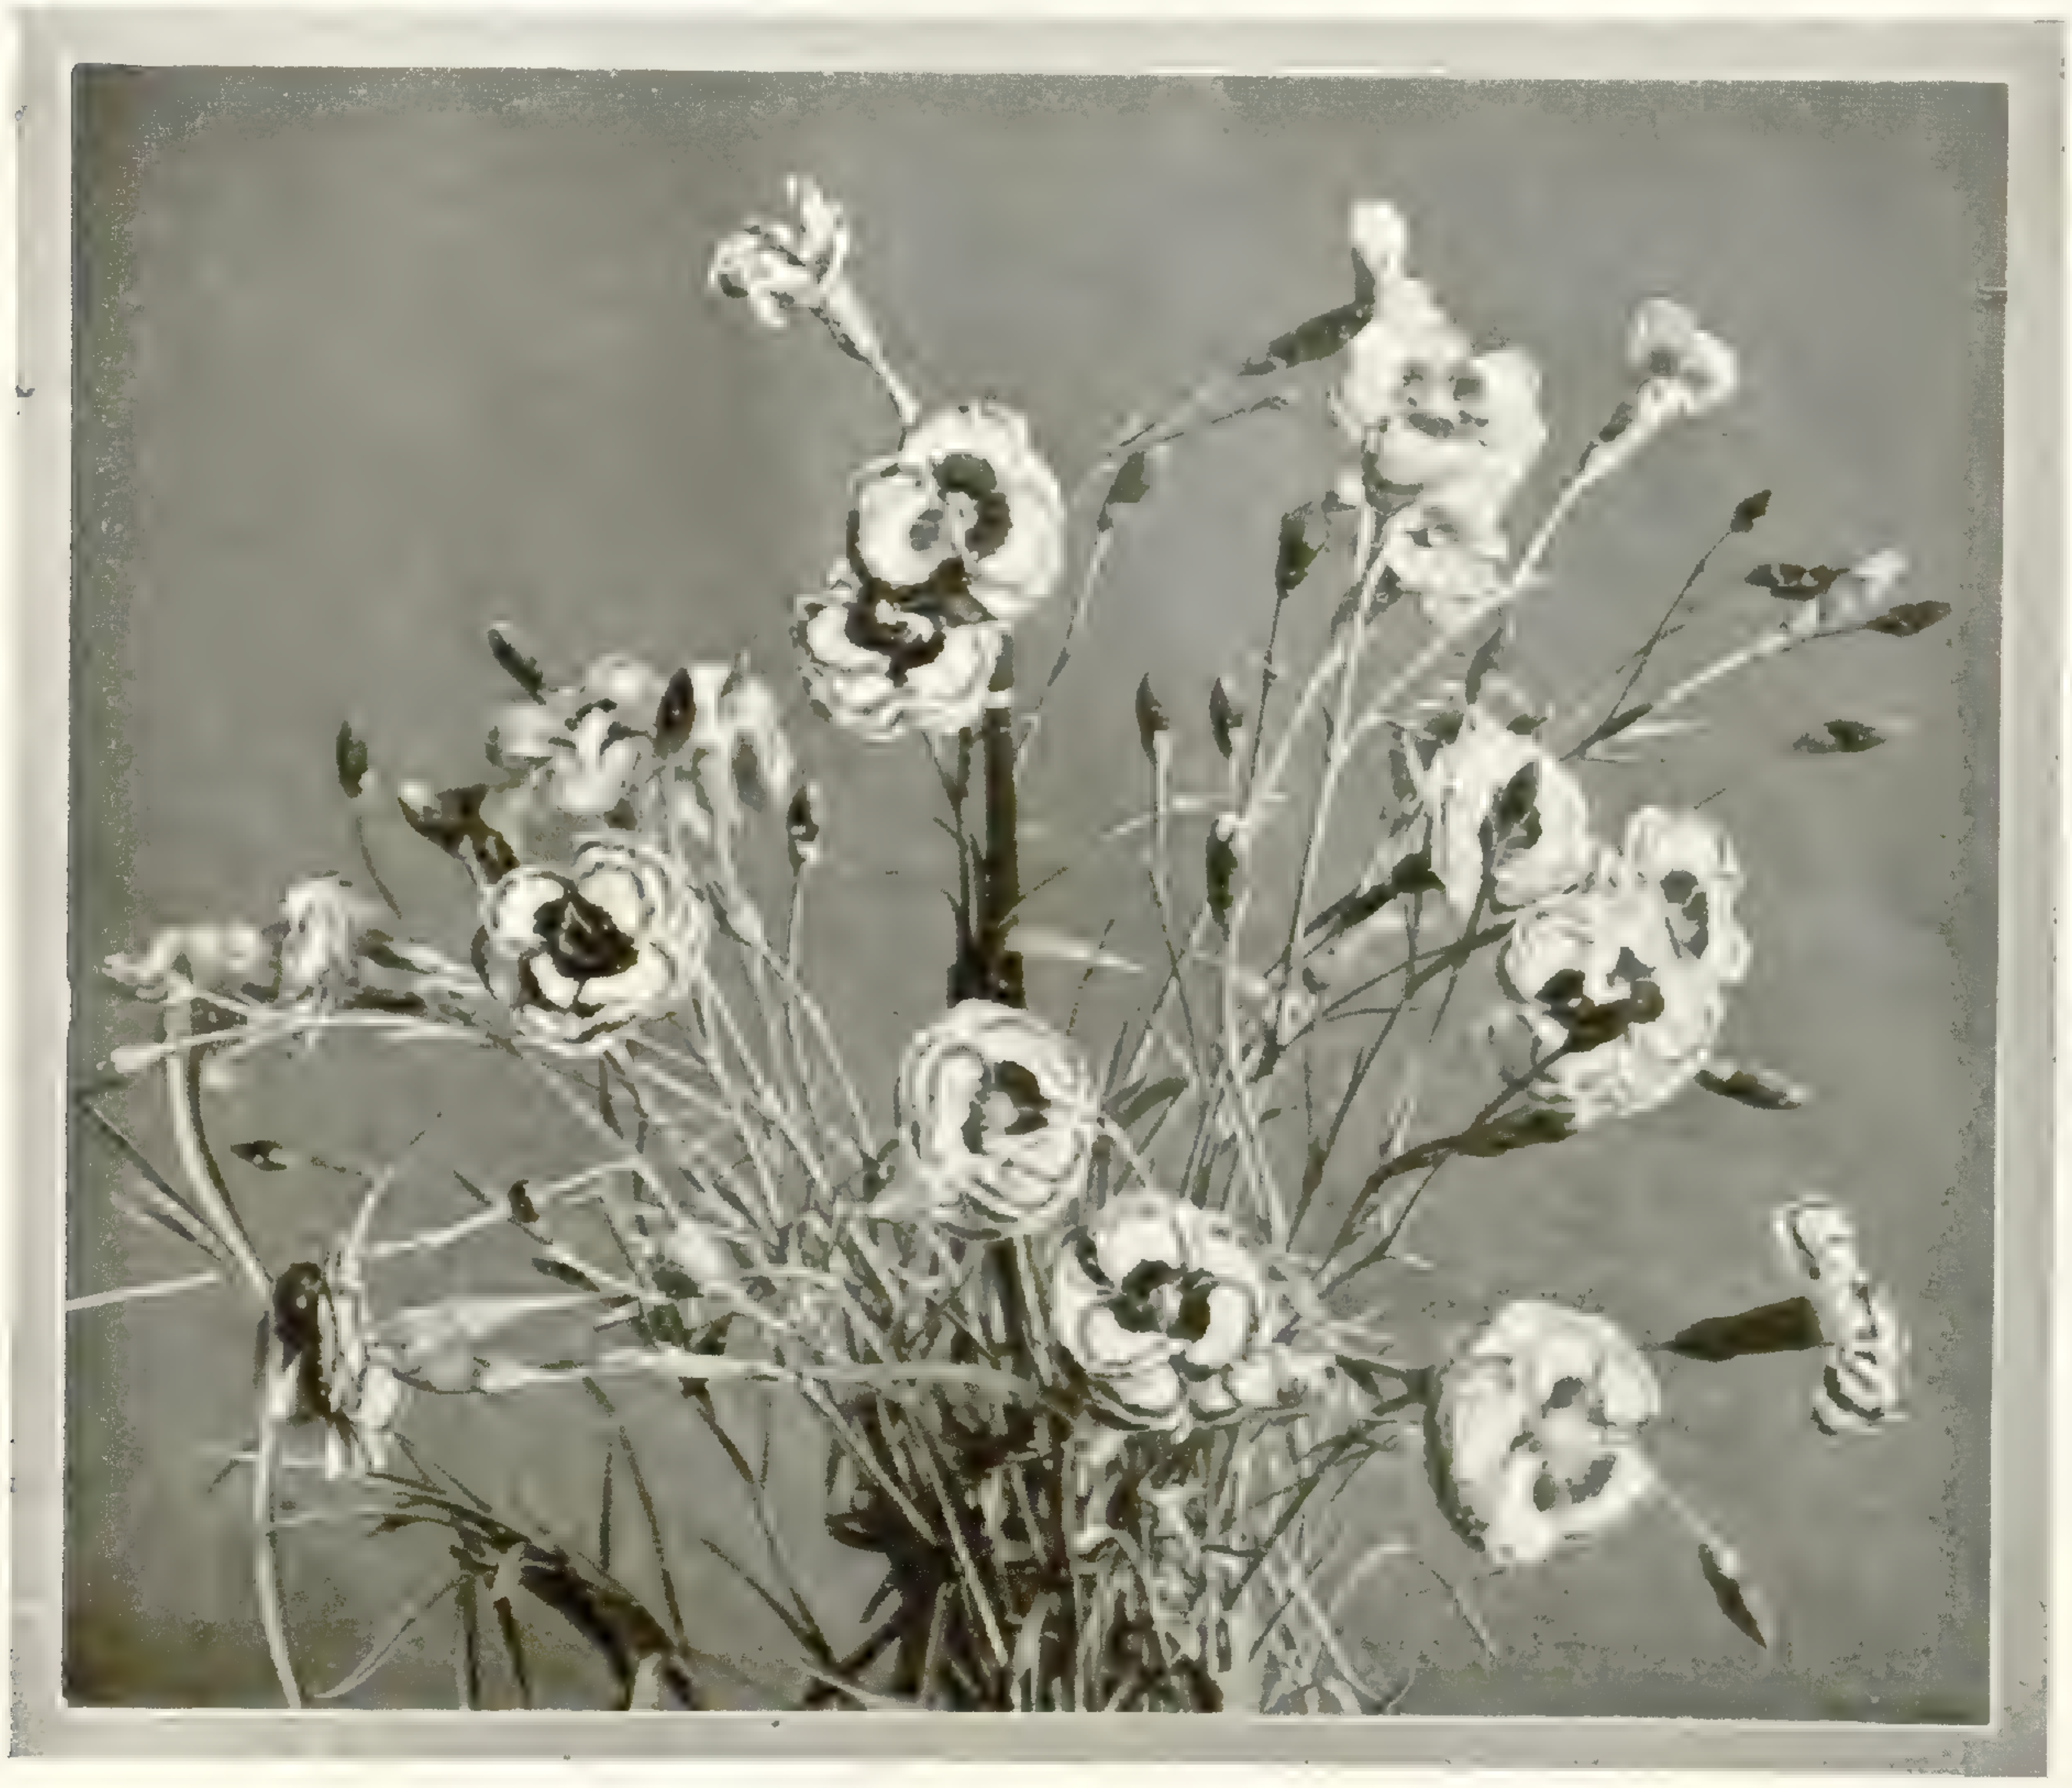
A BED OF SEDUM SPECTABILE IN THE ROYAL GARDENS, KEW.

Although as a border plant Sedum spectabile is well known, it is not usually regarded as a suitable subject for filling a whole bed, and yet it provides a very distinct and attractive bed when so planted. At Kew it is so treated, and the illustration herewith shows its use as a bedder in the Royal Gardens. The only fault that can well be brought against it is its formality when grown in a mass. So even do the plants grow in the matter of height that when in bloom a bed presents an almost flat and solid mass of pink colouring. Possibly, if planted in groups with some taller-growing plant between, instead of in a mass, the effect would be as bright, and possibly more elegant.

HARDY FLOWERS are always popular, as they make the garden bright and attractive, and require but little attention. All the information required for their successful culture is given in Easily Grown Hardy Perennials, by G. H. Vos. Price 5s. net, by post in box, 5s. 6d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

TYDÆAS.

Taken altogether gesneraceous plants are remarkable for the showy nature of their blossoms, yet, excepting gloxinias and streptocarpuses, most of them have their merits overlooked. To my mind, a much-neglected race are the tydæas, which the botanist tells us are not tydæas at all, but isolomas. The older name, however, is, in gardens at least, not likely to be superseded. The flowering period of the tydæas depends to a great extent upon the treatment the plants have received, but if grown under the most natural conditions, that is to say, started into growth in the spring, brought on for a time in an intermediate temperature, and then removed into the greenhouse, they will in that structure form a very attractive feature at this season of the year. Unlike some gesnerads the tydæas form a decided stem; indeed, some will mount up to a fair height. The inflated tubular blossoms are more or less expanded at the mouth, in some varieties to a considerable extent. This spreading portion of the corolla shows the most decided markings which in a few forms at least are very quaint and uncommon.



NEW PINK, THE DUKE.

Flowers white, laced with deep rose. Raised by Mr. Jas. Douglas, Great Bookham.

As a class the tydæas are noteworthy for their continuous flowering, for whereas in many cases they will commence to bloom by midsummer, the shoots lengthen and flowers are produced therefrom till autumn is well advanced. One reason perhaps that tydæas are not more grown is that the blossoms are of little or no service in a cut state, but as already mentioned, they are exceedingly attractive on the plant.

The cultural requirements of tydæas are not at all exacting, and to anyone about to take up their cultivation I should advise obtaining them in early spring before the curious caterpillar-like rhizomes start into growth. In this stage they can be sent by post at a very cheap rate. Like most gesnerads they are especially partial to a liberal amount of vegetable matter in the soil, hence a very suitable compost may be formed of equal parts of loam and well-decayed leaf-mould, with a good sprinkling of sand. The rhizomes should be so placed that the tip or growing portion is about one-third of an inch below the surface of the soil. Very little water will be required until growth recommences; indeed, the general treatment may be much the same as that given to gloxinias, which popular plants may be successfully grown under much cooler conditions than is generally considered necessary for them. From year-old tubers I have grown them with the same treatment as tuberous-rooted begonias, and have had a fine show of flowers in July and August.

Tydæas are very readily propagated by the formation of new rhizomes, and also by seeds, which, if saved from a representative collection, will give a great variety in the markings and colour of the flowers If sown in a warm structure early in the year, pricked off as soon as large enough to handle, and potted on afterwards, tydæas will flower well the first season.

In a most instructive paper on gesneraceous plants by Colonel R. H. Beddome, F.L.S., which appeared in the "Journal" of the Royal Horticultural Society for January, 1908, the writer states in reference to Isoloma amabile (belonging to the tydæa section) that it is one of the oldest of the tydæas,and it is, I believe, the parent of most of the hybrids sent out by Continental growers. Although Colonel Beddome follows the lead of most botanists, and includes the tydæas in the genus Isoloma, he keeps them in a separate section, and thus refers to their points of difference: "Tydæa has a corolla much dilated at the mouth of the tube, the lobes spreading and copiously dotted and flaked. Isoloma has a more cylindric tube, more or less contracted at the mouth, the lobes small, the colour of the flower nearly uniform crimson, scarlet, or orange, with slight flaking about the mouth; tydæa is an old, well-established name, and will not, I think, be readily given up by horticulturists, particularly as it is easily distinguishable from isoloma." W. T.

GALTONIA CANDICANS.

Galtonia candicans is a well-known and extremely beautiful hardy flowering bulb, producing in autumn tall, erect spikes, carrying from 40 to 50 drooping white bell-shaped flowers. In a general way the individual flowers resemble those of the common snowdrop, but are a good deal larger; they begin to expand in August, opening from the bottom of the spike upwards, and it is usually well into October before the last flower on the spike begins to fade.

The whole character of the plant is imposing, the long strap leaves being sub-erect, and from the centre of these spring the stout glaucous scapes often 5 feet or more in height, each spike arrayed with its quota of graceful bells, so that when liberally planted in groups or clumps the effect is extremely pleasing, and one which increases the interest, and adds to the charm of a garden in autumn.

One might readily enumerate instances where galtonias could be effectively planted in association with other subjects; as a contrast to the bright scarlet flowers of Gladiolus brenchleyensis or Salvia splendens, it is frequently employed, the latter being certainly the best plant, as the gladioli is too short-lived for the galtonia. I think, however, that its beauty is doubly refined when employed in harmony with low-toned subjects, such as in the case where the slender inflorescence of Bocconia cordata and Stipa pinnata have maintained the interest of the group during the flowering period of the adjacent lily beds (Lilium longiflorum); and when the galtonias come into flower, the glaucous grey leafage of Eucalyptus globulus and the silver-grey foliage of Leucophyton Browni form an admirable setting for the pearly-white blossoms. A few plants of double lemon hollyhocks add to the effectiveness of the whole. As a composition it is extremely restful and in marked contrast to, and also a decided change from, the stereotyped use of scarlet and white.

Galtonia bulbs require deep planting to be successful from year to year, but it is essential that the ground be well drained, because being natives of South Africa our cold soils are inimical to their welfare during winter.

Positions well exposed to autumn sun ensure the maximum ripening of the leaves and maturing of the bulbs, and in winter it is advisable to cover the ground with some light, open material like bracken or spruce tops, as by these means we admit sun and air on all favourable occasions, and afford protection from frosts.

Ground intended for galtonias should be enriched with manure from a spent mushroom bed and deeply dug during autumn, deferring planting until spring. On heavy soil shallow planting, with winter protection, will give the best results, and a good layer of sharp sand should be put under each bulb at planting time. Galtonias answer readily to stimulants applied when in full growth, and by this means prodigious spikes may often be secured, especially upon soils naturally fertile, but this practice appears to weaken the constitution of the bulbs in that they are liable to decay in winter, and unless one cares to replenish the stock annually, a moderate floral display gives, on the whole, the most satisfactory results.

Thomas Smith.

Walmsgate Gardens.

THE PINK.

We cannot trace the garden history of the pink to a date so early as that of the carnation, but I happened to look into "Flora, Ceres, and Pomona," by John Rea, Gent., 1676, and find he says, "The pinks flower with the roses in June, and every ordinary gardener knows how to plant and dispose of them, as also that vulgar plant called thrift." The flowers, he adds, are used "for posies, mixed with the buds of Damask roses; most of them are single, and there are some that bear double flowers."

Garden varieties had been produced previous to Rea's time, and there were varieties with varied coloured double flowers; white, light red, bright purple, and some with a deeper or paler spot in the middle. The feather Pink of Austria had a large deep purple spot in the centre. The "Floricultural Cabinet" gave many illustrations of pinks from 1833 onward, and the improvement was very rapid during the following years. "The Florist" was started in 1848, and the coloured plates of pinks, by Mr. Andrews, were evidence of the great improvement in the flowers caused by the stimulus of numerous pink shows held all over the country. I remember the late Mr. John Keynes saying they had six pink shows in Salisbury in one year, and that he carried his silver watch to the pawnshop to obtain the wherewith to purchase his first collection.

The bedding-out fever set in about this time, and every garden became a blaze of scarlet geraniums, yellow calceolarias, purple verbenas, blue lobelias, etc., etc., in lines and masses, and all the beautiful florists' flowers were sadly neglected. The fever, like all fevers, ran its course, and the good old-fashioned flowers are again in their right place. It may be of interest to readers of the **Gardeners' Magazine** to know the properties of the pink, defined by the florists, in Vol. II. of the "Floricultural Cabinet," page 46:

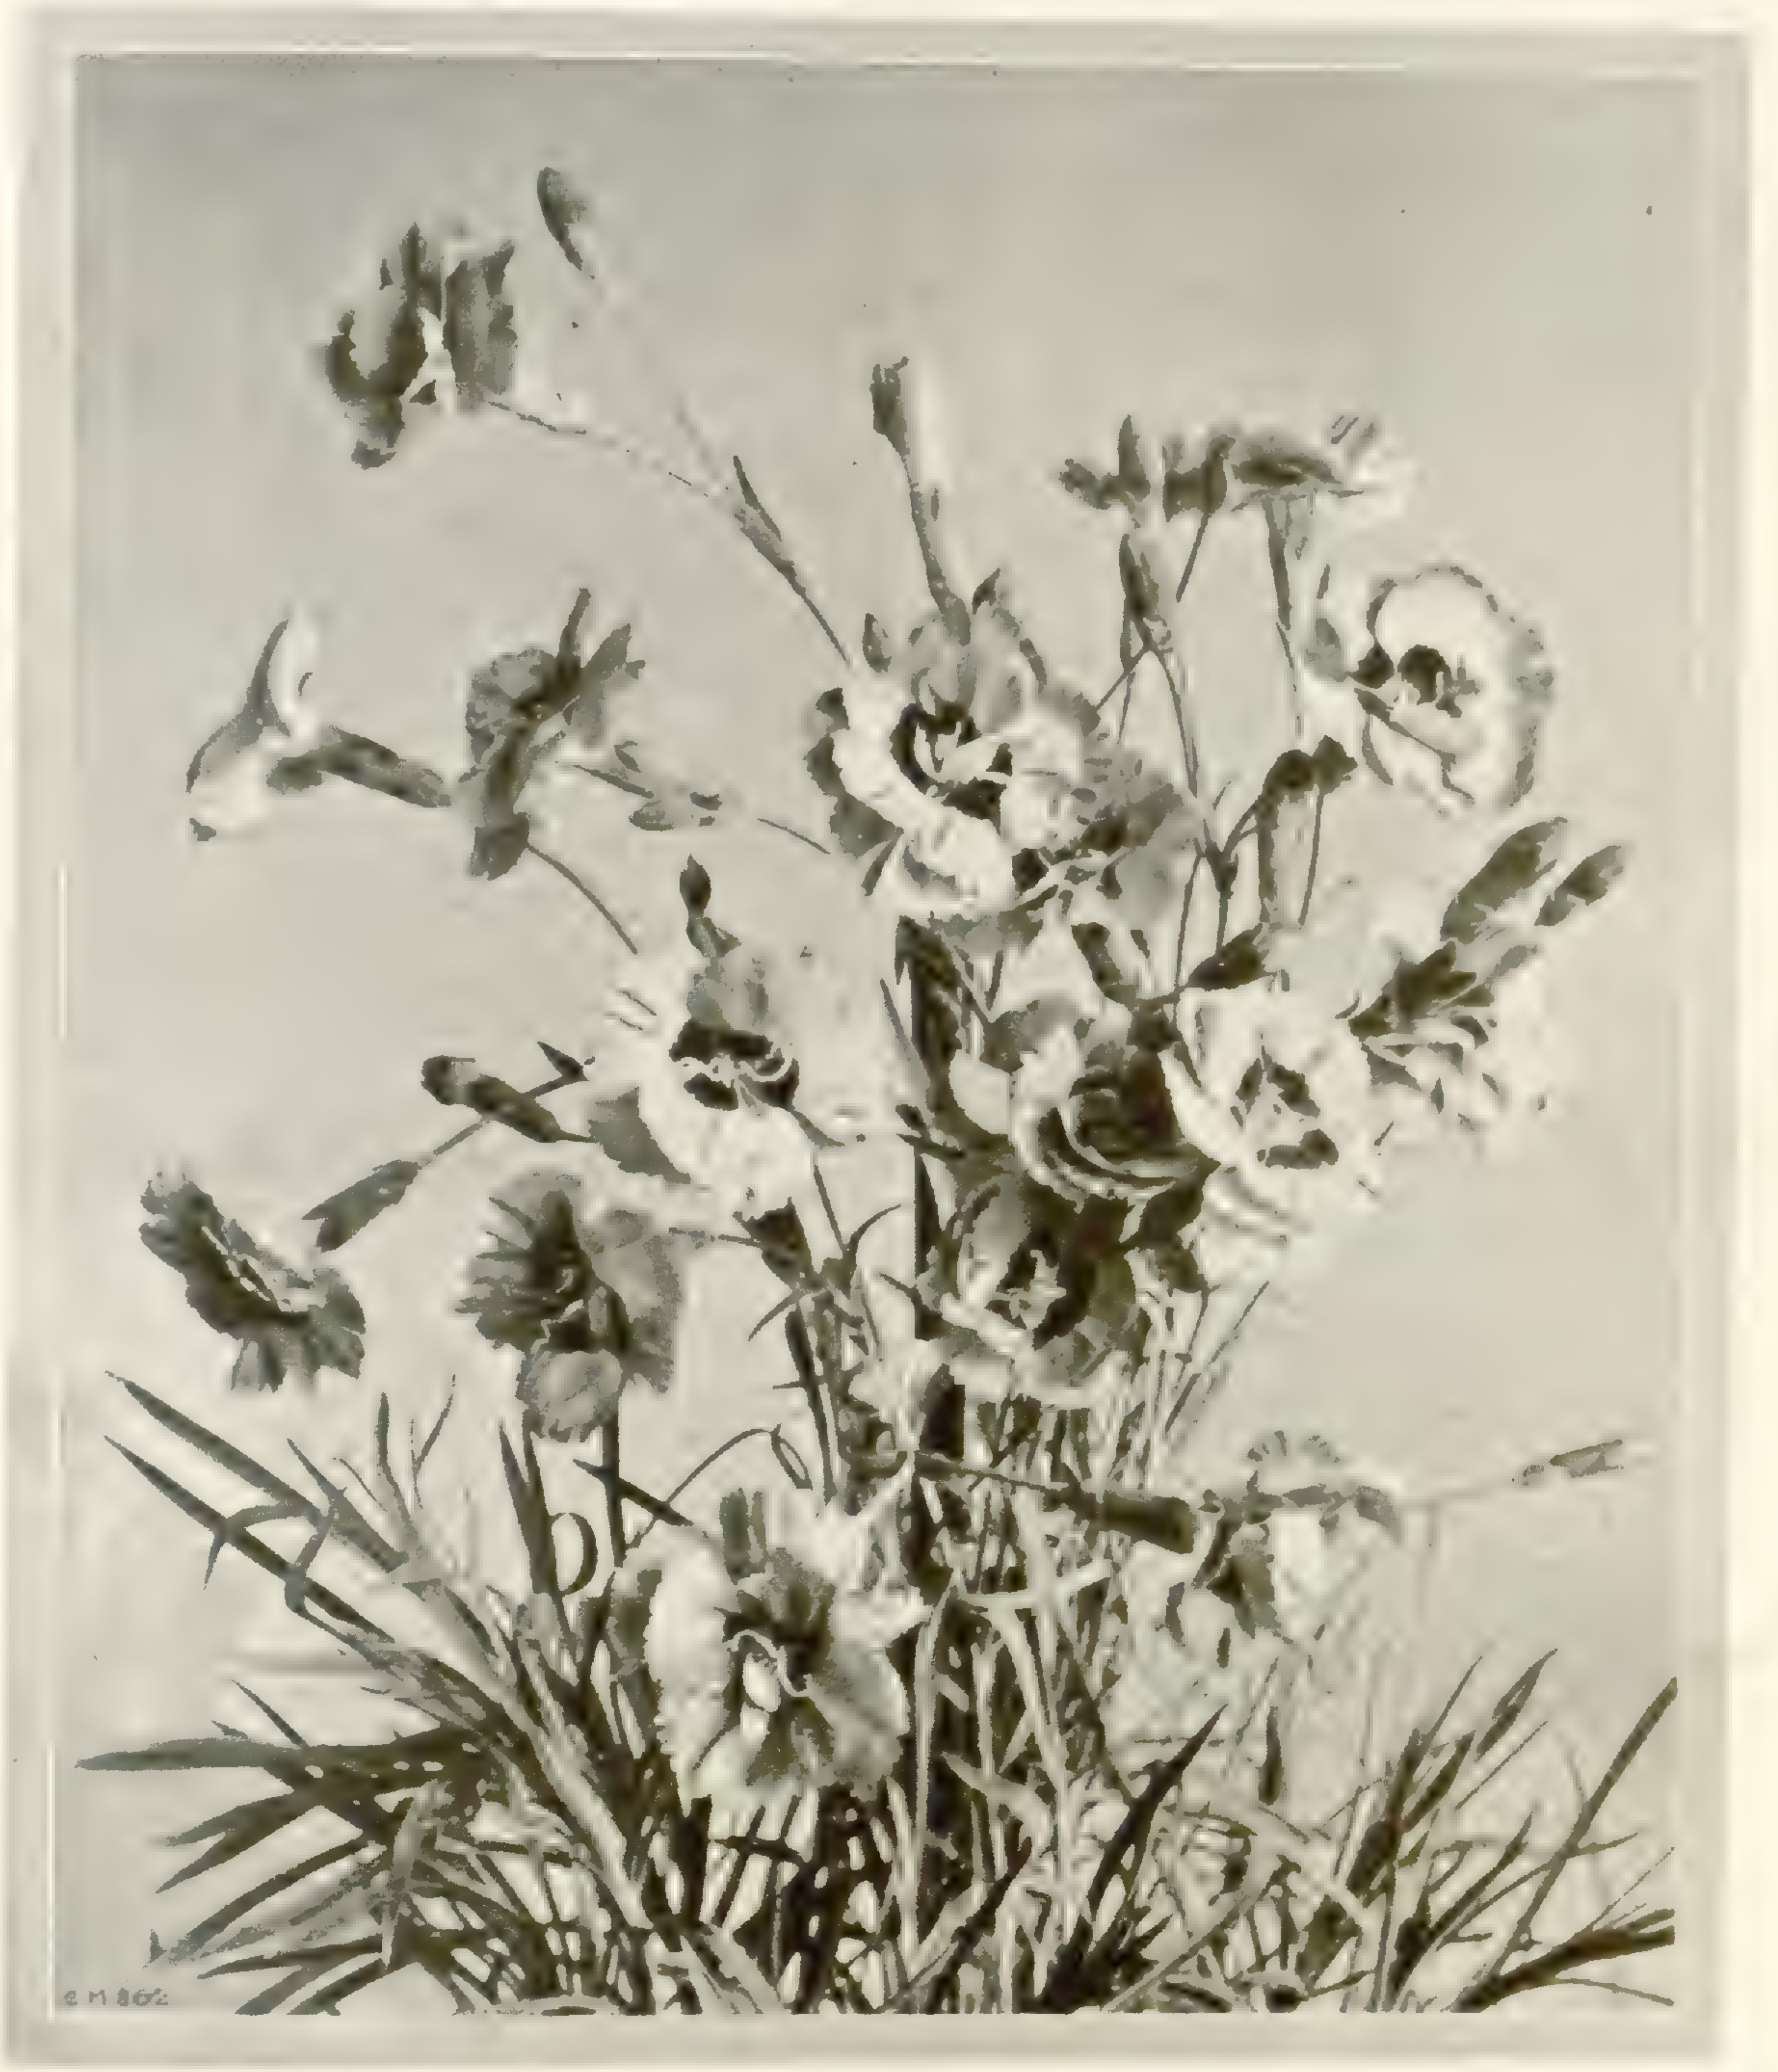
I.—The stem should be strong, elastic, and erect, and not less than twelve inches high.

II.—The flower should not be less than two inches and a-half in diameter; the petals should be large, broad, and substantial, and free from large, coarse, deep notches, or indentures; in short, approach nearest to perfection when they are rose-leaved, i.e., without any fringe at all.

III.—The broad end of the petals should be perfectly white, and distinct from the eye, unless it be a laced pink, which should be bold, clean, and distinct, leaving a considerable proportion of white in the centre, perfectly free from any tinge or spot.

IV.—The eye should consist of a bright rich dark crimson or purple, resembling velvet; but the nearer it approaches to black the more it is esteemed; its proportion should be about equal to that of the white, that it may appear neither too large nor too small.

The lacing of laced pinks is usually lighter than the blotch of colour in the eye, and as sweetly scented. Perfectly hardy plants for the flower garden, there is considerable sameness amongst them. I have cultivated pinks from boyhood, and think any garden incomplete without a collection of them. They are easily grown, and easy of propagation, either by layers or slips, and so hardy that no protection of any kind is needed. It is interesting, too, to raise seedlings, which give excellent results. A large proportion of the seedlings will be as good as the parent plants. The interest in the cultivation of any class of plants is greatly increased by the anticipation of the flowering of seedlings. The seeds of pinks should be sown in March, and the seedlings ought to be pricked out in boxes, and treated much as half-hardy annuals. They are planted out in beds about the end of May or early in June, a foot apart, in good soil, and the foliage will about cover the ground, giving a wealth of blossom the following season; a few of the plants produce single flowers, but many of these are very beautiful, and more esteemed by many tasteful persons than those with double flowers.



NEW PINK, RUBICON.
Flowers old rose and crimson. Raised by Captain Poë, Riverston, Ireland.

If the standard varieties of pinks are propagated by layers, this may be done a month before the carnations are ready. The slips, or pipings, may be taken off at the same time, and inserted under handlights in any fine sandy soil; they soon form roots, and may be planted out as soon as they are well established. It is desirable to have them planted out where they are to flower early in September, so that they may become well established before frosts set in.

Referring to the two illustrations of pinks reproduced herein from photographs of plants grown at Edenside, Great Bookham. The Duke is a very handsome variety, of the laced type. The centre of the flower is a maroon-crimson, and the lacing of a much lighter tint; it was produced from seed at Edenside. Rubicon is a very handsome border pink, raised by Captain Poë at Riverston, Ireland and the colour is what is termed vieux-rose, the centre of the flowers darker; it is quite distinct, and, like The Duke, of vigorous growth.

James Douglas, V.M.H.

OLD MUD WALLS FOR ROSES

Some time ago an old building constructed with mud and a small quantity of shingle, was demolished in the southern part of the county of Hampshire. The mud walls were broken up roughly and carted to some land where it was intended to grow roses. After remaining in heaps for a few weeks exposed to rains and the weather generally, the lumps were broken down to a powder and the material spread evenly on the surface of the land. The ground was then trenched, and the powdered mud and clay well mixed with the soil. The original soil is of a light nature, gravelly and poor in quality. Roses from this ground were exceptionally fine after the treatment above referred to; but they were of only moderate quality before from adjoining ground even after good dressings of well-rotted manure had been given. The old mud wall material acted like magic and proves how valuable well pulverised clay and marl are in the growing of roses in light soils. Hybrid Perpetuals, Hybrid Teas, Teas, and climbing roses were mainly grown in the garden referred to. The leaves were large, and very glossy and of a deep green colour.

G. B.

NEW PLANTS, ETC.

LÆLIO-CATTLEYA GOLDEN ORIOLE WESTONBIRT VAR.

The beautiful and useful hybrid derived from the intercrossing of Lælio-cattleya Charlesworthi and Cattleya Dowiana aurea is variable, but every variation is charming, and the plants bloom in early autumn. The above-named variety is one of the most beautiful forms, and is one of the most attractive of orchids. It has golden sepals and petals, and a fine crimson lip, shaded with red-brown and freely veined with gold. The colouring is splendid. A.M., R.H.S., August 31. Mr. H. Alexander, orchid grower to Lieut.-Colonel Holford, Westonbirt, Gloucester.

MONTBRETIA PAGEANT.
A.M., R.H.S., August 31; Col. Petre, Westwick, Norwich. Flowers orange-yellow and crimson.

SOPHRO-CATTLEYA BLACKI.

A handsome hybrid between Sophronitis grandiflora and Cattleya Hardyana. The flowers are of fair size, and the plant is of dwarf growth. The colour is scarlet, suffused with yellow, the latter showing mostly in the lip. A.M., R.H.S., August 31. Mr. Black, gardener to R. G. Thwaites, Esq., Chessington, Streatham.

ODONTIODA GRAIRIANA.

A new and interesting hybrid, having Odontoglossum Rossi majus and Cochlioda Noetzliana as parents. The colour is pale salmon with darker shading. The influence of both parents is obvious in the flowers and growth. Certificate of Appreciation, R.H.S., August 31. Mons. H. Graire, Amiens, France.

MONTBRETIAS.

Pageant.—A fine addition to the newer montbretias. It is scarcely so splendid as Prometheus, but its great merit lies in its extremely robust growth and free branching and free flowering habit. It is growing 5ft. high at Westwick, and making a splendid blaze of colour. The large, rounded flowers are orange-yellow, with a crimson zone around the eye or centre of the bloom. A.M., R.H.S., August 31. Mr. G. Davison, gardener to Colonel Petre, Westwick, Norwich.

George Henley.—An elegant and pretty variety, bearing branching spikes of pale orange-yellow flowers. A.M., R.H.S., August 31. Mr. G. Henley, gardener to S. Morris, Esq., Thetford.

GENTIANA ORNATA.

A beautiful little plant, collected by Mr. E. H. Wilson at an elevation of about 12,500ft. in China, where it was found growing with Meconopsis punicea. About three inches high, apparently of free growth, this little gem produces intense blue flowers that are rather more than an inch across the mouth. A.M., R.H.S., August 31. Messrs. Jas. Veitch and Sons, Chelsea.

ANTHURIUM TRINERVE.

A distinct species with long, narrow leaves and bearing, somewhat freely, violet-coloured fruits. It is nearly allied to A. violaceum, and is quite distinct from A. trinervium, Kunth. Bot. Mag., t. 8251.

MUSSÆNDA TREUTLERI.

An attractive stove plant with bright scarlet flowers and large white bracts. This species was introduced into cultivation by Messrs. Knight and Perry about 1840, and appears to have flowered with them in 1844 and 1845, and was figured in two of the botanical periodicals as M. macrophylla, Wall, under which name it is usually cultivated. Bot. Mag., t. 8254.

CYPRIPEDIUM A. DE LAIRESSE

As an early autumn flowering cypripedium C. A. de Lairesse ranks high, and though it may lack the finer colouring of the later flowering sorts, it possesses many points of interest and attraction. The hybrid was raised by crossing C. Curtisi with C. Rothschildeanum, and is remarkable for its free growth and freedom of flowering. In the accompanying illustration is depicted a specimen carrying two spikes of three blooms each. C. Curtisi has given the bolder lip and broader petals, while C. Rothschildeanum has given elegance and increased the length of the spike. The colouring is white and green, with stripes and spots of rich purple, with crimson shading on the lip. The specimen figured on page 707 was grown by Mr. G. Day, gardener to H. S. Goodson, Esq., Fairlawn, Putney, and represents cultural skill of a high order.

LONICERA MAACKI.

People who intend to plant shrubs during the forthcoming planting season ought not to overlook this honeysuckle when making their selection. Although it has been in cultivation for a long while, it is only within the last few years that it has proved to be such a good shrub as it really is. The original introduction appears to have been a poor form, for plants which were raised in the Coombe Wood nursery of Messrs. Veitch, from seeds sent from Central China by Mr. E. H. Wilson in 1900, produce larger flowers and blossom more profusely than the old plants.

The species belongs to the bushy set, and grows eventually to a height of eight or ten feet, with long arching branches. The leaves are more or less ovate, and the flowers white and tubular, or rather trumpet shaped. The latter are produced from the leaf axils, and are in such profusion as to make a branch appear to be one large inflorescence. Added to their showy character, they possess the additional advantage of being fragrant. It is a shrub that anyone may try without fear of failure, for it is of good constitution, and grows freely in good garden soil.

The original L. Maackii is said to be one of Fortune's discoveries in 1843, and it was named in honour of Richard Maack, a Russian. A very good illustration of a flowering bush is given in Messrs. Veitch's list of novelties for 1906. D.

PERENNIAL SUNFLOWERS.

And, underneath the mount, a flower I know.
He (the Sun) cannot have perceived, that
changes ever
At his approach; and, in the lost endeavour
To live his life, has parted, one by one,
With all a flower's true graces, for the grace
Of being but a foolish mimic sun,
With ray-like florets round a disk-like face.
. . . .
Men call the flower, the Sunflower, sportively.
—BROWNING (Rudel to the Lady of Tripoli).

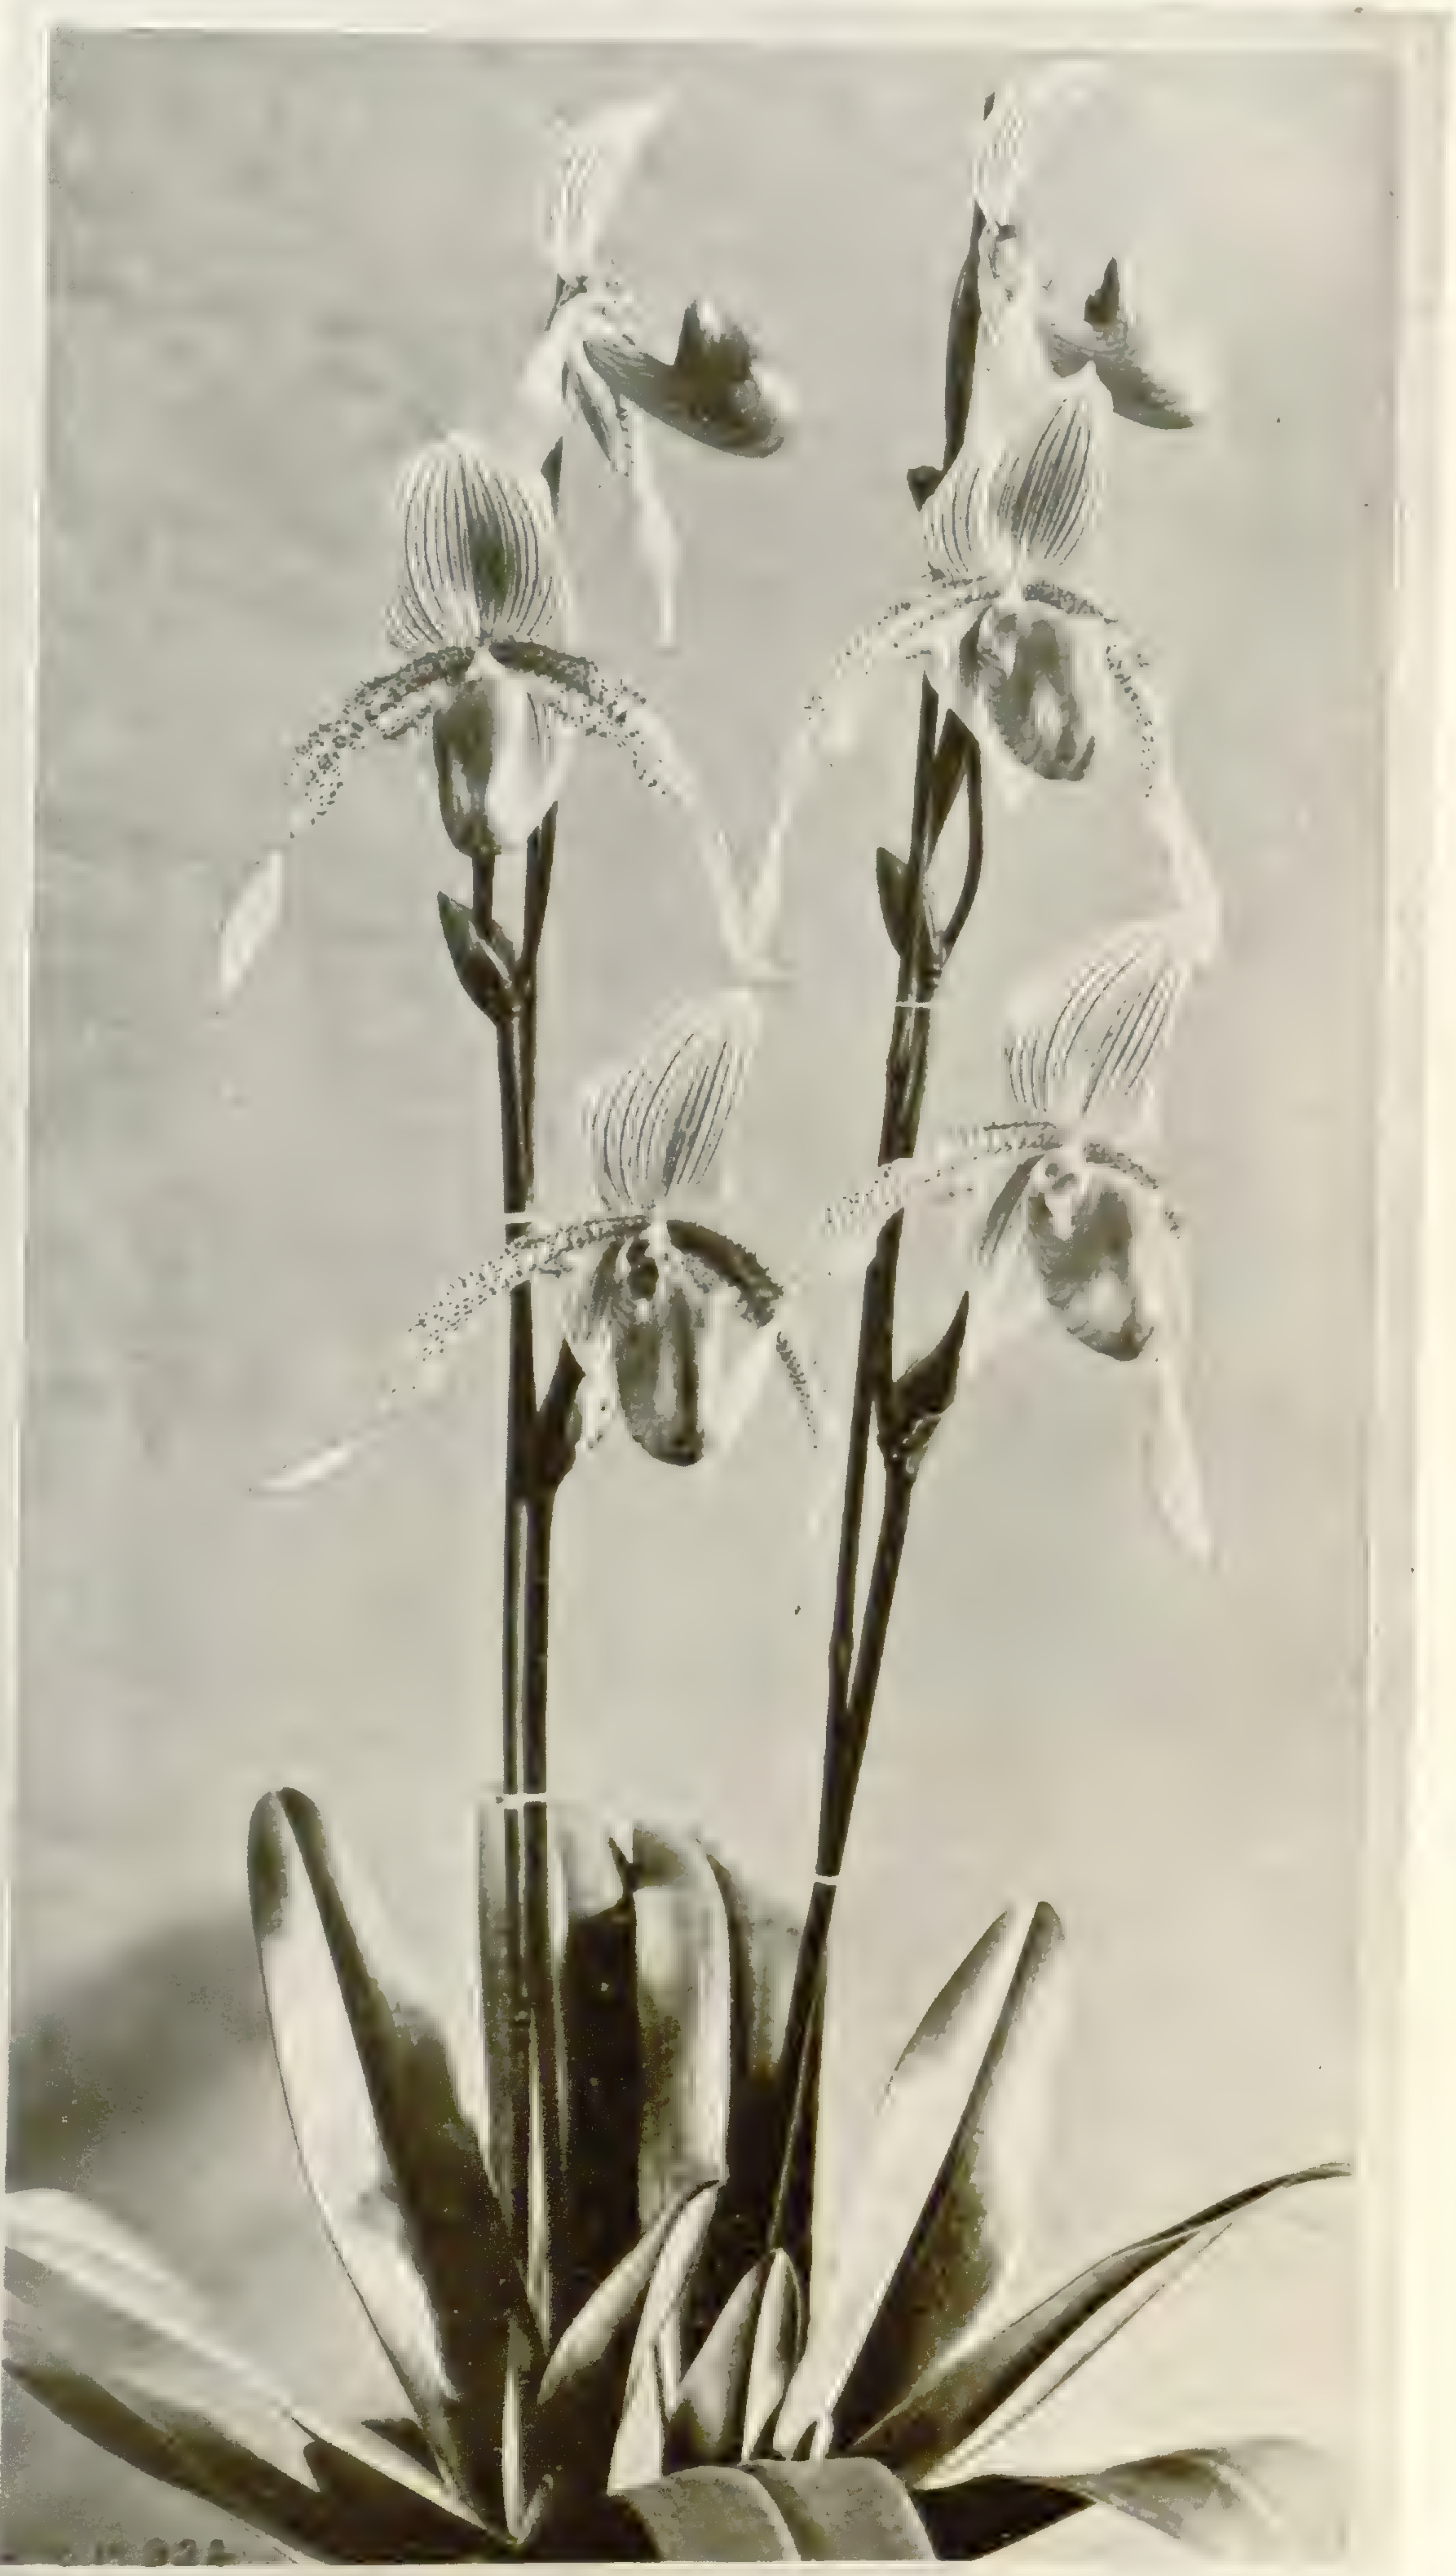
When Browning wrote the above lines the flower in his mind was, of course, the immense annual Sunflower (Helianthus annuus), this being the flower which at that time was generally understood when the sunflower was mentioned, the many perennial varieties which now brighten up our gardens either not having been introduced, or not being generally known. If the poet had known of them he could scarcely have said of them that they had

. . . . . parted, one by one,
With all a flower's true graces. . . . . .

I well remember someone giving me a plant of Helianthus rigidus, the original species, I believe, under the name of Harpalium rigidum, as something quite new, and, indeed, until I grew it in my own garden I had never seen it or any of its varieties, though now any neglected garden is covered with it. Though it is scoffed at as a weed, as, indeed, it is on the prairies of N. America, still it lightens up many a garden which would be a dreary waste otherwise. Many people who want a garden to keep itself in order without any trouble rail at the whole race of perennial sunflowers because of the spreading habit of some members of it. It must be confessed that some species are so rank and coarse in their growth that, though the blossom is beautiful, they are not fitted for the flower garden proper, but rather for the wild garden, copses, woodlands, etc.

The cultivation of the perennial sunflowers is of the simplest, most of the original species abounding in North America in a wild state—on the prairies, by the rivers, and on the dry plains of some of the southern and western States. But they are gross feeders, and the richer the soil the better will be the result, both in the size and quality of the flowers, in the duration of individual blooms, either cut or on the plant, and the length of time a clump will remain in bloom, owing to the greater abundance of laterals on well-grown plants. They will succeed in any soil or situation, if not too dry, but prefer a moist, deep loam, with at least a fair amount of sunshine. In very dry places in a hot summer they often look as unhappy as perennial phloxes in similar positions, and then they fail to give satisfaction. Those with non-spreading roots should be moved every alternate year, divided by means of a cold chisel, and the young outer pieces planted in some good fresh soil, or in a different position. Those varieties which spread by means of creeping underground stems should be taken up every year and the ground cleared of them, the strongest and best species being replanted in bold groups. Autumn is the best time to do the replanting of all sunflowers, but it may be done any time in the spring, even up to early June in a damp season, but the plants will be later in coming into flower, and not so fine.

The uses to which the perennial sunflowers may be put are varied; and although all the varieties are of various shades of yellow, yet a very different effect will be produced by a double yellow flower and a single one of the same colour, with a dark centre. They are essentially plants of the late summer and autumn, though some will be in bloom early in July in a favourable season. They make fine large breaks of colour in the mixed border, not necessarily in a line at the back, but coming to the front in large masses so as to form wide bays. Some of the rank-growing forms may be planted in woodlands, or in the grass in new plantations. For putting in shrubberies, where young shrubs have been planted a sufficient distance apart to allow room for the full and free development of the individuals composing it in years to come, there is splendid scope for showing off these gorgeous plants to advantage, but the planting should be confined to those species and varieties which do not spread by means of underground tubers, as they will get among the roots of choice shrubs, and either they will overwhelm them, or the shrubs will be damaged in getting out the roots of the sunflowers. Few flowers are better adapted for making specimen clumps on the lawn, the beds three or four feet in diameter, deeply dug out, and filled with good soil, giving them the opportunity to develop their full free-



CYPRIPEDIUM A. DE LAIRESSE.
Flowers green, white, and purple. (See page 706.)

dom of growth, and in such places the spreading varieties may be planted with impunity, assuming that the beds will be turned out every year, and the underground stems pulled out where they have got under the turf.

But it is not in the garden only that these flowers are so much appreciated, as they make such excellent material for cutting for the house during the late summer and autumn months. One often sees vases of them at flower shows in a very deplorable condition, sometimes quite withered, and where not so bad as that, yet with all the stiffness gone out of the petals. Some varieties are more subject to this defect than others, but it can be almost completely overcome in all by gathering the flowers either late in the evening or early in the morning before the sun is on them, and putting them at once as deeply as possible in a jug of fairly warm water, where they may be left for an hour or two, after which it will be found that they will last for some days, especially if care is taken to only cut those which, as can be seen by the disc florets, have recently opened. This should be done when it is intended to send or carry any on a journey, the sap vessels then getting so full of water before they are despatched that they will arrive after a journey of some hours as fresh as when they started. They are most appropriate for autumn arrangements, as no flowers look better in a setting of red-tinted foliage.

We must now deal briefly with some of the best varieties. One of my favourites is Helianthus multiflorus maximus. This has been considered by some a variety of H. decapetalus, and by others as a hybrid of which the origin is lost. It grows six to eight feet high, with broad, rough, pointed leaves, and produces from July or August to October, a constant succession of large deep yellow and well formed flowers, which are richer in colour and larger than those of the type, while the ray florets form a larger proportion of the flower, which often measures five to six inches in diameter. The centre is greenish-yellow, when first opened, and afterwards yellowish-brown. Its roots form a compact stool, and it only increases slowly unless taken up every year and replanted in good soil. Small rooted pieces taken off the old clumps in damp weather in May, and planted in good soil, will make fine flowering plants in the autumn if the season is not too dry. Other very desirable forms of H. multiflorus are H. m. plenus and H. m. Soleil d'Or, the latter having the deep yellow ray petals developed to the centre of the flower, which is thus somewhat in the form of a cactus dahlia. The public gardens in London and large towns have made everyone very familiar with these double forms of H. multiflorus. With all of them slugs are very troublesome in winter and early spring, secreting themselves in the hollows of the crowns, and gnawing off the young shoots as fast as they are formed, sometimes killing the clumps completely, and often delaying their period of coming into flower by a month or more.

There are other desirable forms of the same species, notably Queen Victoria and Bouquet d'Or, but we must leave these to speak of the other great class of perennial sunflowers, the varieties of H. rigidus, the prairie sunflower of America. True forms of this species may always be known by their rough, bristly stem, hispid, as botanists call it, with the upper leaves alternate and three-veined, and the lower ones opposite, all the leaves narrowing to a winged petiole. The original H. rigidus, growing three to six feet high, is still not to be despised, both for the garden display and for cutting, if well grown, that is, replanted every year in good soil, or, failing this, having the shoots well thinned out in the spring. Otherwise it is only a weed. This, and an improvement upon it, H. r. grandiflorus, have the advantage of flowering earlier, I think, than any of the sunflowers, sometimes being in flower at the beginning of July. One of the best forms is Miss Mellish, which makes a noble clump when well grown, attaining a height of seven or eight feet, and producing an abundance of bright orange-yellow flowers with a double row of long narrow petals and a very dark brown centre. The first blooms are sometimes as much as six inches across, though the centre is very small, and the petals, or ray florets, by no means flattened out, the whole being cup or bowl-shaped. The later flowers are much smaller. It does not last in flower so long as the multiflorus varieties—none of the rigidus forms quite equal that—but keeps up a good succession during most of August and September, or later in some seasons. It is one of the best for house decoration, though blooms sometimes droop unaccountably even when all precautions are taken. Another variety is H. r. semiplenus, growing four to five feet in height, and flowering in August and September, producing an abundance of beautiful orange-yellow flowers with several rows of petals. It has been awarded a First Class Certificate by the Royal Horticultural Society. As in all the rigidus forms, the flowers stand well above the foliage. Somewhat similar to this last is a variety of comparatively recent introduction, H. G. Moon, which received an Award of Merit by the R.H.S. in 1900.

All the varieties I have described are of the greatest excellence (except H. rigidus type), and though I might mention many more, I do not think I could mention any better, or, in my experience, even as good. Some are very tall and very late, such as H. giganteus and H. orgyalis (the willow-leaved sunflower), both of which are from sunny climes, and need one of our best summers for them to do well. I have confined my descriptions to those I have had actual experience of, and some of them have been among my favourite plants in the garden for many years.

Alger Petts.

APPLE BEAUTY OF HANTS.

I have only seen this variety in one garden in Hampshire, one of which I had charge for a number of years. The tree forms one of the most perfect standards I have ever seen. The main stem grows wonderfully clean, in fact the bark of all the branches is clear and smooth, the foliage ample, on straight-growing shoots—which makes the work of pruning one of delight—and the fruit is freely produced. The latter somewhat resembles that of Blenheim Orange, but is smoother, rather paler green in colour, and more even in form. Moreover, the variety commences to bear fruit much earlier than the Blenheim Orange does. The flavour is much the same, however. I strongly recommend this variety. Perhaps some readers of the Gardeners' Magazine may have had more experience of the apple than I have, and be able to furnish further particulars. It is a good keeping variety, and is in season at Christmas time.

G. B.

BEST PLANTS FOR GREENHOUSE.—Nearly 300 pages are devoted to the description, propagation, and culture of the best flowers and plants for the greenhouse in The Amateur's Greenhouse, by T. W. Sanders, price 5s. net, or by post 5s. 6d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.

THE DOUBLE POTENTILLAS.

Few plants of a hardy character respond more freely to liberal treatment than the double potentillas, flowers that are of much beauty and really valuable ornaments of the border or the bed of mixed hardy plants. At one time more largely cultivated, they seemed for a short season to share the fate of many good hardy plants by being little favoured. Now, however, it is gratifying to know, they are coming into greater prominence, and nurserymen who make specialities of flowers of this class report an increasing demand for the double potentillas. They may be said to be among the most useful of hardy plants, although not specially adapted for cut flowers, but their profusion of bloom and the fine variety of colour embraced in their range of colouration make them most useful indeed.

These double potentillas, which are understood to be of hybrid origin in the first place, are showy plants, excellent either for the border or for large rockwork. In the former they require staking to enable them to display their flowers to perfection, unless they can be so planted that the stems can be made to trail over a part of the soil it is desired to cover. When timeously fastened to sticks so that the stems are not bent, they form clumps of pretty, strawberry-like leaves and good flowers of various shades of colour from light-yellow to orange, and from almost black to light scarlet, with varieties combining two or more of these hues, In the review of varieties below these colours are indicated, so that this point need not be elaborated in the meantime.

Cultivation.

On the rockery, where they look well trailing over large stones, they will thrive and do fairly well without manuring, but in the border it is desirable to give them a deeply-dug and well-manured soil, so as to secure the finest plants, the largest flowers, and a more lengthened bloom. It will be found that the double potentilla in poor soil is always starved-looking in the border, and that a more generous treatment will be rewarded by corresponding results in the way of flowers, and foliage of greater beauty and vigour. In light soils plenty of farm-yard manure, and in heavier mediums, stable manure, both thoroughly decayed and dug deeply in, will be highly beneficial. I now prefer spring planting, except it can be done early in September, when, if small plants are employed, they must be watched, lest frosts lift them partly out of the soil. They must then be pressed gently down.

Propagation of the named varieties is effected by division, but new ones can be raised from seeds. So cheap, however, are the named varieties that it is hardly profitable for the gardener to purchase seeds, seeing that he will secure infinitely better flowers from a few named sorts than from a host of seedlings.

Varieties.

The name of the varieties of the double potentilla may well be termed legion, and a consideration of all those grown in this country under title would be too exhaustive. I have, therefore, endeavoured to give a selection of different varieties, all excellent in their way, but embodying the different colours and shades. Any or all of these will be acquisitions to the garden.

The yellows of various shades are bright and pretty, and from them we may select Drap d'Or, orange with yellow edge; Gloire de Nancy, self; Gold Prince, gold self; the fine Mont d'Or; the large Phœbus; the dwarf-growing St. Blaise; and the red-yellow Vervianum. Any of these will give satisfaction.

Among the self or almost self dark-coloured varieties we have the dark-red Arabella; the deep-coloured, almost black, Belzebuth; the scarlet Etna; the dark crimson Louis van Houtte, a capital thing; and the purplish-red Puritan.

The parti-coloured varieties comprise a large proportion of the flowers, some being spotted; some striped, others blotched; some suffused, and some striped with different colours from those of the ground. Atlas, maroon, marked yellow, is fine; Chameleon, scarlet with stripes of yellow and purple, is good; the great flowered Etendard, yellow and purple, pleases some; [illegible], also with very large flowers, is red and yellow; Fantome is ochre-yellow streaked with purple; and Jupiter has flowers of crimson with yellow spots. I like Le Vesuve, red, flushed yellow; Melpomene, maroon, faintly margined with yellow; and the bright Panorama, which is yellow with purple stripes.

In Proserpine we have a fine blood crimson flower edged with yellow, and the fine Romeo, of blood-red edged yellow, is also fine. Telephone, yellow, striped with red, is a really good potentilla, as also is Van Dyck, yellow, with red stripes. Variabilis is crimson with yellow suffusion; and among the best will be found the gay Versicolor, carnation-like in its stripes and blotches of varied colours; the vermilion Victor Lemoine with its ground striped with gold; and one of the very best, the old William Rollison, deep mahogany, suffused with orange.

These flowers, or many of them, are kept in stock by large dealers in hardy flowers, and their purchase will be followed by a decided increase of interest in the purchaser's garden, to its greater beauty and the profitable pleasure of the cultivator of the best hardy flowers.

S. Arnott.

AUTUMN-FLOWERING CEANOTHUSES.

The ceanothuses which blossom from July until October are made up of two or three species and a large number of hybrids, the majority of which possess considerable decorative merit. The greater number of the hybrids have been raised in France, and one of the best known of them is Gloire de Versailles, a form that enjoys extensive cultivation in English gardens. The group differs from the spring-flowering set by forming softer and more pithy wood, and producing the inflorescences from the current year's shoots, in much the same way as the autumn-flowering spiræas. For this reason different methods of cultivation have to be adopted for the two groups. In the case of the spring-flowering set very little pruning is required, except when the plants are grown against walls, and in such a case it must not be done until after the flowering season has passed. For the autumn-flowering group, however, a considerable amount of pruning is necessary to ensure the best results. This pruning should be done early in spring, say February or March, previous to the commencement of growth, and should consist of cutting the preceding year's wood well back, in the case of weak shoots to within a bud or two of the base, and of strong ones to from six to nine inches of the base. At the same time, branches that appear to be weakening should be removed to the ground, and a strong shoot of the previous year encouraged to take its place. As all the sorts are very floriferous, and the cutting back process is an exhaustive one, plants cannot be expected to retain their vigour for an unlimited period, even when given generous treatment. It is, therefore, a good plan to root cuttings and commence afresh when signs of deterioration appear.

Cuttings of young shoots taken before the flowers open root well if placed in a compost of sandy loam in a warm propagating case, early in July being a good time to take the cuttings. During the first year, whilst the young plants are in nursery quarters, they ought not to be allowed to flower, for by removing the buds as they appear a better foundation is obtained for the future plant. Rich, but rather light loamy soil is most suitable for these ceanothuses, and a light top-dressing of well-rotted manure may be applied with advantage each spring. The various sorts are most effective when planted in groups containing not less than six plants of each variety, whilst beds eight to twelve feet across made up of single varieties are very showy. Some of the stronger-growing sorts, such as Gloire de Versailles and grandiflora, are sometimes grown against walls and trellises, and, under certain conditions, are effective. When grown in this manner, however, they must not be secured too stiffly to the support. The main branches only should be secured, and the young flowering branches allowed to hang free of the wall or trellis. This method of culture is recommended for very cold districts, and in such places plants that are grown in the open ground should be protected in severe weather with a little bracken or spruce branches. The principal autumn-flowering species and varieties are as follows:

FIRST PRIZE AMATEUR'S BASKET OF DAHLIAS.
Shown by Mr. A. Barton, Brand Road, Greenwich, at the National Dahlia Society's Exhibition, Crystal Palace, September 2 and 3.

C. americanus.—A species widely distributed in North America, from Canada to Florida, where it forms a bush up to three feet in height. The leaves are ovate and serrate, and usually about two inches long. The flowers are white, borne in terminal inflorescences, and are succeeded by black fruits. The common name of New Jersey tea is applied to it, on account of the dried leaves being sometimes used as a substitute for tea. Other parts of the plant have also been used for economic purposes, for the stems are said to be of use for dyeing articles to a cinnamon colour, whilst the roots are reputed to possess medicinal properties. Several varieties are known, such as nanus roseus, with reddish flowers, and opacus, which is dwarfer than the type.

C. azureus is a native of Mexico, and under cultivation it attains a height of from four to five feet. The leaves are ovate and serrate, and the flowers blue.

The latter are borne in large terminal panicles, and are more showy than those of the previously-mentioned species.

The principal value of the two species mentioned, however, lies in their breeding qualities, for in the hands of the hybridist they have proved very prolific in producing good hybrids, the majority of which are extremely showy. According to Loudon, one of the earliest hybrids originated upwards of sixty years ago. This was called intermedius, and was raised by Mr. Masters, of Canterbury. The best of the hybrids have, however, originated in France within the last twenty years or so. For general purposes the following will be found to be a good selection: Albert Pittet, large, elegant heads of rosy-lilac flowers; albus plenus, with double white blooms; Asteroide, blue; Bijou, blue, inflorescences very large; Brilliant, purple; Ceres, rose, a very pretty variety; Fleur d'Été, carmine; George Simon, rosy-lilac; Gloire de Versailles, enormous heads of blue flowers; Ibis, rose; Indigo, very dark blue; Lucie Moser, blue; Lustre, rose; Perle Rose, large inflorescences of rose-coloured blooms; and Sirius, blue. W. D.

CHERRIES ON WALLS.

Although the finest cherries are gathered from trees grown under glass, finely flavoured and highly coloured fruit may be obtained from trees growing against walls. But as walls are required for the production of so many other kinds of fruit, wall space becomes scarce, unless, as is the case in some old establishments, the kitchen garden is divided into sections by means of cross walls, then space for the growth of cherries may be provided. In some seasons good crops of fruit may be gathered from trees growing in the open, but the fruit is not of the same quality as that which is allowed to hang until thoroughly ripe, being protected from birds by means of nets. Where wall space is limited it is a good plan to grow cherries on the single cordon or the gridiron system of training, for by this method a greater number of varieties may be planted, which, if judiciously selected, will prolong the supplies. Cherries will not hang for an indefinite time after having become fully ripe.

The number of varieties must in a measure be determined by the requirements of the establishments, but as some kinds are much more prolific than others, a selection of the best and most useful should be made, unless an unlimited quantity can be grown, then it is well to extend the number and plant them on various aspects. Some of the latest varieties should be grown against a north wall, as rains from that quarter are not so frequent as from south or south-west. The early kinds should be planted against south or south-east walls, the mid-season ones against a west or north-west wall, and the later ones against a north or north-east wall, and by this means the season of usefulness may be extended from early in June till November.

With us, Guigne d'Annonay is usually the first to ripen; the fruit is not large, but is very richly flavoured, and as it sets so freely there is generally a good crop. In some seasons when the weather is favourable during the time the trees are in bloom, the crop is so heavy that it is necessary to thin them, otherwise the fruits would be too small for dessert. Thinning should be done as soon as the fruit has stoned, otherwise it will be too late. Early Rivers is a fine dark early cherry, but it is not one of the most prolific, for it seldom sets its fruit so freely as to need thinning. To induce the tree to form ample spurs the shoots ought not to be closer than fifteen inches, as the foliage is very large and excludes the light from the spurs. On heavy soils this makes rampant growth, therefore, to induce it to be more fruitful, the tree should be lifted occasionally. The flower stalks are long and slender, hanging down, therefore it is a good plan to fertilise the flowers artificially in order to secure a full crop. Knight's Early Black, when grown on a south wall where the soil is not too rich, makes short-jointed wood, and if the shoots are not overcrowded it produces ample spurs thickly set with fruit buds. This is a prolific cherry, usually producing a crop of fruit. Belle d'Orleans is a fine prolific cherry of medium size, and when well ripened of excellent flavour. Bigarreau de Schreken is a fine early black cherry of medium growth and one that should be in all collections, as it is of good constitution, fine flavour, and most prolific.

The Noble is a rather new variety, producing large dark-coloured fruits. The tree is of medium growth, makes ample fruit buds, and sets freely; a very fine variety for a south wall. Frogmore Early Bigarreau, when grown against a west or south-west wall, is very fine. The large, pale yellow fruits, marbled with red, hanging in clusters, look very tempting. The tree has a good constitution, is most prolific, and when thoroughly ripened the fruit is of fine flavour. Black Tartarian, with us, is one of the finest cherries we grow, and out of about three dozen varieties grown it has the best constitution of all. There is an old tree that was planted against a north-west wall in 1842 still in existence, and it usually produces a crop of fruit, and though these are not so large as from younger trees, they are still of fair size, and of fine flavour. St. Margaret's, or, as it is sometimes named, Tradescant's Heart, produces large dark purple fruits, which hang well on a north wall. The tree is hardy and an abundant bearer. Bigarreau Napoleon when grown against a north wall and allowed to hang until fully ripe, is very fine, the fruit being of a pale yellow colour, and, where it is exposed, mottled with red. When kept from the rain, as it will be by the nets, it will hang well into the month of August.

Florence is a fine old variety for a north wall. There was an old tree of it here, planted in 1842, which bore fine crops of fruit until last year, when it was cut down. It very seldom failed to produce a crop of fruit, which used to hang well until the beginning of September. Guigne de Winkler is a bright red variety that will hang on the trees until well on in October, provided the fruit is kept from damp. Geant de Hedelfinger is a large black, extra fine variety that hangs well on a north wall. The old Late Duke is also a valuable variety for late use, as when kept free from damp it will hang well on into September.

Cherries have many enemies, but the worst of all are the wasps during dry, hot seasons, especially in rural districts in the South of England. It is astonishing the quantity of fruits they will spoil in the course of a day. To guard against their depredations a close search should be made for all nests within half a mile of the garden, and every one that can be found should be destroyed. Traps should also be set for the queen wasps in spring, and in this way a multitude may be got rid of. Birds are also very fond of cherries, and in some places are very troublesome, especially in thickly wooded districts, where not only blackbirds and thrushes are numerous, but starlings are a great pest. I have watched these crawl up the nets and examine the meshes to see if there are any holes, and if there is the least chance they will get through. Cherry trees are very subject to the attack of black aphis, but this can be kept in check by thoroughly washing the shoots in winter, and by spraying them over in spring as soon as they have flowered and the fruit has set. Quassia extracts and other vegetable bitters are effective, but these should not be used after the fruits have commenced to ripen, or the excessive moisture will cause them to split. Three or four dressings will usually be sufficient to cleanse the trees and rid the young shoots of this troublesome pest. H. C. Prinsep.

Buxted Park Gardens.

GOOSEBERRY AND CURRANT SCALE.

The brown scale of the gooseberry and currant (Lecanium persicæ, var. ribis Fitch) is found in great abundance on the gooseberry, currant, rose, plum, and cotoneaster, but rarely on the raspberry, and it has also been found on a variety of other cultivated and wild plants.

It has a decided preference for the older branches, the young shoots being attacked only when the insects become overcrowded.

It is, as a rule, much more prolific on plants grown in sheltered spots, especially on well-trained trees in a fairly sunny aspect, and no plant suffers in such situations so much as the cotoneaster.

It is very generally distributed throughout England, but is less known in Wales, Scotland, and Ireland.

There can be no doubt that this insect is a variety of the peach scale (L. persicæ), differing only by its usually smaller size, its more rotund or hemispherical form, and the more marked character of the blackish, transverse bands in the immature stage. Apart from these exceptions, the description of the one serves equally for the other, and the methods of control herein described will serve equally well for both kinds.

Description.

Female.—The young gravid female is short and ovate in form, being a little longer than it is broad, flat beneath, and highly convex above. The colour of its upper parts varies from dusky ochreous-yellow to greenish-yellow, with eight or nine more or less interrupted, blackish, transverse bands, of which the foremost is the broadest, the rest diminishing in width as they approach the hinder or cleft extremity of the body. The legs and antennæ are retained, but the insect loses all power of locomotion long before the period of egg-laying commences. As the insect matures the pale colour gradually changes to bright chestnut-brown or ochreous-brown. At this stage the integument becomes hard and brittle, and bears a number of transverse wrinkles at the sides.

Larvæ.—The young larvæ are quite minute, about the size of a large cheese mite, which they somewhat resemble, except that they possess but three pairs of legs, have rather long antennæ, and two long bristles at the end of the abdomen. They are active for a short time, but soon become inert. The mouth parts consist of a fleshy lip or labium, through which pass the extremely slender hair-like mandibles and maxillæ with which the insect pierces the bark, and through which it sucks up the juices of the plant—collectively, therefore, these organs form a sucking tube.

Male.—The male of this insect has not yet been discovered, and there can be no doubt that the females are able to reproduce their species without the intervention of the opposite sex. This remarkable trait is however, quite common among scale insects and some of the plant lice.

Life History.

The female begins to lay her eggs while the body is yet soft and distended, and as the process develops the ventral surface of the insect shrinks until it finally reaches the under surface of the outer hardened skin, so that a relatively large cavity is formed beneath the insect which is filled with hundreds of whitish translucent eggs. At this stage the insect dies, and her dead body, the so-called "scale," forms a protection for the eggs, and for a short period also for the young larvæ or "lice." The young escape from beneath the dead parent chiefly through the little slit or cleft at the posterior extremity, leaving behind them the white egg shells and a little white mealy secretion.

The larvæ usually fix themselves under the partly detached or curled up portions of the bark, so that they are often completely hidden, and in this way pass the winter without any material change. They are then of a reddish-brown colour, and so small that at first sight they may be easily mistaken for the stomata of the plant. In spring they cast their skins, and may become active for a short period; in June they become adults, and the cycle commences again. The old "scales" or dead females may, if undisturbed, remain attached to the host plant for a very long period—two or three years in some instances; it often happens, therefore, that the representatives of two or three generations may occur on the plant at the same time.

The scale insects indigenous to this country are probably single brooded, but egg-laying may sometimes be retarded by the influence of the weather, while the young larvæ may continue to hatch out for a relatively long period, so that the life cycles are not always clearly defined, and there may be a slight overlapping of the stages of development.

Remedies and Methods of Control.

Spraying in the early part of February with either of the washes mentioned below is the only practical means by which this pest can be controlled or destroyed. At the same time, it should be borne in mind that it is the larvæ or young insects which are found living during the winter months; and as they are very minute, and often protected by the semi-detached bark, the spraying must be thorough, or the result will not be satisfactory. Care must also be taken to ensure that the undersides of the branches are well sprayed, as the insects are usually more abundant in such situations than on the exposed and more accessible portions of the bushes.

It is advisable to complete pruning before spraying operations are commenced, and in the case of old and badly infested plants it is desirable to remove as much of the old wood as is practicable.

The spraying apparatus should have the nozzle fitted at an angle of about 45 degrees so that the spray may be conveniently directed to the undersides of the branches.

In the case of the gooseberry, "sponging" or "brushing" is practically impossible owing to the spinose character of the branches.

(1) Caustic Soda Wash.—This wash consists of:—

Sulphate of iron …………	½ lb.
Lime …………………………	¼ lb.
Caustic soda ………………	2 lb.
Paraffin ……………………	5 pints.

Water to make 10 gallons.

The wash should be prepared as follows:—(a) Dissolve the iron sulphate in about 9 gallons of water. (b) Shake the lime in a little water, and then add a little more water to make it into a "milk." (c) Run "b" into "a" through a piece of coarse sacking to keep back grit. (d) Churn the paraffin into the mixture. (e) add the caustic soda in the powdered condition. It is not wise to add the caustic soda till just before using.

(2) Paraffin-soda Wash.—In this case the wash is composed of:—

Caustic soda …………………	2 lb.
Soft soap ……………………	½ lb.
Paraffin ……………………	5 pints.
Water ………………………	10 gallons.

The directions for making are:—Dissolve the soft soap in a gallon of boiling water. Add the paraffin while the soft soap solution is still boiling hot, and churn thoroughly until an emulsion is obtained. Dissolve the caustic soda in the rest of the water, just before using, and then pour it into the paraffin emulsion, mixing well, and using at once.

Rubber gloves should be worn by the sprayer as a protection against the effects of the caustic soda, and goggles fitted with a piece of rubber sheeting or waterproof of some kind are an excellent safeguard for the eyes and face.—Board of Agriculture Leaflet (No. 223).

Propagating. — Good batches of small furnishing stuff, such as panicum, tradescantia, etc., should now be put in, also a batch of coleus cuttings, to provide stock for the spring; and, though not quite in order in this calendar, I think it wise to mention that, if not already done, good batches of fuchsias, heliotropes, iresine, streptosolens, and all other soft-wooded bedding plants should be put in at once, and I find nothing more suitable for striking these subjects in than a mild hotbed with a frame or two placed on it.—Thomas Stevenson.

FIRST PRIZE BASKET OF DAHLIAS AND AUTUMN FOLIAGE.
Shown by Mr. M. V. Seale, Sevenoaks, in the open class at the National Dahlia Society's Exhibition, Crystal Palace, September 2 and 3.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

EAST INDIAN HOUSE.—Most of the saccolabiums, ærides, vandas, and allied genera will still be in an active state of growth, and the plants will need every encouragement to assist them to reach maturity. Sunless seasons such as the past summer are generally found to be most unfavourable to the proper development of growth, and when the season has practically to depend on artificial heat the growths thus produced are generally of a soft and sappy nature, and if not properly matured before winter sets in, they promise anxiety to those in charge. The temperature at night must be maintained at the maximum, but care must be observed that the atmosphere is not charged to excess with moisture; should there be a possibility of this, the roof ventilators should be brought into use on the leeward side. With the maximum conditions of heat during the day, the atmospheric moisture should be maintained accordingly. All permanent shading should be removed from the roof glass, and discreet use of the roof blinds will be desirable, so that while guarding against any possible scorching, the plants may be afforded all the available light.

CATASETUMS and other allied genera that are now producing their flowers should be suspended in a position where they may display their quaint flower scapes to the best advantage. They should be kept in the warm division until the flowers have become expanded, and if the plants are then removed to a cooler, drier atmosphere, the flowers will last much longer in perfection. As soon as the flowers have been removed place the plants again in the warm house, and suspend them in a position where they may obtain plenty of strong light; liberal supplies of root moisture should be continued until the growths reach maturity. As soon as the foliage shows signs of declining, only sufficient water should be given to keep the pseudo-bulbs plump. It is most unfortunate that the catasetums and their allies do not find greater favour in our gardens. Their quaint character is always of the greatest interest, and as they are so easily cultivated in an ordinary plant stove, suspended from the roof, they are far more suitable than many of the subjects we find attempted in the general collection. It is also to be deplored that only in a few of our prominent orchid collections are they included. Possibly many readers think that the space I have here occupied might with advantage be filled with more interesting matter; but I find frequently that information is sought concerning the plants that are not in general cultivation. In the case of catasetums the plants are easily procurable, and we frequently find them in gardens where they have been sent home by friends who have collected them. When the plants are resting there is always a possibility of their being attacked by red spider and other pests. These should be removed by carefully sponging or vapourising with some safe preparation.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

CONSERVATORY.—Hanging baskets that have been furnished with flowering plants such as begonias, fuchsias, petunias, or campanulas, will now be past their best, and should be replaced by others that have been growing in the greenhouses. Those made up with ferns will now be most useful, while several of the ornamental foliaged begonias are well adapted for the conservatory in the winter, B. Haageana being one of the best. Where the conservatory or winter garden is used for sitting out in after dinner, care must be taken to keep the temperature comfortable during dull or wet evenings, as it is apt to fall rather quickly at this season of the year, and a temperature under 65 deg. is not comfortable.

CARNATIONS.—If the weather continues at all damp, it will be wise not to delay the housing of the winter-flowering varieties, but before doing so it will be as well to stake and tie them, carefully removing any grass that may be rusty, and giving the whole of the plants a thorough spraying with sulphide of potassium. They must be kept as cool as possible for a time, and in the event of really warm weather, a daily syringing between the pots, and occasionally overhead, will greatly benefit them. Continue to pot up the young layers of Malmaison varieties as they become fit, keeping them fairly close for a few days until the roots take to the new soil, when more air may be given. Those that have been potted some time should have all the air possible given them, and where intended for very early blooming, they should be potted into their flowering pots at as early a date as possible.

SOLANUMS that have been planted out in frames or in the open air, should now be lifted carefully and potted into as small-sized pots as they will conveniently go in, placing them in a frame, where they may be kept shaded and frequently syringed for a few days. They must on no account receive a check by becoming dry at the roots, or in any other way, or the foliage will drop badly and thus spoil the plants.

PRIMULA SINENSIS AND P. OBCONICA should be potted as they require it, using a light compost, and for all practical purposes a small 32-sized pot is large enough; in fact, a 48-size is the most useful, and in this, with judicious feeding after they have nicely rooted, they will make plants large enough for any purpose.

SALVIAS.—A batch of these should now be placed indoors, and given copious supplies of liquid manure, and they will then soon make a good show. To prolong the season of flowers a batch may be again pinched over, and if these are kept out of doors as long as possible, they should make a bright display till after Christmas.

BEGONIA GLOIRE DE LORRAINE.—The batches of this begonia are now growing away very freely, and whether they are wanted as close pyramids or as good bushy specimens, they should now be carefully staked and tied, using small bamboo tips for the purpose, though if only one is used it should be fairly stiff, as the plants often get somewhat top-heavy.

THE GREENHOUSE generally should now be thoroughly overhauled, putting outside all plants such as cannas, fuchsias, etc., that are going out of bloom; also all plants that are to be dried off, such as amaryllis, begonias, and gloxinias, should be turned into frames, so that with the advent of cold or boisterous weather the houses will be ready to receive the plants that are being brought forward out of doors, and this will be found a much more simple matter when everything is properly arranged beforehand.—Thomas Stevenson, Woburn Place Gardens.

THE FLOWER GARDEN.

CLIMBING ROSES.—Now that these have passed out of flower excellent facilities are afforded for thinning out the growths. Remove as much of the old wood as possible, and tie in loosely the present season's growth. This will greatly help these to mature and ripen, and thus do much towards ensuring a good supply of flowers next season. Give a thorough syringing to clean the foliage from aphis, and guard against mildew, which is now very prevalent owing to sudden changes of temperature. The best time is now at hand for increasing these roses, and this can be readily accomplished by cuttings. The majority of the ramblers will easily strike if well-matured growths are now taken, five or six inches long, and firmly set in shallow trenches of fine sandy soil. An excellent rose now in flower is Madame N. Levavasseur, which is best described as a dwarf Crimson Rambler. This is an excellent variety for cutting at this season, while Rosa rugosa repens alba, another interesting variety now in flower, makes a splendid subject for rockwork, or other undulating parts of the garden.

CROWN IMPERIALS.—The bulbs of these must now be planted in order to give a good effect in the spring. Placed in large masses in the borders or in open positions in the shrubbery, these give a fine effect, and though the flowers are of short duration they are very imposing and beautiful.

HARDY CYCLAMEN. — Where these charming little flowers grow to perfection, as they do in some parts, they readily increase themselves by seed, and nothing is more attractive than colonies under the shade of trees and on grassy slopes. In dry weather copious supplies of water must be given them. This is an excellent time for planting and making further batches.

IRISES.—Nearly all kinds of iris are best propagated during the present month by dividing them up and planting them in fairly good soil. There are very many beautiful species and varieties suitably adapted for growing in the ordinary way in the herbaceous borders, and likewise for grouping on the margins of streams and ponds, as few plants look more happy when growing and flowering by the side of water than this family. The various varieties of I. sibirica are charming for this purpose, as not only when in bloom are they attractive, but their graceful foliage is at all times beautiful. The varieties of I. Kæmpferi are unquestionably the cream of the family, especially when growing by the side of water. Not only are the flowers varied and most attractive in colour and shape, but they continue to bloom more or less till quite late in the autumn. These should be planted in rich soil just above the water level, and be thoroughly dressed with half-decayed cow manure once a year. Seed should be saved from the best varieties, and sown immediately it is sufficiently ripe; sow in pans or boxes and raise in a cold frame. These seedlings if well grown will flower the second season.

MICHAELMAS DAISIES.—Attend to the tying of the growths, and give the plants a good soaking of diluted farmyard manure.—E Beckett, Aldenham Gardens.

HARDY FRUITS.

PEACHES AND NECTARINES.—As soon as the fruits are gathered remove as much of the old fruiting wood as can be spared to allow a better opportunity for the ripening up of the young shoots. Syringe the trees during the afternoon on fine days, endeavouring to keep the foliage in as clean and healthy a condition as possible.

NOTE-TAKING.—This is a good season of the year for making notes of various items which may require special attention during the autumn and winter months. The first of these, no doubt, will be to mark all those trees which are making too much wood at the expense of fruit, and which may be brought into a more fruitful condition by having their main roots pruned back later on. Young trees also, which have been planted two or three years, and are found making extra strong shoots, should be marked for the purpose of their being taken up as soon as the foliage is well ripened, and replanted. Then sometimes the question arises as to the advisability of grafting some more useful variety on trees which bear only worthless fruits. This is always a safe plan to adopt when the stock is thoroughly healthy. Trees for this purpose should be marked, and also notes made of the varieties intended for scions, so that the young shoots may be taken off when the trees are pruned, and reserved by tying them into small bundles, and laying them in by the heels on a north border until required. In making arrangements for planting new quarters of bush fruits, as currants, gooseberries, and raspberries, positions should be chosen on which no fruit has been grown for several years, and these should be made at least two years before they are required to take the place of the old ones. The ground should be well trenched and liberally manured, and have a good dressing of soot and wood ashes well incorporated with the upper layer of soil. On soils deficient in lime, give a good sprinkling of this at the same time, or in its place apply half a pound per square yard of basic slag.

WHEN PLANTING YOUNG TREES in the same positions from which the old and worn-out ones have been removed, it will be necessary to take away a certain amount of the old soil, and replace it with some taken from another part of the garden. Each season there are several acquisitions introduced which may be found superior to some of the older varieties, and it is advisable that a few of the most promising of these should be given a trial, not planting largely of any kind until it has proved suitable to the particular locality. It is a good plan to adopt in gardens where a large quantity and variety of fruit is grown, to purchase a few trees annually, and plant them in a sort of nursery bed for a couple of years, when they may be transplanted into their permanent positions without receiving any check.

AUTUMN-FRUITING RASPBERRIES.—These will soon be in fruit. See that the canes are made secure to the supports, and before the fruit changes colour place some fish netting over the quarter to keep away the birds.

GATHERING FRUIT. — Continue to gather the ripening fruits of apples and pears as they become fit; careful treatment is especially required in dealing with these, as the flesh is more tender than in the case of later varieties. The majority of the early sorts remain for so short a time in use that great care is necessary in sending them to table in the best possible condition.—Geo. Woodgate, Rolleston Hall Gardens.

ROYAL CALEDONIAN HORTICULTURAL SOCIETY.

(Concluded from page 702.)

Acalypha hispida, and Bougainvillea glabra; Mr. H. E. Hughes, gardener to Sir D. E. Hay, Bart., King's Meadows, second; and Mr. G. McKenna third.

Mr. D. Mackay led for four orchids with fine examples of Cattleya Harrisonæ, Oncidium incurvum, Odontoglossum bellatulum, and Cypripedium œnanthum. Mr. G. Pirie, gardener to C. W. Cowan, Esq., Dalhousie Castle, was first for one orchid with a fine Cypripedium insigne Sanderæ carrying ten flowers; Mr. Mackay second, and Mr. R. Findlay, Gogar Park Gardens, third. Mr. A. Findlay, gardener to A. Dryburgh, Esq., Gogar Park, led for three cypripediums with C. Veitchi, C. villosum, and C. Rothschildeanum. Mr. James Templeton, gardener to Mrs. Alex. Rose, Richmond House, Glasgow, showed the best pair of dracænas—Queen Victoria and Doucetti. Mr. A. McMillan scored for half-a-dozen foliage plants with alocasias, anthuriums, and dracænas. Premier place for one fuchsia was won by Mr. D. Penderleith, gardener to T. A. C. Mortimer, Esq., Whitehouse Terrace, with a giant pyramid; Mr. A. Thomson, Dalkeith, second. Mr. D. Mackay had the best three fuchsias, medium-sized, well-flowered examples. Mr. A. Hogg led for ivy-leaved pelargoniums, and Mr. G. McKinna, gardener to Sir Robert Usher, Norton, Ratho, for zonal pelargoniums. Mr. W. Armstrong, gardener to Dr. Scott, Musselburgh, gained first prize for an excellent half-dozen chrysanthemums, bushes of early varieties. Mr. Mackay led for three pots of liliums, while for two pots of Lilium auratum Mr. C. D. Kerry, Langton, Duns, scored, with Mr. W. Galloway first for one specimen of this fine lily carrying eight spikes. Mr. A. Knight was easily first for a pair of crotons, and he was also first for a pair of palms. In the begonia classes Mr. Robert Brown, Union Villa, Eskbank, and Mr. W. Galloway were the leading prizewinners.

CUT FLOWERS.

The great cut-flower class on this occasion was one for three dozen vases of flowers grown in and cut from the open, arranged on a space 6ft. by 5ft. The offer of one of the Centenary Cups as first prize, with the addition of three guineas cash resulted in a fine competition, nine competitors entering. The cup was won by Mr. William Young, gardener to Mrs. Fleming Hamilton, Kirkcowan, who had a grand collection, in which some of the finest things were Francoa appendiculata, Cimicifuga japonica, Erythrina cristi-galli, Montbretias Tigridie and Rayon d'Or, Anemone japonica elegans, Lobelia cardinalis, Lilium auratum, several fine [illegible], Gentiana asclepiadea alba, Chelone barbata, etc. Second prize fell to Mr. A. Dickson, gardener to M. G. Thorburn, Esq., Glenormiston, Innerleithen, and third to Mr. Adam Brydon, Tweedbank, Innerleithen.

There were a very large number of cut flower classes, but time and space permit us only to refer to the first prizewinner in the majority of these. Mr. W. G. Pirie led for three vases of montbretias with Germania, George Davison, and St. Botolph. Mr. J. C. Fordy, Warkworth, Northumberland, scored for a dozen spikes of gladioli with splendid spikes and blooms, and he also was first for six spikes of these stately flowers. For six bunches of pompon dahlias honours fell to Mr. W. Jenkins, Cambuslang, for a well set up lot of neat flowers. Mr. J. C. Wright, Dunblane, scored for six vases of dahlias with splendid flowers of Mrs. S. [illegible], Carabus, Hildegarde, Sam Weller, etc. Mr. D. Halley, Roycroft, Broughty Ferry, scored for six vases in another class, and he also showed finely.

Mr. W. Jenkins had the best six vases of early chrysanthemums, and Mr. J. Richardson, The Schoolhouse, Peebles, led for phloxes. Mr. C. Shaw, gardener to St. Mitchell, Esq., Boquhan, Kippen, led for a dozen cactus dahlia blooms on boards.

First prize for nine bunches of sweet peas was awarded to Mr. G. D. Kerr, Langton Gardens, Duns, who scored with lovely flowers of Prince of Asturias, Evelyn Hemus, Primrose Spencer, J. Ingman, Lavender George Herbert, Mrs. H. Sykes, Etta Dyke, Mrs. Routzahn, and Elsie Herbert; Mr. T. Fender, Crieff, second. For six bunches, Mr. T. Kirkwood Cultoquhey, Crieff, was first, and Mr. G. Reid, Floral Cottage, Dundee, second. The competition was keen in both classes.

Mr. Parlane, Rosslea, Rous, led for a dozen tea roses, but had not a very good set. Mr. J. Pearson, scored for a dozen roses, and Mr. Parlane, led for two dozen blooms. Messrs. Adam and Craigmile, Rubestain, Aberdeen, won first place for three dozen roses with some lovely flowers of C. J. Grahame, B. Cant, Captain Hayward, etc. The same firm scored for eighteen roses. Messrs. D. and W. Croll scored for eighteen teas. Messrs. Adam and Craigmile had the best twelve pink roses—Mrs. W. J. Grant; and Messrs. D. and W. Croll led for twelve white roses with Frau Karl Druschki.

In the class for eighteen bunches of chrysanthemums, Mr. J. Smellie, Busby, was an easy first with grand bunches of Caledonia, Mrs. W. Sydenham, Elstob Yellow, Improved Polly, Roi des Blancs, The Champion, etc.; Mr. G. Bowness, Busby, second. Mr. Bowness scored for six bunches of cactus dahlias with lovely flowers, well set up. Messrs. Campbell and Son, High Blantyre, had the premier award for a collection of dahlias, and here they showed good flowers of the various sections. Mr. J. Paul, Drumbeg, Killearn, had the best twenty-four bunches of cactus dahlias, but as all the flowers in this class were laid flat against velvet they were not pleasing to look at.

Messrs. James Cocker and Sons, Aberdeen, made up a charming display of roses in pillars, stands, bowls, and vases, and they secured first prize for their collection.

VEGETABLES.

In the chief vegetable class, for eighteen dishes, the Centenary Cup offered as first prize brought up Mr. James Gibson, gardener to the Duke of Portland, Welbeck, who annexed the cup and first prize with a grand display, consisting of Superb Pink and Solid White celery; Ailsa Craig and Globe onions, Tender and True parsnips, Centenary and Sutton's Selected peas; Satisfaction and Superlative potatoes; Early Giant and Autumn Mammoth cauliflowers, New Red Intermediate carrots, Sutton's Black beet; Perfection and Princess of Wales tomatoes, Delicacy cucumbers, and Best of All runner beans. Mr. R. Stuart, gardener to Lord Lauderdale, Thirlestane Castle, second with a good set that was however a good way behind Mr. Gibson's.

THE CENTENARY VEGETABLE CLASS.
Mr. J. Gibson's First Prize Collection is the left-hand one.

Mr. W. Galloway led for a display of vegetables grown in Scotland; Mr. W. Harper, gardener to J. Ramsey S. Richardson, Esq., Tulliebolton House, second; and Mr. W. Bell, Bothwell Castle Gardens, third. For a collection of six kinds, Mr. D. A. Hill, Kelso, led, with Mr. G. Watson, Kirkhill, Kippen, second; and Mr. J. B. Brown, Biggar, third.

Vegetables in the single dish classes were splendid, the potatoes alone making quite a good exhibition; onions were also grand, and the roots very clean. Mr. J. Gibson and Mr. S. Gordon won numerous prizes.

FLORAL DECORATIONS.

Six competitors entered in the table decoration class, and the premier award was won by Messrs. M. Campbell and Sons, High Blantyre, with a dainty arrangement of narrow croton leaves and light sprays of Oncidium flexuosum and Francoa ramosa; Mr. W. Kidd, gardener to Lord Elphinstone, Carberry Tower, second, with Sunset roses, montbretias, and francoa sprays; Mr. A. Knight, gardener to Sir Wilfrid Lawson, Bart., Brayton, Carlisle, third.

Mr. A. Hogg, of Aberlady, had the best basket of foliage and berries, and Mr. F. M. Urquhart, Melrose, led for a vase of autumn foliage and berries. The best ladies' spray was of Miltonia vexillaria, shown by Mr. A. Govenlock, Melrose. Mr. A. Knight scored for six gentlemen's buttonholes with neat designs in orchids.

NON-COMPETITIVE.

Sweet peas formed a good feature of the non-competitive section. Mr. H. Eckford, Wem, Salop, contributed a goodly collection of the leading varieties, and among other good things set up Jas. Grieve, Queen Alexandra, Clara Curtis, Evelyn Hemus, Black Knight, President, Countess Spencer, Jeannie Gordon, Henry Eckford, Dorothy Eckford, and Etta Dyke. Messrs. Dobbie and Co., Rothesay, were large exhibitors, and they had a few sweet peas and a commanding display of dahlias, chrysanthemums, pansies, and violas, the first-named predominating. The centre of the display consisted of a cone of the best varieties of cactus dahlias, with four pillars of cactus varieties around it. Then came banks of pompon, pæony-flowered and single dahlias, flanked by pyramids of late roses and early chrysanthemums. Pillars of roses and chrysanthemums marked the corners of the display. This firm had also a fine exhibit of beautifully clean potatoes. Messrs. Tillie, White, and Co., Edinburgh, exhibited a collection of vegetables.

Messrs. James Cocker and Sons, Aberdeen, contributed a fine bank of hardy flowers. Messrs. W. Wells and Co., Merstham, put up a collection of early-flowering chrysanthemums, contributing a fine set of the Marie

Masse varieties. Messrs. Thomas Methven and Son, Edinburgh, had an effective display of plants. Messrs. James Dickson and Sons, Hanover Street, Edinburgh, had an effective exhibit of the useful Hydrangea paniculata grandiflora, associated with neat, well-grown conifers. From Messrs. Laing and Mather, Kelso, came a group of variegated ivies, over dwarf privets. Messrs. Cunningham and Fraser, Comely Bank Nurseries, Edinburgh, contributed a collection of hardy border flowers. Sweet peas were well shown by Mr. T. W. Darlington, Warton, Carnforth.

Messrs. Storrie and Storrie, Glencarse, Perthshire, had a fine exhibit of fruit trees in pots, their miniature orchard being one of the most attractive displays in the market. Over a bed of maidenhair ferns Mr J. Phillips, Granton Road Nurseries, Edinburgh, set up Dracæna Panache, a green and cream-striped variety very like D. Bruanti, the pretty Clianthus Dampieri, and Rochea falcata. Mr. D. McOmish, Crieff, had a large collection of hardy border flowers, early chrysanthemums, dahlias, and roses. Messrs. James Mason and Co., Jamestown, showed some beautiful pansies and violas. The newer sweet and culinary peas were exhibited by Mr. W. G. Holmes, Tain.

A good collection of bright clean apples from Messrs. Spooner and Sons, Hounslow, together with pears, plums, and the strawberry-raspberry, made up an excellent exhibit. Mr. H. N. Ellison, of West Bromwich, contributed a collection of the newer ferns, and set them up charmingly. The herbaceous phloxes contributed by Messrs. Gunn and Sons, Olton, made a grand display.

Mr. D. McLeod, Chorlton-cum-Hardy, Manchester, displayed a small collection of choice orchids. A noble and brilliant lot of well-grown tuberous begonias from Messrs. T. S. Ware, Feltham, Middlesex, was a great centre of attraction, the beautiful colouring and splendid forms of the flowers being greatly admired.

Of considerable interest was the exhibit of growing plants of disease-proof potatoes, all seedlings from Solanum etuberosum, shown by Messrs. Sutton and Sons, Reading; these seedlings showed great diversity of habit, and it is hoped that through them a race of commercially valuable, disease-resisting varieties may be raised.

Roses and herbaceous flowers were staged by Messrs. T. Smith and Sons, of Stranraer. Carnations were abundantly exhibited, and in fine style, by Messrs. M. Campbell and Son, High Blantyre. Particularly brilliant was the long bank of the graceful montbretias staged by Messrs. R. Wallace and Co., Colchester. Here all the leading varieties of these beautiful autumn flowers were set up in quantity.

Mr. D. Nicoll, Rossie, Forgandenny, made a small but capital exhibit of orchard-house grown apples, all grand examples, and highly coloured. The Patent Safety Ladder Company, Peterborough, made an exhibit of their extending ladders and steps. Messrs. Pullock, Tarbolton, contributed summer-houses and rustic seats. Mr. John Downie, Shandwick Place, was represented by a bank of single and double tuberous begonias.

MEDALS.

Gold.—To Messrs. Dobbie and Co., Rothesay; Messrs. Thos. S. Ware, Feltham; Messrs. Storrie and Storrie, Glencarse.

Silver Medal.—To Mr. D. McOmish, Crieff; Mr. John Downie, Edinburgh; Messrs. Thos. Methven and Sons, Edinburgh; Messrs. Jas. Cocker and Sons, Aberdeen; Messrs. S. Spooner and Sons, Hounslow; Messrs. R. Wallace and Co., Colchester; and Mr. Nicoll, Forgandenny.

Bronze Medal.—To Messrs. M. Campbell and Sons, Blantyre; Messrs. Gunn and Son, Olton; Messrs. W. Wells and Co., Merstham; Messrs. J. and A. Glass, Princes Street, Edinburgh; Messrs. Cunningham, Fraser, and Co., Comely Bank, Edinburgh

The two Centenary Cups not previous allocated were awarded to Colonel Stewart Richardson for his first prize group of plants, and to the Earl of Harrington for his first prize table of fruits.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

National Dahlia Society.

The first of the exhibitions held by the National Dahlia Society since its amalgamation with the London Dahlia Union, took place at the Crystal Palace on Thursday and Friday, September 2 and 3. It was not a good show, both quantity and quality falling below the usual standard; but the lateness of the present season entirely accounts for this failing. However, given good weather during the next fortnight or so, the society's second show, at Regent's Park, on September 21 and 22, should be a great success. Pompon dahlias were good on this occasion, and the decorative exhibits were also of a high order of merit.

NURSERYMEN'S SHOW DAHLIAS.

In the premier class for forty-eight show and fancy dahlias there were but two competitors, and here the first prize was easily won by Mr. Wm. Treseder, Cardiff, who had what was a fine lot of flowers for the season, his best varieties being Spitfire, Gracchus, Excellent, Shirley Hibberd, Merlin, David Johnson, Virginale, George Hobbs, Harbinger, Mr. Chamberlain, Prince of Denmark, and Richard Dean; Mr. S. Mortimer, Rowledge, Farnham, was placed second for rather small flowers not yet at their best.

There were three exhibitors of twenty-four show and fancy dahlias, distinct, and here Mr. John Walker, Thame, Oxford, led, showing good specimens of J. Hickling, J. Walker, Rothesay, Wm. Rawlings, R. T. Rawlings, and A. Rawlings; Mr. G. Humphries, Kington Langley, second; and Mr. M. V. Seale, Sevenoaks, third. Mr. W. Treseder was the only exhibitor of eighteen fancy dahlias, and he was awarded the chief prize for good blooms of Rev. J. B. M. Camm, Goldsmith, Tom Perryman, Mrs. Saunders, Peacock, Sunset, etc.

Mr. G. Humphries led for a dozen fancy dahlias with a moderate set, and was followed in order by Mr. S. Mortimer and Mr. M. V. Seale. For a dozen show dahlias, Mr. J. R. Tranter, Henley-on-Thames, scored with bright neat flowers of Goldfinch, Blush Gem, Rebecca, etc.; Messrs. J. Cheal and Sons second; and Messrs. W. Pemberton and Son, Harden Nurseries, Bloxwich, Walsall, third.

NURSERYMEN'S CACTUS DAHLIAS, ETC.

The silver challenge cup offered for the best eighteen varieties of cactus dahlias, in bunches of six blooms each, was once again won by Messrs. Jas. Stredwick and Son, Silverhill, St. Leonards, who showed good flowers, but scarcely up to their usual quality, of Rev. T. W. Jamieson, Snowdon, Saxonia, Wm. Marshall, Penguin, Satisfaction, H. H. Thomas, Red Admiral, Aviator, Saxon Queen, C. E. Wilkins, Ruby Grinstead, Rosel, Iolanthe, J. B. Riding, Harold Peerman, Jupiter, and Indomitable; second prize fell to Messrs. J. Burrell and Co., Cambridge, whose best flowers were of Nelson, C. E. Wilkins, Wm. Marshall, Faunus, and T. A. Havemayer; Messrs. J. Cheal and Sons, Crawley, third.

The finest dozen bunches of cactus dahlias were from Mr. G. Humphries, who had rather small but clean and bright examples of Ruby Grinstead, Nelson, Etruria, Mrs. Gaskill, Conrad, Harold Peerman, Dorothy, Dr. G. J. Gray, Helium, Mrs. Raby, Mrs. MacMillan, and Rev. A. Bridge; the second prize fell to Mr. John Walker; and third to Mr. M. V. Seale, who were the only other exhibitors. In the class for forty-eight blooms, distinct, of cactus varieties, staged on flat boards, the competition was close among the three entrants. Messrs. Keynes, Williams, and Co., Salisbury, were placed first for a bright, even set, in which were good flowers of Clincher, Captain Cody, Killarney, John Peel, Florabelle, Etruria, Joan of Arc, Rev. T. Jamieson, etc.; Messrs. J. Stredwick and Son, St. Leonards, gained second prize, and were but few points behind the Salisbury firm; Messrs. J. Burrell and Co., Cambridge, third.

There were six competitors in the class for two dozen cactus dahlias, distinct, set up on boards, and here Mr. Wm. Treseder, Cardiff, was a good first, his set containing good flowers of Wm. Marshall, Rev. A. Bridge, Ivernia, Faunus, Mrs. McMillan, H. Shoesmith, Harbour Lights, and Harold Peerman. Messrs. W. Pemberton and Son, Walsall, second; and Mr. J. Walker, Thame, third.

For a table of a dozen vases of garden cactus dahlias, Mr. M. V. Seale was a good first with flowers tastefully disposed with golden privet, berberis, grasses, bramble sprays, etc.; C. E. Wilkins, Sirius, Faunus, Phineas, and Mrs. Chas. Scott were the best varieties; Messrs. J. Cheal and Sons, Crawley, were second.

Two competitors came forward in the class for twenty-four bunches of pompon dahlias, distinct, ten flowers in each bunch; premier place was granted to Messrs. J. Cheal and Sons, Crawley, who showed very neat and pretty flowers of Dr. Jim, Ideal, Girlie, Daisy, Jessica, Ganymede, Madeline, Norah, Hesperia, Adelaide, and Phœbus; Mr. M. V. Seale, Sevenoaks, second. Premier award for a dozen bunches of pompon dahlias fell to Messrs. J. Burrell and Co., Cambridge, for a very neat, bright set of Lizzie, Emily Hopper, Phyllis, San Toy, Baccnus, Midget, Darkest of All, Adelaide, Marietta, Jessica, Hecla, and Nellie Broomhead; Mr. J. Walker second, and Messrs. Keynes, Williams, and Co., third.

Single dahlias were very well shown by Messrs. J. Cheal and Sons, Lowfield Nurseries, Crawley, who gained first prize for two dozen bunches, that included very fine flowers of Betty, Mikado, Miss Morland, Miss Roberts, Columbine, Sunray, Peggy, Butterfly, Hector, Eric, Kitty, and Owen Thomas; Mr. M. V. Seale second. For twelve bunches of singles, Mr. J. Walker secured the first prize, and was the only exhibitor. Only one bunch of pæony-flowered dahlias was forthcoming, and this, from Messrs. J. Cheal and Sons, Crawley, was awarded a first prize.

AMATEURS.

The silver cup in the amateurs' section for two dozen show or fancy dahlias was won by Mr. Sidney Cooper, The Hamlet, Chippenham, who, however, must have been run very close by Mr. Thos. Jones, Bryn Penylan, Ruabon, who was placed second; Mr. G. Buss, Windmill Hill Place, Hailsham, third. Mr. T. Jones led for a dozen show dahlias, and was followed by Mr. S. Cooper and Mr. A. Robbins, Prospect Place, Keynsham. For six show dahlias, Mr. C. Luckin, Apsley, Pulborough, scored, with Mr. J. Haycock, Wagoners' Inn, Gyfelia, Wrexham, second, and Mr. A. P. Ironside, Park Lane, Chippenham, third.

Mr. S. Cooper led for a dozen fancy dahlias, with Mr. G. Buss second, but neither showed really well. Mr. Ironside, Mr. A. Robbins, and Mr. G. Boothroyd, Portfield, Chichester, were the winners in order of merit for six fancy dahlias.

The Crystal Palace Company's silver cup for six varieties of cactus dahlias, in vases, arranged with appropriate foliage, was withheld on this occasion; the Rev. A. Bridge, Worth Rectory, Three Bridges, was disqualified for using supports to some of his flowers, and Mr. Francis H. Currey, Osborne Road, Palmers Green, was awarded a second prize; these were the only two entrants. The competition was keen in the class for three blooms each of nine varieties of cactus dahlias, there being six competitors. Mr. Daisley, gardener to the Rev. A. Bridge, Worth Rctory, gained the first prize and silver challenge cup with very good flowers of Ivernia, Wm. Marshall, T. A. Havemayer, Snowdon, Rev. T. W. Jamieson, Nelson, Harold Peerman, Ruby Grinstead, and J. B. Riding; Mr. F. Grinsted, Beaufort Park, Battle, second; and

Will be published Next Week.

Amongst its Features will be an interesting

ILLUSTRATED ARTICLE on the PROPAGATION of HYACINTHS.

There will also be Illustrated Articles on

- TULIPS FOR GARDEN DECORATION.
- LACHENALIAS FOR THE CONSERVATORY.
- CHOICE INEXPENSIVE DAFFODILS.
- UNCOMMON BULBS.
- JONQUILS IN THE WILD GARDEN.
- BULBOUS PLANTS FOR MID-WINTER.
- CHOICE BULBS FOR THE ROCKERY.
- BULB CULTURE IN FIBRE, etc., etc.

TO ADVERTISERS

This will be a Capital Issue for a SPECIAL ANNOUNCEMENT.
Book Space without delay.

WEDNESDAY, SEPTEMBER 15th, is the latest date for receiving advertisements.

Mr. Chas. Luckin, Pulborough, third. Mr. H. Jackson, The Leys, Woburn Sands, scored for six bunches of cactus dahlias, with Mr. Francis H. Currey, Palmers Green, second, and Mr. A. H. Palmer, Kitchener Road, Walthamstow, third; seven entries. For two dozen cactus blooms, on boards, Mr. J. B. Bryant, St. Martin's Terrace, Salisbury, won the chief award with a very even, clean set of moderate sized flowers of popular varieties; Mr. Edward E. Barton, Brand Street, Greenwich, second; and Mr. L. H. Farmer third; five contestants.

Mr. Montague W. Dance, School House, Abbott's Ann, Andover, scored for a dozen cactus blooms, distinct, on boards, and was followed in order by the Rev. A. Bridge and Mr. H. Jackson. This was a good class, and contained some very good flowers of varieties already noticed. Mr. F. H. Currey led for six cactus dahlias, with Mr. R. Carrington Willis, Palmers Green, second.

Mr. H. Brown, Dahlia Dene, Luton, had the best dozen bunches of pompon dahlias, and he won with very neat examples of Nerissa, Nellie Broomhead, Bacchus, Emily Hopper, Daisy, Phœbus, Jessica, etc.; Mr. W. C. Pagram, Weybridge, second; and Mr. S. Cooper third. Mr. Brown scored again for six bunches, followed by Mr. G. Davidson, Quadrant Road, Thornton Heath; and Mr. A. Tofield, Seaforth Avenue, New Malden.

Rev. S. Spence Pearce, Woodstock, had the best six bunches of single dahlias, and led with Polly, Kitty, Eclipse, Miss Morland, Columbine, and Miss Roberts; Mr. E. Mawley, V.M.H., second. For six bunches of ten blooms each, the Rev. A. Bridge scored with Columbine, Snowdrop, Leslie Seale, Eclipse, Princess of Wales, and Polly Eccles, all well shown; Mr. A. Brown second. Mr. Mawley scored for four vases of single dahlias, and Mr. A. Brown was second.

DECORATIVE EXHIBITS.

The best basket of cactus dahlias and autumn foliage came from Mr. Edward E. Barton, Broad Street, Greenwich, and was a very fine, bold design of yellow, cream, and crimson varieties; Mr. Thos. Jones second, and Mr. W. Cooper, gardener to Miss Gladstone, Hampton Hill, Bishop's Waltham, third. In the open class for a basket of dahlias and appropriate foliage, Mr. M. V. Seale was the chief prize winner, with a very elegant design in yellow and red cactus dahlias, grasses, and berberis sprays; Mr. W. Treseder second. Mr. Seale was first, and Mr. Pagram second, for a vase of pompon dahlias. Mr. Seale was placed first, and Mr. Treseder second, for a shower bouquet of dahlias, with Mr. Walker third; many folks preferred Mr. Treseder's bouquet before Mr. Seale's. Mr. Jas. Bryant had the best three vases of cactus dahlias and appropriate foliage, with Mr. Thos. Jones a good second, and Mr. C. Luckin third.

OPEN CLASSES.

In the open classes Mr. W. Treseder led for six show blooms, one variety, with J. Walker. Mr. F. H. Curry was first for six cactus dahlias, one variety, with Nelson. Messrs. J. Burrell and Co. led for six bunches of pompon cactus dahlias with Nora, Minima, Mary, Martha, Wm. Marshall, and Lena; Messrs. J. Cheal and Sons second, and Mr. M. V. Seale third.

Messrs. J. Stredwick and Son led for six bunches of fancy cactus dahlias with Columbine, Flora, Sirius, Mercury, Cockatoo, and Pegasus; Mr. J. Walker second. Messrs. J. Cheal and Sons had the best set of six bunches of fancy single varieties, and were followed by Mr. M. V. Seale and Mr. J. Walker; the Rev. A. Bridge was disqualified for showing Mrs. W. W. Merry as a fancy.

NON-COMPETITIVE.

Messrs. Hobbies, Lim., Dereham, were large exhibitors of roses and hardy flowers, and they displayed a collection of cactus and pæony-flowered dahlias (gold medal). Messrs. H. Cannell and Sons, Swanley, arranged a bright bank of cactus, decorative, and pæony-flowered dahlias, associating these with gypsophila, etc. (gold medal). Mr. J. T. West, Brentwood, contributed a charming set of pretty pompon varieties of dahlias, together with a collection of cactus dahlias (gold medal). Another exhibitor of cactus and pæony-flowered dahlias and hardy flowers was Mr. J. E. Knight, Wolverhampton, who gained a silver medal.

Royal Horticultural Society.

SCIENTIFIC COMMITTEE, August 31.

Present: Mr. G. Massee, F.L.S., V.M.H. (in the chair); Messrs. J. W. Odell, W. Cuthbertson, W. Hales, J. Fraser, G. Saunders, and F. J. Chittenden (hon. sec.), and Messrs. H. Alexander, E. H. Wilson, and F. N. Meyer (of the U.S.A. Dep. Agr.), visitors.

MALFORMATIONS IN TRIFOLIUM.—Mr. J. Fraser, F.L.S., showed specimens of Trifolium hybridum with the pedicels elongated, the calyx with elongated teeth, the petals widely separated and the stamens exposed, and the pistil developed into a trifoliate leaf consisting of a stalk bent in the part where the style usually begins, and carrying the leaflets above this. As he remarked, according to this evidence, the ovary is made up of the base of the petiole with its stipules, the top of the petiole forms the style, and the leaflets form the stigma of the normal flowers. He also showed T. pratense with the primary capitulum having two opposite bracts at its base, above these a calyx with many teeth, springing from the inside of which were the pedicels unusually elongated, then a second calyx enclosing a corolla of five petals, sometimes partly affected with chloranthy and exposed stamens, then a leafy bract, and in the centre numerous flowers. The central flowers have a well-formed calyx, are apetalous, with exposed stamens and a small pistil in the centre. The Chairman remarked that the occurrence of virescence such as was exhibited in the specimens shown was the result of the attack upon the base of the plant of a small grub belonging to the family Diptera.

HYBRID RADICULA.—Mr. Fraser also showed specimens of what he considered to be a hybrid between Radicula (Nasturtium) palustris and R. sylvestris. The plant had occurred in company with both its supposed parents, and had imperfect flowers. In most of its characters it appeared midway between the two plants named, although perhaps nearer to R. palustris.

THE WONDERBERRY.—Mr. Cuthbertson showed a specimen of the American "Wonderberry," said to have been raised by Mr. Burbank. He also showed Solanum nigrum for comparison. The plant, though differing in some few details from the specimen of Solanum nigrum shown, is apparently only a form of that very widespread and variable weed of cultivated land. Mr. Meyer remarked that the fruit of S. nigrum was frequently made into pies and eaten in different parts of the States, and he was unable to distinguish the plant exhibited from the spontaneously occurring plant.

SPENCER SWEET PEAS.—Mr. Cuthbertson also made some remarks regarding the reasons why the Spencer type of sweet pea is shy in producing seed, showing photographs and flowers in illustration of his remarks. The reasons he considers to be as follows:

1. The keel is not constricted or clamped, and consequently the anthers and stigma are not compressed together as in the old type of flower.

2. The open keel tends to allow the pollen to drop into the base of the keel without coming in contact with the stigmatic point. In the old type this was hardly possible.

3. In many of the waved forms the style grows beyond the anthers before the anthers dehisce, and the point is thus never brought into contact with the pollen.

4. In some, notably salmon and orange-coloured varieties, the anthers are nearly sterile.

5. The large waved standard does not act as an umbrella in bad weather. The hooded standard did deflect the rain from the vital parts of the flower.

Note.—The Unwin or moderately waved type of flower is a good seeder. It follows the old type very closely in the formation of its keel.

CHINESE PLANTS.—Mr. E. H. Wil showed an interesting series of photographs of some of the plants he had met with in his last travels in China. Among them were pictures of—

1. Pinus Bungeana, taken in S.W. Ichang at an altitude of 3,500ft., showing the [illegible] bark of the stem and exposed parts of [illegible] root. Mr. Wilson said he regarded this [illegible] and Pinus sylvestris, which has in certain parts of the world a very light bark, as the two most picturesque of the pines.

2. Cunninghamia sinensis, a picture of solitary tree 130ft. in height and 20ft. girth. This tree forms pure forest in Ch at an elevation of 5,000ft., and is the [illegible] monest timber tree in Central China, wh it is very valuable. The photograph [illegible] taken in S.W. Tatien-lu.

3. Gingko biloba. Mr. Wilson remark that it had recently been stated that this [illegible] occurred truly wild in China, but althoug he had traversed the whole of the land wh it was said to occur, he had found [illegible] planted trees. The photograph was tak at Kiating, and depicted a tree 90ft. h and 24ft in girth.

4. Actinidia chinensis, a beautiful shrub producing green fruit with a russet tinge, of excellent flavour as a dessert fruit, and making good preserves. This plant has flowered in France and England, but so [illegible] only staminate flowers have been produ Hermaphrodite flowers are borne by [illegible] plants, and, perhaps rarely, pistillate flo only.

5. Cypripedium tibeticum. This is one [illegible] the commonest herbaceous plants in [illegible] places at an altitude of 11,500ft. to 12,0

SPORT IN PHLOX DECUSSATA.—[illegible] Mr. Douglas came an inflorescence of Ph decussata, some of the flowers of which [illegible] white with the faintest tinge of violet, [illegible] others (the greater number) were white w broad stripes of violet-mauve. The plant had for fifteen years borne only white flowers, but last year had some coloured flowers, and again this year.

WINTER-ROT IN POTATOES.—Mr. Wigley sent from Hartridge, Grav [illegible] specimens of potato badly affected [illegible] winter rot, due to Fusarium solani. [illegible] variety, Midlothian Early, had been [illegible] as soon as the tops died down, and some tubers selected for seed next season; these were placed in the sun to "green," and had "sweated with dark liquid drops at the eyes, and had softened on that side and then shrivelled." None of the stored potatoes (kept cool) showed signs of the disease at present, while 50 per cent. of the portion saved for seed were affected.

LARGE LARCH SAWFLY.—Mr. E. [illegible] Holmes, F.L.S., sent specimens of the [illegible] of this destructive insect (Nematus E [illegible] soni) collected in the Lake District, wh [illegible] larch is being defoliated by them on La [illegible] and Skiddaw. This insect seems likely [illegible] destroy the larches in the district unless [illegible] natural enemy should prove effective.

MALFORMED CYPRIPEDIUM.—Mr. R. W. Richards, of Usk Priory, sent a [illegible] of Cypripedium insigne in which the [illegible] lateral petals had a slight tendency [illegible] the form of the lip, and the bract was g [illegible] and leathery instead of membranous.

ASTER DISEASED.—From Patcham, Sus sex, came specimens of asters attacked by [illegible] species of Fusarium. This fungus att [illegible] the plants by the roots, which are killed, [illegible] the plant wilts through lack of water. [illegible] unsafe to plant asters in soil where [illegible] have previously been attacked, and the [illegible] in which they are grown should be lim [illegible]

"SHOT-HOLE" IN PEACHES.—[illegible] mens of peach leaves from near East [illegible] showing round browned patches, and [illegible] some cases holes, from which the dead tis had fallen out. The committee was [illegible] mously of opinion that the spots were [illegible] to the "shot-hole" fungus.

ANSWERS TO CORRESPONDENTS.

PLANTING BULBS.—E. W., Birmingham: Can you give us chapter and verse? If you can we will look the matter up and do our best to oblige you.

BOURBON ROSES.—J. B., Shoreham: The best of these are Mrs. Paul, Mdme. Isaac Periere, Armosa (or Hermosa), Souv. de la Malmaison, Setina, and Zephirine Drouhin.

ROSES FOR POT CULTURE.—J. B., Shoreham: The best H.P. roses for pot culture are Captain Hayward, Frau Karl Druschki, and Mrs. J. Laing. Excellent H.T. varieties for the purpose are Antoine Rivoire, Caroline Testout, Lady Battersea, Liberty, Mdme. Abel Chatenay, and Papa Gontier. Good tea-scented roses for pots are Bridesmaid, Lady Roberts, Mdme. Falcot, Mdme. Hoste, Mrs. Edward Mawley, Souv. de Pierre Notting, Sunrise, The Bride, and White Maman Cochet.

CANKERED MELON STEM.—E. F., Yorks: The damage is due to canker caused either by an excess of moisture round the "collar" of the plant, or to rupture produced by careless handling, tight ligatures, knocks with the spout of the can, etc. Water should not be applied directly around the stems of melons; a zinc or earthen ring six inches or so in diameter, placed round each plant stem, will serve as a guide, and no water should be given within the ring. Sulphur serves as a good remedy if applied at the slightest sign of damage.

AUTUMN-SOWN SWEET PEAS.—W. A. C., Yeovil: Where the intention is to sow sweet peas out of doors in the autumn the ground, if not already prepared, must be made ready at once by deep digging and manuring. A firm seed bed is essential, consequently just previous to sowing the soil should be trodden over both ways, unless it has been worked some time previously and has had ample time to settle down. Take advantage of suitable weather at the end of the present month or the first week in October, and, having already red-leaded the seeds, sow them thinly in shallow trenches about eight inches wide, and cover with about three inches of soil. Label the varieties directly they are sown. A good dressing of lime, or old soot, given about ten days or a fortnight after sowing, will check the attacks of slugs and snails that are always ready to feast upon the new growth. When the seedlings are four inches high, draw some soil up to them from each side of the row, as the ridge thus produced is a great protection. Thin out the seedlings at the end of March, and, if space is available, plant the thinnings to make other rows. Supposing a double row is left in each drill or trench, the plants should be about fifteen inches apart when the work of thinning is finished. Staking should immediately follow thinning.

WINTER-FLOWERING ORCHIDS.—C., Norwich: If you rule all the cypripediums out of order, then you very materially reduce the chances of a display from orchids from December on to the end of the winter season. Where dendrobiums are largely and well grown it is quite possible to force some of these into flower by January, notably D. nobile, D. Pierardi, D. aureum, D. Ainsworthi, and several hybrids of similar character to the latter. Cœlogyne cristata, Cattleya Trianæ, Lycaste Skinneri, Odontoglossum crispum, Oncidium crispum, and O. varicosum Rogersi will be giving flowers in most large collections, and zygopetalums will bloom early in the year. Some of the calanthes will also be still in flower. In February and March dendrobiums will be much more in evidence, and give a splendid display, provided a good selection of species and hybrids is made. Cattleya gigas, Cymbidium eburneum, odontoglossums, and phalænopsis will now be blooming; indeed, where there is a good collection of cool orchids, odontoglossums are almost always to be had in bloom. Towards the end of the winter period Cymbidium Lowianum will begin to flower, as well as the various phaius. You do not state what facilities you have for orchid culture, hence it is difficult to give really useful advice on the subject. So far as we are able to judge, you will, in the absence of cypripediums, have to depend largely upon dendrobiums for flowers in late winter.

COMBATING THE APPLE SUCKER.—S. J. C., Cirencester: The apple sucker (Psylla mali) lays its eggs during September, October, and November, and therefore spraying with a paraffin emulsion, in the case of trees from which the crop has been gathered, will destroy large numbers of adult insects, and so greatly reduce the pest. Winter spraying does not appear to be of any real value as a means of checking the apple sucker, but it is useful in cleaning the trees and giving them a better chance of making clean growth another season. The best method of dealing with the apple sucker is to spray the trees just before the blossoms open, though nicotine solution does not harm expanded blooms or kill the bees that are at work among them. Nicotine of 96 per cent. purity should be used at the rate of 1 1-5th oz. to each ten gallons of water.

NAMES OF PLANTS.

F. W., Rochester.—1, Odontoglossum ardentissimum; 2, Oncidium flexuosum.

F. E. S., Ongar.—1, Sidalcea rosea; 2, Lonicera sempervirens; 3, Lomaria procera.

J. B., Warrington.—1, Centaurea macrocephala; 2, Astilbe Davidi; 3, Thalictrum adiantifolium; 4, Helxine Solieroli.

W. E., Guildford.—1, Tacsonia Van Volxemi; 2, Chorezema Lowi; 3, Fuchsia triphylla; 4, Ipomaea rubro-caerulea.

L. R. C., Fakenham.—1, Thuia Lobbi; 2, Juniperus chinensis; 3, Libocedrus decurrens; 4, Abies Douglasi; 5, Pinus Pinsapo.

E. F. S., Sandling: 1, Sedum spectabile; 2, Vitis Henryi; 3, Ceanothus azureus; 4, Dabœcia polifolia; 5, Cotoneaster horizontalis.

OBITUARY.

MR. JOHN FORBES.

With deep regret we have to record the death of Mr. John Forbes, of the Royal Nurseries, Hawick, which occurred on the 6th inst., in his 68th year. Mr. Forbes was a native of Alberfeldy, Perthshire, and commenced his horticultural career in the gardens at Killiechassie Castle. In 1870 he commenced business at Hawick, and during the thirty-nine years he was engaged in commercial horticulture he enjoyed uninterrupted success, and was highly esteemed by his wide circle of friends, and indeed by all who knew him. Mr. Forbes specially distinguished himself as a raiser and cultivator of pentstemons, phloxes, pansies, and other classes of florists' and hardy border flowers, and large numbers of varieties of the highest merit were distributed by him. His comprehensive catalogue of these subjects is a model of its kind, and has much value as a work of reference, for in his collections Mr. Forbes was careful to include all the finest varieties, whether raised at Hawick or elsewhere. Two years since Mr. Forbes received the Royal Warrant appointing him nurseryman and florist to the King, and for family reasons the business was a year ago converted into a limited liability company under the title of John Forbes, Hawick, Lim. For many years Mr. Forbes has been assisted by his son in the conduct of his important business.

MR. JOHN HENRY WILSON.

We regret to record the death of Mr. J. H. Wilson, a well-known florist of Handsworth, which occurred on August 29, in his 58th year. Mr. Wilson devoted considerable attention to auriculas, in the cultivation of which he achieved much success.

PATENTED REG.D
SIMPLE, SAFE and SURE.
Nothing is necessary for its preparation beyond a packet of QUASSOP and some cold water to produce a fine and powerful soap solution containing the bitter principle of quassia wood freshly extracted by the action both of water and of the oleaginous and alkaline principles employed.
QUASSOP not only destroys aphis and other insects, but it also leaves a bitter coating on the foliage and so prevents further attacks. It is non-poisonous and will not stain even white paint.
QUASSOP is sold in packages with full directions. 10 gallon size 1s., 50 gallons 3s., 200 gallons 10s. Sample packet (to make 3 gallons) 6d., from Seedsmen, &c. or post free from
SAVRIL Ltd., D, The Arcade, Brook St., Chester

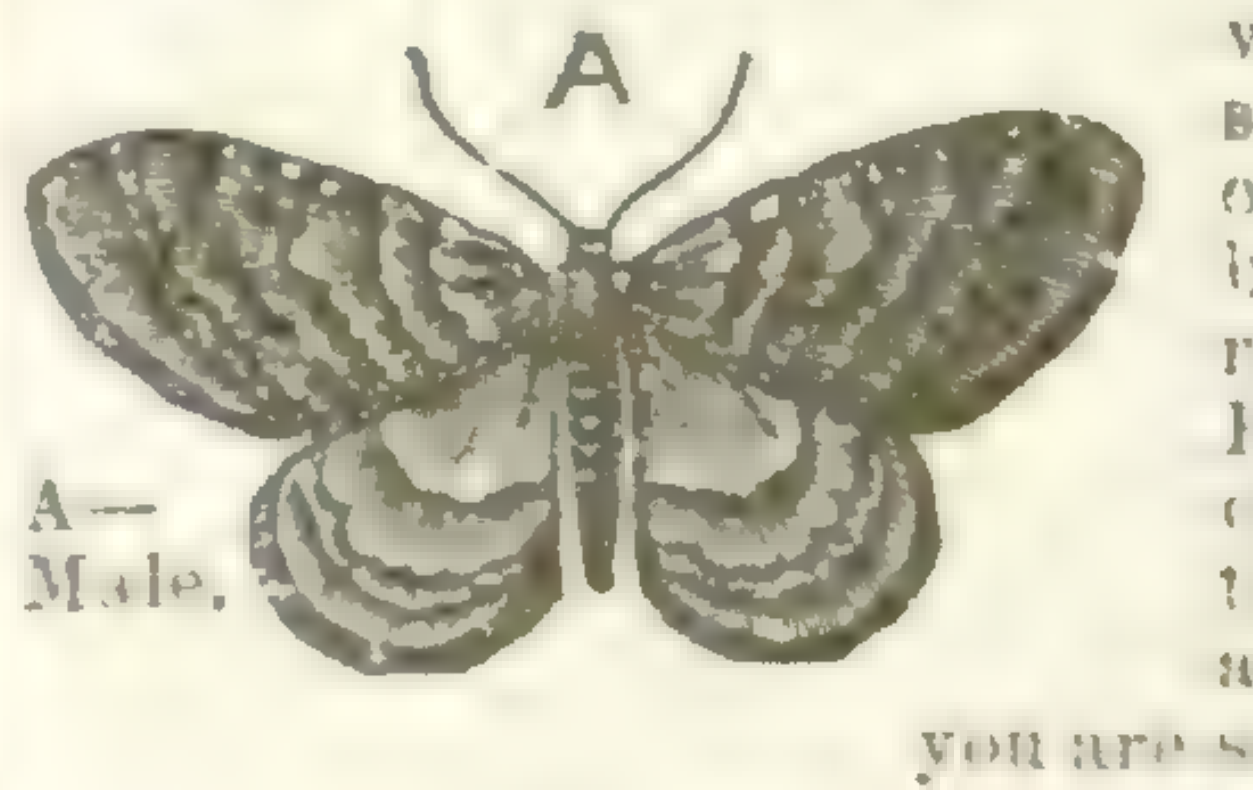
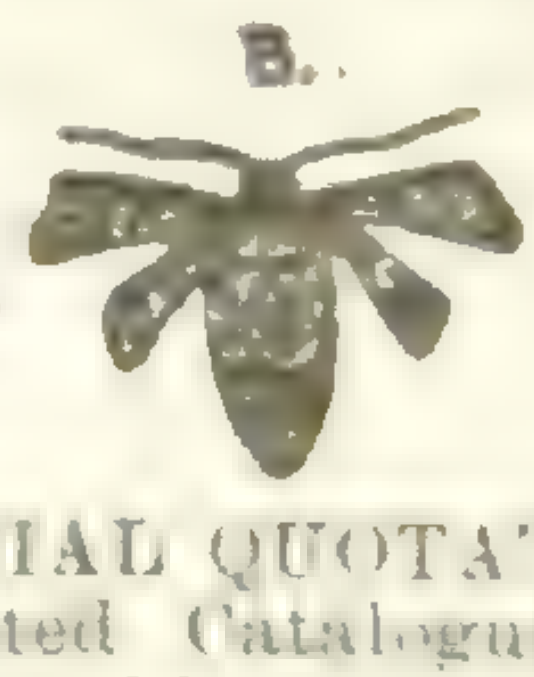
HORNE'S
FRUIT TREE DRESSING
Has Stood the Test of 20 Years.

WINTER MOTH.



A—Male.



B—Female.

Thousands of pounds' worth of fruit have been saved by its use that otherwise would have been lost if left to the ravages of the Caterpillar Pest. INVALUABLE. It is obvious that by catching the female moth in its ascent to deposit the eggs you are striking at the root of the evil. It will capture the Winter Moth, Mottled Umber Moth, March Moth, Apple Blossom Weevil, and Codlin Moth.

EVERY GARDENER knows that the XL-ALL SPECIALITIES are the best on the market. The time is at hand for housing Plants for the Winter. When these are arranged under glass a fumigation with XL-ALL COMPOUND, or a syringing with XL-ALL LIQUID INSECTICIDE will at once free them from insect pests and save lots of trouble later on. Any plants or fruit trees suffering from Mildew should be sprayed with XL-ALL MILDEW WASH, or with the newly-patented CUCASA, the finest preparation of Copper ever offered to Gardeners. RICHARDS XL-ALL FERTILIZER is unequalled for finishing off fine blooms and fruit. Please ask your Nurseryman, Seedsman, or Florist for a copy of my small pink List, giving particulars of these and many other "XL-ALL" Preparations which can be obtained from the Horticultural Trade throughout the World. G. H. RICHARDS, Manufacturer and Patentee, 234, Borough High Street, London, S.E.

FLOWERS IN THE HOME
OUR CATALOGUE OF SELECTED BULBS, profusely illustrated from photographs, tells you how you can have, at a trifling cost, a display of beautiful flowers in your home from Christmas till April, with as good results as if you had a greenhouse. The instructions are so clear, and the method so simple, you cannot fail. It also describes the best bulbs and plants for making a brilliant display in the greenhouse and garden during spring, and contains very cheap offers of herbaceous plants. Send for a copy to-day—it will interest you.

With interesting illustrated article upon Growing Bulbs in Moss Fibre in China Vases without Drainage, on application. This has proved the most charming way of growing Narcissi and other Bulbs for house decoration, or for those who cannot get good soil, or who have not the convenience of greenhouses, cold frames, or similar accommodation.

VOL. LII.—No. 2,916. SATURDAY, SEPTEMBER 18, 1909.

THE GARDENERS' MAGAZINE.

NOTES OF THE WEEK.

Spring-flowering Bulbs.

Hardy bulbs that bloom in spring have of late years attained to so important a position among the plants suitable for the production of attractive colour effects early in the year that we have no doubt as to our readers fully appreciating the large amount of information relating to them we are giving in this issue. In devoting the present issue chiefly to a consideration of the more useful of the hardy bulbous plants we are only continuing the policy which has proved so useful to our readers in past years, and has exercised an enormous influence for good on the extension of bulb culture which has formed so characteristic a feature of flower garden management for a considerable period. We have not only persistently advocated a more generous use of bulbous plants in the garden than was for so long considered advisable, but we have constantly kept in view the possibilities of bulb culture for commercial purposes. Our views with regard to the cultivation of bulbs for profit were not accepted without some question, and it would have been unreasonable to expect a general acquiescence in them immediately on their being expressed. In process of time their soundness was recognised, and we have had the satisfaction of seeing the commercial culture of bulbs in England become a large and profitable industry. It has been proved to demonstration that with the exception of hyacinths, all the more important classes of bulbous plants can be grown in England, at least as successfully as in any other part of the world. As the result of this extension of flower farming the more popular bulbs have been so cheapened as to be within the reach of the majority of those who love flowers, and these flowers are supplied to the markets in such quantities as to enable all but the poorest of town dwellers to enjoy their beauty. Although the possibilities of the production of hyacinth bulbs has not as yet been fully demonstrated, it by no means follows that they cannot be successfully grown in England for profit. We have on several occasions had brought under our notice bulbs that have been wholly grown in this country, and the best of these have been of high quality, as proved by the test of flower production. The question whether, given favourable soil conditions, hyacinth bulbs equal to those received from Holland can be produced in large quantities at a remunerative rate, might with advantage be put to a practical test by those who have command of a soil similar to that of the districts in Holland that are largely devoted to these flowers. We do not suggest trials should be made in soils of all descriptions, for many failures would be inevitable, and these would, in all probability, check experimental culture in soils of the proper character. To those who may have a desire to give some attention to this matter, the fully-illustrated article on the propagation of hyacinths which appears on another page should be of material assistance. It will be seen that the increase of stock is a comparatively simple matter, but production of clean, solid bulbs that will give fine spikes of flowers within the period mentioned by our correspondent, will require a carefully devised method of procedure. There is no occasion to pass under review the several classes of bulbs available for general cultivation for the purpose of endeavouring to determine their relative merits. It is generally accepted by those who have had experience in flower garden management that the narcissi and tulips are the most generally useful. The crocuses are recognised as of much value in the production of rich displays quite early in the spring, and hyacinths obtain much favour for their distinctness, both in habit and colouring. There are numerous other classes of bulbs that deserve a much higher degree of popularity than they at present receive, and those who have any considerable area of border that is devoted to hardy flowers should endeavour to become well acquainted with the finest of the kinds that are usually found in catalogues under the general heading of "Miscellaneous Bulbs." While full advantage should be taken of the more noteworthy kinds for massing in beds and borders that during the summer months are occupied with other classes of plants, the usefulness of bulbs generally for carpeting the surface of shrubbery borders should not be overlooked. Where the shrubs are deciduous, and not overcrowded, a considerable number of kinds may be planted between them with the most successful results. Indeed, a considerable number will retain their full vigour for a much longer period than will bulbs of similar kinds planted in rich borders in the open. This important fact admits of an explanation that can be given in a few words. The soil of the shrubbery border is filled with roots, which become very active in the absorption of moisture when the shrubs are in full leaf, and evaporation is proceeding at a rapid rate. Usually, the soil in which shrubs are growing becomes very dry during the summer, when the bulbs are passing into their resting period, and as the dry conditions continue for some time, they are able to enjoy a rest more or less complete. On the other hand, bulbs that are planted in rich borders devoted to hardy perennials have more moisture about their roots during their resting season, and frequently suffer from the effects of heavy rains following short periods of dry weather. It is satisfactory there should

MR. HENRY R. FARMER.

be a steady increase in the growth of narcissi in the grass in the less highly-dressed part of the grounds, for nowhere do these elegant flowers appear to greater advantage than when they spring from fresh green turf. For grass culture it is advisable that varieties having a strong constitution be selected, and that crowding should be avoided. We refer to this point because we now and again meet with glades and spaces between trees so thickly planted as to suggest narcissi beds on a flower farm rather than a portion of the pleasure grounds, and much of the charm of the effect produced by the bulbs is lost. While it is most desirable that spring-flowering bulbs should be liberally planted in both country and town gardens, it is important to point out that they are especially valuable in the latter. It matters not whether the soil or atmospheric conditions are unfavourable to plant life, or whether the garden be surrounded by trees that shade a considerable part of the area, the owner can, with the aid of bulbs,have most attractive displays of flowers during the spring months. The bulbs prepared in some part of the country, where they enjoy the advantage of pure air, a well-tilled soil, and full exposure to the sun's rays, complete their growth under the most favourable conditions, and in the year following yield freely of their wealth of floral beauty, even if the conditions under which they are placed are distinctly unfavourable. After they have flowered the bulbs can be removed to make way for the summer occupants, and if the cheaper kinds are selected this annual renewal will not be a costly matter.

Mr. Henry R. Farmer, as chief of the Cardiff Castle gardens, occupies a commanding position among practical horticulturists, and although quite a young man, has shown such remarkable ability as to have greatly enhanced the fame the gardens under his charge have so long enjoyed. Mr. Farmer commenced his gardening career at an early age, under his father, at West Hill, Fareham, the country seat of General Sir Percy Fielding, K.C.B., where he remained two and a-half years. Thence he went to fill a position in the gardens of Longleat, the seat of the Marquis of Bath, and in this well-known establishment he remained three years. Mr. Farmer was then appointed to a position in the kitchen and fruit gardens at Cardiff, which were under the charge of the late Mr. A. Pettigrew. At the end of about twenty months he was promoted to the post of foreman in the plant and fruit houses, which he occupied until some five years later, when he was made general foreman. In this position Mr. Farmer remained until about two and a-half years after Mr. Pettigrew's death, having sole charge of the gardens, no head gardener having been appointed. Three years ago Mr. Farmer was appointed by the Marquis of Bute head gardener, with the charge, in addition to the castle gardens, of the vineyards and recreation grounds. During the past three years many alterations have been made in the extensive pleasure grounds. Large shrubberies and plantations of laurels and other evergreen shrubs have been cut down, and the spaces planted with a choice collection of flowering trees and shrubs. Another attractive feature has been added by the planting of thousands of hardy bulbs on the banks and slopes in the pleasure grounds. The expanding city of Cardiff had so far encroached upon the old gardens that it was decided to make a new kitchen garden, half a mile or so from the castle, and to build new plant and fruit houses. The manner in which the alterations have been carried out under Mr. Farmer's direction is beyond praise, and we hope at no distant date to refer to this new garden with more fulness than is now possible. We will only say that the new garden is not less remarkable for skilful management than for careful planning, and that in common with the pleasure grounds, is well able to afford abundant interest to those who are in any way concerned with horticulture. The high estimation in which Mr. Farmer is held by the gardening community in the district of which Cardiff is the centre, is indicated by the fact that for the past three years he has been chairman of the Cardiff Gardeners' Society, and is vice-chairman of the Cardiff County Horticultural Society, and of the Cardiff and District Chrysanthemum Society.

National Vegetable Society.—This newly-formed and important society is quietly forging ahead, and already has some good work in hand. Trials of spring cabbages and autumn-sown onions are being made at Guildford on gravelly soil, at Twickenham on marshy land, and at Romford on stiff Essex clay, and the seeds are sown and the young plants making good progress. What the new society now wants is members, and there must be many of our readers who have a great interest in vegetables and who would derive much benefit from the society. As previously stated in our columns, His Grace the Duke of Portland, K.G., is the president. The annual subscription for members is only 5s., and we invite our readers to support the committee in its praiseworthy endeavours to promote the culture and more extensive consumption of high-class home-grown vegetables. A circular has been prepared setting forth clearly the aims of the society and inviting membership, and a copy of this will be sent to anyone on application being made to the hon. secretary, Mr. E. G. Quick, Kelmscott, Harrow View, Wealdstone, Harrow.

M. Viger.—This eminent representative of French horticulture has recently been the object of a special honour, the first he has yet received from England. At a recent meeting of the council of the Royal Horticultural Society it was resolved, upon the motion of Sir Albert Rollit, to confer upon M. Viger the distinction of honorary corresponding member. M. Viger has for many years been president of the Société Nationale d'Horticulture de France, and has always been held in the highest esteem by his colleagues for his devotion to the interests of horticulture. Many English visitors to French shows have admired his eloquence, for as an orator he has few equals, and have also been grateful to him for the courtesy and hospitality he has bestowed upon them. His nomination by the Royal Horticultural Society will meet with a responsive echo in the minds of all our countrymen who have come into contact with M. Viger, and we venture to indulge the hope that he may long live to enjoy the well-deserved honour conferred upon him.

The Vegetable Imports were rather above the average in August, and the most noteworthy increases were in the foreign supplies of onions and tomatoes. The excellent crop of British-grown potatoes had the effect of reducing the prices to an extent that imposed a great check upon the importation of foreign-grown tubers. The imports of potatoes aggregated 124,581 cwt., of the value of £22,090, as compared with 152,075 cwt., of the value of £30,287, in the corresponding month of last year. Of tomatoes the imports were 135,739 cwt., of the value of £125,539, or an increase in quantity of about 11,000 cwt., and in value of about £5,000. Onions, as indicated above, were received in largely-increased quantities, the total having been 717,490 bushels, of the value of £98,626, against 593,973 bushels, of the value of £65,820, in August, 1909. Unenumerated vegetables, on the other hand, were received in smaller quantities, and the value was only £12,141, or a trifle over 50 per cent. of the value in the corresponding month of last year.

Wilton House, Salisbury.—On the occasion of the annual excursion of the Gosport Gardeners' Association, the members, some fifty in number, visited Wilton House, Salisbury, the seat of the Earl of Pembroke, and also the nurseries of Messrs. Keynes, Williams, and Co. The latter were first visited, and the members of the party were much interested in the dahlias and roses. After the luncheon at the Salisbury Assembly Rooms, the party proceeded to Wilton House, where the great range of fruit houses, the numerous plant houses, the kitchen garden, the fine wall trees, and the extensive pleasure grounds were found rich in interest and highly attractive.

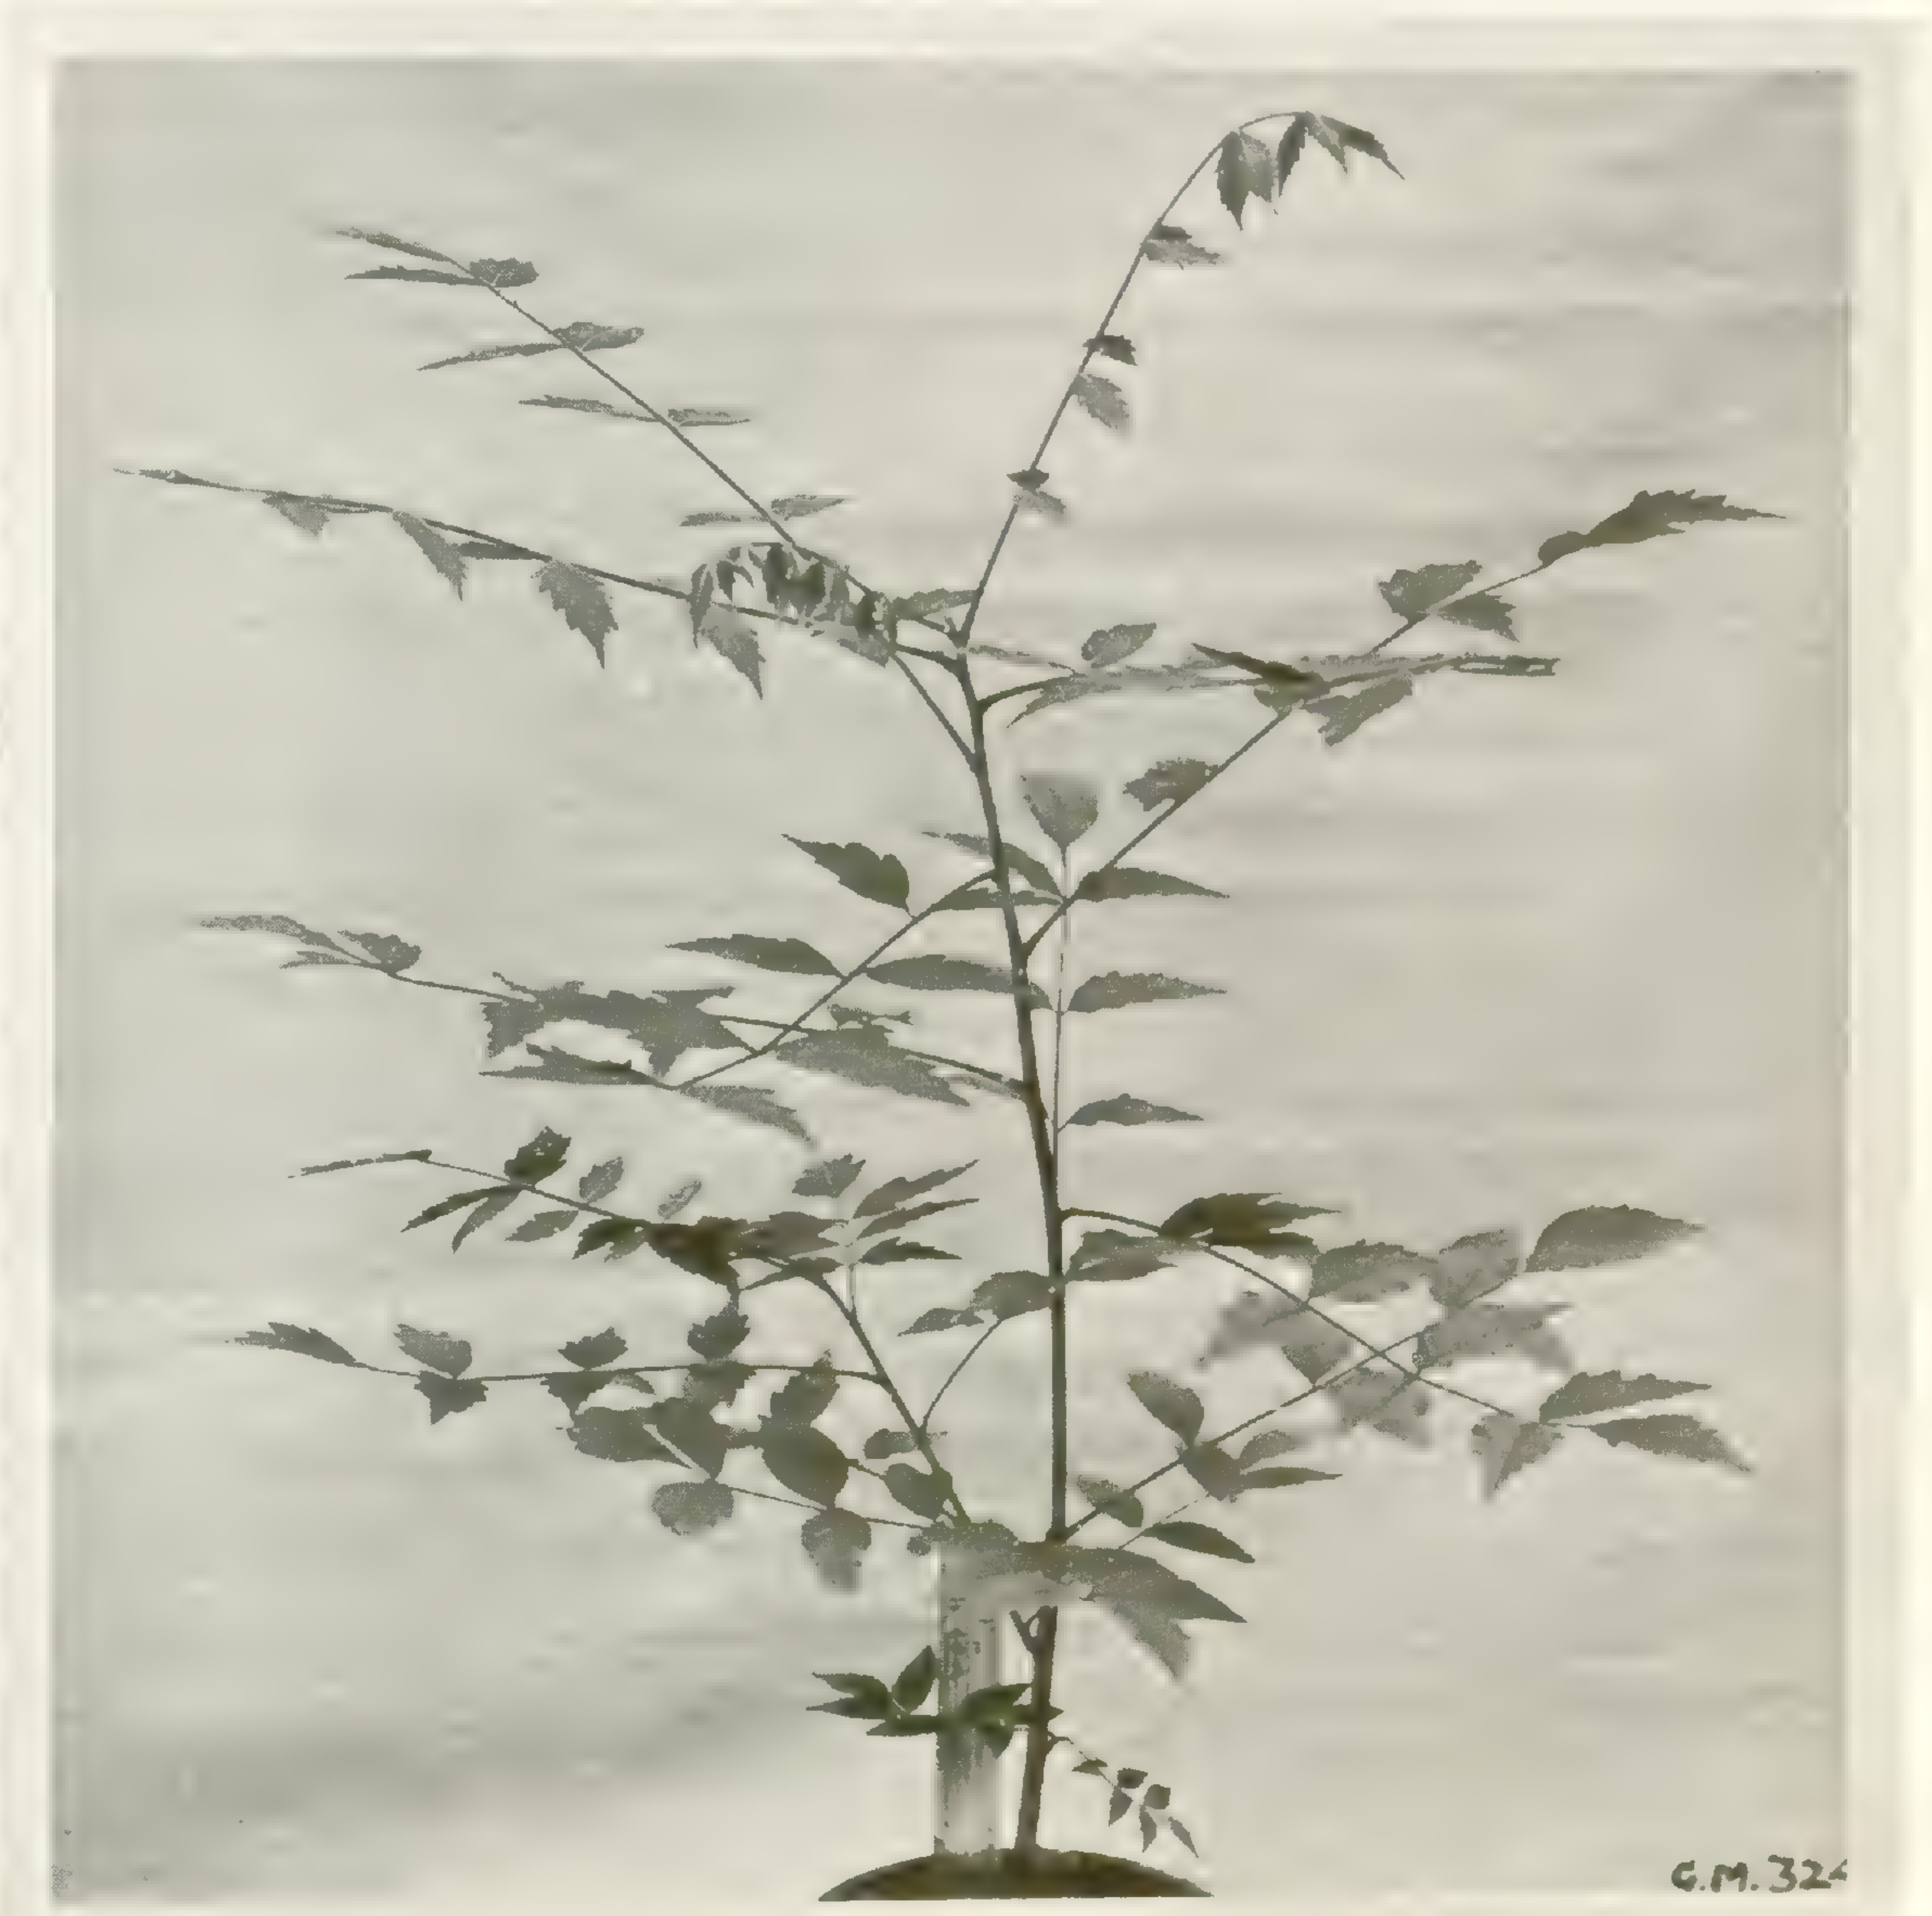
Summer Rainfall.—According to the summary of the weather issued by the Meteorological Office for the past summer the rainfall for the three months June, July, and August, was in excess of the average in all the English districts except in the South-west, where the deficiency amounted to 0.76in. The excess in the North-east of England was 1.67in. The deficiency in the South of Ireland was 4.12in., and in the Channel Islands 2.95in., where the aggregate rainfall was only 3.81in.

The Honey Harvest in the North. It is only too apparent, writes our Aberdeen correspondent, that the honey harvest in the North this year must be ranked as little better than the disastrous one of 1907. Assuming that a little surplus may still be gathered from the heather, it cannot do more, in many cases, than help to keep down the heavy expenses of preparing the apiary for the coming winter. The old-fashioned straw-made hive still abounds in the North, and is still a favourite with those who keep bees on a small scale, but in these a number of stocks have perished during the summer, while many more will doubtless be lost where heavy swarming prevailed, from want of stores and queens. Now is the time for everyone interested to see that his stock goes into winter quarters with ample stores and a fertile queen, and thereby lay the foundations for success next season. Bad and hopeless as the outlook may appear at the end of an unproductive season, let those concerned not forget that two bad years never follow each other in the bee-keeping world. Last year was a most remunerative one, and especially so where stocks received due attention at the end of 1907. This season has been too cold and sunless all through, except for a brief period of very warm weather in early August. The honey gathered from clover this season has been a very small quantity. From charlock, which was in blossom in August, during the heat wave, a considerable quantity was gleaned. Much was expected of the weather, but the onset of a prolonged period of bad weather after St. Bartholomew's Day has proved disastrous. Reports from the most experienced of apiarists are this season depressing in the extreme.

The "Botanical Magazine" for the current month contains illustrations and descriptions of Aphelandra tetragona, a handsome stove plant, with bright orange-red flowers, which has long been in cultivation at Kew. Megaclinium purpureorachis, an interesting orchid, met with by Mr. Gentil on the Upper Lomami, a tributary of the Congo, a few years since, with brownish and decidedly unattractive flowers. Exostemma subcordata, a low-growing shrub, introduced from San Domingo, blooming in autumn, and bearing white flowers; it thrives under the same conditions as the ixoras. Euphorbia Ledieni, an interesting species, with thick fleshy stems, and yellow flowers. Peliosanthes violacea, var. Clarkei, the most attractive of the forms of this distinct species.

Soil Moisture.—At a meeting of the Agricultural Section of the British Association at Winnipeg, Mr. F. H. King read a paper on soil moisture in relation to plant growth. He first directed attention to the importance of soil moisture in crop production, and then proceeded to state that water was not only an important plant food, but was also the medium in which all other plant food derived from the soil was elaborated and carried to the plant tissues. To produce a ton of dry matter in the crop from 250 to 600 tons of water were withdrawn from the soil by transpiration and by evaporation from soil. It was not possible to separate these two factors, but probably the plant took not less than from 200 to 400 tons. Only a portion of the water in the soil was available for the crop; the rest was held as a film to the soil particles and could not enter the plant roots. The amount of this unavailable water depended on the size and arrangements of the soil particles and on the quantity of colloidal matter present. Thus a soil might be physiologically dry and yet contain more moisture than another soil which was actually supplying water to plants. Further, on one soil (e.g., a coarse sand) 0.3in. of rain would double the water content of the surface root and place it in a good growing condition, while on another soil (e.g., a clay) the same rainfall would be largely retained near the surface, above the roots, and be quickly lost by evaporation. On the sandy soil also the rain would have dissolved any soluble salts accumulated near the surface and have carried them down about the surfaces of the active root hairs, so that the crop would have been fertilised as well as watered; on the clay soil the water might even have the effect of strengthening the upward capillary rise from below, leaving the deeper soil both drier and less richly charged with soluble plant food than before. When the natural particles were caused to agglomerate by tillage, the amount of available water increased; suitable soil texture was, therefore, a very important consideration.

New Flora of Krakatau.—Considerable interest attaches, observes "Nature," to the report by Professor D. H. Campbell, on the new flora of Krakatau (Krakatoa). When the island was first visited by scientific men two months after the great eruption of 1883, the whole surface was buried under a layer of ashes and pumice averaging 90 feet in depth, and in some places reaching double this depth. A clean sweep of living organisms was thus made. Except phosphorus and nitrogen, the elements necessary for plant life existed in the ashes. By 1886, when the island was visited by Dr. Treub, from Java, a number of plants had already established themselves, slimy, blue-green algæ being of special importance in preparing the soil for higher plants. The plants in the interior were found to be quite different from those near the coast, and the preponderance of ferns was remarkable. Since 1897, when another visit was paid, the progress of the new flora has been rapid, this being especially noticeable in 1906 in the case of the forest trees, which made it evident that the island will ere long be as densely afforested as ever. Nitrogen-forming bacteria have played an important part in rendering the soil fitted for vegetation. As regards distributional agencies, there seems no doubt that the earliest plant-immigrants, such as bacteria, blue-green algæ, ferns, and mosses, were wind-borne, and the same is probably true of the first phanerogams, Compositæ, and grasses to reach the island. On the other hand, ocean currents have probably been the chief agents in transporting seeds and fruits, those of the strand plants being almost certainly water-borne.



RHUS SINICA.

An elegant Chinese shrub remarkable for the bright colouring of the leaves in autumn. Exhibited by Messrs. Paul and Son, at the Royal Horticultural Society's Meeting, on the 14th inst., when it received an Award of Merit.

Sicilian Lemons.—It is estimated that, under good cultivation the Sicilian lemon trees yield from 500 to 1,200 fruits per annum, but a good deal depends on whether irrigation can be practised or not. Under the most favourable circumstances, well developed and vigorous lemon trees in Sicily have yielded as high as 1,700 to 2,000 lemons and even more. In the year 1908 there were produced about 23,000 pipes of citrate of lime in Sicily. About 100,000 lemons are required to make 1 pipe (672lb.) of citrate, and it is estimated that about one-third of the total crop is used in the manufacture of citrate of lime. The total production of lemons has more than doubled in the past ten years. In 1897-8 there were manufactured 9,500 pipes of citrate of lime as compared with 23,000 pipes in 1907-8. The chief reasons that account for this extension of the industry are the improved facilities that have been introduced for irrigation of the groves, and for transport of the fruit.

Eucalyptus viminalis. — Mr. Francis George Heath, writing to "The Times," from Silverton, Devon, says:— "The cultivation in this country of the various species of gums, many of which are highly esteemed for their timber as well as for the beauty of their foliage, has hitherto been prevented owing to their extreme susceptibility to our frosts during the early stages of their growth. Hitherto the only species that during those stages has survived our winters is Eucalyptus coccifera. In the spring of last year Mr. P. C. M. Veitch, J.P., head of the Exeter nurseries, knowing my interest in the subject, kindly sent me two or three seedlings believed to be very hardy from seed he had obtained from California. Of these the hardiest, which I augur will exceed the frost-resisting capacity of E. coccifera, is E. viminalis, the osier-barked or 'Manna' gum. It has stood in my garden here absolutely uninjured over 12 deg. of frost, and the seedling of 3in. is now over 10ft. high. It has exceedingly graceful and beautiful foliage, and is highly perfumed. The secret of its hardiness is the early formation of a hard woody stem, in great contrast to the soft-wooded succulent stem of the popular E. globulus, which almost invariably succumbs to our winters."

THE AMATEUR'S PERPLEXITY.

Happy in his gardening experience is he who can say that if he were planting fruit trees in his garden again he would put in the same varieties as he did before. Such a one is indeed lucky, for, however great his experience, and sound his judgment, the cultivator is still to some extent at the mercy of chance, for he may find that something in his soil does not suit a particular variety; or that trees growing upon it are late in maturing their fruit, so that the latest varieties, like Sturmer Pippin, Adams' Pearmain, and Duke of Devonshire, are a failure in any but the best seasons; or that some trees are not upon the stocks most suited to them, a weak grower having been put upon an exceptionally feeble stock, or a strong grower upon a very strong one, for even in nurseries a good deal of work has to be left to paid men, and mistakes will occur. Still, barring accidents, of which there must be some, it is possible by the exercise of judgment, combined with experience and observation, to reduce the number of failures to a minimum. It is hoped that these few notes, by pointing out some of the pitfalls which beset the amateur, may help him, if not in the making of a good selection, at least in the avoidance of some of the mistakes into which so many fall.

Perhaps the most frequent source of failure is the exhibition table. The would-be grower inspects the varieties, and feels he must have this and that, without taking into account the exceptional conditions that have contributed to the placing upon the table of such splendid specimens—selected, perhaps, from the produce of scores, or even hundreds, of trees of the same variety. A given variety may be a poor bearer, extremely subject to canker, very tender, liable to spot, a feeble grower, very slow coming into bearing, etc., etc., but if a grower has a hundred three-year-old trees of it he will be unlucky indeed if he does not get enough fruit to be able to show a half-dozen selected specimens. If you had a dozen bushels of the ugliest variety of apple grown you would probably be able to pick out half a dozen that were fairly presentable. It should be remembered, too, that the finest specimens are usually obtained from two or three-year-old trees, of which a nurseryman, of course, has a large stock.

Varieties are all too numerous, and are becoming yearly more so. In some lists nothing is mentioned that is unfavourable to any variety which is catalogued, though there are few varieties of fruits which do not possess some drawback. If a variety is a poor grower, or bad cropper, or very tender, the catalogue should say so, but it rarely does. The comparing of two or three catalogues together also adds to the planter's perplexity, but it may also save him from hastily deciding upon certain varieties when he sees what different opinions are held by people of experience.

For instance, one describes Lord Burghley apple as a small grower only suitable for garden culture, while another says that it forms a large pyramid and a good standard. Of Winter Nelis pear one says that it is hardy and a good cropper, and another that it is tender, and can only be depended upon as a garden tree or on walls. Of Oullin's Golden Gage plum, one says it is a shy bearer until the tree gets old, and another that it is remarkable for its abounding fertility. No less perplexing is the diversity of opinion as to the quality of different varieties. One says that the old Roundway Magnum Bonum apple is the best dessert kind, richer in flavour than Cox's Orange Pippin, and withal fruitful on the paradise, while another well-known list omits it altogether. One says that that beautiful pear, Josephine de Malines, is one of the most regular-bearing sorts we have, while the first grower you meet will probably tell you that he has a difficulty in getting it to fruit, at least, until the tree gets old.

There is no doubt that not only do fruits behave very differently in different soils—a liability to variation which is increased by the varying nature of the stocks upon which they are worked—but that nurserymen have different strains of the same fruit, strong or weak, prolific or the reverse, early or late, more or less highly coloured, and so on. It is a well-known fact that two Blenheim Orange trees may be growing side by side, and the fruit on one be different from the fruit on the other. This increases the element of luck in the purchase of fruit trees. I have had some striking instances of this in my own experience. Catalogues tell us that Fearn's Pippin is a small grower, and an abundant bearer, but with me it grows so rampantly that no pinching will subdue it, and I have had to vigorously root-prune it, while during the half-dozen years I have had the tree—a cordon on the paradise—it has scarcely produced anything. So with Lord Burghley, which someone writing about in one of the gardening papers a little while ago, said was the worst grower and bearer he knew of, and yet with me it grows too strongly for the space assigned to it, and bears fairly well.

Similar instances might be multiplied. Novices at fruit-growing may well say it is hopeless to make a successful selection of varieties for planting. If he is quite a novice it doubtless is so, and the best thing he can do is to take the advice of some experienced gardening friend or nurseryman. But whether inexperienced or otherwise the first thing to do is to make up one's mind for what definite purpose one wants the fruit. To go to a man and say to him, "Tell me some good apples to plant," is as careless and diffuse a way of speaking as to say, "What book shall I read ?" It is of no use consulting catalogues or friends until one has quite settled in one's own mind whether one wants dessert or cooking sorts, early, mid-season, or late; whether as standards, dwarfs, or wall-trained, etc., having regard to the nature of the soil and situation, with all that it involves in the matter of spring frosts, early or late ripening, the inducing of canker, and other considerations which lead the experienced amateur to determine what sorts he will plant. All this needs careful study, and after it one is in a position to profit by a friend's advice, and to put some leading questions to him, with the result that one's mistakes may be reduced to a minimum. There is one mistake most of us make, and that is in the planting of too many varieties. It is interesting, of course, to have in one's garden a collection of varieties, but the more sorts the more failures, besides which, after the novelty of growing the different sorts has worn off, one wishes that he had more of the best sorts, and less of the indifferent ones, as some are bound to turn out to be. The most valuable help one can get is to see the sorts which succeed best in gardens adjoining one's own, or in the near neighbourhood, assuming the soil and general conditions are somewhat similar. As regards the number of varieties, it has been said of apples that a half-dozen dessert, and a half-dozen culinary varieties are enough for any man, and yet we generally want to plant more. The sorts which are really excellent in all respects, however, are not much more numerous than this, and if we can find out two or three of these sorts which do well in the neighbourhood, the best thing to do, if they answer our purpose as to season, etc., is to plant as many of them as we have space available for.

ALGER PETTS.

ANEMONE BLANDA.

Earlier than the delightful Apennine windflower, what is known as the Greek windflower (Anemone blanda) is in no whit behind that charming flower in its attractions to our eyes. Its popular name is somewhat misleading, inasmuch as it is not a native of Greece alone, but is widely spread throughout the Mediterranean region, and some of our most beautiful forms have come to us from Asia Minor. Thus I should almost prefer the other popular term of Winter Windflower to that which gives a false impression of the nationality of the flower. Yet the name matters little when the flower itself is so beautiful.

It is like the Apennine windflower in its general appearance, but it owns several points of distinctness. For one thing, it is earlier; sometimes, in favoured places and in favoured seasons, coming into flower at Christmas, and lasting even till its congener, A. apennina, comes into blow. It is seldom, however, that it blooms so early, and it matters little, for we have, as a rule, too little sunshine to induce it to open its starry flowers. In February and March it is probably at its best, and then a group of its blue, starry flowers, moving on their slender pedicels with every breath of wind, is delightful indeed. It is dwarfer than A. apennina, has larger flowers, is harder and smoother in the leaves, and is even more enduring than it when in suitable places, although in poor and sandy soil, where I have seen A. apennina do well enough, A. blanda is liable to become weak and die out.

It is easy for those who know the true plant to distinguish it from A. apennina, but, as I have seen the latter, which is cheaper, supplied for A. blanda, it may be well to point out one great distinction between the two. The carpels of A. blanda have a black-pointed style.

It is not difficult to find room in every garden for A. blanda, as it can be accommodated on the rockery, in the border, or even in thin grass or on bare banks, where it may catch the early sunshine, for it will not open well in the shade. This charming flower, of a deep blue in the type, and not more than four inches high, can surely be granted a place in all our gardens.

There are quite a number of forms or colours of this lovely anemone. One of the prettiest of these is A. blanda scythinica, which has white flowers, with the outside of the petals blue. There are other forms, such as white, light blue, and deeper blue ones. The late Mr. James Allen raised a pink one, which I have the good fortune to possess.

This windflower seems to prefer a rather strong soil, and in such thrives better and gives larger flowers than in a poor one. Like other anemones, A. blanda is subject to several diseases, and the best preventive for any of these is the drastic, but effectual one of removing all infected plants and burning every vestige of them, and even charring some of the soil in which they were placed. Planting is effected in autumn, when the tubers are at rest. Seedlings can be raised, but the seeds must be saved just as they are about to fall from the carpel, and sown when ripe.

A.

TULIPS FOR GARDEN DECORATION.

Of all the bulbous plants that are used to embellish our gardens none are either more beautiful or possess a greater variety of colouring than the tulips. From a very early date they have been great favourites, and their cultivation in olden times was not less enthusiastic than it is to-day, though they were grown less then for cutting than now. To prolong the season of bloom it is necessary to grow both the early and late flowering kinds, and these are divided into various groups, such as Early, May-flowering, Parrot, Darwin, etc. Each and all in their way are very beautiful, but it is more with the self-coloured forms that we wish to treat at the present time, as these are far more effective for bedding when employed with other plants as a groundwork, than are those having various colourings on the same flower.

First let us treat of the plants to be used as a carpeting. Though these are by no means numerous, they are ample for the purpose. Of the myosotis, or forget-me-not, there are various shades of blue, in addition to the white forms. Seeds sown in July will produce plants large enough for putting out by the time the beds are ready for them in the autumn. Where a large quantity have to be required sow the seeds thinly on a north or shaded border, where the soil can be kept moist. In such a place the seeds will germinate freely and the plants grow away rapidly. When large enough to handle, prick them out about four or five inches apart, and let them stand until the beds are ready, when they can be lifted with balls of earth attached. The same remarks apply to Alyssum saxatile compacta, the common white arabis, aubrietias, and others of that class. Pansies and violas may also be treated in like manner; but where particular shades of colours are desired, they are best grown from cuttings. By sowing early in July, and giving the plants liberal treatment, the majority of them will be in bloom by the autumn, so that the best may be picked out, keeping each distinct colour by itself.

There are many plants, however, that will not seed readily, and these must be propagated by cuttings. The double white arabis is one of them, and nothing could be more beautiful for carpeting beds in which some of the tall May-flowering tulips are planted. If cuttings of this plant are inserted in a light sandy soil in a north border they will soon take root, and thousands of them may be propagated in this way with but little trouble. When rooted they should be transplanted, so as to induce them to make a sturdy growth. The various wallflowers are also useful, but a preference should be given to the dwarf-growing kinds when employed for this purpose. The seeds should be sown thinly in June or early in July, and when the plants are large enough to handle prick them out sufficiently far apart in an open space on poor ground to induce them to grow the more sturdy. There are also some annuals which, if sown in the autumn, will flower early in spring. Having a good stock of these plants, there should be no difficulty in making a fine display, provided the colours are properly blended, and the varieties so arranged that both the carpet beneath and the tulips above flower at the same time.

Amongst the early-flowering tulips the Pottebakkers, Proserpine, Yellow Prince, Chrysolora, White Hawk, La Reine, and Crimson King are the best selfs, while in mixed colours Keizerskroon, Duchesse de Parma, Rosa Mundi, and the like are useful. The May-flowering class, however, are by far the most effective. What can be more beautiful than a bed of forget-me-nots over which are fine bold flowers of Mrs. Moon, Gesneriana lutea, or Mrs. Keightley tulips are waving their stately blooms? When well grown the stems of these tulips vary from eighteen inches to two and a-half feet, so that in exposed places they will need slight supports. The first-named grows the tallest, and produces bright yellow pointed flowers, while lutea is of globular form, large size, and good substance. Mrs. Keightley is pale primrose. There are several others of this class varying from a pale primrose or straw colour to a deep orange-yellow, such as elegans maxima lutea, retroflexa, vitellina, Leghorn Bonnet, ixioides, Illuminator, and the old Bouton-d'Or, all first class.

Of whites we have such varieties as the old Picotee, or Maiden's Blush, which has for a long time been a great favourite: then there is the Parisian White, a fine globular form; Milkmaid, a dwarf-growing variety, suitable for small beds; Didieri alba, White Swan, Snowdon, elegans alba, and Creamy White. The beautiful shades of pink and fawn colour should not be overlooked, as amongst these we have some of the finest blooms, notably Inglescombe Pink, La Perle, The Fawn, La Merveille, and others. Amongst the most showy of all the tulips are the scarlets and crimsons. The old Gesneriana is a fine, tall-growing kind; macrospila, Greigi, spathulata major, fulgens, and its early form, elegans, are all beautiful in their way, and may be grown in beds carpeted with other plants to harmonise with their colours. The number of varieties producing striped and mixed-coloured blooms is very large, and these, as a rule, are best planted in groups by themselves in borders, that their colouring may not clash with other things: Bridesmaid, Bronze Prince, Clusiana, Bainty Maid, Billietiana, Shandon Belle, and Striped Beauty, are all good.

We now come to the Darwins, which are noted for their long stout stems and blooms of remarkable beauty. These are best

MAY-FLOWERING TULIPS AT KEW.
Combined with violas, wallflowers, and other fibrous-rooted plants flowering in spring.

planted in rather a shady position, so that the bright sunshine may not take the colouring out of their thick fleshy petals. The colours range from a creamy-white to almost a jet black. For cutting they should be grown in quantity, as their stems are stout enough to carry the blooms erect when placed in vases. Then we have what are called the Parrot tulips, but as these produce flowers out of all proportion to the strength of their stems, they cannot be recommended either for cutting or for making a display in the flower garden, as the flowers flop over so much, unless staked, that they come in contact with the soil, and are therefore spoiled by the heavy rains in spring. There is one other set, the old English varieties, which include Bizarres, Byblœmens, and Roses, all known by their various markings. These florists' tulips are best grown by themselves, where each can be given proper treatment, but I do not advise their cultivation for making a display in the flower garden, as the colours, as a rule, are not bright enough for that purpose, but as show flowers they are a most interesting group, and should be cultivated on that account.

Buxted Park Gardens.

PROFITABLE FRUIT GROWING for Cottagers and Small Holders of Land.—By John Wright, V.M.H. A Gold Medal Essay, written for the Worshipful Company of Fruiterers. Fully illustrated. Price 1s., by post 1s. 3d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

LACHENALIAS FOR THE CONSERVATORY.

For the decoration both of house and conservatory in the late winter and early spring months some of the lachenalias, or Cape hyacinths, are well worthy of cultivation, one of the prettiest and most useful being L. Nelsoni, a garden variety, raised, I believe, about 1880.

This may be grown equally well in pots or baskets, but is perhaps seen at its best when well grown in small wire baskets. I find it succeeds well in a compost of three parts good fibrous loam, one and a-half parts of leaf-mould, a similar proportion of spent mushroom bed manure, and one part each of sand and burnt earth from the rubbish heap fire, to which may be added a little dried cow manure rubbed through a half-inch sieve, the whole being well mixed.

LACHENALIA NELSONI.
As grown at Hatfield House for conservatory decoration. Flowers rich golden-yellow.

About the end of July or early in August the baskets, six inches to eight inches in diameter, and nearly as deep, should be lined with fresh moss, about one and a-half inches of the compost being placed in the bottom over the moss, and the bulbs set about one and a-half to two inches apart on this, with the crowns close to the moss, and pointing slighting downwards; another layer of soil and bulbs should be added, and the soil made firm: then follow with a third layer of soil, and the bulbs towards the sides, as well as some bulbs, crown upward, about two inches apart, over the surface, using sufficient soil to well cover them. When finished the soil should be fairly firm, with a space of about half an inch left at the top of the basket to allow of watering.

The baskets may be suspended from the roof of a cool greenhouse, syringed once or twice on all fine days, and watered only when the soil is thoroughly dry until they are well filled with roots, when they will require more frequent waterings. I find that to examine them once or twice weekly, for watering, is sufficient during the winter months. When the flower spikes appear assistance may be given in the form of a little artificial manure. Unless required for increasing the stock the small side growths from new bulbs, at this time showing rather freely, should be removed carefully.

After flowering, watering and occasional feeding should be continued until the foliage has naturally died down and the bulbs are quite resting. At this time I prefer to carefully shake out the bulbs, place them in shallow boxes, and in fine weather stand them outside in a sunny position until they are thoroughly ripened, and then store them until the time to again start them into growth arrives.

Hatfield House Gardens. H. Prime.

THE POET'S NARCISSUS IN THE WILD GARDEN.

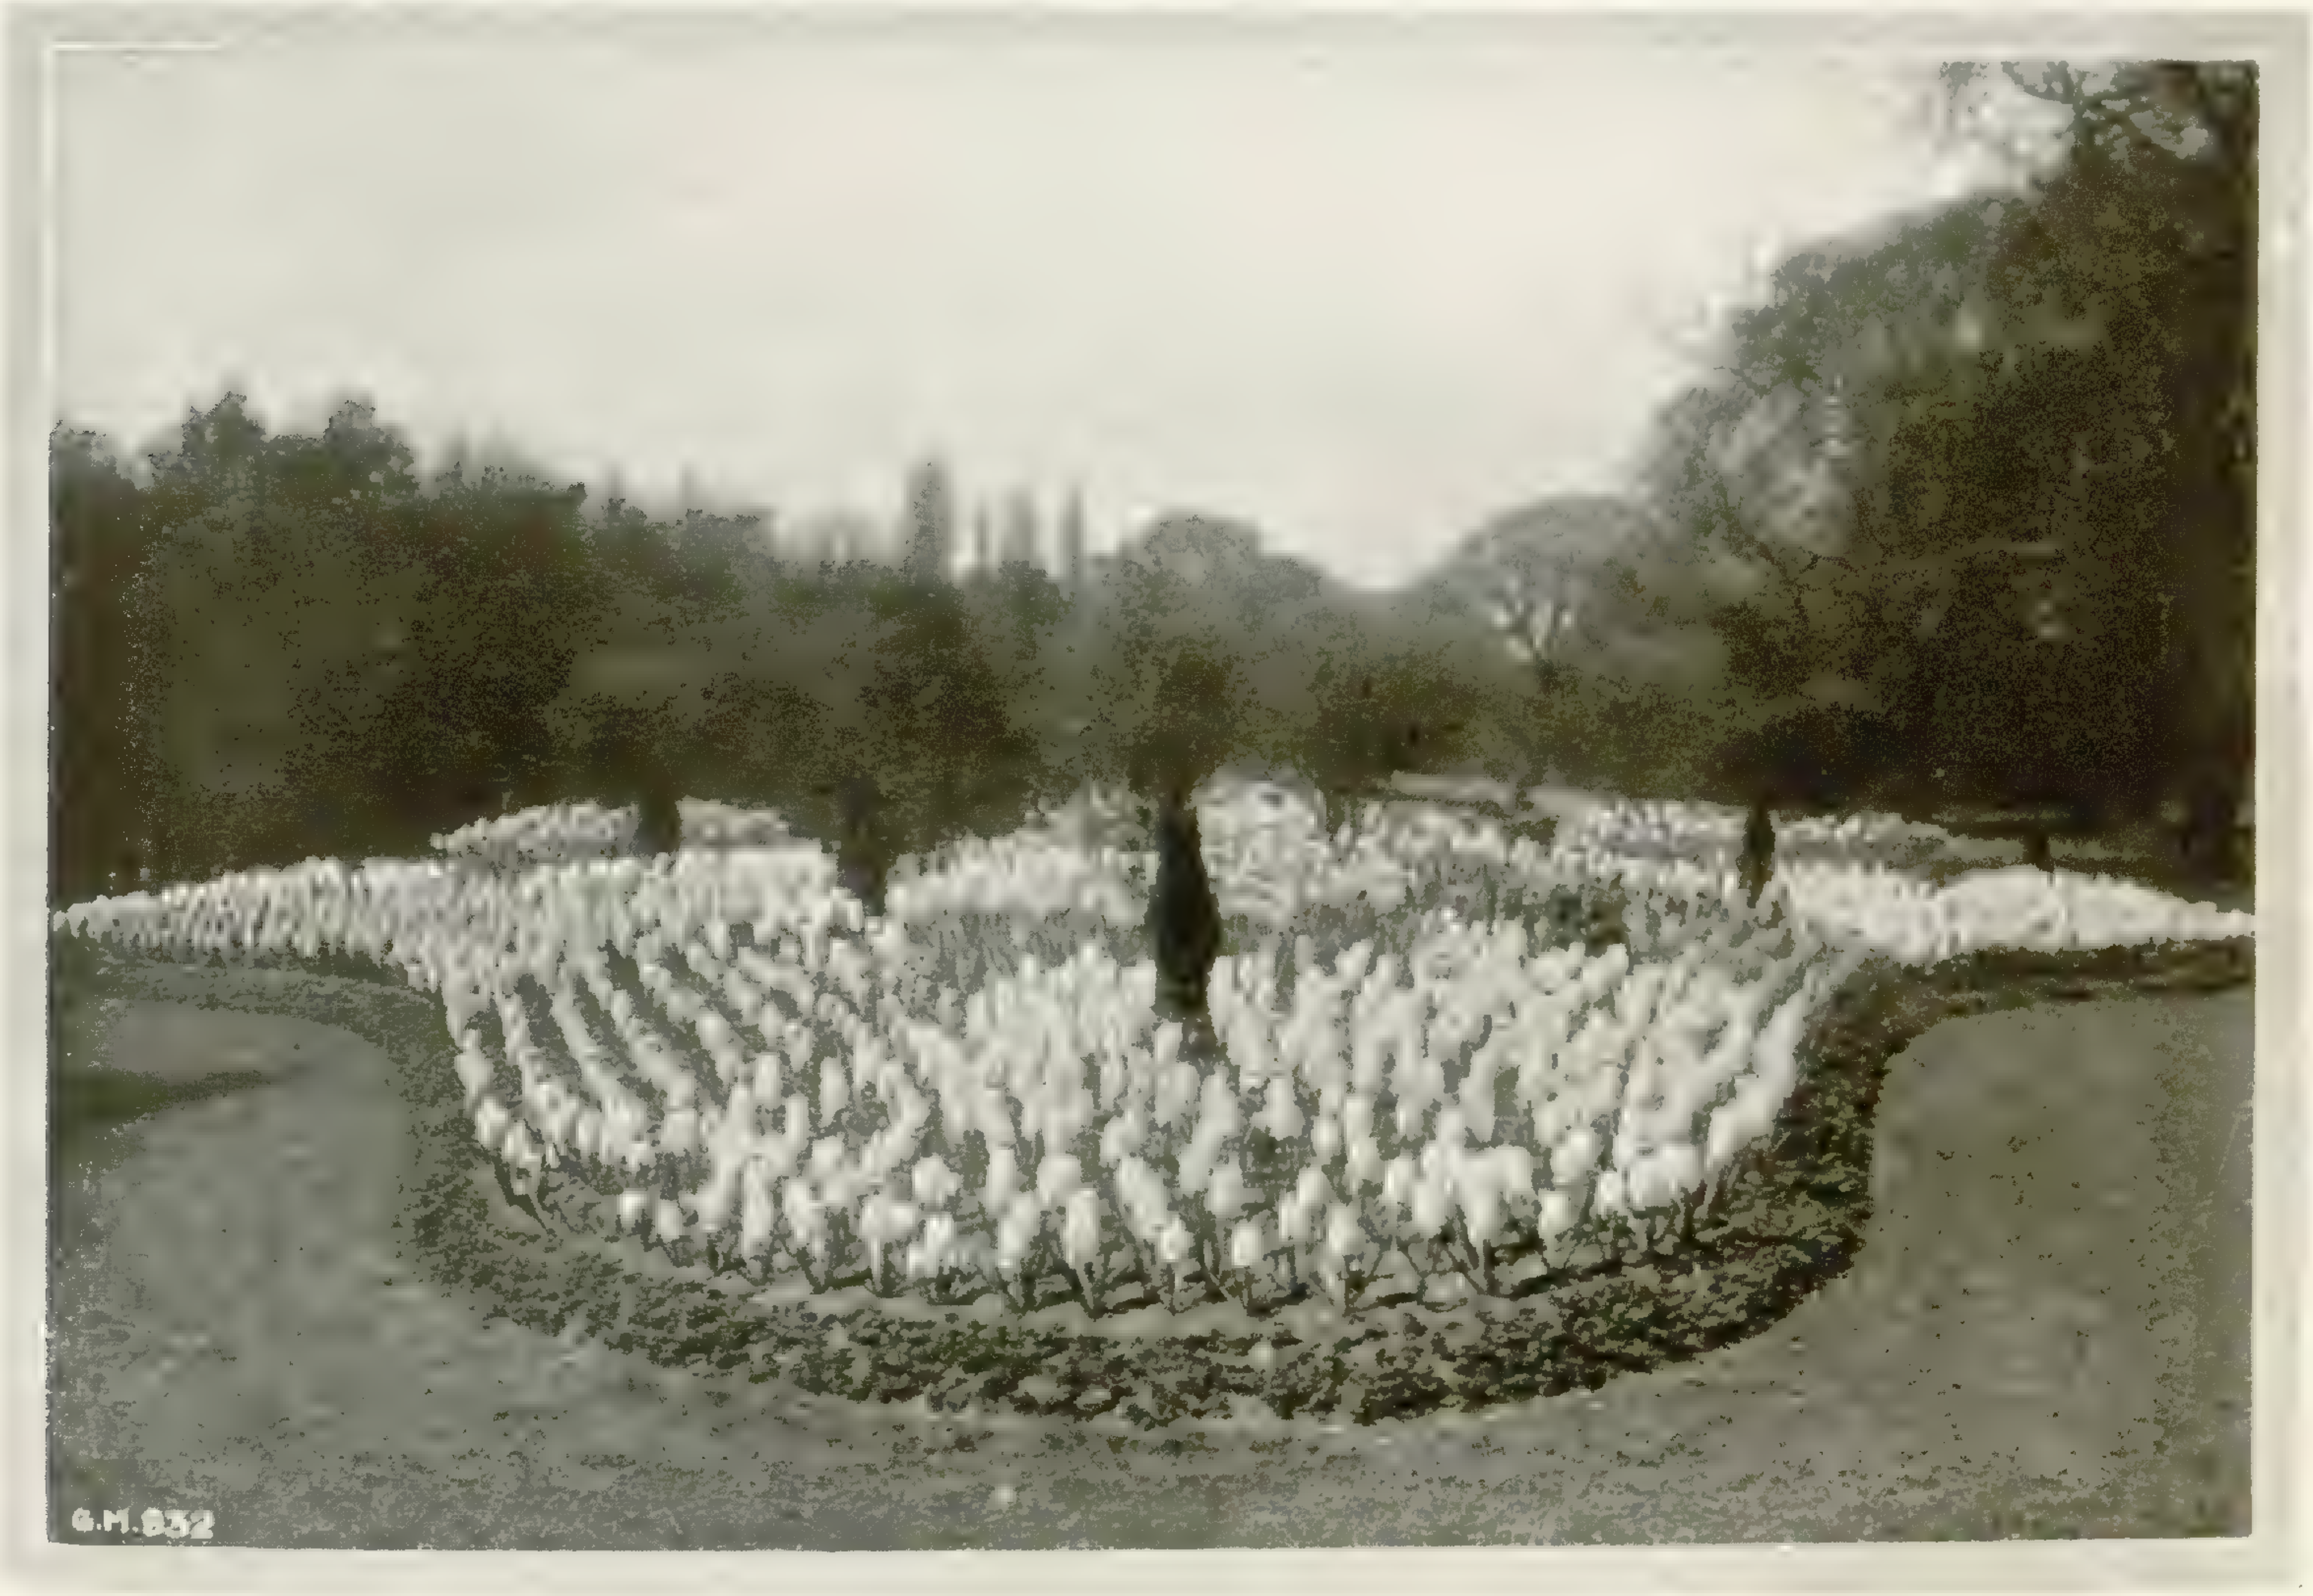
The poet's, or pheasant's-eye, narcissus, Narcissus poeticus, is infinitely prettier when planted amongst grass in the wilder parts of the garden than when grown in a formal bed, and it is one of the best of the numerous species for planting amongst grass. It thrives best in good loamy soil, but is quite a success in land of a light character, and plantations made fifteen years ago in the latter kind of soil continue to give a good account of themselves. It is specially suited for planting in the vicinity of dark coniferous trees, the dark green foliage forming a suitable setting for the delicate white flowers. As to whether this, and, in fact, any kind of narcissus, is to look well or not when planted in grass depends largely on the planter, for if he plants without thought and taste the effect is wretched. Hard lines must be avoided, and so must a repetition of the same-sized groups. Copy nature as far as possible; here and there extensive patches of irregular outline must be formed, with open spaces between, and again a small patch, a group of three or four bulbs, or even a single one. On the outskirts of the groups, likewise, a few bulbs should be scattered here and there several yards away, so that the idea of planting is done away with as far as possible. In fact, they must be made to look as one would expect to find them if they had been sown broadcast, or, if such a thing were possible, had been blown about by the wind.

As this is the narcissus that a certain amount of romance centres round, it is worth a little trouble to have it at its best. Tradition says that it was this particular sort that was created by the gods from the corpse of a very beautiful youth of Bœotia. Of this youth it had been prophesied that he would lead a very happy life until he saw his own face. He was petted and courted by everybody until one day, after becoming very heated whilst hunting, he stooped to quench his thirst in a stream of clear water, and saw the reflection of his face. He was so enamoured with his own beauty that he could not stir from the spot, and eventually died there. From his corpse the flower is said to have sprung.

D. K.

HYACINTHS IN THE FLOWER GARDEN.

Although it can hardly be said that hyacinths compare favourably with narcissi and tulips in the production of colour effects in the garden during the spring months, they are so distinct in character and attractive in colouring that they possess a value for garden decoration that should not be lost sight of. They are too formal to appeal to some flower lovers, and the bulbs are comparatively expensive, but their formality assists the planter in producing distinct contrasts, and suitable varieties for outdoor culture are not so costly as to be beyond the means of the majority of the owners of gardens. Those who would be satisfied with bulbs selected according to their colours, and sold without name, may fill their beds and borders at a really small cost.



AN EFFECTIVE ARRANGEMENT OF HYACINTHS IN ASSOCIATION WITH NARCISSI, REGENT'S PARK.

There is an advantage in the purchase of hyacinth bulbs for outdoor culture under name, as the planter is able to obtain exactly the shades of colour desired, and flower spikes uniform in height and shape. There is no occasion to select first quality bulbs, such as are desirable for forcing and pot culture generally, and for a long number of years the writer has planted second-size bulbs of the finest of the cheap varieties, which can be obtained retail at a price per hundred averaging about twenty-five shillings. The results have been most satisfactory, and to those who have no occasion to exercise the greatest economy in the garden this practice can be recommended. The cheap varieties of special value for massing in the flower garden are: shades of red, Gertrude, Gigantea, King of the Belgians, and Robert Steiger; white, Grandeur à Merveille, L'Innocence, and Madame Van der Hoop; shades of blue, Grand Maitre, King of the Blues, and Shotel. The bulbs, in selected colours, cost about a guinea a hundred, and the most effective shades are bright red, bright blue, porcelain blue, and white.

There is no necessity for preparing the beds and the stations in borders otherwise than by the application of a dressing of leaf-mould or some such material, and moderately deep digging. To produce a really good effect the bulbs should be planted from nine to ten inches apart, when they are grown by themselves, or twelve inches apart when associated with fibrous-rooted plants, such as the evergreen candytuft, aubrietias, and double daisies. It is of importance that the fibrous-rooted plants be of low growth.

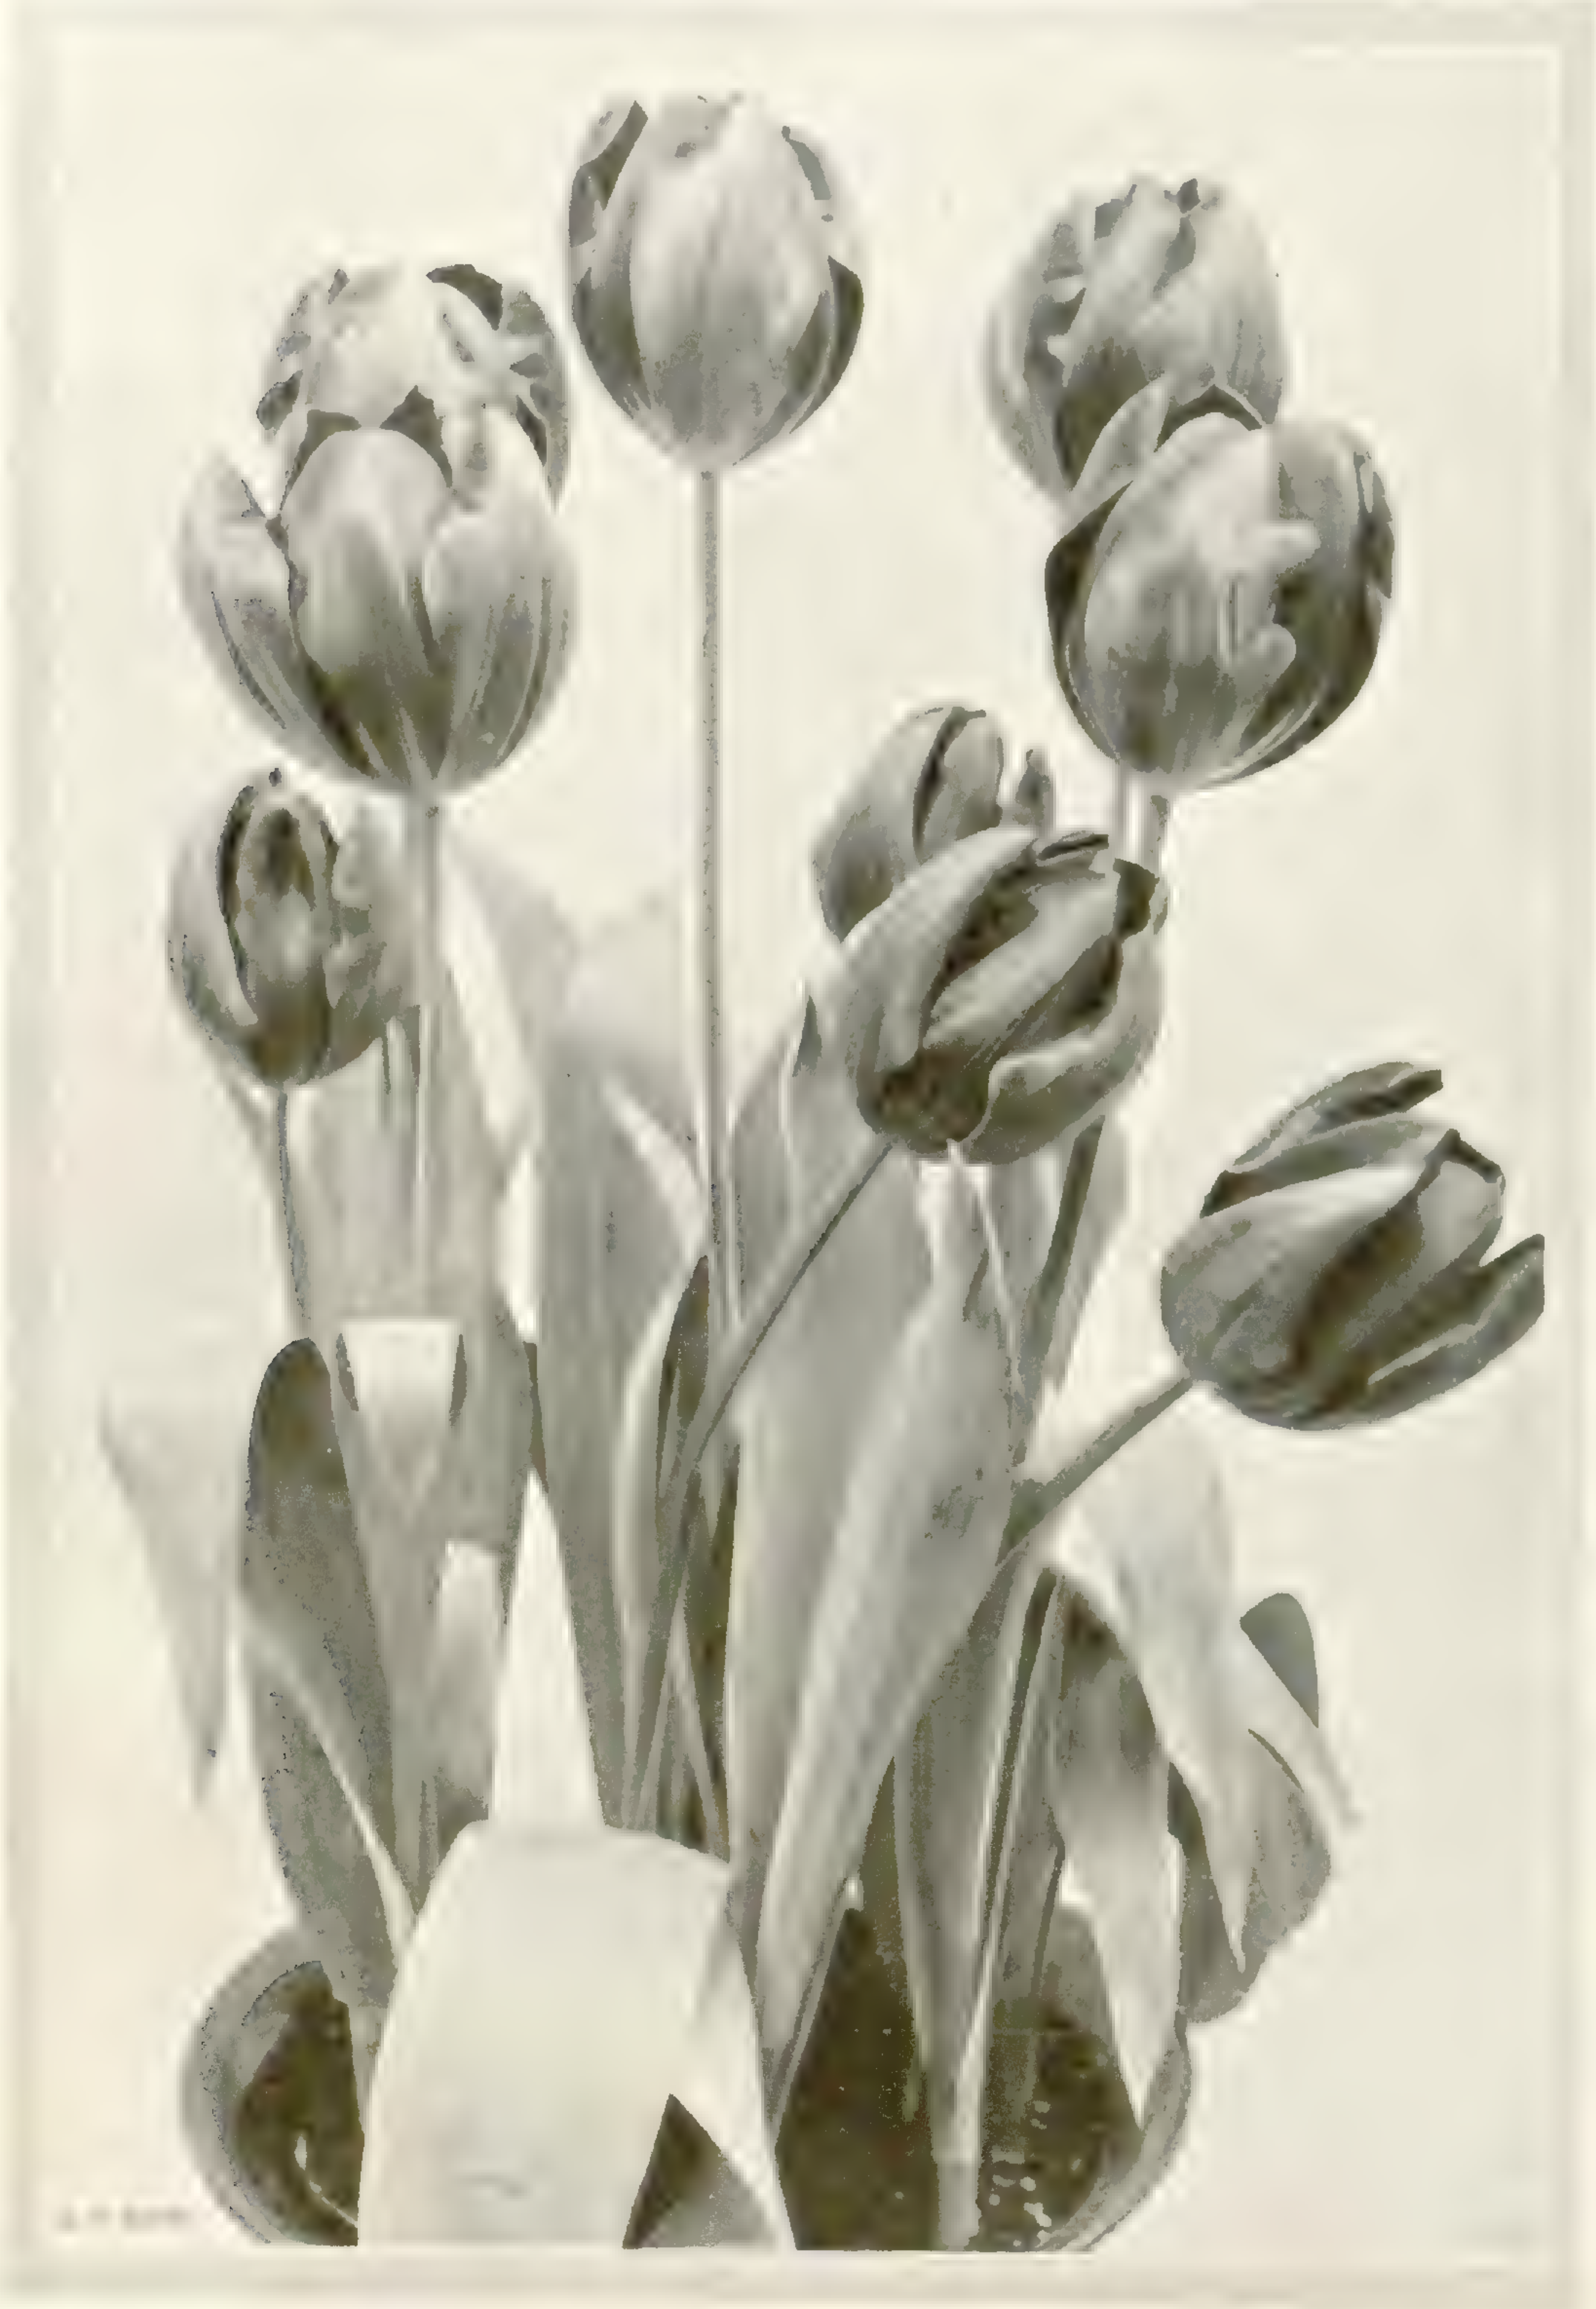
One of the finest displays of hyacinths that has yet come under the notice of the writer was the arrangement that formed so striking a feature in Regent's Park in the spring of the current year. The illustration given herewith will afford an excellent idea of the arrangement which brought so much praise to Mr. A. D. Webster, the superintendent of this park. It will be seen that the larger-growing narcissi, particularly Sir Watkin, were arranged in bold groups, in association with the hyacinths, and did much to relieve the sameness that characterises beds which are composed mainly of the last-named flowers. Six varieties of hyacinths were used in the planting of the huge bed, the number of bulbs being about 3,500. For the sake of a diversity each variety was massed separately, the harmony of colour arrangement being readily carried out with such varieties as Robert Steiger, Gertrude, Gigantea, Grandeur à Merveille, Grand Maitre, and La Peyrouse. The large masses of Sir Watkin narcissi were arranged round the dark cypress, and golden privets in the centre, and towards the back, and on the margin was a bold band of saxifrage, which formed an excellent finish to what was properly regarded as one of the most effective arrangements of spring flowers that has yet been made in Regent's Park.

G. G.

INEXPENSIVE NARCISSI.

The activity of the raisers of new narcissi has of late years been so great as to materially augment the number of varieties in commerce, and to increase the difficulty usually felt by the less experienced cultivators in making selections of these highly popular and extremely beautiful spring flowers. As a grower with considerable experience and possessing an extensive collection, I do not complain of what is being done in the creation of new forms; but, on the contrary, am always ready to give a hearty welcome to varieties that combine distinctness with high quality. I am not thinking of myself and other experienced cultivators, but of those who are not well acquainted with any considerable proportion of the numerous varieties, and are consequently much perplexed when they take up a catalogue for the purpose of making a selection that can be purchased at a comparatively small cost. The purchaser of high-priced varieties will not be in need of assistance, for he will have been careful to become acquainted with the new varieties as they are presented to public notice, and, in the case of any that he may not have seen, he will look up the reports of the spring exhibitions in the Gardeners' Magazine, and see whether they have received awards from any of the principal societies. The inexperienced cultivator, on the other hand, may, in making selections, attach too much importance to the price as a guide to the value of a variety for beautifying the garden. Generally speaking, the more expensive varieties are the best in their several sections and shades of colour; but this is not invariably the case, the price being sometimes determined by the difference in the rate of increase. For instance, such fine varieties as Barri conspicuus, Emperor, Bicolor grandis, and Sir Watkin have a strong constitution, and multiply at so rapid a rate that the growers are able to place them on the market at a very low price.

It is always advisable to commence the cultivation of narcissi with the best of the inexpensive varieties, for should there be a failure consequent on the cultural requirements being imperfectly understood, the stock can be readily replenished. Not so with the expensive varieties, and when the losses are heavy, there is usually a strong tendency to abandon the culture of daffodils. The advice I usually give to my friends who become interested in these flowers is to buy the best of the established favourites, and when sufficient progress has been made to grow them well, to add the more expensive forms according to the amount of money they may be disposed to spend. This advice may be repeated here with advantage.



TULIP PRINCE OF AUSTRIA GROWN IN FIBRE.

A handsome variety with orange-scarlet flowers.

In making a selection of varieties that are inexpensive and meritorious, I shall arrange them in two groups. The first of these will contain varieties that may be purchased retail at a rate not exceeding half-a-crown per dozen, and the second varieties that will not cost more than seven shillings and sixpence per bulb. A considerable proportion of the varieties in each of the groups will be much less than the maximum stated. Those forming the cheaper group should, it may be suggested, be utilised in filling beds and borders, in planting in the grass, and in forming beds in the kitchen garden for the supply of cut flowers. The varieties forming the other groups should be used chiefly in the formation of clumps along the front of herbaceous borders, the size of the clumps being in some measure determined by their cost. Twelve bulbs will form an effective group, but a less number will suffice in the case of those approaching the maximum price. They should be planted in moderately open spaces, and the position clearly marked to avoid the risk of their being injured by any of the tools when the leaves have died down. The cheaper kinds may also be arranged in the herbaceous borders in groups of a dozen or so bulbs in each, where considered desirable.

The following will make an excellent selection of inexpensive narcissi. Large trumpet varieties: Ard Righ, rich yellow, early, and effective; Empress and Grandis are two fine bicolors of high quality. Mrs. Walter T. Ware and Princeps are also meritorious bicolors, and of exceptional excellence in the bicolor section is Victoria, a very strong growing and effective variety of which it would be difficult to speak too highly. C. W. Cowan and Countess of Annesley are two charming varieties with light perianths and bright yellow trumpets. Emperor is strong in growth, has rich yellow flowers is effective, and one of the best for the wild garden. Golden Spur, rich yellow; M. J. Berkeley, bright yellow; Moschatus, white, dwarf in growth and very pleasing; P. R. Barr, primrose perianth, with yellow trumpet, very fine; William Goldring, white. Barri varieties: Barri conspicuus, yellow, with orange-scarlet margin to the cup; Flora Wilson, pure white, with yellow cup edged with scarlet; and Maurice Vilmorin, cream-white, with lemon and red cup. Incomparabilis varieties: Stella superba, white with yellow cup, and Sir Watkin, bright yellow, of much value for extensive planting. Leedsi varieties: Minnie Hume, Mrs. Langtry, and M. M. de Graaff may be specially mentioned for their distinctive beauty; they have all white perianths, and the first-named has a white cup, while the other two have yellow cups.
